GENERAL

Section C & Section D of this specification cover design, preparation of general arrangement drawings, construction and fabrication drawings, supply of materials and construction of all civil, structural and architectural works.

Section-C covers specific technical & functional requirements of contract and should be read in conjunction with BOQ, Section-D and other sections of the contract. In case of any conflict between the contents of BOQ and Section-C, BOQ will prevail over Section-C. In case of any conflict between Section-C and Section-D, Section-C will prevail over Section-D. Further contract document and clarifications given by BHEL to Bidder will prevail over Section C and D in case of any conflict. During the detailed engineering if there is some change in requirements, which is agreed by customer, consultant and BHEL, the same shall prevail over all.

REV.NO. DATE 16/12/2017
SHEET 3 OF 23

**STANDARD TECHNICAL SPECIFICATION FOR EARTHWORK IN
EXCAVATION AND BACKFILLING**

1.0.0 SCOPE

This specification covers earth work excavation in all types of soil, soft rock and hard rock including setting out, clearing and grubbing, shoring, dewatering, back filling around foundations/pipelines to grade, watering, compaction of fills, testing, approaches, disposal of surplus earth, protective fencing, lighting etc relevant to the structures and locations covered under this contract.

2.0.0 GENERAL

2.1.0 Work to be provided for by the Contractor

The work to be provided for by the contractor unless specified otherwise shall include but not be limited to the following.

a) Supplying and providing all labour, supervision services, earth moving machineries, surveying instruments including facilities as required under statutory labour regulations, materials, scaffolds, equipment, tools and plants, transportation, etc. required for the work.

b) Preparation and submission of working drawings showing the approaches, slopes, berms, shoring, sumps for dewatering including drainage, space for temporary stacking of soils, disposal area, fencing etc and all other details as may be required by the engineer.

c) To carry tests and submit to the Engineer, test results of fill materials and degree of soil compaction of fill whenever required by the Engineer to assess the quality of fill.

d) Design, construction and maintenance of Magazine of proper capacity for storage of explosives for blasting work and removal of the same after completion of the work etc. including procurement of necessary licenses from proper authorities.

2.2.0 Work to be provided by others

No work under this specification will be provided by any agency other than the contractor unless specifically mentioned elsewhere in the contract.

TITLE:

BACKFILLING**

SPECIFICATION NO. PE-TS-999-600-C001
VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 4 OF 23

2.3.0 Codes and Standards

All works shall be carried out as per this specification and shall conform to the latest revision and/or replacements of the following or any other Indian Standard (IS) Codes unless specified otherwise.

IS-1200	Method of measurement of building and civil engineering works, Part-I: Earthwork
IS-2720	Method of test for soils (Relevant parts)
IS-3764	Excavation work - Code of safety
IS-4081	Safety code for blasting and related drilling operations
IS-4701	Indian Standard Code of Practice for earthwork on Canals
IS:6922	Criteria for safety and design of structures subject to underground blasts
IS: 3764	Excavation work – code of safety

In case of conflict between this specification and those (IS Codes) referred to herein, the former shall prevail. In case any particular aspect of work is not covered specifically by this specification/IS Codes, any other standard practice as may be specified by the engineer shall be followed.

2.4.0 Conformity with Designs

The contractor shall carry out the work as per the approved drawings, specification and as directed by the engineer.

2.5.0 Materials

2.5.1 General

All materials required for the work shall be of the best commercial variety and approved by the engineer.

2.5.2 Material for Excavation

For the purpose of identifying the various strata encountered during the course of excavation, refer clause no. 3.4.0 for the classification of earth strata.

2.5.3 Material for Filling

Material to be used for back filling shall be free from vegetations, roots, salts, rubbish, lumps, organic matter and any other harmful chemicals etc and shall be got approved by the engineer. Normally excavated earth shall be used for back filling. In case such earth contains deleterious salts, the same shall not be used. All clods of earth shall be broken or removed. Where the excavated

TITLE:
TECHNICAL SPECIFICATION FOR

BACKFILLING

SPECIFICATION NO. PE-TS-999-600-C001
 VOLUME - II B
 SECTION - D | SUB-SECTION – D1
 REV.NO. DATE 16/12/2017
 SHEET 5 OF 23

material is mostly rock and if filling with the same is permitted by the engineer in writing, then the filling with rock shall be done in the following manner. The boulders shall be broken into pieces not exceeding 150mm size in any direction and mixed with fine materials consisting of decomposed rock, moorum or any approved earth to fill the voids as far as possible and the mixture shall then be used for filling.

In case the earth required for backfilling is over and above the earth available from the compulsory excavations within the project area, then borrow areas for obtaining suitable fill material shall be arranged by the contractor himself from outside the plant boundary limits and all expenses including royalties, taxes, duties etc shall be borne by him. The selected earth from the borrow areas shall be got approved by the engineer. The borrowed material shall be free from roots, vegetations, decayed organic matter, harmful salts and chemicals, free from lumps and clods etc. The contractor shall obtain and submit necessary clearances/permissions from the concerned authorities for the borrow areas/materials acquired to the engineer.

If specified, the back filling shall be done with clean well graded sand from approved quarries free from harmful and deleterious materials.

2.6.0 Quality Control

All works shall confirm to the lines, levels, grades, cross sections and dimensions shown on the approved drawings and/or as directed by the engineer. The contractor shall establish and maintain quality control for the various aspects of the work, method of construction, materials and equipments used etc. The quality control operation shall include but not be limited to the following.

Sl. No.	Activity	Check
1	Lines, levels & grades	a) By periodic surveys b) By establishing markers, boards etc
2	Back filling	(a) On quality of fill material (b) On moisture content of back fill (c) On degree of compaction achieved

2.7.0 Information regarding site conditions

Surface and Sub-surface data regarding the nature of soil, rock, sub-soil water etc. shown on drawing or otherwise furnished to the Contractor shall be taken as a guidance only and variation therefrom shall not affect the terms of the contract. The Contractor must satisfy himself regarding the character and volume of all work under this contract and expected surface, sub-surface and /

TITLE:

SHEET 6 OF 23

or sub-soil water to be encountered. He must also satisfy himself about the general conditions of site and ascertain the existing and future construction likely to come up during the execution of the contract so that he may evolve a realistic programme of execution.

3.0.0 EXECUTION

The contractor shall prepare and submit the detailed drawings/schemes for excavation and back filling works as proposed to be executed by him showing the dimensions as per the construction drawings and specification adding his proposal of slopes, shoring, approaches, dewatering, drainage, berms etc. for the approval of engineer.

3.1.0 Setting out

On receiving the approval from the engineer with modifications and corrections if any, the contractor shall set out the work from the control points furnished by the engineer and fix permanent points and markers for ease of periodic checking as the work proceeds. These permanent points and markers shall be fixed at the interval as prescribed by the engineer and shall be got checked and certified by the engineer after whom the contractor shall proceed with the work. It should be noted that this checking by the engineer prior to the start of the work will in no way relieve the contractor of his responsibility of carrying out the work to true lines, levels and grades as per the drawings and specification. If any errors are noticed in the contractor's work at any stage, the same shall be rectified by the contractor at his own risk and cost.

3.2.0 Initial Levels

Initial levels of the ground either in a definite grid pattern or as directed by the Engineer will be taken by the Contractor jointly with the Engineer over the original ground prior to starting actual excavation work and after setting out. These initial levels will be used for preparing cross-sections for volume measurement or for cross-checking the depths obtained from tape measurements. All records of levels, measurements etc. and also any drawing, cross-section etc. made therefrom, shall be jointly signed by the authorised representative of the contractor and the Engineer before the commencement of work and they shall form the basis of all payments in future.

3.3.0 Clearing and Grubbing

The area to be excavated shall be cleared out of fences, trees, logs, stumps, bushes, vegetation, rubbish, slush etc. Trees upto 300mm girth shall be uprooted. Trees above 300mm girth to be cut shall be approved by the engineer and marked. Cutting of trees shall include removing roots as well.

TITLE:
**TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING**

SPECIFICATION NO. PE-TS-999-600-C001
VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 7 OF 23

After the tree is cut and roots taken out, the pot holes formed shall be filled with good earth in 250mm layers and compacted unless directed otherwise by the engineer. The trees shall be cut in to suitable pieces as instructed by the engineer. Before earthwork is started, all the spoils, unserviceable materials and rubbish shall be burnt or removed and disposed to the approved disposal area(s) as specified by the engineer. Useful materials, saleable timber, fire woods etc shall be the property of the owner and shall be stacked properly at the worksite in a manner as directed by the engineer.

3.4.0

Classification

All earthwork shall be classified under the following categories:

No distinction will be made whether the material is dry or wet.

a) **Ordinary Soil**

This shall comprise vegetable or organic soil, turf, sand, silt, loam, clay, mud, peat, black cotton soil, soft shale or loose moorum, a mixture of these and similar material which yields to the ordinary application of pick and shovel, rake or other ordinary digging implement. Removal of gravel or any other nodular material having diameter in any one direction not exceeding 75 mm occurring in such strata shall be deemed to be covered under this category.

b) **Hard Soil**

This shall include :

- i) stiff heavy clay, hard shale, or compact moorum requiring grafting tool or pick or both and shovel, closely applied ;
- ii) gravel and cobble stone having maximum diameter in any one direction between 75 and 300 mm ;
- iii) soling of roads, paths, etc., and hard core ;
- iv) macadam surfaces such as water bound, and bitumen/tar bound;
- v) lime concrete, stone masonry in lime mortar and brick work in lime/cement mortar, below ground level ;
- vi) soft conglomerate, where the stones may be detached from the matrix with picks ; and
- vii) generally any material which requires the close application of picks, or scarifiers to loosen and not affording resistance to digging greater than the hardest of any soil mentioned in (i) and (vi) above.

c) **Soft and Decomposed Rock**

This shall include :

- i) limestone, sandstone, laterite, hard conglomerate or other soft or disintegrated rock which may be quarried or split with crowbars ;

TITLE:
**TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING**

SPECIFICATION NO. PE-TS-999-600-C001
VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 8 OF 23

- ii) unreinforced cement concrete which may be broken up with crowbars or picks and stone masonry in cement mortar below ground level ;
- iii) boulders which do not require blasting having maximum diameter in any direction of more than 300 mm, found lying loose on the surface or embedded in river bed, soil, talus, slope wash and terrace material of dissimilar origin ; and
- iv) any rock which in dry state may be hard, requiring blasting, but which when wet becomes soft and manageable by means other than blasting.

d) Hard Rock (requiring blasting)

This shall include :

- i) any rock or cement concrete for the excavation of which the use of mechanical plant or blasting is required ;
- ii) reinforced cement concrete (reinforcement cut through but not separated from the concrete) below ground level; and
- iii) boulders requiring blasting.

e) Hard Rock (blasting prohibited)

Hard rock requiring blasting as described under (d) but where blasting is prohibited for any reason and excavation has to be carried out by chiselling, wedging or any other agreed method.

In case of any dispute regarding classification, the decision of the Engineer shall be final.

3.5.0 Excavation for Foundations and Trenches

3.5.1 General

All excavation shall be done to the minimum dimensions as required for the safety and working facility. In each individual case, the contractor shall obtain prior approval of the engineer for the method he proposes to adopt for the excavation including dimensions, side slopes, shoring, dewatering, drainage and disposal etc. This approval however shall not in any way make the engineer responsible for any consequent loss or damage. The excavation must be carried out in the most expeditious and efficient manner. All excavation in open cuts shall be made true to the line, slopes and grades as shown on the drawings and/or as directed by the engineer. No material shall project within the dimension of minimum excavation lines marked. Boulders (if any) projecting out of the excavated surfaces shall be removed if they are likely to be a hindrance to the work/workers in the opinion of the engineer.

Method of excavation shall in every case be subject to the approval of the engineer. The contractor shall ensure the stability and safety of the excavation, adjacent structures, services and works etc including the safety of the

TITLE:

BACKFILLING**

SPECIFICATION NO. PE-TS-999-600-C001
VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 9 OF 23

workmen. If any slip occurs, the contractor shall remove all the slipped materials from the excavated pit without any extra cost to the engineer/owner. All loose boulders and semi detached rocks which are not inside but so close to the area to be excavated and may liable to fall or otherwise endanger the workmen, equipment of the work etc during excavation in the opinion of the engineer shall be stripped off and removed away from the area of excavation. The method to be used for removal shall be such that it should not shatter or render unstable or unsafe the portion which was originally sound and safe. In case any material not required to be removed initially but later to become loose or unstable in the opinion of the engineer shall also be promptly and satisfactorily removed.

The rough excavation may be carried out upto a maximum depth of 150 mm above the final level. The balance shall be excavated with special care. If directed by the engineer, soft and undesirable spots shall be removed even below the final level. The extra excavation shall be filled up as instructed by the engineer. If the excavation (in all types of soil and rock) is done to a depth greater than that shown on the drawing or as directed by the engineer, the excess depth up to the required level shall be filled with cement concrete not leaner than 1:4:8 or richer as directed by the engineer at the own risk and cost of the contractor. In case where excavation in soil, soft rock (including weathered rock) and hard rock are involved, the excavation in each stratum shall be carried out separately with the approved methodology and as per the instructions of the engineer.

All excavated materials such as rock, boulders, bricks, dismantled concrete blocks etc shall be the property of the owner and shall be stacked separately as directed by the engineer. All gold, silver, oil, minerals, archeological and other findings of importance, trees cut or other materials of any description and all precious stones, coins, treasures, relics, antiquities and other similar things which may be found in or upon the site shall be the property of the owner and the contractor shall duly preserve the same to the satisfaction of the engineer/owner. The contractor shall deliver the same to such person or persons as may be authorized or appointed from time to time by the owner to receive the same.

Prior to starting the excavation, the ground level at the location shall be checked jointly with the engineer.

3.5.2

Excavation in All Type of Soil and in Soft Rock

The excavation in all type of soil, soft rock including decomposed rock etc shall be carried out as per the approved proposal and as directed by the engineer. The work shall be carried out in a workmanlike manner without endangering the safety of nearby structures/services or works and without causing hindrance to any other activities in the area. Foundation pits shall not

TITLE:
**TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING**

VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 10 OF 23

be excavated to the full depth unless construction is imminent. The last 150mm depth shall be excavated once concreting work is imminent. At the discretion of the engineer, the full depth may be excavated and the bed be covered with lean concrete as specified after watering and compacting the bed. As the excavation reaches the required dimensions, lines, levels and grades etc, the work shall be got checked and approved by the engineer. In cases where deterioration of the ground, upheaval, slips etc are expected, the engineer may order to suspend the work at any stage and instruct the contractor to carry out the protection works before the excavation will be restarted.

3.5.3 Excavation in Hard Rock

Hard rocks shall normally be excavated by means of blasting. In case where blasting is prohibited for any reasons, the excavation shall be carried out by chiselling or any other approved method as directed by the engineer. Personnel deployed for rock excavation shall be protected from all hazards such as loose rock/boulder rolling down and from general slips of excavated surfaces. Where the excavated surface is not stable against sliding, necessary supports such as props, bracings or bulkheads shall be provided and maintained during the period of construction. Where the danger of falling loose rock/boulder from the excavated surfaces deeper than 2m exist, steel mesh anchored to the lower edge of the excavation and extending over and above the rock face adequate to retain the dislodged material shall be provided and maintained.

3.5.4 Blasting

Storage, handing and use of explosives shall be governed by the current explosive rules/regulations laid down by the Central and the State Governments. The contractor shall ensure that these rules/regulations are strictly adhere to. The following instructions are also to be strictly followed and the instructions wherever found in variance with the above said rules/regulations, the former (instructions) shall be superseded with the later (above said rules/regulations).

No child under the age of 16 and no person who is in a state of intoxication shall be allowed to enter the premises where explosives are stored nor they shall be allowed to handle the explosives. The contractor shall obtain licence from the District Authorities for undertaking the blasting work as well as for obtaining and storing the explosives as per Explosives Rules, 1940 corrected upto date. The contractor shall purchase the explosives, fuses, detonators etc only from a licensed dealer and shall be responsible for the safe custody and proper accounting of the explosive materials. The engineer or his authorized representative shall have the access to check the contractor's store of explosives and his accounts at any time. It is the full responsibility of the contractor to transport the explosives as and when required for the work in a safe manner to the work spot.

TITLE:

VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 11 OF 23

Further, the engineer may issue modifications, alterations and new instructions to the contractor from time to time. The contractor shall comply with the same without these being made a cause for any extra claim.

3.5.4.1 Materials

All materials such as explosives, detonators, fuses, tamping materials etc proposed to be used in the blasting operation shall have the prior approval of the engineer. Only explosives of approved make and strength are to be used. The fuses known as instantaneous fuse must not be used. The issue of fuse with only one protective coat is prohibited. The fuse shall be sufficiently water resistant as to be unaffected when immersed in water for 30 minutes. The rate of burning of the fuse shall be uniform and shall be not less than 4 seconds per inch of length with 10% tolerance on either side. Before use, the fuse shall be inspected. Moist, damaged or broken ones shall be discarded. When the fuses are in stock for long, the rate of burning of fuses shall be tested before use. The detonators shall be capable of giving an effective blasting of the explosives. Moist and damaged detonators shall be discarded.

3.5.4.2 Storage of Explosives

The current Explosive Rules shall govern the storage of explosives. Explosives shall be stored in a clean, dry and well ventilated magazine to be specially built for the purpose. Under no circumstances should a magazine be erected within 400m of the actual work site or any source of fire. The space surrounding the magazine shall be fenced and the ground inside shall be kept clear and free from trees, bushes etc. The admission to this fenced space shall be through a single gate only and no person shall be allowed without the permission of the officer-in-charge. The clear space between the fence and the magazine shall not be less than 90m. The magazine shall be well drained. Two lightning conductors, one at each end shall be provided to the magazine. The lightning conductors shall be tested once in every year.

Explosives, fuses and detonators shall each be separately stored. Cases of explosives must be kept clear of the walls and floors for free circulation of air on all sides. Special care shall be taken to keep the floor free from any grains of explosives. Cases containing explosives shall not be opened inside the magazine and the explosives in open cases shall not be received into a magazine. Explosives which appear to be in a damaged or dangerous condition are not to be kept in any magazine but must be removed without delay to a safe distance and be destroyed.

Artificial light, matches, inflammable materials, oily cotton, rag waste and articles liable to spontaneous ignition shall not be allowed inside the magazine. Illumination shall be obtained from an electric storage battery

SHEET 12 OF 23

lantern. No smoking shall be allowed within 100m distance from any magazine.

Magazine shoes without nails shall be used while entering the magazine. The persons entering the magazine must put on the magazine shoes which shall be provided at the magazine for this purpose and should be careful

- * not to put their feet on the clean floor unless the magazine shoes on.
- * not to touch the magazine shoes on ground outside the clean floor.
- * not to allow any dirt or grit to fall on the clean floor.

Persons with bare feet shall dip their feet in water before entering the magazine and then step directly from the tub to the clean floor. No person having article of steel or iron with/on him shall be allowed to enter the magazine. Workmen shall be examined before entering the magazine to check none of the prohibited articles are with them. A brush broom shall be kept in the lobby of the magazine for cleaning the magazine. Cleaning shall be done immediately after each occasion whenever the magazine is opened for receipt, delivery or inspection of the explosives.

The mallets, levers, wedges etc for opening the barrels or cases shall be of wood. The cases of explosives are to be carried by hand and shall not be rolled or dragged inside the magazine. Explosives which have been issued and returned to the magazine are to be issued first; otherwise those which have been stored long in the store are to be issued first. Neither the magazine shall be opened nor any person shall be allowed in the vicinity of the magazine during any dust storm or thunderstorm. All magazines shall be officially inspected at definite intervals and a record of such inspections shall be kept.

3.5.4.3 Carriage of Explosives

Detonators and explosives shall be transported separately to the blast site. Explosives shall be kept dry and away from direct rays of the sun, artificial lights, steam pipes or heated metal and other sources of heat. Before explosives are removed, each case or package shall be carefully examined to ascertain that it is properly closed and shows no sign of leakage.

No person except the driver shall be allowed to travel on the vehicle conveying explosives. No explosive shall be transported in a carriage or vessel unless all iron or steel therein the carriage or vessel which are likely to contact the package containing explosives are effectually covered with lead, leather, wood, cloth or any other suitable material. No light shall be carried on the vehicle carrying explosives and no operation connected with the loading, unloading and handling of explosives shall be conducted after sunset.

SHEET 13 OF 23

3.5.4.4 Use of Explosives

The contractor shall appoint an agent who shall personally superintend the firing and all operations connected therewith. The contractor shall satisfy himself that the person so appointed is fully acquainted with his responsibilities.

Holes for charging the explosives shall be drilled with pneumatic drills and the drilling pattern shall be so planned that the rock pieces after blasting will be suitable for handling. The hole diameter shall be of such a size that the cartridges can easily pass down through them and any undue force is not required during charging. Charging operation shall be carried out by or under the personal supervision of the shot firer. Wrappings shall never be removed from the explosive cartridges. Only one cartridge at a time shall be inserted in a hole and wooden rods shall only be used for loading and stemming the shot holes. Only such quantities of explosives as are required for a particular work shall be brought to the work site. Should any surplus remain when all the holes have been charged shall be carefully removed to a point at least 300m away from the firing point.

