			A. <u>Purpose of the test cabinet:</u>								
			<p>The <b>TEST CABINET</b> is used for storing the semiconductor devices (DUT) such as high power diodes and thyristors at an elevated temperature up to 200 °C, under an applied high voltage bias (full-wave rectified sine wave) selected based on device rating. For diodes, the bias is in reverse direction applied for 16 hours. For thyristors, the bias is applied initially in reverse direction for 8 hours followed by an automatic change-over to forward direction for 8 hours. In either case, the maximum bias requirement is 5000 V (peak) and the maximum leakage current through each DUT is 100 mA (peak).</p> <p>In the test, I-V characteristic of the DUT is measured before and after the 16-hours storage, using an external measuring source and the observed change in the characteristic is used as a measure of electrical stability of the device. It is necessary that the post-storage measurements are taken without switching-off the storage bias, as the external source is allowed to interrupt the bias only for the momentary duration of I-V measurement.</p> <p><b>The external measuring source is within the scope of BHEL.</b> The test cabinet, as detailed under section B, shall have provisions for connecting to the external source and shall also be provided with suitable circuitry for the momentary interruption of storage bias during post-storage measurement.</p> <p>To enable clear understanding of the scope of test cabinet, the test procedure is explained under section-H.</p>