The authorized shot firer himself shall make all the connections. The shot firing cable shall not be dragged along the ground to avoid any damage to the insulation. The shot firing cable shall be tested each time for its continuity and possible short circuiting. The shot firer shall always carry the exploder handle with him until he is ready to fire shots. The number of shots fired at a time shall not exceed the permissible limits. Before any blasting is carried out it shall be ensured that all workmen, vehicles and equipment on the site are cleared from an area of minimum 300m radius from the firing point or as required by the statutory regulations at least 10 minutes before the time of firing by sounding a warning siren and the area shall be encircled by red flags.

The explosives shall be fired by means of an electric detonator placed inside the cartridge. For simultaneous firing of a number of charges, the electric detonators shall be connected with the exploder through the shot firing cable in a simple series circuit. Due precautions shall be taken to keep the firing circuit insulated from the ground, bare wires, rails, pipes or any other path of stray current etc and keep the lead wires short circuited until it is ready to fire. Any kink in the detonator leading wire shall be avoided. For simultaneous firing of a large number of shot holes, use of cordtex may be done. An electric detonator attached to its side with adhesive tape shall initiate cordtex connecting wire or string. Blasting shall only be carried out at certain specified times to be agreed jointly by the contractor and the engineer.

At least five minutes after the blast has been fired in case of electric firing or as stipulated in the regulations, the authorized shot firer shall return to the

**TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING**

SPECIFICATION NO. PE-TS-999-600-C001
VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 14 OF 23

blast area and inspect carefully the work and satisfy himself that all the charged holes have exploded. Cases of misfired unexploded charges shall be exploded by drilling a parallel fresh hole at a distance of not less than 600mm from the misfired hole and by exploding a new charge. The authorized shot firer shall be present during the removal of debris as it may contain unexploded explosives near the misfired hole. The workmen shall not return to the site of firing until at least half an hour after firing.

Where blasting is to be carried out in proximity of other structures, controlled blasting by drilling shallow shot holes and proper muffling arrangements with steel plates loaded with sand bags etc shall be used on top of the blast holes to prevent the rock fragments from causing any damage to the adjacent structures and other properties. Adequate safety precautions as per building byelaws, safety codes, statutory regulations etc shall be taken during blasting operations.

3.5.4.5 Restrictions in Blasting

- a) Blasting which may disturb or endanger the stability, safety or quality of the adjacent structures/foundations shall not be permitted.
- b) Blasting within 200m of a permanent structure or construction work in progress shall not be permitted.
- c) Progressive blasting shall be limited to two third of the total remaining depth of excavation.
- d) No large scale blasting operations will be resorted to when the excavation reaches the last one metre and only small charge preferably black powder may be allowed so as not to shatter the parent rock.
- e) The last blast shall not be more than 0.50 m in depth.
- f) In rocky formations, at locations where specifically indicated or ordered in writing by the engineer, the use of explosives shall be discontinued and excavation shall be completed by chiselling or any other suitable method as approved by the engineer.

3.5.5 Disposal

The excavated spoils shall be disposed of in any (or all) of the following manner as directed by the engineer.

- a) By using it straightway for backfilling.
- b) By stacking it temporarily to use for backfilling at a later date during execution of the contract.
- c)
 - i) By either spreading
 - or
 - ii) By spreading and compacting at designated disposal areas.

TITLE:
**TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING**

SPECIFICATION NO. PE-TS-999-600-C001
VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 15 OF 23

a) By selecting the useful material and stacking it neatly in designated areas as indicated by the engineer for use in backfilling by some other agency.

3.5.6 Disposal of Surplus Materials

All surplus material from excavation shall be removed and disposed of from the excavation site to the designated disposal area indicated by the engineer. All good and sound rocks obtained from excavations and all assorted materials of dismantled structures are the property of the owner and if the contractor wants to use it, he shall have to obtain it from the engineer at a mutually agreed rate. All sound rocks and other assorted materials like excavated bricks etc shall be stacked separately.

3.5.7 Protection

The contractor shall notify the engineer as soon as the excavation is expected to be completed within a day so that he shall inspect it at the earliest. Immediately after approval of the engineer, the excavation must be covered up in a shortest possible time. But in no case the excavation shall be covered up or worked on before approval by the engineer. Excavated material shall be placed 1.5m or half the depth (of excavation) whichever is more from the edge of the excavation or further away if directed by the engineer. Excavation shall not be carried out below the foundation level of the structure close by until the required precautions are taken. Adequate fencing is to be made enclosing the excavation. The contractor shall protect all the underground services exposed during excavation. All existing surface drains in the work area shall be suitably diverted by the contractor before taking up excavation to maintain the working area neat and clean.

3.5.8 Dealing with Surface Water

All working areas shall be kept free of surface water as far as reasonably practicable. Works in the vicinity of cut areas shall be controlled to prevent the ingress of surface water.

No works shall commence until surface water streams have been properly intercepted, redirected or otherwise dealt with.

Where works are undertaken in the monsoon period, the Contractor may need to construct temporary drainage systems to drain surface water from working areas.

3.5.9 Dewatering

All excavation shall be kept free of water and slush. Grading in the vicinity shall be controlled to prevent the surface water running into the excavations.

TITLE:
**TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING**

SPECIFICATION NO. PE-TS-999-600-C001
VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 16 OF 23

The contractor shall remove any water inclusive of rain water and subsoil water etc accumulated in the excavation by pumping or other means as approved by the engineer and keep the excavations dewatered and/or lower the subsoil water level to 300mm below the founding level until the construction of foundation and backfilling are completed in all respects.

Sumps made for dewatering must be kept clear of the foundations. The engineer's prior approval on the method of pumping to be adopted shall be taken; but in any case, the pumping arrangement shall be such that there shall be no movement or blowing in of subsoil due to the differential head of water during pumping.

3.5.10 Timber Shoring

Close or open type timber shoring as approved by the engineer depending on the nature of sub-soil, depth of pit or trench and the type of timbering shall be adopted. Timbers made out of approved quality shall only be used. It shall be the responsibility of the contractor to take all necessary steps to prevent the sides of trenches and pits from collapsing.

3.5.10.1 Close Timbering

Close timbering shall be done by completely covering the sides of the trenches and pits generally with short, upright members called "polling boards". These shall be of 250mm wide(min.) and 40mm thick(min.) sections as directed by the engineer. The boards shall generally be placed vertically in pairs, one on each side of the cut and shall be kept apart (maximum spacing is limited to 1.20m) by horizontal walers of strong wood cross strutted with wooden struts or as directed by the engineer. The length of wooden struts shall depend on the width of the trench or pit.

In case where the soil is very soft and loose, the boards shall be placed horizontally against the sides of excavation and supported by vertical walers which shall be strutted to similar timber pieces on the opposite face of the trench or pit. The lowest board supporting the sides shall be taken into the ground. No portion of the vertical side of the trench or pit shall remain exposed to avoid any slipping out of earth.

The withdrawal of the timber shall be done very carefully to prevent the collapse of the pit or trench. It shall be started from one end and proceeded systematically to the other end. Concrete or masonry shall not be damaged during the removal of the timber. No claim shall be entertained for any timber which cannot be withdrawn and is lost or buried.

3.5.10.2 Open Timbering

TITLE:
**TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING**

SPECIFICATION NO. PE-TS-999-600-C001
VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 17 OF 23

In case of open timbering, vertical board of 250mm wide(min.) and 40mm thick(min.) shall be spaced sufficiently apart to leave unsupported strips of maximum 500mm average width. The detailed arrangement, size of timber and the spacing etc shall be subjected to the approval of the engineer. In all other respects, the specification for close timbering shall apply to open timbering as well.

3.6.0 Treatment of Slips

The contractor shall take all precautions to avoid high surcharges and provide proper surface drainage to prevent flow of water over the sides of the excavations. These precautions along with proper slopes, berms, shoring and control of ground water should cause no slips to occur. If however slips still occur, the same shall be removed by the contractor with his own risk and cost.

3.7.0 Backfilling

3.7.1 General

The material to be used for backfilling shall be approved by the engineer which shall be obtained directly from the excavation, from the nearby areas where excavation work by the same agency is in progress, from the temporary stacks of excavated spoils or from the borrow pits as directed by the engineer. The material shall be free from lumps and clods, roots and vegetations, harmful salts and chemicals, organic materials etc.

In locations where sand filling is required, the sand used should be clean, well graded and be of the quality normally acceptable for use in concrete.

3.7.2 Filling and Compaction in Pits and Trenches all Around the Structures

As soon as the work in foundation has been accepted, the spaces around the foundation in pits and trenches shall be cleared of all debris, brick bats, mortar droppings etc and filled with approved earth in layers not exceeding 250mm (in loose thickness). Each layer(loose) shall be watered, rammed and properly compacted to the required degree to the satisfaction of the engineer. Earth shall be compacted with approved mechanized compaction machine. Usually, no manual compaction shall be allowed unless specifically permitted by the engineer. The moisture content of the fill material during compaction shall be controlled near to its optimum moisture content so as to obtain the required degree of compaction. The final surface shall be trimmed and levelled to proper profile as desired by the engineer.

3.7.3 Plinth Filling

TITLE:
**TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING**

SPECIFICATION NO. PE-TS-999-600-C001			
VOLUME - II B			
SECTION - D		SUB-SECTION – D1	
REV.NO.		DATE	16/12/2017
SHEET	18	OF	23

The plinth shall be filled with earth in layers not exceeding 250mm (in loose thickness) and each layer shall be watered and compacted to the required degree with approved compaction machine or manually if specifically permitted by the engineer. When the filling reaches the finished level, the surface shall be flooded with water for at least 24 hours, allowed to dry and then rammed and compacted in order to avoid any settlement at a later stage. The finished surface of fill shall be trimmed to the slope intended to be provided for the floor.

3.7.4 Filling in Trenches for Water Pipes and Drains

Filling in trenches for pipes and drains shall be commenced as soon as the joints of pipes and drains have been tested and passed. Where the trenches are excavated in soil, the filling shall be done with earth on the sides and top of pipes in layers not exceeding 150mm, watered, rammed and compacted taking care that no damage is caused to the pipe below.

In case of trenches excavated in rock, the filling upto a height of 300mm or the diameter of the pipe whichever is more above the crown of the pipe or barrel shall be done with fine material such as earth, moorum, disintegrated rock or ash as per the availability at site and shall be filled in compacted layers not exceeding 150mm. The remaining filling shall be done in layers with the mixture of boulders (of size not exceeding 150mm) and fine material as specified elsewhere in the specification. Each layer shall be watered, rammed and compacted to the required degree and to the satisfaction of the engineer.

3.7.5 Filling in Disposal Area

Surplus materials from excavation which are not required for backfilling shall be disposed of in the designated disposal areas. The spoils shall not be dumped haphazardly but should be spread in layers approximately 250mm thick when loose, watered and compacted with the help of a compacting equipment as per the directions of the engineer. In wide areas, rollers shall be employed and compaction shall be done to the satisfaction of the engineer at the optimum moisture content which shall be checked and controlled by the contractor. In certain cases the engineer may direct the contractor to dispose the surplus materials without compaction which can be done by tipping the spoils from a high bench neatly maintaining a proper level and grade of the bench.

3.8.0 Approaches and Fencing

The contractor should provide and maintain proper approaches for the workmen and inspection. The roads and approaches around the excavation

TITLE:
TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING

SPECIFICATION NO. PE-TS-999-600-C001
 VOLUME - II B
 SECTION - D | SUB-SECTION - D1
 REV.NO. DATE 16/12/2017
 SHEET 19 OF 23

should be kept clear at all times so that there is no hindrance to the movement of men, material and equipment of various agencies connected with the project. Sturdy and elegant fencing is to be provided around the top edge of the excavation as well as around the bottom of the fill at the surplus disposal area where dumping from a high bench is in progress.

3.9.0 Lighting

Full scale area lighting is to be provided if night work is permitted or directed by the engineer. If no night work is in progress, red warning lights should be provided at the corners of the excavated pit and the edges of the fill.

4.0.0 TESTING AND ACCEPTANCE CRITERIA

4.1.0 Excavation

On completion of excavation, the dimension of the pits will be checked as per the drawings after the pits are completely dewatered. The work will be accepted after all undercuts have been set right and all over excavations are filled back to the required lines, levels and grades by placing ordinary cement concrete of 1:4:8 proportion and/or richer and/or by compacted earth as directed by the engineer. The choice of the grade of concrete will be a matter of unfettered discretion of the engineer. Over excavation of the sides shall be made good by the contractor while carrying out the backfilling. The excavation work will be accepted after the above requirements are fulfilled and all the temporary approaches encroaching inside the excavation have been removed.

4.2.0 Backfilling

The degree of compaction required will be as per the stipulation laid down in IS: 4701 and the actual method of measuring the degree of compaction will be as decided by the engineer. The work of back filling will be accepted after the engineer is satisfied with the degree of compaction achieved.

5.0.0 RATES AND MEASUREMENTS

5.1.0 Rates

a) The item of work in the schedule of quantities describe the work very briefly. The various items of the schedule of quantities shall be read in conjunction with the corresponding section in the technical specification including amendments and additions if any. For each item in the schedule of quantities, the bidder's rate shall include all the activities covered in the description of the items as well as for all necessary operations in detail as described in the technical specification.

TITLE:
**TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING**

SPECIFICATION NO. PE-TS-999-600-C001
VOLUME - II B
SECTION - D | SUB-SECTION - D1
REV.NO. DATE 16/12/2017
SHEET 20 OF 23

b) No claims shall be entertained if the details shown on the released for construction drawings differ in any way from those shown on the tender drawings.

c) The unit rate quoted shall include minor details which are obviously and fairly intended and which may not have been included in these documents but are essential for the satisfactory completion of the work.

d) The bidder's quoted rate shall be inclusive of supplying and providing all labour, men, materials, equipments, tools and plants, supervision, services, approaches, schemes etc.

f) In case blasting in hard rock is envisaged, the unit rate quoted for earth work shall include the cost of storage and safety arrangements for the materials required for blasting. No separate payment will be made on this account.

5.2.0

Measurements

Method of measurements are specified as below:

a) The length, breadth and depth shall be measured correct to the nearest centimeter if measurements are taken by tape. Rounding of numerical shall be as per relevant IS Codes. If the measurements are taken with staff and level, the levels shall be recorded correct to 5mm. The area and volume shall be worked out in square meter and cubic meter respectively correct to the nearest of two decimal places.

b) For earth work in excavation, the ground levels shall be taken before and after completion of the work in the actually excavated area. The quantity of earth work in excavation shall be computed from these levels in cubic meter.

c) In case of open footings (rafts/ pilecaps/ drains/ cable trench/ pipe trench/ sub soil beams etc.) up to the depth of 2.0 metres from ground level, around excavation of 30 cm beyond the outer dimension of footing (not the PCC dimension below footing) shall be measured for payment to make allowances for centering and shuttering. Any additional/excess excavation beyond this limit shall be at the risk and cost of the contractor and shall not be measured for payment for item of work on excavation, backfilling, carriage, dewatering etc. Required shoring & strutting, side slopes, benching, dewatering sump pits, approaches to the excavated pit etc. are deemed to be included in the quoted rates in the schedule of quantities.

d) In case of open footings (Rafts/ pilecaps / drains/ cable trench/ pipe trench/ sub soil beams etc.) at a depth of more than 2.0 metre from ground level,

TITLE:
TECHNICAL SPECIFICATION FOR
EARTHWORK IN EXCAVATION AND
BACKFILLING

SPECIFICATION NO. PE-TS-999-600-C001
 VOLUME - II B
 SECTION - D | SUB-SECTION - D1
 REV.NO. DATE 16/12/2017
 SHEET 21 OF 23

around excavation of 75 cm beyond the outer dimension of footing (not the PCC dimension below footing) shall be measured for payment to make allowances for centering and shuttering. Any additional/excess excavation beyond this limit shall be at the risk and cost of the contractor and shall not be measured for payment for item of work on excavation, backfilling, carriage, dewatering etc. Required shoring & strutting, side slopes, benching, dewatering sump pits, approaches to the excavated pit etc. are deemed to be included in the quoted rates in the schedule of quantities.

e) Where soft rock and hard rock are mixed, the measurement shall be done as follows. The two types of rock shall be stacked separately and measured in stacks. The net quantity of each type of rock shall be so arrived by applying a deduction of 50% for looseness/voids in the stacks. If the sum of net quantity of the two types of rock so arrived exceeds the total quantity of excavation, then the quantity of each type of rock shall be worked out from the total quantity (from excavation) in the ratio of net quantities in stack measurements of the two types of rock. If stacking is not feasible, the method as suggested by the engineer shall be followed.

f) Where soil, soft rock and hard rock are mixed, the measurement shall be done as follows. The soft and hard rock shall be removed from the excavated material and stacked separately and measured in stacks. The net quantity of each type of rock shall be so arrived by applying a deduction of 50% for looseness/voids in stacks. The difference between the entire excavation and the sum of the quantities of soft and hard rock so arrived shall be taken as soil.

g) The authorized quantity (calculated on the basis of authorized width/working space under clause no. 5.2.0 c & 5.2.0 d) or those actually excavated, whichever, are less, shall be measured for payment.

h) Tree cutting having girth more than 300mm shall be measured in number and are separately payable as deemed not covered in excavation items of work in the schedule of quantities.

6.0.0 INFORMATION TO BE SUBMITTED BY THE BIDDER

6.1.0 With Tender

Detail of equipments and machineries proposed to be used for excavation, backfilling and compaction shall be submitted along with the tender.

6.2.0

After Award

After award of the contract the successful bidder shall submit the following for approval.

a) Within 30 days of the award of contract, the contractor shall submit a detailed programme of the work as proposed to be executed giving completion dates of excavation for the various foundations and the time required for backfilling and compaction after completion of foundation for the structures. The earthwork programme shall be planned in accordance with the foundation programme. The programme should also show how the excavation and backfilling quantities will be balanced minimizing the temporary stacking of spoils. It is to be noted that the engineer even after initial approval of the programme may instruct the contractor to enhance or to retard the progress of work during the actual execution in order to match with the progress of foundations. The initial programme being submitted by the contractor should have sufficient flexibility to take care of such reasonable variations.

b) Within 15 days of the award of contract, the contractor shall submit the drawings for earth work in excavation and backfilling showing detail of slopes, shoring, approaches, sump pits, dewatering lines, fencing etc for the approval of the engineer.

CEMENT CONCRETE (PLAIN & REINFORCED)

1.00.00 SCOPE

1.01.00 General

This specification covers all the requirements, described hereinafter for general use of Plain and Reinforced Cement Concrete work in Structures and locations, cast-in-situ or precast, and shall include all incidental items of work not shown or specified but reasonably implied or necessary for the completion of the work. Special requirements for structures such as reinforced concrete chimney, cooling towers, etc. have been covered under the respective specifications. Those specifications shall be used in conjunction with this specification.

1.02.00 IS: 456 shall form a part of this specification and shall be complied with unless permitted otherwise. For any particular aspect not covered by this Code, appropriate Code, specifications and/or replacement by any International code of practice as may be specified by the Engineer shall be followed. All codes and Standards shall conform to its latest revisions. A list of IS codes and Standards is enclosed hereinafter for reference. However, should the list be not exhaustive and does not cover any aspect of the work, then relevant Indian and, in its absence, relevant International code shall apply.

2.00.00 General

2.01.00 Work to be provided for by the Contractor

The work to be provided for by the Contractor, unless otherwise specified shall include but not be limited to the following

- a) Furnish all labour, supervision, services including facilities as may be required under statutory labour regulations, materials, forms, templates, supports, scaffolds, approaches, aids, construction equipment, tools and plants, transportations, etc. required for the work.
- b) Prepare Bar bending Schedules for reinforcement bars showing the positions and details of spacers, supports, chairs, hangers etc.
- c) Prepare working drawings of formworks, scaffolds, supports, etc.
- d) Prepare shop drawings for various inserts, anchors, anchor bolts, pipe sleeves, embedments, hangers, openings, frames etc.
- e) Prepare detailed drawings of supports, templates, hangers, etc. required for

SHEET 4 OF 57

installation of various embedments like inserts, anchor bolts, pipe sleeves, frames, joint seals, frames, openings etc.

As decided by the Engineer some or all of the drawings & schedules prepared under item (b) to (e) above will have to be submitted for approval.

- f) Submit for approval detailed schemes of all operations required for executing the work, e.g. material handling, Concrete mixing, Placement of concrete, Compaction, curing, services, Approaches, etc.
- g) Design and submit for approval concrete mix designs required to be adopted on the job.

Furnish samples and submit for approval results of tests of various properties of the following:

- i) The various ingredients of concrete
- ii) Concrete
- iii) Embedments
- iv) Joint seals
- i) Provide all incidental items not shown or specified in particular but reasonably implied or necessary for successful completion of the work in accordance with the drawings and specifications.
- j) For supply of certain materials normally manufactured by specialist firms, the Contractor may have to produce, if directed by the Engineer, a guarantee in approved Performa for satisfactory performance for a reasonable period as may be specified, binding both the manufacturers and the Contractor, jointly and severally.

2.02.00 Work by others

No work under this specification will be provided by any agency other than the Contractor unless specifically mentioned elsewhere in the contract.

2.03.00 Information to be submitted by the Tenderer

2.03.01 With Tender

The following technical information's are required with the tender:

- a) Source and arrangement of processing of aggregates proposed to be

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

adopted.

- b) Type of plant and equipment proposed to be used.
- c) Names of firms with which association is sought for to execute the special items of work in the contract.
- d) Types of formwork proposed to be used.

2.03.02

After Award

The Contractor shall submit the following information and data including samples where necessary, progressively during the execution of the contract.

a) Programme of Execution

Within 30 days of the award of contract, the Contractor will submit a Master Programme for completion of the work.

This Master Programme may have to be reviewed and updated by the Contractor, quarterly or at more frequent intervals as may be directed by the Engineer depending on the exigencies of the work.

Detailed day-to-day Programme of every month is to be submitted by the Contractor before the end of the previous month.

b) Samples

Samples of the following materials and any other materials proposed to be used shall be submitted as directed by the Engineer, in sufficient quantities free of cost, for approval. The Engineer for future reference will preserve approved samples. The approval of the Engineer shall not, in any way, relieve the Contractor of his responsibility of supplying materials of specified qualities:

- i) Coarse and fine aggregates.
- ii) Admixtures.
- iii) Plywood for Formwork.
- iv) Embedded and anchorage materials as may be desired by the Engineer.
- v) Joint sealing strips and other*waterproofing materials.
- vi) Joint filling compounds.

vii) Foundation quality Rubber Pads.

c) Design Mix

Design mix as per specification giving proportions of the ingredients, sources of aggregates and cement, along with test results of trial mixes as per relevant I.S., is to be submitted to the Engineer for his approval before it can be used on the works.

d) Bar Bending Schedules

Bar Bending Schedules in accordance with Clause 2.01.00 (b) and 3.16.01 of this specification.

e) Detailed Drawings and Designs of Formworks to be used

Detailed design data and drawings of standard formworks to be used as per clause 2.01.00 (c).

f) Detailed Drawings for Templates & Temporary Supports for embedment
As per Clause 2.01.00 (e).

g) Mill Test Reports for Cement & Reinforcing Steel.

h) Inspection Reports

The Engineer in accordance with Clause 2.04.00 of this specification may desire inspection Reports in respect of Formwork and Reinforcement and any other item of work as.

i) Test Reports

Reports of tests of various materials and concrete as required under Clause 4.0: SAMPLING & TESTING of this specification or as directed by the Engineer.

j) Any other data, which may be required as per this specification or as directed by the Engineer.

2.04.00 Conformity with Design

The Contractor will prepare checklists in approved Performa, which will be called "Pour Cards". These Pour Cards will list out all items of work involved. The Contractor will inform the Engineer, sufficiently in advance, whenever any particular pour is ready for concreting. He shall accord all

necessary help and assistance to the Engineer for all checking required in the pour. On satisfying himself that all details are in accordance to the drawings and specifications, the engineer will give written permission on the same Pour Cards allowing the contractor to commence placement of concrete. Details of all instructions issued by the Engineer and the records of compliance by the Contractor, deviations allowed by the Engineer and any other relevant information will be written on accompanying sheets attached to the Pour Cards. The Pour Cards along with accompaniments will be handed over to the Engineer before starting placement of concrete. One of the mix designs developed by the Contractor as per the I.S. Specifications and established to the satisfaction of the Engineer by trial mixes shall be permitted to be used by the Engineer, the choice being dictated by the requirements of designs and workability. The methods of mixing, conveyance, placement, vibration, finishing, curing, protection and testing of concrete will be as approved or directed by the Engineer.

2.05.00 Materials to be used

2.05.01 General Requirement

All materials whether to be incorporated in the work or used temporarily for the construction shall conform to the relevant IS Specifications unless-stated otherwise and be of best approved quality.

2.05.02 Cement

Ordinary Portland cement of grade-43 as per IS:8112/fly ash based Portland puzzolona cement conforming to IS:1489 (Part-1) shall preferably be used in reinforced/plain cement concrete works for all areas other than for the critical structures identified below. However, other types of cement such as ordinary Portland cement conforming to IS:269, Portland slag cement conforming to IS:455 respectively can be used under special circumstances. Cement used in all concrete mixes shall be in general of grade 33/43 unless design requires a higher grade. Ordinary Portland cement shall be used for following structure.

- a) TG foundation top deck and sub structures including raft.
- b) Spring Supporting decks of all machine foundations.
- c) Structures requiring grade of concrete of M30 and above.

In special cases, Rapid Hardening Portland Cement, Low Heat Cement, Sulphate resistant cement, high strength Ordinary Portland Cement etc. may be permitted or directed to be used by the Engineer.

For Brickwork, plaster, flooring and other finishing works, ordinary Portland cement of 33/43 grade shall be used.

2.05.03 Coarse Aggregate

Aggregate of sizes ranging between 4.75 mm and 150 mm will be termed as Coarse Aggregate. Coarse aggregate for concrete shall be chemically inert, hard, strong durable against weathering, of limited porosity, and free from deleterious materials. It shall be properly graded. Coarse aggregates shall be either crushed gravel or stone. All aggregates shall meet the requirement of IS:383:1970. Only Coarse Aggregate from, approved quarries and conforming to IS-383 will be allowed to be used on the works. Petrographic test shall be carried out by the contractor free of cost for checking the quality of rock from quarry. This test shall be repeated by the Contractor free of cost for change in quarry or as directed by the Engineer. The results shall be checked for reactivity of silica in aggregate with alkalis of cement.

2.05.04 Fine Aggregate

Aggregate smaller than 4.75 mm and within the grading limits and other requirements set in IS: 383 are termed as Fine Aggregate or Sand. Only Fine Aggregate from approved sources and conforming to the above IS Specification will be allowed to be used in works. Sand shall be hard, durable, clean and free from adherent coatings or organic matter and clay balls or pellets. Sand when used as fine aggregate in concrete shall conform to IS:383. For plaster, it shall conform to IS:1542 and for masonry work to IS:2116.

2.05.05 Water

Water for use in Concrete shall be clear and free from injurious oils, acids, alkalis, organic matter, salt, silts, or other impurities. Generally, IS: 3550 will be followed for routine tests. Acceptance of water shall be as per IS: 456.

2.05.06 Admixture

Only admixtures of approved quality will be used when directed or permitted by the Engineer. The different types of admixtures, which may be necessary to satisfy the concrete mix and the design requirement, shall be as per IS-9103 and may be one of the followings:

- a) Accelerating admixture
- b) Retarding admixture
- c) Water reducing admixture
- d) Air entraining admixture

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 9 OF 57

e) Water proofing admixture

The contractor shall inform the Engineer about the type of admixture which he is planning to use in different areas within the scope of work for the approval of the Engineer. The admixture shall be of proven make and from a reputed manufacturer. It should not have any adverse effect on strength, durability of concrete and reinforcement. Super plasticizers conforming to IS: 9103 or ASTM-C494 shall only be used as admixture having the above properties either individually or in a combination as per the direction of the Engineer.

2.05.07 Reinforcement

Reinforcement shall be as per relevant IS Specification as mentioned in the Contract/Drawing/Instructions. All bars shall be of tested quality.

2.06.00 Storage of Materials

2.06.01 General

All materials shall be stored so as to prevent deterioration or intrusion of foreign matter and to ensure the preservation of their quality and fitness for the work. Any material, which has deteriorated or has been damaged or is otherwise considered defective by the Engineer, shall not be used for concrete and shall be removed from site immediately, failing which, the Engineer shall be at liberty to get the materials removed and the cost incurred thereof shall be realised from the Contractor's dues. The Contractor shall maintain upto-date accounts of receipt, issue and balance (stack wise) of all materials. Storage of materials shall conform to IS: 4082.

2.06.02 Cement

Sufficient space for storage, with open passages between stacks, shall be arranged by the Contractor to the satisfaction of the Engineer.

Cement shall be stored off the ground in dry, leak proof, well-ventilated warehouses at the works in such a manner as to prevent deterioration due to moisture or intrusion of foreign matter.

Cement shall be stored in easily countable stacks with consignment identification marks. Consignments shall be used in the order of their receipts at site. Sub-standard or partly set cement shall not be used and shall be removed from the site, with the knowledge of the Engineer, as soon as it is detected.

2.06.03 Aggregates

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 10 OF 57

Aggregates shall be stored on raised surface constructed by providing planks or steel plates or on concrete or brick masonry pavement. Each size shall be kept separated with wooden or steel or concrete or masonry bulkheads or in separate stacks and sufficient care shall be taken to prevent the material at the edges of the stock piles from getting intermixed. Stacks of fine and coarse aggregates shall be kept sufficiently apart with proper arrangement of drainage. The aggregates shall be stored in easily measurable stacks of suitable depths as may be directed by the Engineer.

2.06.04 Reinforcement

Reinforcing steel shall be stored consignment-wise and size-wise off the ground and under cover, if desired by the Engineer. It shall be protected from rusting, oil, grease, and distortions.

If necessary, the reinforcing steel may be coated with cement wash before stacking to prevent scale and rust at no extra cost to the Owner. The stacks shall be easily measurable. Steel needed for immediate use shall only be removed from storage.

2.07.00 Quality Control

Contractor shall establish and maintain quality control for different items of work and materials as may be directed by the Engineer to assure compliance with contract requirements and maintain and submit to the Engineer records of the same. The quality control operation shall include but not be limited to the following items of work:

a) Admixture:	Type, quantity, physical, and chemical properties that affects strength, workability, and durability of concrete. For air entraining admixtures, dosage to be adjusted to maintain air contents within desirable limits.
b) Aggregate:	Physical, chemical and mineralogical qualities. Grading, moisture content and impurities.
c) Water:	Impurities tests.
d) Cement:	Tests to satisfy relevant IS Specifications.
e) Formwork:	Material, shapes, dimensions, lines, elevations, surface finish, adequacy of form, ties, bracing

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 11 OF 57

and shoring and coating.

f) Reinforcement:	Shapes, dimensions, length of splices, clearances, ties and supports. Quality and requirement of welded splices.
	Material tests or Certificates to satisfy relevant IS Specification.
g) Grades of Concrete:	Usage and mix design, testing of all properties.
h) Batching & Mixing:	Types and capacity of plant, concrete mixers and transportation equipment.
i) Joints:	Locations of joints, water stops and filler materials. Dimension of joints, quality, and shape of joint material and splices.
j) Embedded and Anchorage Items:	Material, shape, location, setting.
k) Placing:	Preparation, rate of pouring, weather limitations, time intervals between mixing and placing and between two successive lifts, covering over dry or wet surfaces, cleaning and preparation of surfaces on which concrete is to be placed, application of mortar/slurry for proper bond, prevention of cold joint, types of chutes or conveyors.
l) Compaction:	Number of vibrators, their prime mover, frequency and amplitude of vibration, diameter and weight of vibrators, duration of vibration, hand-spreading, rodding and tamping.
m) Setting of base & Bearing plates:	Lines, elevations, and bedding mortar.
n) Concrete Finishes:	Repairs of surface defects, screening, floating, steel trowelling and brooming, special finishes.
o) Curing:	Methods and length of time.

Copies of records and tests for the items noted above, as well as, records of corrective action taken shall be submitted to the Engineer for approval as may be desired.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 12 OF 57

3.00.00 INSTALLATION

All installation requirements shall be in accordance with IS: 456 and as supplemented or modified herein or by other best possible standards where the specific requirements mentioned in this section of the specification do not cover all the aspects to the full satisfaction of the Engineer.

3.01.00 Washing and Screening of Aggregates

Washing and screening of coarse and fine aggregates to remove fines, dirt, or other deleterious materials shall be carried out by approved means as desired by the Engineer.

3.02.00 Admixture

All concrete shall be designed for normal rate of setting and hardening at normal temperature. Variations in temperature and humidity under different climatic conditions will affect the rate of setting and hardening, which will, in turn, affect the workability and quality of the concrete. Admixtures including plasticisers of approved make may be used with the Engineer's approval in accordance with IS-456 to modify the rate of hardening, to improve workability or as an aid to control concrete quality. The Engineer reserves the right to require laboratory test or use test data, or owner satisfactory reference before granting approval. The admixture shall be used strictly in accordance with the manufacturer's directions and/or as directed by the Engineer.

3.03.00 Grades of Concrete

Concrete shall be in one of the grades designated in IS: 456. Grade of concrete to be used in different parts of work shall be as shown on the drawing. In case of liquid retaining structures, IS: 3370 will be followed. Minimum cement content shall be as per IS: 456.

3.04.00 Proportioning and Works Control

3.04.01 General

“Design Mix Concrete” and “Nominal Mix Design” is defined as follows for use in this specification:

- a) Proportioning of ingredients of concrete made with preliminary tests by designing the concrete mix. Such concrete shall be called "Design Mix Concrete".
- b) Proportioning of ingredients of concrete made without preliminary tests

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 13 OF 57

adopting nominal concrete mix. Such concrete shall be called "Nominal Mix Concrete".

As far as possible, design mix concrete shall be used on all concrete works. Nominal mix concrete, in grades M-15 or lower only may be used if shown on drawings or approved by the Engineer. In all cases the Proportioning of ingredients and works control shall be in accordance with IS: 456 and shall be adopted for use after the Engineer is satisfied regarding its adequacy and after obtaining his approval in writing.

3.04.02 Mix Design Criteria

Concrete mixes will be designed by the Contractor to achieve the strength, durability, and workability necessary for the job, by the most economical use of the various ingredients. In general, the design will keep in view the following considerations

- a) Consistent with the various other requirements of the mix, the quantity of water should be kept at the lowest possible level.
- b) The nominal maximum size of coarse aggregate shall be as large as possible within the limits specified.
- c) The various fractions of coarse and fine aggregates should be mixed in such a proportion as to produce the best possible combined internal grading giving the densest and most workable mix.
- d) The finished concrete should have adequate durability in all condition, to withstand satisfactorily the weather and other destruction agencies, which it is expected to be subjected to in actual service.
- e) The mix design shall have required workability and characteristic strength as per IS: 456. The quantity of cement, aggregates, and admixtures shall be determined by mass.

The requirement of adequate structural strength is catered for by the choice of proper grade of concrete in structural design. The Contractor will strictly abide by the same in his design of concrete mix installation. Various trials shall be given by the contractor with specific cement content on each trial. In some cases, plasticizers and other admixtures may be necessary to achieve the desired results.

3.05.00 Strength Requirements

The strength requirements of both design mix and nominal mix concrete where ordinary Portland Cement or Portland Blast furnace slag cement is used, shall

be as per IS:456. All other relevant clauses of IS:456 shall also apply.

3.06.00 Minimum Cement Content

The minimum cement content for each grade of concrete shall be as per IS: 456. Contractor has to consider actual environmental exposure condition at site. Based on various tests results and as per Engineer, the environment condition shall be adopted for which minimum cement content shall be considered. No extra payment shall be made on account of any variation in environment condition.

- a) Sufficient number of trial mixes (to be decided by the Engineer) will be taken at the laboratory for the various designs and graphs of w/c ratio Vs crushing strengths at various ages will be plotted.
- b) All tests will be done in presence of the Engineer who shall be the final authority to decide upon the adoption of any revised minimum cement content. The Contractor will always be responsible to produce quality concrete of the required grade as per the acceptance criteria of IS: 456.
- c) The Engineer will always have the unquestionable right to revise the minimum cement content as decided above, if, in his opinion, there is any chance of deterioration of quality on account of use of lower cement content or any other reason.

3.07.00 Water-Cement Ratio

The choice of water-cement ratio in designing a concrete mix will depend on:-

- a) The requirement of strength.
- b) The requirement of durability.

3.07.01 Strength Requirement

In case of "Design Mix Concrete" the water-cement ratio of such value as to give acceptable test results as per IS: 456, will be selected by trial and error. The values of water-cement ratios for different grade and mix designs will have to be established after conducting sufficiently large number of preliminary tests in the laboratory to the satisfaction of the Engineer. Frequent checks on test will have to be carried out and the water-cement ratios will be revised if the tests produce unsatisfactory results. Notwithstanding anything stated above the Contractor's responsibility to produce satisfactory test results and to bear all the consequences in case of default remains unaltered.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 15 OF 57

In case of nominal mix concrete, the maximum water-cement ratio for different grades of concrete is specified in Table-5 of IS: 456 and no tests are necessary. The acceptance test criterion for nominal mix concrete shall be as per IS: 456.

3.07.02 Durability Requirement

Tables 4 & 5 of IS: 456 give the maximum water-cement ratio permissible from the point of view of durability of concrete subjected to adverse exposure to weather, sulphate attacks, and contact with harmful chemicals. Impermeability may also be an important consideration.

Whenever the water-cement ratio dictated by Durability consideration is lower than that required from strength criteria, the former should be adopted.

In general the water cement ratio between 0.4 and 0.45 will be desirable to satisfy the durability requirement and from the consideration of impermeability of concrete. The contractor may propose lower water cement ratio as mentioned above by addition of a suitable plasticizer/super-plasticizer. Trial mix shall be carried out accordingly. However, the contractor has to propose specifically along with field trials in the event of lower cement content if found suitable along with a plasticizer.

3.08.00 Workability

The degree of workability necessary to allow the concrete to be well consolidated and to be worked into the corners of formwork and around the reinforcement and embedments and to give the required surface finish shall depend*on the type and nature of structure and shall be based on experience and tests. The usual limits of consistency for various types of structures are given below:

TABLE-V

LIMITS OF CONSISTENCY

Degree of workability	Slump in mm with Standard Cone as per IS: 1199		Use for which concrete is suitable
	Min.	Max.	
Very low	0	25	Large Mass concrete structure with heavy compaction equipments, roads
Low	25	50	Uncongested wide and shallow R.C.C. structures
Medium	50	100	Deep but wide R.C.C. structures with congestion of reinforcement and inserts
High	100	150	Very narrow and deep R.C.C. structures with congestion due to reinforcement and inserts.

Note: Notwithstanding anything mentioned above, the slump to be obtained for work in progress shall be as per direction of the Engineer.

With the permission of the Engineer, for any grade of concrete, if the water has to be increased in special cases, cement shall also be increased proportionately to keep the ratio of water to cement same as adopted in trial mix design for each grade of concrete. No extra payment will be made for this additional cement.

The workability of concrete shall be checked at frequent intervals by slump tests.

3.09.00 Size of coarse Aggregates

The maximum size of coarse aggregates for different locations shall be as follows unless otherwise directed by the Engineer

Very narrow space

- 12 mm

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 17 OF 57

Reinforced concrete
Except foundation - 20 mm

Ordinary Plain concrete and Reinforced
concrete foundations - 40 mm

Mass concrete - 80 mm

Lean concrete - 40 mm

Grading of coarse aggregates for a particular size shall conform to relevant I.S. Codes and shall also be such as to produce a dense concrete of the specified proportions, strength and consistency that will work readily into position without segregation.

Coarse aggregate will normally be separated into the following sizes and stacked separately in properly designed stockpiles

80 mm to 40 mm, 40 mm to 20 mm and 20 mm to 5 mm. In certain cases it may be necessary to further split the 20 mm to 5 mm fraction into 20 mm to 10 mm and 10 mm to 5 mm fractions.

This separation of aggregates in different size fractions is necessary so that they may be remixed in the desired proportion to arrive at a correct internal grading to produce the best mix.

3.09.01 Temperature control of concrete in top decks of machine foundations (i.e. of TGs, BFPs, Fans and Mills) as extra payable over RCC item of BOQ:

The temperature of fresh concrete shall not exceed 23°C when placed. A suitable measuring device for measuring the temperature of concrete as approved by the Engineer shall be used. For maintaining the limiting temperature of the 23°C, crushed ice shall be used as mixing water. The ice shall be formed of water conforming IS: 456. The Contractor shall establish the quantity of crushed ice to be mixed in order to achieve the limiting temperature of 23°C.

3.09.02 Base raft of Turbo Generator foundations and top decks of all machine foundations shall be cast in a continuous operation without any construction joint.

3.10.00 **Mixing of Concrete**

Ingredients of the concrete mix shall be measured by weight. Concrete shall always be mixed in mechanical mixer. Water shall not normally be charged

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 18 OF 57

into the drum of the mixer until all the cement and aggregates constituting the batch are already in the drum and mixed for at least one minute. Mixing of each batch shall be continued until there is a uniform distribution of the materials and the mass is uniform in colour and consistency, but in no case shall mixing be done for less than 2 (two) minutes and at least 40 (forty) revolutions after all the materials and water are in the drum. When absorbent Aggregates are used or when the mix is very dry, the mixing time shall be extended as may be directed by the Engineer. Mixers shall not be loaded above their rated capacity as this prevents thorough mixing.

The entire contents of the drum shall be discharged before the ingredients for the next batch are fed into the drum. No partly set or remixed or excessively wet concrete shall be used. Such concrete shall be immediately removed from site. Each time the work stops, the mixer shall be thoroughly cleaned & when the next mixing commences, the first batch shall have 10% additional cement at no extra cost to the Owner to allow for loss in the drum.

Regular checks on mixer efficiency shall be carried out as directed by the Engineer as per IS: 4634 on all mixers employed at site only those mixers whose efficiencies are within the tolerances specified in IS: 1791 will be allowed to be employed.

Batching Plant shall conform to IS: 4925. The measuring gauges of batching plant shall be periodically calibrated for which the contractor shall provide standard weights. The accuracy of all gauges shall be within limits prescribed by the Engineer.

When hand mixing is permitted by the Engineer, for unimportant out of the way locations in small quantities, it shall be carried out on a water-tight platform and care shall be taken to ensure that mixing is continued until the mass is uniform in colour and consistency. In case of hand-mixing, 10% extra cement shall be added to each batch at no extra cost to the owner.

3.11.00

Conveying Concrete

Concrete shall be handled and conveyed from the place of mixing to the place of laying as rapidly as practicable by approved means and placed and compacted in the final position before the initial setting of the cement starts. Concrete should be conveyed in such a way as will prevent segregation or loss of any of the ingredients. For long distance haulage, agitator cars of approved design will be used. If, in spite of all precautions, segregations does occur during transport, the concrete shall be properly re-mixed before placement. During very hot or cold weather, if directed by the Engineer, concrete shall be transported in deep containers, which will reduce the rate of loss of water, by evaporation or loss of heat. If necessary, the container may have to be covered and insulated. Conveying equipments for concrete shall be well maintained

and thoroughly cleaned before, commencement of concrete mixing. Such equipments shall be kept free from set concrete.

3.12.00 Placing and Compacting Concrete

Where specifically covered, the relevant I.S. Code will be followed for the procedure of surface preparation, placement, consolidation, curing, finishes, repairs and maintenance of concrete. If, however, there is no specific provision in relevant I.S. code for any particular aspect of work, any other standard code of practice, as may be specified by the Engineer, will be adopted. Concrete may have to be placed against the following types of surfaces:

- a) Earth foundation
- b) Rock foundation
- c) Formwork
- d) Construction joint in concrete or masonry

The surface on or against which concrete is to be placed has to be cleaned thoroughly. Rock or old construction joint has to be roughened by wire brushing, chipping, sand blasting or any other approved means for proper bond. All cuttings, dirt, oil, foreign and deleterious material, laitance, etc. are to be removed by air water jetting or water at high pressure. Earth foundation on which direct placement of concrete is allowed, will be consolidated as directed by the Engineer such that it does not crumble and get mixed up with the concrete during or after placement, before it has sufficiently set and hardened.

Formwork, reinforcement, preparation of surface, embedments, joint seals etc., shall be approved in writing by the Engineer before concrete is placed. As far as possible, concrete shall be placed in the formwork by means approved by the Engineer and shall not be dropped from a height or handled in a manner which may cause segregation. Any drop over 1500 mm shall have to be approved by the Engineer.

Rock foundation or construction joint will be kept moist for at least 72 hours prior to placement. Concrete will be placed always against moist surface but never on pools of water. In case the foundation cannot be dewatered completely, special procedure and precaution, as directed by the Engineer will have to be adopted.

Formwork will be cleaned thoroughly and smeared lightly with form oil or grease of approved quality just prior to placement.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 20 OF 57

A layer of mortar of thickness 12 mm of the same or less w/c ratio and the same proportion as that of the concrete being placed or cement slurry will be spread thoroughly on the rock Foundation or construction joint just prior to placement of concrete.

After concrete has been placed, it shall be spread, if necessary & thoroughly compacted by approved mechanical vibration to maximum, subsidence without segregation and thoroughly worked around shape. Vibrators shall not be used for pushing concrete into adjoining areas. Vibrators must be operated by experienced workmen and the work carried out as per relevant IS Code of Practice: In thin members with heavy congestion of reinforcement or other embedments, where effective use of internal vibrator is, in the opinion of the Engineer, doubtful, in addition to immersion vibrators the contractor may have to employ form vibrators conforming to IS: 4656. For slabs and other similar structures, the contractor will additionally employ screed vibrator as per IS: 2506. Hand tamping may be allowed in rare cases, subject to the approval of the Engineer. Care must be taken to ensure that the inserts, fixtures, reinforcement, and formwork are not displaced or distorted during placing & consolidation of concrete.

The rate of placement of concrete shall be such that no cold joint is formed and fresh concrete is placed always against green Concrete, which is still plastic and workable. No concrete shall be placed in open, during rains. During rainy season, no placement in the open is to be attempted unless sufficient tarpaulins or other similar protective arrangement for completely covering the still green concrete from rain is kept at the site of placement. If there has been any sign of washing of cement and sand, the entire affected concrete shall be removed immediately. Suitable precautions shall be taken in advance to guard against rains before leaving the fresh concrete unattended. No accumulation of water shall be permitted on or around freshly laid concrete.

Slabs, beams, and similar members shall be poured in one operation, unless otherwise instructed by the Engineer. Mouldings, throating, drip course, etc., shall be poured as shown on the drawings or as directed by the Engineer. Holes shall be provided and bolts, sleeves, anchors, fastenings, or other fixtures shall be embedded in concrete as shown on the drawings or as directed by the Engineer. Any deviation there from shall be set right by the Contractor at his own expense as instructed by the Engineer.

In case the forms or supports get displaced during or immediately after the placement and bring the concrete surface out of alignment beyond tolerance limits, the Engineer may direct to remove the portion and reconstruct or repair the same -at the Contractor's expense.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 21 OF 57

The Engineer shall decide upon the time interval between two placements of concrete of different ages coming in contact with each other, taking in consideration the degree of maturity of the older concrete, shrinkage, heat dissipation and the ability of the older concrete to withstand the load imposed upon it by the fresh placement.

Once the concrete is deposited, consolidated and finished in its final position, it shall not be distributed.

3.13.00 Construction Joints and Cold Joints

3.13.01 Construction Joints

It is always desirable to complete any concrete structure by continuous pouring in one operation. However, due to practical limitation of methods and equipment and certain design considerations, construction joints are formed by discontinuing concrete certain predetermined stages. These joints will be formed in a manner specified in the drawings/Instruction.

Vertical construction joints will be made with rigid stop-board forms having slots for allowing passage of reinforcement rods and any other embedments and fixtures that may be shown. Next stage concrete shall be placed against construction joint as per clause 3.12.

Where the location of the joints are not specified, it will be in accordance with the following:

- a) In a column, the joint shall be formed 75 mm below the lowest soffit of the beam framing into it.
- b) Concrete in a beam shall preferably be placed without a joint, but if Provision of a joint is unavoidable, the joint shall be vertical and at the middle of the span.
- c) A joint in a suspended floor slab shall be vertical and at the middle of the span and at right angles to the principal reinforcement.
- d) Feather-edges in concrete shall be avoided while forming a joint.
- e) A construction joint should preferably be placed in a low-stress zone and at right angles to the direction of the principal stress.
- f) In case the Contractor proposes to have a construction joint anywhere to facilitate his work, the proposal should be submitted well in advance to the Engineer for study and approval without which no construction joint will be allowed.

3.13.02 Cold Joint

An advancing face of a concrete pour, which could not be covered by fresh concrete before expiry of initial setting time (due to an unscheduled stoppage or delay on account of breakdown in plant, inclement weather, low rate of placement or any other reason), is called a cold joint. The Contractor should always remain vigilant to avoid cold joints.

If, however, a cold joint is formed due to unavoidable reasons, the following procedure shall be adopted for treating it:

- a) If the concrete is so green that it can be removed manually and if vibrators can penetrate the surface without much effort, fresh concrete can be placed directly against the old surface. The old concrete should be covered by fresh concrete as quickly as possible and the joint thoroughly and systematically vibrated.
- b) In case concrete has hardened a bit more than (a) but can still be easily removed by a light hand pick, the surface will be raked thoroughly and the loose concrete removed completely without disturbing the rest of the concrete in depth. A rich mortar layer 12 mm in thickness, will be placed on the cold joint fresh concrete shall be placed on the mortar layer and the joint will be thoroughly and systematically vibrated penetrating the vibrator deep into the old layer of concrete.
- c) In case the concrete at the joint has become so stiff that it cannot be remoulded and mortar or slurry does not raise inspite of extensive vibration, the joint, will be left to harden for at least 12 - 24 hrs. It Will then be treated as a regular construction joint, after cutting the concrete to required shape and preparing the surface as described under clause 3.12.

3.14.00 Repairs, Finishes, and Treatment of Concrete surfaces

3.14.01 Adequate and sound concrete surfaces, whether formed or unformed, can be obtained by employing a concrete mix of proper design, competent formwork, appropriate methods of handling, placing, and consolidation by experienced workmen.

Unsound concrete resulting from improper mix design, incompetent methods, equipment and formwork, poor workmanship and protection will not be accepted and will have to be dismantled, removed and replaced by sound concrete at the Contractor's cost. The Engineer may, at his sole discretion, allow to retain concrete with minor defects provided the Contractor is able to repair it by approved methods at no extra cost to the Owner, All concrete work shall be inspected by the Contractor immediately after the forms are removed

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 23 OF 57

& he will promptly report occurrence of any defects to the Engineer. All repair works will be carried out as per the instructions and in the presence of the Engineer or his representative. Generally, repair work will consist of any or all of the following operations:

- a) Sack rubbing with mortar and stoning with carborundum stone.
- b) Cutting away the defective concrete to the required depth shape.
- c) Cleaning of reinforcement & embedments. It may be necessary to provide an anti-corrosive coating on the reinforcement.
- d) Roughening by sand blasting or chipping.
- e) Installing additional reinforcement/welded mesh fabric.
- f) Dry packing with stiff mortar.
- g) Plastering, guniting, shotcreting etc.
- h) Placing and compacting concrete in the void left by cutting out defective concrete.
- i) Grouting with cement sand slurry of 1:1 mix.
- j) Repairing with a suitable mortar either cement or resin modified mortars.
- k) Polymer modified patching and adhesive repair& mortar for beams & columns.

3.14.02 Finishing unformed Surface

The contractor shall provide normal finishes in unformed surfaces which can be achieved by screeding, floating, trowelling etc. A few typical and common cases of treatment of concrete surface are cited below

a) Floor

Whenever a non-integral floor finish is indicated, the surface of reinforced concrete slab shall be struck off at the specified levels and slopes and shall be finished with a wooden float fairly smooth removing all laitance. No over trowelling, to obtain a very smooth surface, shall be done, as it will prevent adequate bond with the subsequent finish. If desired by the Engineer, the surface shall be scored and marked to provide better bond.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 24 OF 57

Where monolithic finish is specified or required, concrete shall be compacted and struck off at the specified levels and slopes with a screed, preferably a vibrating type and then floated with a wooden float. Steel trowelling is then started after the moisture film and shine have disappeared from the surface and after the concrete has hardened enough to prevent excess of fines and water to rise to the surface but not hard enough to prevent proper finishing of aberrations. Steel trowelling properly done will flatten and smoothen sandy surface left by wooden floats and produce a dense surface free from blemishes, ripples, and trowel marks.

A fine textured surface that is not slick and can be used where there is likelihood of spillage of oil or water can be obtained by trowelling the surface lightly with a circular motion after initial trowelling keeping the steel trowel flat on the surface.

To provide a better grip the Engineer may instruct marking the floor in a regular geometric pattern after initial trowelling.

b) Beans, Columns & Walls

If on such or any other concrete structure it is intended to apply plaster or such concrete surfaces against which brickwork or other allied works are to be built, the Contractor shall hack the surface adequately as soon as the form is stripped off so that proper bond can develop. Pattern, adequacy, and details of such hacking shall meet with the approval of the Engineer, who shall be informed to inspect such surfaces before they are covered up.

3.15.00 Protection and Curing of concrete

Newly placed concrete shall be protected by approved means from rain, sun, and wind. Concrete placed below the ground level shall be protected against contamination from falling earth during and after placing. Concrete placed in ground containing deleterious substances, shall be protected from contact with such ground, or with water draining from such ground, during placing of concrete and for a period of at least three days, or as otherwise instructed by the Engineer. The ground water around newly poured concrete shall be kept to an approved level by pumping out or other adequate means of drainage to prevent floatation or flooding. Steps, as approved by the Engineer, shall be taken to protect immature concrete from damage by debris, excessive 'Loadings, vibration, abrasion, mixing with earth or other deleterious materials, etc. that may impair the strength and durability of the concrete.

As soon as the concrete has hardened sufficiently, it shall be covered either with sand, hessian, canvas, or similar materials and kept continuously wet for at least 14 (fourteen) days after final setting. Curing by continuous sprinkling of water will be allowed if the Engineer is satisfied with the adequacy of the

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 25 OF 57

arrangements made by the Contractor. Quality of water for curing shall be as per IS: 456.

If permitted by the Engineer, liquid curing compound may be used for prevention of premature water loss in concrete and thereby effecting curing of concrete. This type of curing compound shall be sprayed on newly laid concrete surfaces to form a thin film barrier against premature water loss without disturbances to normal setting action. The curing compound shall be emulsified paraffin based and shall comply with ASTM requirements for acceptance.

The curing compound shall be applied following the final finishing operation and immediately after disappearance of water from concrete surface. It is important not to apply the curing compound when standing water is still present on concrete.

The contractor shall arrange for the manufacturer's supervision at no extra cost.

The Contractor shall remain extremely vigilant and employ proper equipment and workmen under able supervision for curing. The Engineer's decision regarding the adequacy of curing is final. In case the Engineer notices any lapse on the part of the Contractor, he will inform the Contractor or his supervisor verbally or in writing to correct the deficiency in curing. If no satisfactory action is taken by the Contractor within 3 (three) hours of issuance of such instruction, the Engineer will be at liberty either to employ sufficient means through any agency to make good the deficiency and recover the cost thereof from the Contractor, or deduct certain amount from contractor's payment for the part where inadequate curing was noticed entirely at the discretion of the Engineer.

3.16.00 Reinforcement

Mild steel round bars, TMT bars, Hot rolled deformed bars or cold twisted deformed bars as medium tensile or high yield strength steel, plain hard drawn steel wire fabric etc, will be used as reinforcement as per drawings and directions. In an aggressive environment an anti-corrosive coating on the reinforcement may be provided as per IS: 9077, as shown on the drawing or as directed by the Engineer.

3.16.01 Bar Bending Schedules

The Contractor shall prepare Bar Bending Schedules showing clearly the arrangements proposed by the Contractor to match available stock of reinforcing steel, progressively, starting within one week of receipt of approval on corresponding design of RCC structure. As decided by the Engineer, some

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 26 OF 57

or all the detailed drawings and schedules will have to be submitted for approval. Approval of such detailed drawings by the Engineer shall not relieve the Contractor of his responsibility for correctness nor of any of his obligations to meet the other requirements of the contract. The contractor for record and distribution shall submit six prints of the final drawings & schedules with one reproducible print.

3.16.02 Cleaning

All steel for reinforcement shall be free from loose scales, oil, grease, paint or other harmful matters immediately before placing the concrete.

3.16.03 Bending

Unless otherwise specified, reinforcing steel shall be bent in accordance with the procedure specified in IS: 2502 or as approved by the Engineer. Bends and shapes shall comply strictly with the dimensions corresponding with the final Bar Bending Schedules. Bar Bending Schedules shall be rechecked by the Contractor before any cutting, bending is done.

No reinforcement shall be bent when already in position in the work, without approval of the Engineer, whether or not it is partially embedded in concrete. Bars shall not be straightened in a manner that will injure the material. Rebending can be done only if approved by the Engineer. Reinforcing bars shall be bent by machine or other approved means producing a gradual and even motion. All the bars shall be cold bent unless otherwise approved. Bending hot at a cherry-red heat (not exceeding 845°C) may be allowed under very exceptional circumstances except for bars whose strength depends on cold working. Bars bent hot shall not be cooled by quenching.

3.16.04 Placing in Position

All reinforcements shall be accurately fixed and maintained in position as shown on the drawings by such approved and adequate means like mild steel chairs and/or concrete spacer blocks. Bars intended to be in contact at crossing points, shall be securely tied together at all such points by No. 20 G annealed soft iron wire or by tack welding in case of Bar larger than 25 mm dia., as may be directed by the Engineer. Binders shall tightly embrace the bars with which they are intended to be in contact and shall be securely held. The vertical distance between successive layers of bars shall be maintained by provision of mild steel spacer bars. They should be spaced such that the main bars do not sag perceptibly between adjacent spacers. Before actual placing, the Contractor shall study the drawings thoroughly and inform the Engineer in case he feels that placement of certain bars is not possible due to congestion. In such cases he should not start placing any bar before obtaining clearance from the Engineer.

3.16.05 Welding / Coupler for Splicing

Lapping shall normally do splicing of reinforcement. For M.S. reinforcement bars, butt-welding may be done, if permitted by the Engineer, under certain conditions. The work should be done with suitable safeguards in accordance with relevant Indian Standards for welding of mild steel bars used in reinforced concrete construction as per IS: 2751 and IS: 456. For High yield strength deformed bars, lap welding may be done, if permitted by the Engineer, under certain conditions. The work should be done with suitable safeguards in accordance with relevant Indian Standards as per IS: 9417. Welding of High yield strength deformed bar shall not be allowed.

Splicing of reinforcement using mechanical coupler may be done, if permitted by the Engineer, under certain conditions. The work should be done with suitable safeguards in accordance with relevant Indian standards for "Reinforcement couplers for mechanical splices of bars in concrete" as per IS: 16172. Corrosion test in the coupler-bar connections exposed to marine or severe environmental conditions to rule out any risk of galvanic corrosion will be done by the contractor at no extra cost. Proper fitting & fixing of mechanical coupler to rebar shall be ensured at site for each coupled joint as per inspection testing plan developed at site in consultation with manufacturer of coupler. If so required at site, coupler/ threading on rebar shall be such that two bars can be coupled by moving couplers not rebar (as being heavy reinforcement weight and L shaped, it is not feasible to rotate the rebar for fixing up the coupler) at no extra cost.

3.16.06 Control

The placing of reinforcements shall be completed well in advance of concrete pouring. Immediately before pouring, the reinforcement shall be examined by the Engineer for accuracy of placement and cleanliness. Necessary corrections as directed by him shall be carried out. Laps and anchorage lengths of reinforcing bars shall be in accordance with IS: 456, unless otherwise specified. The laps shall be staggered as far as practicable and as directed by the Engineer. Arrangements for placing concrete shall be such that reinforcement in position does not have to bear extra load and get disturbed. The cover for concrete over the reinforcements shall be as shown on the approved drawings unless otherwise directed by the Engineer. Where concrete blocks are used for ensuring the cover and positioning reinforcement, they shall be made of mortar not leaner than 1 (one) part cement to 2 (two) parts sand by –volume and cured in a pond for at least 14 (fourteen) days. The type, shape, size and location of the concrete blocks shall be as approved by the Engineer.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 28 OF 57

3.17.00 Cold Weather Concreting

When conditions are such that the ambient temperature may be expected to be 5°C or below during the placing and curing period, the work shall conform to the requirement of IS: 456 and IS: 7861.

3.18.00 Hot Weather Concreting

When depositing concrete in very hot weather, the Contractor shall take all precautions as per IS: 7861 and stagger the work to the cooler parts of the day to ensure that the temperature of wet concrete used in massive structures does not exceed 38°C while placing. Positive temperature control by precooling, post cooling or any other method, if required, will have to be done by the contractor at no extra cost.

3.19.00 Concreting under water

When it is necessary to deposit concrete under water it shall be done in accordance with the requirements of IS: 456.

3.20.00 Form Work

3.20.01 General

If it is so desired by the Engineer, the contractor shall prepare, before commencement of actual work, designs and working drawings for formwork and centring and get them approved by the Engineer. The formwork shall conform to the shape, grade, lines, levels and dimensions as shown on the drawings.

Materials used for the formwork inclusive of the supports and centring shall be capable of withstanding the working load and remain undistorted throughout the period it is left in service. All supports and scaffolds should be manufactured from structural or tubular steel except when specifically permitted otherwise by the Engineer.

The centring shall be true to vertical, rigid and thoroughly braced both horizontally and diagonally. Rakers are to be used where forms are to support inclined members. The forms shall be sufficiently strong to carry without undue deformation, the dead weight and horizontal pressure of the concrete as a liquid as well as the working load. In case the contractor wishes to adopt any other design criteria, he has to convince the Engineer about its acceptability before adopting it. Where the concrete is vibrated, the formwork shall be strong enough to withstand the effects of vibration without appreciable deflection, bulging, distortion or loosening of its components. The joints in the formwork shall be sufficiently tight to prevent any leakage of slurry or

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 29 OF 57

mortar.

To achieve the desired rigidity, tie bolts, spacer blocks, tie wires and clamps as approved by the Engineer shall be used but they must in no way impair the strength of concrete or cause stains or marks on the finished surface. Where there are chances of these fixtures being embedded, only mild steel and concrete of adequate strength shall be used. Bolts passing completely through liquid retaining walls/slabs for the purpose of securing and aligning the formwork shall not be used.

The formwork shall be such as to ensure a smooth uniform surface free from honeycombs, air bubbles, bulges, fins and other blemishes. Any blemish or defect found on the surface of the concrete must be brought to the notice of the Engineer immediately and rectified as directed by him.

For exposed interior and exterior concrete surfaces of beams, columns and wall, plywood or other approved form shall be thoroughly cleaned and tied together with approved corrosion-resistant devices. Rigid care shall be exercised in ensuring that all column forms are in true plumb and thoroughly cross-braced to keep them so. All floor and beam centring shall be crowned not less than 8 mm in all directions for every 5 metres span. The formwork should lap and be secured sufficiently at the lift joints to prevent bulges and offsets.

Temporary openings for cleaning, inspection and for pouring concrete shall be provided at the base vertical forms and at other places, where they are necessary and as may be directed by the Engineer. The temporary openings shall be so formed that they can be conveniently closed when required, during pouring operations without leaving any mark on the concrete.

3.20.02 Cleaning and Treatment of Forms

All parts of the forms shall be thoroughly cleaned of old concrete, wood shavings, saw dust, dirt and dust sticking to them before they are fixed in position. All rubbish, loose concrete, chippings, shavings, sawdust etc. shall be scrupulously removed from the interior of the forms before concrete is poured. Compressed air jet and/or water jet along with wire brushes brooms etc. shall be used for cleaning. The inside surface of the formwork shall be treated with approved non-staining oil or other compound before it is placed in position. Care shall be taken that oil or other compound does not come in contact with reinforcing steel or construction joint surfaces. They shall not be allowed to accumulate at the bottom of the formwork. The oiling of the formwork will be inspected just prior to placement of concrete and redone wherever necessary.

3.20.03 Design

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 30 OF 57

The formwork shall be so designed and erected that the forms for slabs and the sides of beams, columns, and walls are independent of the soffits of beams and can be removed without any strain to the concrete already placed or affecting the remaining formwork.

Removing any props or repropping shall not be done except with the specific approval of the Engineer. If formwork for column is erected for the full height of the column, one side shall be left open and built up in sections, as placing of concrete progress. Wedges, spacer bolts, clamps or other suitable means shall be provided to allow accurate adjustment and alignment of the formwork and to allow it to be removed gradually without jarring the concrete.

3.20.04 Inspection of Forms

Casting of Concrete shall start only after the formwork has been inspected and approved by the Engineer. The concreting shall start as early as possible within 3 (three) days after the approval of the formwork and during this period the formwork shall be kept under constant vigilance against any interference. In case of delay beyond three days, a fresh approval from the Engineer shall be obtained.

3.20.05 Removal of Forms

Formwork shall be kept in position after casting of concrete for a minimum period as mentioned in IS: 456, however the period of retaining form in position can be extended as per drawing, instruction of Engineer or as required for satisfactory completion of work without any extra cost. Before removing any formwork, the Contractor must notify the Engineer well in advance to enable him to inspect the concrete if the Engineer so desires.

The Contractor shall record on the drawing or in any other approved manner, the date on which concrete is placed in each part of the work and the date on which the formwork is removed there from and have this record checked and countersigned by the Engineer regularly. The Contractor shall be responsible for the safe removal of the formwork and any work showing signs of damage through premature removal of formwork or loading shall be rejected and entirely reconstructed by him without any extra cost to the Owner, The Engineer may, however, instruct to postpone the removal of formwork if he considers it necessary.

If any other type of cement other than ordinary Portland cement and Rapid hardening cement is used, the time of removal of forms shall be revised such that the strength of this cement at the time of removal of forms match with strength of Portland cement at the time of removal of form.

3.20.06 Tolerance

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 31 OF 57

The formwork shall be so made as to produce a finished concrete, true to shape, lines, levels, plumb and dimensions as shown on the drawings subject to the following tolerances unless otherwise specified in this specification or drawings or directed by the Engineer:-

- For -
- a) Sectional dimension - ± 5 mm
 - b) Plumb - 1 in 1000 of height
 - c) Levels - ± 3 mm before any deflection has taken place

The tolerance given above are specified for local aberrations in the finished concrete surface & should not be taken as tolerances for the entire structure taken as a whole or for the setting and alignment of formwork, which should be as accurate as possible to the entire satisfaction of the Engineer. Any error, within the above tolerance limits or any other as may be specially set up by the Engineer, if noticed in any lift of the structure after stripping of forms, shall be corrected in the subsequent work to bring back the surface of the structure to its true alignment.

3.20.07 Re-use of Forms

Before re-use, all forms shall be thoroughly scraped, cleaned, joints and planes examined and when necessary repaired, and inside surface treated as specified hereinbefore. Formwork shall not be used/re-used if declared unfit or unserviceable by the Engineer.

3.20.08 Classification

Generally, the "ordinary" class formwork shall be used unless otherwise specified.

- a) **Ordinary:** These shall be used in places where ordinary surface finish is required and shall be composed of steel and/or approved good quality partially seasoned timber.
- b) **Plywood:** These shall be used in exposed surfaces, where specially good finish is required and shall be made of approved brand of heavy quality plywood to produce a perfectly uniform and smooth surface conforming to the shape described in the drawing with required grain texture on the concrete. Re-use may only be permitted after special inspection and approval by the Engineer. He may also permit utilization of used plywood for the "ordinary" class, if it is still in good condition.
- c) **Ornamental:** These shall be used where ornamental and curved surface are required and shall be made of selected best quality well seasoned

**TECHNICAL SPECIFICATION FOR
CEMENT CONCRETE (PLAIN &
REINFORCED)**

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 32 OF 57

timbers or of plywood, which can be shaped correctly.

3.21.00 Opening, Chases, Grooves, Rebates, Blockouts etc.

The Contractor shall leave all openings, grooves, chases, etc. in concrete work as shown on the drawings or as specified by the Engineer.

3.22.00 Anchor Bolts, Anchors, Sleeves, Inserts, Hangers/Conduits/Pipe and other misc. Embedded Fixtures

The Contractor shall build into concrete work all the items noted below and shall embed them partly or fully as shown on drawings and secure the same as may be required. The materials shall be as specified and be of best quality available according to relevant Indian Standards of approved manufacture and to the satisfaction of the Engineer. Exposed surfaces of embedded materials are to paint with one coat of approved anti- corrosive paint and/or bituminous paint without any extra cost to the Owner. If welding is to be done subsequently on the exposed surface of embedded material, the paint shall be cleaned off the member to a minimum length of 50 mm beyond each side of the weld line.

Necessary templates, jigs, fixtures, supports etc. shall be used as may be required or directed by the Engineer.

Items to be embedded

- a) Inserts, hangers, anchors, frame around openings, manhole covers, frames, floor clips, sleeves conduits and pipes.
- b) Anchor bolts and plates for machinery, equipment and for structural steel work.
- c) Steel structurals to be left embedded for future extension, special connection etc.
- d) Dowel bars, etc. for concrete work falling under the scope of other contractors.
- e) Lugs or plugs for door and window frames occurring in concrete work.
- f) Flashing and jointing in concrete work.
- g) Any misc. embedments and fixture as may be required.

Correct location and alignment, as per drawings/instruction of all these

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 33 OF 57

embedded items shall be entirely the responsibility of the Contractor.

3.23.00 Expansion and Isolation Joints

3.23.01 General

Expansion and isolation joints in concrete structures shall be provided at specific places as per details indicated on the drawings. The materials and types of joints shall be as specified hereinafter. In case of liquid retaining structures, additional precautions shall be taken to prevent leakage of liquids as may be specified on the drawings or as directed by the Engineer. All materials are to be procured from reliable manufacturers and must have the approval of the Engineer. Where it is the responsibility of the Contractor to supply the material, the Engineer may demand test certificates for the materials and/or instruct the Contractor to get them tested in an approved laboratory free of cost to the Owner. Joints shall be formed true to line, level, shape, dimension, and quality as per drawings and specifications. Prior approval of the method of forming the joints should be obtained from the Engineer before starting the work.

3.23.02 Bitumen Board/ Expanded Polystyrene Board

a) Bitumen Board

Bitumen impregnated fibreboard of approved manufacturer as per IS: 1838 may be used as fillers for expansion joints. It must be durable and waterproof. It shall be compressible and possess a high degree of rebound. The dimensions of the board should be equal to that of the joint being formed. It should, preferably be manufactured in one piece, matching the dimension of the joint and not prepared by cutting to size smaller pieces from larger boards at site. At the exposed end, the joint shall be sealed with approved sealing compound to a depth of at least 25 mm after application of an approved primer. The sealing compound and the primer shall be applied as specified by the manufacturer.

b) Expanded Polystyrene Boards

If required, commercial quality of expanded polystyrene products commonly used for thermal insulations may also be used as filler material in expansion joints. The thickness may vary from 12 mm to 50 mm. The material will have to be procured from reliable manufacturers as approved by the Engineer. The method of installations will be similar to that recommended by the manufacturers for fixing on cold storage walls. A coat of Bitumen paint may have to be applied on the board against which concrete will be placed.

3.23.03

Joint sealing strips

Joint sealing strips may be provided at the construction, expansion, and isolation joints as a continuous diaphragm to contain the filler material and/or to exclude passage of water or any other material into or out of the structure. The sealing strips will be either metallic like G.I., Aluminums, or Copper, or non-metallic like rubber or P.V.C.

Sealing strips will not have any longitudinal joint and will be procured and installed in largest practicable lengths having a minimum number of transverse joints. The material is to be procured from reputed manufacturers having proven records of satisfactory supply of joint strips of similar make and shape for other jobs. The jointing procedure shall be as per the manufacturer's recommendations, revised if necessary, by the Engineer. The Contractor is to supply all labour and material for installation -including the material and tools required for jointing, testing, protection, etc. If desired by the Engineer, joints in rubber seals may have to be vulcanized.

a) Metal Sealing Strips

Metal sealing strips shall be either G.I., Aluminium or Copper and formed straight, U shaped, Z shaped or any other shape and of thickness as indicated in the drawing. The transverse joints will be gas welded using brass rods and approved flux and will be tested by an approved method to establish that it is leak proof. If required, longer lap lengths and different method of brazing which will render it leak proof, will be adopted by the Contractor. The edges shall be neatly crimped and bent to ensure proper bond with the concrete.

i) G.I. Strips

G.I. strips shall be minimum 1.5 mm thick and 150 mm in width unless specified otherwise. The standard of Galvanizing shall be as per relevant Indian Standards for heavy-duty work. At the joints, the overlapping should be for a minimum length of 50 mm.

ii) Aluminium Strips

Aluminium strips shall be minimum 18 SWG thick and 300 mm wide unless specified otherwise and shall conform to IS: 737 of 19000 grades or 31000 grade (Designation as per IS: 6051). A minimum lap of 50 mm length is required at the joints.

iii) Copper Strips

The Copper strips shall be minimum 18 SWC in thickness and 300 mm

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 35 OF 57

width unless specified otherwise and shall conform to the relevant Indian Standards. It should be cleaned thoroughly before use to expose fresh surface, without any reduction in gauge. A minimum lap of 50 mm in length is required at the joints.

b) Non-metallic Sealing Strips

These will be normally in Rubber or P.V.C. Rubber or P.V.C. joint seals can be of shape having any combination of the following features:

- i) Plain
- ii) Central bulb
- iii) Dumb-bell or flattened ends
- iv) Ribbed and Corrugated Wings
- v) V shaped

As these types of seals can be easily handled in very large lengths unlike metal strips, transverse joints will be allowed only under unavoidable circumstances and with the specific approval of the Engineer. The method of forming these joints, laps etc. shall be as specified by the Manufacturer and/or as approved by the Engineer taking particular care to match the central bulbs & the edges accurately.

c) Rubber Sealing Strips

The minimum thickness of Rubber sealing strips shall be 3 mm and the minimum width 100 mm. The actual size and shape will be as shown in drawings or as directed by the Engineer. The material will be natural rubber and be resistant to corrosion, abrasion, and tear and also to attacks from the acids, alkalis and chemicals normally encountered in service. The physical properties will be generally as follows. The actual requirements may be slightly different as decided by the Engineer:

Specific Gravity	:	1.1 to 1.15
Shore Hardness	:	65A to 75A
Tensile Strength	:	25 - 30 N/Sq.mm
Maximum Safe Continuous Temperature	:	75°C

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 36 OF 57

Ultimate Elongation : Not less than 350%

b) P.V.C., Sealing Strips

The minimum thickness of P.V.C. sealing strips will be 3 mm and the minimum width 100 mm. The actual size and shape will be as shown in drawings or as directed by the Engineer. The material should be of good quality Polyvinyl Chloride highly resistant to tearing, abrasion, and corrosion as well as to chemicals likely to come in contact with during use. The physical properties will generally be as follows. The actual requirements, which will be directed by the Engineer, may vary slightly

Specific Gravity : 1.3 to 1.35

Shore Hardness : 60A to SOA

Tensile Strength : 10 - 15 N/Sq.mm

Maximum Safe Continuous
Temperature : 70 Deg.C

Ultimate Elongation : Not less than 275%

3.23.04 Bitumen Compound

When shown in drawing or directed, the gap in expansion joints shall be thoroughly cleaned and bitumen compound laid as per manufacturer's specifications. The compound to be used shall be of approved manufacture and shall conform to the requirements of IS: 1834.

3.23.05 Isolation Joints

Strong and tough alkathene sheet or equivalent, about 1 mm in thickness and as approved by the Engineer shall be used in isolation joints. It shall be fixed by an approved adhesive compound on the cleaned surface of the already set concrete to cover it fully. Fresh concrete shall be laid against the sheet, care being taken not to damage the sheet in any way.

3.23.06 Pad

Hard foundation quality rubber pads of required thickness and shapes shall be put below machine or other foundations as shown on the drawings. The rubber shall have a unit weight of 1500 Kg/Cu.m, a shore hardness - 65A to 70A and be of best quality of approved manufacture, durable, capable of absorbing vibration and must be chemically inert in contact with moist or dry earth or any other deleterious material expected under normal conditions.

3.24.00 Grouting under Machinery or Structural Steel Bases

If required, grouting under base plates of machines or structural steel etc. shall be carried out by the Contractor. In general, the mix shall be 1 (one) part cement and 1 (one) part sand and just enough water to make it flow as required. The areas to be grouted shall be cleaned thoroughly with compressed air jet and/or with water in locations where accumulated surplus water can be removed. Where directed by the Engineer, 6 mm down stone chips may have to be used in the mix. Surface to be grouted shall be kept moist for at least 24 hours in advance. The grout shall be placed under expert supervision, so that there is no locked up air. Edges shall be finished properly. If specified on drawings, admixtures like Aluminium powder, "Ironite" etc. may have to be added with the grout in required proportions. Premixed non-shrink grout of approved manufacture having proper strength shall be used with Engineer's approval for important machineries.

3.25.00 Precast Concrete

The Specification for precast concrete will be similar as for the cast-in-place concrete described herein and as supplemented in this section. All precast work shall be carried out in a yard made for the purpose. This yard shall be dry, properly levelled and having a hard and even surface. If the ground is to be used as a soffit former of the units, it shall be paved with concrete or masonry and provided with a layer of plaster (1:2 proportion) with smooth neat cement finish or a layer of M.S. sheeting. Where directed by the Engineer, casting will have to be done on suitable vibrating table. The yard, lifting equipment, curing tank, finished material storage space etc. shall be designed such that the units are not lifted from the mould before 7 (seven) days of curing and can be removed for erection after 28 (twenty-eight) days of curing. The moulds shall preferably be of steel or of timber lined with G.I. sheet metal. The yard shall preferably be fenced.

Lifting hooks, where necessary or as directed by the Engineer, shall be embedded in correct position of the units to facilitate erection, even though they may not be shown on the drawings, and shall be burnt off and finished after erection.

Precast concrete units, when ready, shall be transported to site by suitable means approved by the Engineer. Care shall be taken to ensure that no damage occurs during transportation. All adjustments, levelling, and plumbing shall be done as per instructions of the Engineer. The Contractor shall render all help with instruments, materials, and men to the Engineer for checking the proper erection of the precast units.

After erection and alignment, the joints shall be filled with grout or concrete as

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 38 OF 57

per drawings. If centrings have to be used for supporting the precast units, they shall not be removed until the joints have attained sufficient strength and in no case before 14 (fourteen) days. The joint between precast roof planks shall be pointed with 1:2 cement: sand mortar where called for in the drawings.

3.26.00 Waterproofing of Concrete Structure

3.26.01 General

Where required, waterproofing of concrete structures shall be ensured internally by suitable design of the concrete mix, addition of suitable admixtures in the concrete or mortar at the time of mixing and/or installing water bars at the joints. In addition to the above measures, the structures shall be made watertight by adopting "structural waterproofing" as per specification. The design, material, and workmanship shall conform to the relevant I.S. Codes where applicable. The Engineer's approval of the materials shall be obtained by the Contractor before procurement. If desired by the Engineer, test certificates for the materials and samples shall be submitted by the Contractor free of charge. The materials shall be of best quality available indigenously, fresh clean and suitable for the duties called upon.

3.26.02 Water Bar/Seal/Special Treatment of Construction Joint

Water bearing structures and underground structures may have water bar/seals installed at the joints. They may be metallic, rubber, or P.V.C. The materials and installation will be as described under Clause 3.23.3. Construction joint shall be provided as per clause 3.13.1 with or without water bar/seal as shown on the drawing. In case of water bars being used at the construction joint, fixing of the same has to be done carefully, so that the water bar is not disturbed during concreting. The construction joint shall also be treated by any one of the following methods.

Method 1: A surface retarder in the form of a thixotropic gel shall be applied on the joint surface of the previous pour in case of joint on the wall and in case of floor the same shall be applied on the formwork against which previous pour of concreting shall be done. The retarder may be liquid or paste form depending on the type of formwork. The formwork shall be removed within 24 hours after concreting. Within 2 hours of striking of the formwork the retarder shall be washed off with strong water jet to make surface rough and clean. Then a rich cement mortar using cement, sand and aggregates (maximum size 8 mm) along with synthetic rubber emulsion type water resistant bonding agent shall be applied for a depth of 50 mm just before pouring the next stage of concreting. In case of walls, the above bonding agent will be mixed with water, which will be used for making the cement mortar. The proportion of mixing of this bonding agent with water shall be as per manufacturer's specification. In case of floor joint, however, after washing of retarder a

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 39 OF 57

solvent free two-component epoxy resin-bonding agent will be used at the joint before the next pour of concrete. The above bonding agent shall have the following properties after 28 days

Compressive strength	-	55 to 60 N/Sq.mm
Flexural strength	-	5 to 30 N/sq.mm
Tensile strength	-	15 N/Sq.mm (approx.)
Bonding strength to concrete	-	3 N/Sq.mm (approx.)
Bonding strength to steel	-	20 N/Sq.m (approx.)

The whole operation shall be done as per manufacturers specification. The contractor shall provide manufacturer's supervision at no extra cost to the owner.

Method 2: One row of threaded nozzles at regular intervals not exceeding 1.5 m centre to centre shall be placed in concrete along the construction joint during casting. Injection of cement water together with a suitable waterproof expanding grouting admixture of approved quality shall be done through the nozzles after the concrete has set to seal the voids in concrete near the construction joint in walls and slabs. The injection shall be done under pressure of approximately 2 to 4 kg/sq.cm. The nozzles shall be sealed off with suitable admixture after the injection is over. The whole operation shall be carried out as per manufacturer's specification and supervision. The cost of such manufacturer's supervision shall be borne by the contractor.

3.26.03 Waterproofing Admixtures

The waterproofing admixture for concrete and cement mortar/plaster shall conform to IS: 2645. The admixture shall not cause decrease of strength of concrete/plaster at any stage and it shall be free from chlorides and sulphates. The admixture shall not affect the setting time by more than 5%. The maximum permissible dosage of admixture will be 3% (three percent) by weight of cement, but a lower dosage will always be preferred. The product shall be stored in strong moisture proof packings. However, in case of important structures where M25 or higher grade concrete is specified, the use of melamine based, high range water reducing concrete admixture shall be used to provide a waterproof concrete, For achieving high strength concrete having cement content around 400 kg/cu.m. a melamine based super plasticizer will be preferable.

- In concrete: The admixtures shall be procured from reliable and reputed manufacturers and approved by the Engineer. The method of application

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 40 OF 57

and other details shall conform to the manufacturer's specification and/or as instructed by the Engineer. The Contractor shall have the services of the manufacturer's supervisor at no extra cost to supervise the work, if desired by the Engineer.

- b) In Plaster: The concrete surface, to be plastered, shall be hacked to Engineer's satisfaction, cleaned thoroughly and kept wetted for 24 hours. The plaster shall be in cement sand mortar mixed in proportion varying from 1:1 to 1:4 by volume along with the approved waterproofing admixture and laid in appropriate thickness and in layers not exceeding 15 mm/layer or as per manufacturer's specification. The additive shall be of quality and type approved by the Engineer. If desired by the Engineer, the Contractor shall have the work supervised by the manufacturer's supervisor at no extra cost. On completion, the Plastered surface shall be cured continuously for a minimum period of 14 days like concrete.

3.26.04 Structural waterproofing

- a) Nozzles spaced as required after the concrete is completed shall be drilled into surfaces to be rendered watertight. Non-shrink cement grout with waterproofing compound as per manufacturers specifications shall be injected under pressure to seal all voids. Special care shall be taken at joints by providing additional nozzles. The pressure grouting shall be done on the internal surface.

- b) External Treatment

Two layers of (1:4) plaster of 12 mm thick each with waterproofing compound as per manufacturer's specification shall be provided on outer surface of concrete underground structures.

3.26.05 Protective coating on Inside Surface.

Two coats of cement based two components polymer modified flexible protective and waterproofing slurry having 1 mm thick for each coat shall be applied on the walls/floor after proper surface preparation as mentioned above. The slurry shall be applied by brush.

3.26.06 Bitumen Felt: Application for Tanking

This specification shall cover laying the waterproof course on the outside and inside of the walls and bases of structures.

The materials shall conform to IS: 1322, and the workmanship to IS: 1609. The bitumen felt should be hessian base and/or fibre base as specified in Drawing. If required by the Engineer, tests as specified in relevant IS Codes

shall be arranged by the Contractor without charging any extra to the Owner.

The Contractor shall execute this work in direct collaboration with one of the well-known specialized firm approved by the Engineer.

Cleaning the surface, keeping it dry, providing, necessary corner fillets and cement rendering and cutting chases, etc. shall be done as per drawings and/or instructions. If any protective brickwork on/against concrete sub-bases or walls are required, the same shall be provided. A twenty (20) years guarantee for satisfactory performances shall be given by the Contractor as well as his specialist sub-contractor jointly and severally, for this work. Free rectification of any defects noted in the work within this guarantee period will be carried out by the Contractor even if it is beyond the specified maintenance period of the contract as a whole.

3.26.07 Polyethylene Films: Application in Walls or base of structures

Waterproof treatment shall be applied as outlined and as per sequence given hereunder

- i) the concrete surface shall be made smooth with 12 mm cement plaster 1:6.
- ii) apply hot bitumen 80/100 grade (IS: 73-1961) at the rate of 1.0 Kg/Sq.m minimum
- iii) lay black polyethylene film 250-micron (IS: 2508-1977) with cut back bitumen adhesive in overlaps over hot bitumen surface, gently pressed, taking care not to puncture the film.

Alternatively, the overlaps shall be heat sealed by an electric iron having three parallel sealing bars. A long piece of plywood is to be placed below the polyethylene film to be heat-sealed. On the plywood a rubber gasket is to be laid to provide a cushion for better welding of the film. On the rubber padding, a cellophane tape is to be spread and on this the LDPE film, with 100 mm overlap, is to be stretched. On the overlapped film another cellophane tape is to be placed to prevent the heat sealer from sticking to the LDPE film. After this, the electric iron is to be pressed on the overlap joint for sufficient time so as to allow perfect welding. The operation is to be repeated for subsequent lengths of joints. After heat-sealing, the cellophane tape is to be removed and the joints are to be tested for leaks.

- iv) Lay 100 gm brown craft paper laminated with a layer of straight run bitumen,
- v) Lay hot bitumen 80/100 grade (IS: 73-1961) at 1.0 Kg/Sq.m minimum.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 42 OF 57

- vi) Lay 250-micron polyethylene film as second layer similar to (iii) above.
- viii) Lay second layer of 100 gm. brown craft paper laminated similar to (iv) above.
- ix) Apply hot bitumen (straight run grade) to IS: 73-1961 at 1.0 Kg/Sq.m dusted with fine sand.
- x) Protecting with a layer of 75 mm plain cement concrete M-10, or a layer of brick laid in cement mortar 1:6 in case of wall apply a 12 mm thick plaster as shown on the drawing or a protective brick wall in 1:6 cement mortar as shown on the drawing.

3.27.00 Protective Coating on Concrete Surface

3.27.01 On Foundation

The outside faces of foundation of important structures will be protected from adverse effect of soil/underground water, if shown on drawing by using rubber/bitumen emulsion protective coating of approved manufacturer.

4.00.00 SAMPLING AND TESTING

4.01.00 General

The Contractor shall carry out all sampling and testing in accordance with the relevant Indian Standards and as supplemented herein for the following items at his own cost unless otherwise specified in this specification. The Contractor shall get the specimens tested in a laboratory approved by the Engineer and submit to the Engineer the test results in triplicate within 3 (three) days after completion of the test.

4.02.00 Cement

Representative samples will be taken from each consignment of cement received from the manufacturer/supplier for carrying out the tests for fineness (by hand sieving), setting time and compressive strengths as per guidelines of IS: 269. Soundness Tests may also be required to be carried out if required by the Engineer. The Contractor shall carry out the tests without any expense to BHEL. No cement from a particular consignment/batch will be used on the works unless satisfactory 3 (three) days and 7 (seven) days test results for compressive strength are known. The Engineer and Contractor will jointly associate themselves with the tests irrespective of whether they are carried out by the BHEL or the Contractor. These tests are of great importance, as their results will have a bearing on the acceptance of concrete or otherwise as per the terms and conditions of the Contract.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 43 OF 57

4.03.00 Aggregates

The contractor shall carry out any or all the tests on aggregates as may be required by the Engineer in accordance with IS: 2386 PARTS-I to VIII. The acceptance criteria of the samples tested shall be in accordance with the requirements of the relevant Indian Standards.

4.04.00 Water

Sampling and Testing of water being used for concrete works as per IS: 3550 will be carried out by the Contractor at regular intervals and whenever directed by the Engineer. The acceptance criteria will be as per IS: 456.

4.05.00 Admixture

4.05.01 Air Entraining Agents

Initially, before starting to use A.E.A., relationship between the percentage of air entrained and the cylinder cube crushing strength vis-a-vis quantity of A.E.A. used for all types of concrete will be established by the Contractor by carrying out sufficiently large number of tests. After that, at regular intervals and whenever directed by the Engineer, the Contractor will check up the actual percentages of air entrained and corresponding crushing strengths to correlate with the earlier test results.

4.05.02 Other Admixtures

Tests for establishing the various properties of any other admixtures, which may be required to be added, shall be carried out by the Contractor.

4.06.00 Concrete

The sampling of concrete, making the test specimens, curing and testing procedure etc. shall be in accordance with IS: 516 and IS: 1199, the size of specimen being 15 cm cubes. Normally, only compression tests shall be performed but under special circumstances the Engineer may require other tests to be performed in accordance with IS: 516. Sampling procedure, frequency of sampling and test specimen shall conform to IS: 456. To control the consistency of concrete from every mixing plant, slump tests shall be carried out by the Contractor every two hours or as directed by the Engineer. Slumps corresponding to the test specimens shall be recorded for reference. The acceptance criteria of concrete shall be in accordance with IS: 456. Concrete work found unsuitable for acceptance shall have to be dismantled and replacement is to be done as per specification by the Contractor at his own cost. In the course of dismantling, if any damage is done to the embedded

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 44 OF 57

items or adjacent structures, the same shall be made good, free of charge by the Contractor, to the satisfaction of the Engineer.

5.00.00 ACCEPTANCE CRITERIA

5.01.00 Standard Deviation

Standard deviation shall be based on test results and determination of Standard deviation shall conform to IS: 456.

5.02.00 Acceptance Criteria

The strength requirements and acceptance criteria shall conform to IS: 456.

5.03.00 Inspection and Core Tests

Inspection of concrete work immediately after stripping the formwork and core test of structures shall conform to IS: 456.

5.04.00 Load Test

Load tests of structural members as per IS:456 may be required by the Engineer, when the strength of test specimen results falls below the required strength.

If the member shows evident failure, the Contractor shall make the structure adequately strong free of cost to BHEL.

The entire cost of load testing shall be borne by the Contractor. If a portion of the structure is found to be unacceptable, it shall be dismantled and replaced by a new structure as per specification. The entire cost of dismantling and replacement and restoration of the site being borne by the Contractor.

If, in the course of dismantling, any damage is done to the embedded items and or other adjacent structures, the same will be made good, free of charge by the Contractor to the satisfaction of the Engineer.

6.00.00 RATES AND MEASUREMENTS

6.01.00 Cast-in-situ Concrete

6.01.01 Rates

- a) The unit rates shall include the cost of labour, materials, equipment, handling, transporting, botching, mixing, placing in position, vibrating, compacting, finishing, curing, testing, etc. at all elevations. This shall include the cost of curing by regular wetting or by using curing compound.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 45 OF 57

- b) The unit rates shall include for all working conditions including at locations under water, liquid, mud, in or under foul positions and extreme weather conditions.
 - c) The unit rates for exposed concrete works (including machine foundations) shall include all incidentals, rendering, smoothening with carborandum stone, finishing with a paste of cement sand mortar, curing, etc.
 - d) The unit rates shall include all arrangement for maintaining stability of structure during execution.
 - e) Nothing extra shall be payable for the handling/mixing of extra cement on account of any reason or pouring of second stage concrete.
 - f) Nothing shall be payable to the Contractor on account of facilities and arrangement provided by him for conducting ultrasonic pulse velocity (UPV) tests or other relevant tests to ascertain grade and quality, etc. of the concrete in case the concrete quality is in doubt and contractor has to establish the quality by further tests. In case of any defects, the Contractor shall rectify the same by cement/epoxy grout at his own cost.
- However, mandatory UPV test as specified in the drawings shall be carried out including arrangement of all its facilities, staging, etc. and shall be payable to the contractor as per BOQ item.
- g) The unit rates for controlling of the temperature of concrete shall include storing and mixing of ice, water, cooling of aggregate etc.
 - h) The quoted rate shall include the cost of MIX design, making of all trial mixes using admixtures and mixing in concrete etc. complete.

6.01.02

Measurements

- a) Actual volume of concrete work as executed or as per drawings issued, whichever is less shall be measured in cubic metres to the nearest two decimals.
- b) No deductions shall be made for the following:
 - i) Ends of dissimilar materials embedded inside for example, beams, posts, girders, rafters, purlins, trusses, corbels and steps upto 500 sqcm in cross section;
 - ii) Opening upto 0.1 sq.m.

**TECHNICAL SPECIFICATION FOR
CEMENT CONCRETE (PLAIN &
REINFORCED)**

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 46 OF 57

iii) Volume occupied by reinforcement, sleeves, anchor bolts, and similar items.

iv) Volume occupied by pipes, conduits, sheathing, etc. not exceeding 100 sq.cm. each in cross sectional area.

c) The concrete works of different grades; below and above ground floor finished level shall be measured separately, unless otherwise specified in the schedule of items. Accordingly rates shall be applied for concrete in foundation for concrete below ground floor finished level and concrete in superstructure for concrete above ground floor finished level.

d) For temperature control measures, measurement shall be done in terms of quantity of concrete in cum. in concreting of which the ice have been used or cooling of aggregates has been done to keep the temperature of freshly laid concrete to less than 23°C.

6.02.00 Reinforcement

6.02.01 Rates

a) The unit rates shall include for cover block, providing binding wire, welding, separator pieces between two or more layers of reinforcement required for keeping the steel in position, etc. at all elevations.

b) No extra will be paid for transportation from stores, cleaning, straightening of steel, cutting, bending, binding with annealed wire, welding, tack welding, placing the reinforcement modification of already embedded reinforcement, if required, due to faulty fabrication or placement and other cost of tools and plants, materials, labours, return of unused steel to the store, etc.

c) However, lap welding of reinforcement steel if permitted shall be paid under separate item as provided in the BOQ and no deduction for labour and binding wire saved for not providing lap length shall be made. Similarly, splicing of reinforcement bars using mechanical couplers if permitted shall be paid under separate item as provided in the BOQ and no deduction for labour and binding wire saved for not providing lap length shall be made.

d) No extra shall be paid for preparing and getting approved bar bending schedules (including all revisions).

e) Generally members are straight and have straight edges. However, for bending, binding, placing of reinforcement in any curved member in length

**TECHNICAL SPECIFICATION FOR
CEMENT CONCRETE (PLAIN &
REINFORCED)**

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 47 OF 57

or cross section or both, no extra payment shall be made.

6.02.02 Measurements

- a) Bar or any other type of reinforcement used like hard drawn steel wire fabric etc. for reinforced concrete shall be measured by weight in tonnes. The weight shall be arrived at by multiplying the actual or theoretical length measured alongwith standard hooks, cranks, bends, authorized laps, etc. whichever is less by the sectional weights. Claims for payment for this item shall be submitted with supporting documents giving the schedule of bars with sketches. The sectional weight to be adopted shall be IS Section weight. Nothing extra will be payable to the Contractor on account of, difference in weight, if any, due to different methods adopted for issue and measurement.
- b) Standard hooks, cranks, bends, authorised laps, supports, hangers and chairs which are covered in approved bar bending schedule shall be measured in tonnes.

6.03.00 Formwork and Staging

6.03.01 Rates

- a) The unit rates shall be inclusive of all staging, scaffolding, making the formwork watertight, etc. for all elevations and in all types of works.
- b) No separate payment shall be made for providing fillets, for rounding or chamfering at junctions, comers, etc.
- c) The unit rates shall include the cost of labour, materials etc. and the extra time, which shall be required for the removal of shuttering/ support for satisfactory completion of work.
- d) No extra payment shall be made on account of difficulty, wastage etc. for placement/removal of formwork between the network of closely placed steel beams or for the lacing/bracing portions and ribbed slab constructions.
- e) Payment for curved shuttering shall be made for curved members/wall whose centerline radius in plan is less than 6m.
- f) If the contact surface area in pockets is less than or equal to 0.1 sq.m. in each case, payment shall be done under item for providing formwork in pockets.

6.03.02 Measurements

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 48 OF 57

a) Formwork for different classes (types) shall be measured separately as the actual surface in contact with the concrete and paid on area basis unless included in the rate for concrete. The unit of measurement shall be in sq.m.

b) Openings upto 0.1 sq.m or boxing left for inserts etc. for facility of Contractor's work, shall be neglected as if nonexistent for the purpose of formwork measurement of surface in which the openings occur.

For suspended floor, no deduction shall be made for flange area of secondary steel beams.

d) No measurement shall be taken for the formwork in pockets, openings, chases, blockouts, etc. in concrete, the contact surface area is less than or equal to 0.1 sq.m. in each case.

e) For pockets, if the contact surface area is less than or equal to 0.1 sq.m. in each case, measurement shall be done under item for providing formwork in pockets.

e) Formwork, if required, for joints shown on drawing or instructed by the Engineer, shall be paid for the 'leading side' only.

6.04.00 Embedded Parts

6.04.01 Rates

a) The unit rate for erection of embedded steel parts, supplied by Engineer shall include transportation from Owner's store to the place of work, erection & installation including setting material in concrete, etc. complete.

b) The unit rate for MS pipe embedments and PVC pipe embedments shall include cutting, welding, fabrication, erection, embedding, and transportation to site. Unit rate shall also include the cost of the pipes.

c) Rate for expansion fasteners shall include cost of fasteners, installation, and fixing including cost of washers and nuts and site testing if required.

6.04.02 Measurements

a) The measurement of the embedded steel parts fabricated and installed by the Contractor shall be based on the calculated weight of steel sections in tonne corrected to second place of decimal.

b) Embedded steel parts supplied by Owner and installed by Contractor Measurement shall be done for the net weight of the embedments installed in tonnes correct to second place of decimal.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 49 OF 57

- c) For PVC pipes/conduits, measurements shall be in quintals correct to second place of decimal for the net weight.
- d) For mild steel pipes, measurement shall be in quintals, correct to second place of decimal, for the net weight of the steel pipe supplied, fabricated, and installed.
- e) The lugs shall be measured in Kg. correct to second place decimal for the net weight.
- f) The expansion fasteners shall be measured in number according to tension capacity.
- g) The rails shall not be treated as embedded steel part and the track shall be measured in running metres along the centre line and paid for under separate item of work as specified in schedule of items. Other related civil items associated with the laying of track shall be measured separately and paid under respective items of works.

6.05.00 Groutings

6.05.01 Rates

Rate shall include the cost of surface preparation, admixtures, and curing.

6.05.02 Measurements:

- a) Measurement shall be in cubic decimeters.
- b) Measurement for grouting shall be by volume of the block out, pockets or bolt hole upto the top surface of foundation concrete and shall be calculated from the dimensions shown on the drawings.
- c) Measurement for underpinning shall be by volume between the top surface of the foundation concrete and the underside of the base plate, the plan dimensions being as indicated on the drawings.
- d) No deduction shall be made for shims, bolts, shear keys and such other embedments.
- f) Pressure injection grouting with cement based grout if required as per drawing shall be applied at appropriate spacing to cover the desired surface area and measurement shall be made for the surface area grouted in sqm as per BOQ item. However in water retaining structures, the structural grouting if required to ensure water tightness shall not be payable

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 50 OF 57

separately as deemed to be covered in water retaining concrete item of BOQ.

6.06.00 Joints

6.06.01 Rates

The unit rate shall include all the activities described in the schedule of items.

6.06.02 Measurements

a) Bitumen Board/Expanded polystyrene.

The measurement for bitumen board shall be based on actual finished surface area in square meters nearest to second decimal, for the specified thickness.

b) Water Stops

The measurement for water stops shall be in running metres of actual length of the joint covered, for specified thickness, width, and shapes. No separate measurement shall be made for laps/splices for cross-joints and mitered joints.

c) Metal Cover Strips

The measurement for Metal Cover Strips shall be based on actual finished surface area in square metres for the specified thickness.

d) Vibration Damping Resilient Pads

The measurement for this item shall be in square metres for the specified thickness, measured correct to the second place of decimal, of the actual finished surface area.

6.07.00 Dismantling/Demolishing Work – RCC and PCC and Chipping of Concrete

6.07.01 Rates

The unit rates shall include the cost of all necessary propping, shoring, underpinning scaffolding, safety measures, temporary enclosures, disposal/stacking of serviceable/unserviceable materials, etc. for all types of work and for all grades of concrete.

In the case of dismantling/demolishing work, the cutting of reinforcement shall also be included in the rate.

TECHNICAL SPECIFICATION FOR CEMENT CONCRETE (PLAIN & REINFORCED)

SPECIFICATION NO. PE-TS-999-600-C002

VOLUME - II B

SECTION - D SUB SECTION - D2

REV.NO. 0 DATE : 30/11/2015

SHEET 51 OF 57

In the case of chipping work, the cutting of reinforcement shall be paid separately.

If the serviceable material including reinforcement steel from dismantled structure is allowed to be used/taken out by bidder, suitable rebate shall be given by bidder.

6.07.02 Measurements

- a) Dismantling of PCC and RCC work shall be measured in cu.m separately. Measurement of all work, except hidden work shall be taken before execution of work and no allowance for increase in bulk shall be allowed. Specifications for deductions of voids, openings etc, shall be done on the same basis as that applied for construction work.
- b) Chipping of concrete, making holes/pockets etc. shall be measured in cubic decimeters (i.e. 0.001 cu.m.).
- c) Cutting of reinforcement in chipping work for making of pockets and openings shall be measured in sq. cm. of cross-sectional area.

6.08.00 Precast Concrete

This clause shall be read in conjunction with relevant provisions specified elsewhere for cast in-situ Concrete.

6.08.01 Rates

- a) The unit rate shall include cost of preparation of casting yard, formwork, concrete and its casting, finishing as specified, setting filling of gaps between adjacent pre-cast concrete units with concrete, or cement mortar, curing, handling, erection, grouting, welding, preparation of supporting surface, etc.

6.08.02 Measurements

The measurement of pre-cast concrete members shall be on the basis of volume of concrete in cubic metres nearest to second place of decimal. No deduction shall be made for volume occupied by reinforcement/inserts/sleeves and for openings up to 0.1 sq.m. The setting of element with cement mortar shall not be measured separately The filling of concrete cement mortar between the gaps of adjacent precast units shall be considered while computing the volume of pre-cast concrete work and shall be paid for under this item itself.

VOLUME - II B

SECTION - D SUB SECTION - D3

REV.NO. 0 DATE : 30/11/2015

SHEET 3 OF 7

CARPENTRY AND JOINERY

1.00.00 SCOPE

This section covers supply, fitting and fixing of timber frames to doors and windows with M S holdfasts, flush doors, windows, shutters, partitions, wall panelling, pelmets, shelves, furniture, etc. as shown in drawings, including a prime coat of approved paint, varnish, or fixing of decorative plastic laminate where called for. This shall also include the supply and fixing of all hardware and fixtures shown in drawing or specified.

2.00.00 INSTALLATION

2.00.01 Materials

a) Timber

Unless otherwise specified, all timber shall be best quality well seasoned CP teakwood free from large or loose knots, cracks or any other defects. All timber shall be treated with approved wood preservative before use, unless specified otherwise. The rough timber shall be approved by the Engineer before incorporating in the works and starting the carpenter's work.

b) Plywood

Plywood shall be of commercial quality or with decorative surface veneer. Unless specifically permitted otherwise, the adhesive used in plywood shall be phenol formaldehyde synthetic resin of BWP grade conforming to IS: 848.

c) Decorative Laminated Plastic Sheets

The colour, pattern, finish and texture shall be approved by the Engineer. The bulk supply shall be procured in full sheet sizes which will ensure the least number of joints in one surface.

d) Flush Doors

Flush doors shall be solid core doors with commercial or decorative faces and hardwood edges conforming to IS: 2202 (Part-1). The core for solid core doors shall be of block board or wood particle board. Manufacturer's literature and test certificates shall be submitted for the approval of the Engineer. The Contractor shall give a guarantee that the adhesive used is BWP grade phenol formaldehyde synthetic resin conforming to IS: 848.

TECHNICAL SPECIFICATION FOR CARPENTRY AND JOINERY

SPECIFICATION NO. PE-TS-999-600-C003

VOLUME - II B

SECTION - D SUB SECTION - D3

REV.NO. 0 DATE : 30/11/2015

SHEET 4 OF 7

The thickness shall be as specified.

e) Panel Doors

Panel door shall be of teakwood shutter frame, unless otherwise noted and panels with teakwood/commercial ply/teakwood particle board. Other considerations shall be as mentioned in item (d) above.

f) Windows, Ventilators

Windows and ventilators shall made of teakwood shutter frame, unless specified otherwise and glazing of specified thickness shall be fixed with wooden beadings.

g) Fixtures

Fixtures for doors, windows, furniture etc. shall be as shown on drawing or specified.

2.02.00 Workmanship

2.02.01 General

The work shall be done by skilled carpenters as per details shown on drawing or instructed by the Engineer.

Framing timber and other work shall be close - fitting with proper wood joinery, accurately set to required lines or levels and rigidly secured in place. The surface of frames etc., which will come in contact with masonry after fixing, shall be given two coats of approved paint before fixing. Mastic caulking shall be done after fixing external door and window frames. Special care shall be taken to match the grain of timber or plywood, which will be subsequently polished. Screwing or nailing will not be permitted to the edge of plywood and particle board. The edge of all plywood, blackboard and particle board shall be finished with teakwood lipping unless otherwise shown on drawings.

Fixing to frames and partitions shall generally be with 40 mm x 6 mm x 300 mm long M S holdfasts bifurcated at end and grouted with 1:2:4 cement concrete. The gap between masonry and external door and window frame shall be caulked with polysulphide mastic. M.S. grills or guard bars shall be provided to windows where called for in the drawings.

TECHNICAL SPECIFICATION FOR CARPENTRY AND JOINERY

SPECIFICATION NO. PE-TS-999-600-C003

VOLUME - II B

SECTION - D SUB SECTION - D3

REV.NO. 0 DATE : 30/11/2015

SHEET 5 OF 7

2.02.02 Finish

All carpentry work after finishing shall be sand papered smooth. A prime coat paint shall be given after inspection of the Engineer to all surfaces other than those, which shall be subsequently polished or covered with laminated plastic sheet.

2.02.03 Surface Treatment

When shown on drawings or called for, decorative ply or laminated plastic sheets shall be bonded under pressure to the surface to be finished. The adhesive used shall be of brand and brought to site in sealed containers. The rate of application and the length of time for which the pressure is to be applied shall be as per the manufacturer's instructions. The edge of sheets shall be protected by teak lipping or bevelled as shown on drawings.

3.00.00 ACCEPTANCE CRITERIA

3.00.01 Door and Window Frames

All frames shall be square and flat at the time of delivery and shall be checked for dimensions and corner angles. After fixing they shall be on a fine vertical plane. All external door and window frames shall be caulked with mastic.

3.02.00 Door and Window Shutters

All doors and window shutters shall be of proper size, shape, and design and free of warp. When fixed to frames, these shall operate smoothly without jamming and all latching or locking devices shall engage properly without undue pressure.

3.03.00 Partitions, Paneling, Pellets, Furniture, etc.

3.03.01 General

These shall conform to drawings in all details. No unsightly nail marks etc. shall be permitted. Plywood grains shall be matched to give a uniform and pleasing appearance.

3.03.02 Partition

Shall be checked for rigidity of fixing, plumb and horizontal as well as vertical alignment.

TECHNICAL SPECIFICATION FOR CARPENTRY AND JOINERY

VOLUME - II B

SECTION - D SUB SECTION - D3

REV.NO. 0 DATE : 30/11/2015

SHEET 6 OF 7

3.03.03 Pelmets

Shall be checked for rigidity of fixing and adequate clearance of fixture.

3.03.04 Cupboard Shutters

Shall operate smoothly without jamming and locks, bolts and double ball catches shall engage securely. Single ball catches shall not be used.

3.03.05 Drawers

Shall operate smoothly and have backstops to prevent them from being pushed too far. Locks shall engage securely.

3.03.06 Loose Furniture

When placed on a level surface, tables tops etc. shall be horizontal and the pieces stand stably on legs or supports.

4.00.00 IS CODES

All work shall be carried out as per this specification and shall conform to the latest revision and/or replacements of the following or any other Indian Standard (IS) Codes, unless specified otherwise. In case any particular aspect of work is not specifically covered by Indian Standard Codes, any other standard practice, as may be specified by the Engineer, shall be followed.

IS: 848 - Synthetic resin adhesives for plywood (Phenolic and Aminoplastic)

IS: 1003 - Timber panelled and glazed shutters.

IS: 2191 - Wooden flush door shutter (Cellular and hollow core type).

IS: 2202 - Wooden flush door shutters (solid core type).

IS: 4021 - Timber door, window, and ventilator frames.

5.00.00	RATES AND MEASUREMENTS	13

**ROOF AND UNDERGROUND WATER PROOFING,
INSULATION AND ALLIED WORKS**

1.00.00 SCOPE

This section covers furnishing, installation, repairing, finishing, curing, testing, protection, maintenance till handing over of roof and underground water-proofing, insulation and allied works for buildings and at locations covered under the scope of this package.

2.00.00 INSTALLATION

2.01.00 GRADING UNDERBED

The surface to receive the underbed shall be roughened and thoroughly cleaned with wire brush and water. Oil patches if any shall be removed with detergent. The surface shall be soaked with water and all excess water removed just before laying of the underbed.

The underbed shall not be laid under direct hot sun and shall be kept in shade immediately after laying so as to avoid quick loss of water from the mix and separation from the roof surface. The underbed shall be cured under water for at least 7 days.

The underbed shall be laid to provide an ultimate run off gradient not less than 1 in 120 and as directed by the Engineer. Upto an average thickness of 25mm the underbed shall usually be composed of cement and sand plaster. For higher thickness the underbed shall be made with cement concrete. The underbed shall be finished to receive the waterproofing treatment direct or insulation as the case may be.

2.01.01 Cement Mortar Underbed

The underbed grading plaster shall be average 25 mm thick maximum. It shall consist of cement and coarse sand in the ratio 1:4 nominal by volume. The sand and cement shall be thoroughly mixed dry and then water added. Each batch of mix shall be consumed before the initial set starts.

The plaster shall be fully compacted to the desired grade in continuous operation. The surface shall be even and reasonably smooth.

2.01.02 Cement Concrete Underbed

The underbed cement concrete shall be used where the subgrade is more than average 25 mm thick. It shall consist of cement concrete 1:2:4 nominal mix

by volume with 12 mm down stone chips and coarse sand. The aggregate shall be mixed dry and minimum quantity of water shall be added to make the mix workable.

The mix shall be laid to proper grade, fully consolidated and surface shall be smooth and even.

2.02.00 INSULATION

The Tenderer shall, along with the tender, send specifications of insulating materials he proposes to use and the proposed method of laying. Before bulk supply, the contractor shall send samples of insulating material to the Engineer, and after approval of the samples, the Contractor shall procure and transport the bulk material to the site. Whenever asked by the Engineer, the Contractor shall furnish test certificates from testing laboratory on the insulating and other properties of the materials.

After laying the insulation, the surface shall be made ready as required to receive the waterproofing treatment. If any plastering is used it shall be not leaner than 1:4 cement sand by volume and not thinner than 12 mm and it shall be cured for seven days.

2.02.01 Foam Concrete

This shall be of lightweight foam concrete of average 50 mm thickness or as specified or as shown on drawings. This may be laid in situ in suitable panels or precast blocks. The insulating properties shall be such that the thermal conductivity shall not exceed 0.125 Kcl/sq.m. hr degree C. Before starting the laying of foam concrete samples shall be prepared at site and got tested for approval of the Engineer.

The foam concrete laid shall be sufficiently strong to withstand the usual workload and standard loads expected on the roof. Any damaged portion shall be removed and replaced forthwith. Approval of the Engineer shall be taken before laying the waterproofing over the insulation.

While laying the foam concrete, samples from each batch of the mix shall be kept for test if so desired by the Engineer.

2.02.02 Expanded Polystyrene Blocks

The expanded polystyrene block Insulation shall be fire retardant quality and shall have a maximum thermal conductivity of 0.026 Kcl m/sq.m h °C. It must be strong enough to withstand without any deformation under the workload and standard loads expected on the roof.

**TECHNICAL SPECIFICATION FOR
ROOF AND UNDERGROUND
STRUCTURES WATER PROOFING,
INSULATION AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C004

VOLUME - II B

SECTION - D SUB SECTION - D4

REV.NO. 0 DATE : 30/11/2015

SHEET 6 OF 15

The Contractor shall lay the expanded polystyrene block as per manufacturer's approved specification. Only specifically experienced workers shall be used for this work. If the Engineer is not satisfied about the efficiency of the workers the Contractor shall secure manufacturers supervision at no extra cost to the Owner.

2.03.00 Fillets

Fillets at Junction of roofs and vertical walls shall be provided with the same insulating material as provided for the main roof insulation. The fillets shall be 150 mm x 150 mm in size unless otherwise shown on drawings or instructed by the Engineer.

Where there is no insulation over roof slab, fillets shall be cast-in-situ cement concrete (1:2:4) nominal mix volume.

2.04.00 Waterproofing Treatment

2.04.01 Bitumen Felt Treatment

Waterproofing treatment shall be laid by a specialist firm with long experience in the particular trade.

The waterproofing treatment for roofs with bitumen felts shall be done following relevant IS: 1346. Bitumen felt shall conform to IS: 1322 and Bitumen primer to IS: 3384.

The bonding materials shall consist of blown type conforming to IS: 702 or residual bitumen conforming to IS: 73 or a mixture of the two to withstand local conditions of prevailing temperature or gradient of roof surface. The Contractor shall convince the Engineer that the bonding material proposed to be used is suitable for the particular job.

The Contractor shall state the source from where he proposed to procure the materials. Samples of the self-finished felt shall be submitted in advance to the Engineer along with test certificates for his review. Test certificates for the bonding materials shall also be submitted and samples, if desired by the Engineer, shall be provided for confirmatory tests. Samples shall be submitted if instructed by the Engineer.

Minimum overlaps of 100 and 75 mm shall be given at the end and sides of strips of felt and properly bonded with bitumen. Joints in successive layers of felt shall be staggered.

Normal treatment with one layer of felt, heavy treatment with two layers of felt

or Extra Heavy treatment with three layers of felt shall be indicated. Brief details of the various treatments shall be as follows:

a) Normal Treatment - Five courses

- 1) Primer coat conforming to IS:3384 applied at the rate 0.27lits/sqm min.
- 2) Hot applied bitumen at the rate of 1.2 kg/sq.m. (min.)
- 3) Hessian base self finished felt, type 3, grade 1.
- 4) Hot applied bitumen at the rate of 1.2 kg/sq.m. (min.)
- 5) 20 mm thick pressed precast concrete tiles with 15 mm, thick 1:4 cement-sand mortar underbed.

b) Heavy Treatment - Seven Courses

With Hessian base felt

- 1) Primer coat conforming to IS:3384 applied at the rate 0.27lits/sqm min.
- 2) Hot applied bitumen at the rate of 1.2 kg/sq.m (Min.)
- 3) Hessian base self-finished felt, type 3, grade 1.
- 4) Hot applied bitumen at the rate of 1.2 kg/sq.m (Min.)
- 5) Hessian base self-finished felt, type 3, grade I.
- 6) Hot applied bitumen at the rate of 1.2 kg/sq.m (Min.)
- 7) 20 mm thick pressed precast concrete tiles with 15 mm thick 1:4 cement: sand mortar underbed.

or

With fiber base felt

- 1) Primer coat conforming to IS:3384 applied at the rate 0.27lits/sqm min.
- 2) Not applied bitumen at the rate of 1.2 kg/sq.m (Min.)
- 3) Fiber base self-finished felt, type 2, grade 2.
- 4) Hot applied bitumen at the rate of 1.2 kg/sq.m (Min.)

With Hessian base felt

1) Primer coat conforming to IS:3384 applied at the rate 0.27lits/sqm min.

2) Hot applied bitumen at the rate of 1.2 kg/sqm. (min.)

3) Hessian base self-finished felt, type 3, grade 1.

4) Hot applied bitumen at the rate of 1.2 kg/sqm. (min.)

5) Hessian base self-finished felt, type 3, grade 1.

6) Hot applied bitumen at the rate of 1.2 kg/sqm. min.

7) Hessian base self-finished felt, type 3, grade 1.

8) Hot applied bitumen at the rate of 1.2 kg/sqm. min.

9) 20 mm thick pressed precast concrete tiles with 15 thick 1:4 cement: sand mortar underbed.

However, in special cases, more courses, or a combination of fibre base and hessian base felts may be asked for.

The surface to receive the waterproofing treatment must be cleaned and dried satisfactorily and the Engineer's approval taken before starting the work. If any existing waterproofing treatment is being augmented the existing top course shall be completely removed and all damaged felts or other defects repaired.

The Engineer may instruct the Contractor to lay part of the stipulated courses at the first instant to be followed later on with the balance courses. This interim finish shall be done with a course of hot applied bitumen. While doing the balance again hot bitumen shall be applied to start with after repair of all damages to the already laid course.

After completion the surface shall be cleaned taking care that felt cuttings etc. do not find their way into rainwater down comers.

2.04.02

Elastomeric Membrane

a) Material

The material shall consist of high solid content Polyurethane based cold liquid applied coatings as per ASTM C836-89a comprising of urethane pre-polymers extended with flexible material, which cure by reaction with atmospheric moisture to give a continuous film which is rubbery and elastic or any other equivalent material permitted as per ASTM and approved by the Engineer. The material shall consist of high solid coating designed to give a high-build film. The material shall not be diluted. The coating shall have physical feature like high viscosity, 90% solids, high resistance to impact, abrasion and cracking, superior tensile strength, application limit of 70°C minimum, 300% elongation and forming a perfectly smooth permanently flexible seamless membrane which should have good adhesion to roof substrates (RCC, tiles, brick, and metals), having a minimum life of 10 years. It should also be resistant to acid (mild concentrated), alkalies and have a very low water absorption rate (0.5%) max. at ambient temp. after 7 days.

The pack shall not be older than 9 months after the date of manufacture and packing.

b) Primer coat

It shall consists of polyurethane (P.U.) or any other equivalent material. Primer coat shall be a special blend of moisture curing urethane pre-polymers in solvent. A single coat of this primer shall be applied by brush over the prepared bed as an adhesion coat of an application rate of minimum 6 sq.m per litre.

The primer shall be allowed to dry for minimum of 2hrs. time before the successive finishing coats of P.U. liquid membrane are applied.

c) Finishing coats :

The finishing coats shall consist of two successive liquid coatings of high solids content urethane pre-polymers or equivalent material to form an elastomeric membrane. The overall dry film thickness shall be 1.5mm subject to minimum 500 gm per sq.m per coat application rate.

Each coat shall be allowed to dry for minimum 12 hours before applying the next coat. The surface should be dry and smooth before application.

The coating shall be continued up the parapets/walls for a minimum of 150mm over the finished roof surface. It shall be continued into rain water pipes by atleast 100mm.

The final coat of P.U. liquid when tacky shall be sprinkled with the sand.

For edges, expansion joints and any vulnerable points a later of polyscrim cloth /fabric to be embedded between 2 finishing coats.

d) Surface Finish :

Areas of roof treatment which are vulnerable to accidental damage shall be provided with wearing course consist of minimum 20 mm thick PCC of Grade M15 (using 12.5mm size aggregate) cast in panel of maximum size of 1.20m x 1.20m and reinforced with 0.56mm diameter galvanised chicken wire mesh and sealing of joints using sealant or elastomeric compound.

When the roof surface is subjected to foot traffic or used as a working area, a cement mortar (1:4) shall be applied over the top most layer of roofing treatment. Over this, a layer of chequered cement concrete flooring tiles conforming to IS:13801 shall be provided in place of stone grit and cement painted. The tiles shall be laid as per IS:1443.

2.04.03 Waterproofing By Epoxy Resin Based Application

Exposed surfaces of cement concrete, lime concrete or brickwork to be treated for waterproofing by the resin-based application shall be thoroughly cleaned and the epoxy resin based material to be applied as directed by the manufacturer. The material shall not have any adverse effect on the surface on which it is applied and must stick to it uniformly to make a strong durable bond. It shall not be affected by short duration fire, sun exposure, and light duty traffic. The application shall be resistant to growth of fungus and proof against saltpetre action. If desired by the Engineer, a sample shall be prepared in advance and tested for waterproofness for 48 hours under 300 mm depth of standing water. The Contractor shall arrange the demonstration by providing free the materials and labour for the application as free of cost to Owner. This item shall carry a guarantee as specified.

2.04.02 Flashing

Unless otherwise stated flashing shall be done in the same way as the waterproofing except that the last layer shall be finished with two coats of bituminous primer. The flashing shall be extended up the vertical surfaces as shown on drawing. The flashing shall end in grooves in vertical walls. The grooves shall be at least 65 mm deep and caulked with waterproof mastic cement. The minimum overlap with horizontal roofing felt shall be 100 mm.

Where specified or directed by the Engineer, metal flashing shall be provided. The materials shall be 18 Gage or 22 G G.I. sheets, as specified or as directed by the Engineer.

2.05.00 WATER-PROOFING OF UNDERGROUND STRUCTURES

Basements, ducts, pits, tunnels (excluding tanks) etc below the ground water table and in contact with soil are covered under this. Bonding material shall be blown bitumen of 65/25 grade conforming to IS: 702.

Waterproofing shall be provided on the outside of walls and top of RCC slab and shall be carried out upto 150mm above ground level. The number of layers of bitumen felt to be used for walls and floor unless otherwise shown in the drawing shall be:

- a) 2 layers - for depths up to 5m below ground level
- b) 3 layers - for depths beyond 5m below ground level

2.05.01

Method of laying the bitumen felts and workmanship shall be as per IS: 1609 and IS: 3067. Water proofing work shall be taken in hand only when the sub-soil water level is at its lowest; the site shall be kept dry by adequate arrangements for pumping out water till the work has been completed.

For this purpose drains shall be formed along the edges of the excavation but beyond the building line, with suitable collecting sumps.

In case of large excavation areas where it is necessary to dewater under the floor, additional land drains shall be formed across the excavation, to adequately drain the area.

Adequate arrangement shall be made to protect the sides of excavation from slipping while the work is in progress.

The base concrete or mud-mat shall be rendered smooth by a 20mm thick sand-cement plaster (6:1). Any sharp edges/corners, over which the waterproofing course is to be laid, shall be eased out by means of cement.

The surface must be dry before the next operation is carried out.

Water proofing/damp proofing treatment:

A) Heavy Treatment (Two layers of felt)

- i) Primer (For vertical faces only), as per I.S. 3384.
- ii) Hot applied blown bitumen at the rate of 1.2 Kg/m²
- iii) Hessian base, bitumen felt type 3 grades 2
- iv) Hot applied blown bitumen @ 1.2 Kg/m²
- v) Hessian base, bitumen felt type 3 grade 2
- vi) Hot applied blown bitumen @ 1.2 Kg/m²

B) Extra Heavy treatment (Three layers of felt)

- i) Primer (for vertical faces only) as per I.S. 3384
- ii) Hot applied bitumen at the rate of 1.2 Kg/m²
- iii) Hessian base bitumen felt type 3 grades 2
- iv) Hot applied bitumen at the rate 1.2 Kg/m²

**TECHNICAL SPECIFICATION FOR
ROOF AND UNDERGROUND
STRUCTURES WATER PROOFING,
INSULATION AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C004

VOLUME - II B

SECTION - D SUB SECTION - D4

REV.NO. 0 DATE : 30/11/2015

SHEET 13 OF 15

v) Hessian base bitumen felt type 3 grades 2

vi) Hot applied bitumen at the rate of 1.2 Kg/m²

vii) Hessian base bitumen felt type 3 grades 2

viii) Hot applied bitumen at the rate of 1.2 Kg/m²

The surface must be dry before the next operation is carried out at each stage said above.

The laying of felt over the bitumen so applied that it shall always commence on the floor, and shall be carried over to the walls only after treatment of the floor is complete. The minimum over lapping at sides and ends of strips shall be 10cm. Point for subsequent layers completely sealed by blow lamp.

A protective flooring of either brick flat in cement mortar (1:3) or 6cm thick cement concrete (M 15) or a coat of cement plaster (1:3) 4 cm thick shall be constructed over the bitumen layers to prevent damage to the latter during subsequent construction of the structural floor.

The walls shall be treated in a similar way; the bitumen felts joining at the base with the projecting felt laid over the mud-mat. The wall surface shall be made smooth where necessary with a coat of cement plaster (1:3), the felts laid as for the floor, ensuring that the surface to be treated is dry and then a protective brick wall, 12.5 cm nominal thickness shall be built in cement mortar (1:3) over the projecting mud-mat, the space between the wall and felt being grouted with cement.

3.00.00

ACCEPTANCE CRITERIA AND GUARANTEE

The surface level shall be such as to allow quick draining of rains without leaving any pool anywhere. The finishing course shall be fully secured and shall have an even density. There shall not be any bubble formation or crushed or squeezed insulation or underbed.

The contractor shall give a guarantee in writing for all works executed under this specification supplemented by a separate and unilateral guarantee from the specified agency for the roof waterproofing treatment work. The guarantee shall be for materials and workmanship as under:

For Bitumen Felt Treatment under clause no. 2.04.01: 5 years in case of normal treatment, 10 years for heavy treatment and 20 years for extra heavy treatment.

For Elastomeric Membrane under clause no. 2.04.02: 10 (ten) years

In case guarantee is more stringent in owner specification, more stringent guarantee shall be applicable. The mode of execution of the guarantee shall be such, which shall be acceptable to the Owner.

4.00.00 I.S. CODES AND STANDARDS

All work shall be carried out as per this specification and shall conform to the latest revision and/or replacements of the following or any other Indian Standard (IS) Codes, unless specified otherwise. In case any particular aspect of work is not specifically covered by Indian Standard Codes, any other standard practice, as may be specified by the Engineer, shall be followed.

a)	IS: 73	-	Paving Bitumen
b)	IS: 702	-	Industrial Bitumen
c)	IS: 1203	-	Methods of testing tar and bitumen
d)	IS: 1322	-	Bitumen felts for waterproofing and damp proofing.
e)	IS: 1346	-	Code of practice for waterproofing of roofs with bitumen felts.
f)	IS: 1609	-	Damp-proofing Treatment using Bitumen Felts – Code of Practice
g)	IS: 3067	-	Code of practice for General design details and preparatory work for Damp-proofing and water-proofing of buildings
h)	IS: 3384	-	Bitumen primer for use in waterproofing and damp proofing.

5.00.00 RATES AND MEASUREMENT

5.01.00 Rates

Rates shall be for complete work, including the cost of all materials and labour, as detailed in the specification unless any portion is specifically excluded in the “Schedule of Items”.

No extra shall be paid for finishing around opening, sleeves, pipes, ducts, inserts, etc.

**TECHNICAL SPECIFICATION FOR

METAL DOORS, WINDOWS, VENTILATORS, LOUVERS ETC.

1.00.00 SCOPE

This section covers supplying and/or erecting and installing of all metal doors, windows, ventilators, louvers, glazed partitions, etc. The scope of work shall also include the assembly and erection of all doors, windows, louvers, glazed partitions, etc. Supplying and/or fixing of all door and window accessories and hardware are also included in the scope.

2.00.00 INSTALLATION

2.01.00 Materials

Steel sections used for fabrication of doors, windows etc. shall be standard rolled steel sections specified in IS: 1038 and IS: 1361 or as specified.

Steel sheets for frames, shutters, louver blades etc. shall be of gauge mentioned in drawings and schedules.

Aluminium sections for fabricating doors, windows, partitions etc. shall be extruded sections conforming to IS:733 or IS:1285 or as manufactured by Indian Aluminium Company Limited or approved equivalent. Aluminium door, windows and ventilator shall be fabricated as per IS:1948 and IS:1949. The alloy used shall conform to IS Designation HE 9-WP of IS: 733.

Hardware and fixtures shall be as specified and the best quality from approved manufacturers shall only be used. The tenderer shall specifically state the particular manufacturer's materials he proposes to use. Improper alignment or faulty operation due to inadequate strength of hardware or fixture shall entirely be the Contractor's responsibility.

All hardware and fixtures shall be able to withstand repeated use. Door closures shall conform to IS: 3564 and shall be suitable for doors weighing 61-80 Kg. unless otherwise stated. Each closer shall be guaranteed against manufacturing defect for one year and any defect found within this period shall be rectified or shall be replaced free of charge. Concealed door closers shall be either floor mounted or transom mounted, suitable for installation with metal doors. It shall conform to the performance Requirements and endurance test stated in IS: 3564 - Appendix-A. The Contractor shall submit samples of each type of hardware to the Engineer. The approved samples shall be retained by the Engineer for comparison of bulk supply. The samples shall be returned to the Contractor towards end for incorporation in the job. The mastic for caulking shall be of best quality from a manufacturer approved by, the Engineer. In general, mastic for fixing of metals frames shall be as per IS:

SHEET 4 OF 15

1081 or as approved by the Engineer.

2.02.00 Fabrication**2.02.01 Steel Doors, Windows, Ventilators, louvers etc.****a) Door Frames**

Frames shall be fabricated from 16 gage(G) sheets. They shall, be mortised, reinforced, drilled, and tapped for hinge lock and bolt strikes. Where necessary, frames shall be reinforced for door closers. Welded construction with mitered Corners shall be used. Rubber door silencers shall be furnished for the striking jamb. Loose "T" masonry anchors shall be provided. Frames shall finish flush with floor and adjustable floor anchors shall be installed. Frames shall be brought to site with floor ties/weather bars installed in, place.

b) Double Plate Flush Door Shutters

Door shutters shall be 45 mm thick, completely flush design and shall comprise of the outer sheets or 18 G steel sheets, rigidly connected and reinforced inside with continuous vertical 20 G stiffeners, spot welded in position at not more than 150 mm on centres.

Both edges of doors shall be joined and reinforced full height by steel channels placed immediately inside and welded to the door faces. Top and bottom of doors shall be reinforced horizontally as shown on drawing by steel channels running full width of door. Doors shall not have more than 2.5 mm clearance at jambs and heads, shall have proper level on lock stiles and rails to operate without binding, and shall be reinforced at corners to prevent sagging or twisting. Pairs or double doors shall have meeting-stile edges bevelled or rebated. Where shown on drawing, or called for in the schedule of items, the doors shall be sound deadened by filling the inside voids with mineral wool or other suitable approved materials.

Doors shall be mortised, reinforced, drilled, and tapped in shop for hinges, locks, and bolts. They shall also be reinforced for closers, push-plates, and other surface hardwares where necessary. Any drilling and tapping required for surface hardware shall be done at site. Where shown drawing, provision shall be made for fixing glazing, vision panels, louvers etc. glazing mouldings shall be of 18 G steel or extruded aluminium sections and suitable for fixing 6 mm. glass. Louvers blades shall be V or Z shaped and made out of 16 G sheets.

VOLUME - II B

SECTION - D | SUB-SECTION - D5

REV.NO. 00 DATE 16/12/2017

SHEET 5 OF 15

c) Single Sheet Door Shutters

Single sheet doors shall be made from best quality 18 G mild steel sheets, and shall present a flush surface on the outside. The inside shall be stiffened with semi tubular edge and central stiffening rail, which shall convey the lock and other fixture. The frames shall be made from best quality, 16 G mild steel sheets.

Wherever required, provisions for fixing glass panes, louvers etc. shall be made.

The manufacturing shall be done as specified in 2.02.01 (b) "Double Plate Flush Door Shutters."

d) Sliding Door

Sliding doors shall be either double plate or single plate Construction made out of 18 gauge steel sheets with adequate stiffeners. The contractor shall specify the weight of the door in his shop and submit the manufacturer's catalogue of the sliding gear he proposes to use. Where called for the Contractor shall make provision for openings to the door for monorail beams. Doors shall close positively to exclude rainwater from seeping in. When called for, sliding doors shall withstand specified wind loads without buckling or jamming. The door shall slide freely under all ambient conditions.

e) Door Threshold

Door threshold shall be provided. Doors without threshold shall have bottom tie of approved type.

f) Steel Windows, Sashes, and Ventilators etc.

These shall conform in all respects to IS: 1038 and IS: 1361 latest editions. The details as called for in the above codes shall be applicable for coupling mullions, transoms, weather bars, and pivot arrangements for ventilators, etc. or as called for. All welds shall be dressed flush on all exposed and contact surfaces. Where composite unit openings are required the individual window units shall be joined together with requisite transoms and mullions. All windows shall be outside glazed, fixed with putty or metal glazing beads as specified. Where aluminium glazing beads are specified, they shall be extruded aluminium channel 9.5 mm x 9.5 mm x 1.6 mm (Indal Section No. 2209) unless otherwise shown on drawings. Aluminium beads shall be given one coat of zinc chromate primer before fixing to windows.

REV.NO. 00 DATE 16/12/2017

SHEET 6 OF 15

2.02.02

Aluminium Door, Windows, and Frames

Extruded sections shall have a minimum 3 mm wall thickness. All sections shall be approved by the Engineer before fabrication is taken up. Doors frames, mullions, transom etc. shall be anodized in a bath of sulphuric acid to provide a clear coating of minimum 15 micron thickness. The anodized materials shall then be sealed by immersing in boiling water for 15 minutes. A protective transparent Coating shall be applied to the sections before shipment from the factory.

All work shall be fitted and shop assembled to a first class job, and ready for erection. Shop joints shall be made to hair lines and then welded or braced by such method as will produce an uniform colour throughout the work. Work on the above, other than described, shall be carefully fitted and assembled with neat joints with concealed fasteners. Wherever possible, joints shall be made in concealed locations and on edges of doors. Field connections of all work may be made with concealed screws or other approved type of fasteners. Glazing beads shall be snap fit type without visible screws and shall be of sizes to accommodate 6 mm thick glazing. All work shall be adequately braced and reinforced as necessary for strength and rigidity.

2.03.00

Shop Coat or Paint

The shop Paint for steel doors, windows etc. shall be best lead or zinc chromate primer paint from, approved manufacturer. All surfaces shall be thoroughly cleaned of rust, grease, loose mill scales etc. and given one coat of shop paint. Portions like mullions, transoms etc. that will be inaccessible after assembly of units shall be given an extra coat of paint before assembly.

Where called for, all steel doors, windows, etc. shall be hot dip galvanized to give a coating weight of 1½ - 2 oz. per sqft. One coat zinc chromate primer coat shall then be applied as shop paint.

Portions of aluminium frame, which come in contact with masonry construction shall be (before shipment from workshop) protected with a heavy coat of alkali resistant paint. Aluminium coming in contact with other incompatible metals shall be coated with zinc chromate primer.

2.04.00

Handling & Storage of Fabricated Material

All metal doors, windows, etc. shall be packed and crated properly before dispatch, to ensure that there will be no damage to the fabricated materials. Loading into wagons and trucks shall be done with all care to ensure safe arrival of materials at site in undamaged condition.

SECTION - D | SUB-SECTION - D5

REV.NO. 00 DATE 16/12/2017

SHEET 7 OF 15

When taking delivery of items supplied by Owner, the Contractor shall satisfy himself that the items supplied are up to the specified standard. Any defect detected shall promptly be brought to the notice of the Engineer.

All metal doors, windows etc. shall be stored under cover in a way to prevent damage or distortion. Special care shall be taken to prevent staining of aluminium products by rust, mortar etc.

2.05.00

Assembly & Erection at Site

In general, the fixing of steel doors, windows, ventilators, louvers, etc. shall conform to IS: 1081. The Contractor shall assemble and install all steel doors, windows, sashes, fixed metal louvers, etc. including transoms and mullions for composite units in respective places, keening proper "Lines and levels", and in approved workmanlike manner, to give trouble free and leak-proof installations. Installation shall be done according to instructions of the manufacturer, and/or as approved by the Engineer. If required by the Engineer, the installation shall have to be carried out under the supervision of the manufacturer's staff. The Contractor shall take all precaution against damage of the components during installation. Necessary holes, chases, etc. required for fixing shall be made by the Contractor and made good again as per original, after installation, without any extra charge.

After installation of steel doors, windows, etc. all abrasions to shop-coat of paint shall be retouched and made good the same quality of paint used in shop coat.

All coupling mullions, transoms, frames, etc. in contact with adjacent steel and other members, shall be well bedded in mastic. The Contractor shall bring to the site the cement in original sealed containers of manufacturer and shall apply it as per the instruction. For all frames supplied by either the owner or the Contractor, mastic shall be supplied by the Contractor and caulking done properly as per drawings, specifications and as per instructions of the Engineer.

Door shutters, partitions hardware fixtures etc. shall be fixed only after major equipments have been installed in rooms.

Wherever required, nylon cords of approved quality shall be supplied along with pivoted sashes and shall be of adequate length to terminate one metres from the floor. Loose ends of cords shall end in metal or plastic pull as approved by the Engineer.

SHEET 8 OF 15

Fire proof doors shall be provided at all fire exit points as specified and also to restrict the spread of fire within buildings whether from internal fire or from external fire. The construction details of door shall conform to the requirements stipulated in IS:3614(Part-1). Doors shall comply with the testing requirement mentioned in IS:3614 (Part-2). The doors shall be approved by Tariff Advisory Committee and shall have minimum 2 hrs. fire rating.

Metal covered (on both sides) Doors having insulating core filled up with mineral wool shall be used at all fire exit points and shall open out side.

All necessary accessories and hardware shall also be supplied along with doors. Fire proof door shall be provided with zinc silicate primer (minimum DFT 75 micron) after blast cleaning the surface to near white metal surface and shall be finished painted with epoxy based painting.

3.00.00 ACCEPTANCE CRITERIA

3.01.00 For fabricated Items

- a) Overall dimensions shall be within ± 1.5 mm of the size shown on drawings.
- b) Mullions, transoms etc. shall be in one length and permissible deviations from straightness shall be limited to ± 1.5 mm from the axis of the member.
- c) Door and window shutters shall operate without jamming. The clearance at head and jamb for door shutters shall not exceed 1.5 mm for double leaf doors; the gap at the meeting stiles shall not be more than 1.5 mm.
- d) Door leaves shall be undercut where shown on drawings.
- e) Doors, windows, frames, etc. shall be on a true planes, free from warp or buckle.
- f) All welds shall be dressed flush on exposed and contact surfaces.
- g) Correctness of location and smoothness of operations of all shop installed hardware and fixtures
- h) Provision for hardware and fixtures to be installed at site.
- i) Glazing beads shall be cut with mitred corners.
- j) Glazing clips, fixing devices etc. shall be supplied in adequate numbers.
- k) Shop coats shall be properly applied.

of unit, caulking and jamming of frames, including cutting/drilling/welding, grouting, grinding, making good of the structure for installing the unit etc. complete as per "Schedule of Items".

Rates shall also include cost of surface preparation, application of primer, enamel painting or anodizing as applicable.

Rate for fire proof door is inclusive of providing insulation core, primer, shop painting (epoxy based), all hardware as specified in Schedule of items.

6.02.00

Measurement

Supply and installation of doors, windows, and ventilators shall be measured in Sqm or Kg as per BOQ item. If measured in sqm, it shall be for net outer to outer (excluding frame) area of doors, windows, and ventilators of each type used as described in "Schedule of Items". Frame for steel or aluminium shall be measured in Kgs. Wooden frames shall be measured in Cum. Measurement for aluminium partition frames shall be in Kg. Panelling and glazing shall be paid separately if not covered in BOQ item description.

Measurement for fire proof door shall be in SqM in net area outer to outer of the door.

GLASS AND GLAZING

1.00.00 SCOPE

This section covers supplying and fixing of all glass and glazing including all clips, putty, mastic cement etc. wherever required as per specifications.

2.00.00 INSTALLATION

2.01.00 General

The Contractor shall supply and install all glass and glazing as required for various doors, windows, sashes, ventilators and fixed louvers, miscellaneous glazing and partitions, from approved manufacturer like Hindustan Pilkinton or equivalent, having uniform refractive index and free from flaws, specks, and bubbles. The glass shall be brought to site in the original packing from the manufacturer and cut to size at site.

Materials

- a) Glare reducing or heat absorbing glass shall be "Calorex" of Hindustan Pilkinton or approved equivalent and special care shall be taken to grind smooth and round off the edges before fixing.
- b) Clear glass shall be flat draw sheet glass and shall be at least 4 mm thick. Sheet glass for doors shall be minimum 5.5 mm thick.
- c) Wired glass shall be thick- rolled glass with centrally embedded 42g wire mesh of Georgian type. This may be of clear or coloured glass, as required.
- d) Obscure glasses shall have a cast surface in one side.
- e) Coloured and figured glass shall be as per approved sample.
- f) In general, the putty shall conform to IS: 400 and be of best quality from approved manufacturer. It shall be brought to site in the manufacturer's original packing.
- g) Neoprene gaskets with snap-fit glazing beads shall be fixed as per manufacturer's instructions and shall sit snugly against glass to give a leak proof installation.

2.03.00 Glazing, Setting, and Finish

All glazing clips, bolts, nuts, putty, mastic cement etc. as required shall be supplied by the Contractor.

TITLE:

**TECHNICAL SPECIFICATION
FOR GLASS AND GLAZING**

SPECIFICATION NO. PE-TS-999-600-C006

VOLUME - II B

SECTION - D

SUB-SECTION - D6

REV.NO. 00

DATE 16/12/2017

SHEET 4

OF 5

All glass shall be thoroughly cleaned before putting in position. Each glass pane shall be held in place by special glazing clips of approved type. As specified in relevant I.S. Codes, four glazing chips shall be provided per glass pane, except for large panes where six or more clips shall be used as per engineer's instructions. All holes that may be necessary for holding the clips glazing heads and all other attachments shall be drilled by, the Contractor.

Glass panes shall be set without springing, and shall be bedded in putty and back puttied, except where mouldings or gasket are specified, putty, mastic cement etc. shall be smoothly finished to the even line and figured glass shall be set with smooth side out.

Where owner will supply glass, the Contractor shall cut it to size and fix them in the same as specified above.

The Contractor shall supply necessary glazing clips, putty, mastic cement etc.

After completion of glazing, the Contractor shall remove all dirt stains, excess putty etc. clean glass panes and leave the work in perfectly acceptable condition. All broken cracked or damaged glass shall be replaced by new ones at the contractor's own cost.

3.00.00

ACCEPTANCE CRITERIA

- a) All installation shall be free from cracked, broken, or damaged glass. Edges of large panes of thicker glass and heat absorbing glass shall be inspected carefully for chipped, cracked, or underground edges.
- b) Glazing shall be carefully done to avoid direct contact with metal frames.
- c) All glass shall be embedded in mastic or fixed by neoprene gaskets to give a leak proof installation.
- d) At completion, the panes shall be free from dirt, stains, excess putty etc. to the complete satisfaction of the Engineer.

4.00.00

I.S. CODES

Following are some of the important I.S.Codes relevant to this Section:

IS: 3548 - Code of practice for glazing in building.

IS: 1081 - Code of practice' for fixing and glazing metal doors, windows ventilators.

ROLLING STEEL SHUTTERS AND GRILLS

1.00.00 SCOPE

This Section covers the design and supply of materials, fabrication, delivery and erection of Rolling Shutters/Grills with motor drive and/or manual operation including all accessories as hereinafter specified.

2.00.00 INSTALLATION

2.01.00 Components

- a) Slats for rolling shutters shall be made from tested bright cold rolled, annealed M.S. strips, not less than 0.9 mm thick for shutters upto 4.5 M wide and not less than 1.25 mm thick for shutters having width more than 4.5 M, wide and above, machine rolled at 75 mm rolling centers, interlocking with each other. The profile will be such as to prevent excessive deflection under specified wind load.
- b) Rolling grills shall be constructed out of 6mm rods at 35 mm on centers running horizontally flexible connected with vertical links spaced not more than 200 centers. Alternatively, rolling grills shall be made from perforated slats of approved design reinforced with 6mm dia rods.
- c) End locks shall be heavy type M.C.I./C.I. and shall be provided at each end of alternate slats unless specified otherwise.
- d) Bottom bars shall be finished with two angles not less than 6 mm thick for external shutters. When shown on drawings, a flexible weather strip shall be applied to make tight contact with the floor.
- e) Guides shall be of such depth as to retain the shutter under a wind pressure of 100 Kg/Sq.m.
- f) Shafts shall be of steel pipe of sufficient size to carry the tensional load with a maximum deflection of 1/360th of span. Grease packed ball bearings or bushings shall be provided for smooth trouble free operation.
- g) Hoods shall be formed of not less than 20 gauge steel, suitable reinforced to prevent sag.
- h) Locks shall be slide bolt and hasp, or cylinder lock operable from one or both sides. Provision securing hand chain with pad-lock, provision for removable handle for hand cranks etc. shall be made as prescribed by the Engineer.

TITLE:

**TECHNICAL SPECIFICATION FOR
ROLLING STEEL SHUTTERS AND
GRILLS**

SPECIFICATION NO. PE-TS-999-600-C007

VOLUME - II B

SECTION - D

SUB-SECTION – D7

REV.NO. 00

DATE 30/11/2015

SHEET 4

OF 5

- i) Power unit shall be suitable for 3 phase, 50 cycles, 400-volt A.C. power supply and be either floor or wall mounted unit. The motor shall be of sufficient capacity, to move the shutter in either direction at a speed of 0.3 metres per second. In addition to the gear motor each standard power unit shall include a magnetic brake, a reversing starter with built-in overload protection, a geared limit switch and one push button station located inside the building unless otherwise stated in drawing.

It is desirable that the bottom bar of motor operated doors shall be provided with a sensitive edge, electrically connected to stop the travel of the door on meeting an obstruction.

- j) Operating chains shall be of tested quality, heavily galvanized and with all ends rounded to assure smooth operation and hand protection.
- k) Reduction gears shall be high strength grey cast iron, machine moulded from machine out patterns.

2.02.00 Manually Operated Shutters/Grills

Manually operated shutters shall be easily operable by one person. The speed of operation shall be about 1.3 metres per second. In general, manually operated shutters shall be push pull type for opening up to 9 Sq. metre in area. Larger shutters shall, be either chain and gear operated or crank and gear operated. The crank handle shall be removable. All shutters shall be lockable from one or both sides as desired by the Engineer.

2.03.00 Power operated Shutters/Grills

These shall be operable from a push button station conveniently located beside the door. One emergency hand chain/crank operation shall also be provided for use in case of failure of the electric system. Where called for, externally mounted shutters shall be operated by control mechanism located inside the building.

2.04.00 Shop Coat

Shutters shall be painted with one coat of red lead or zinc chromate primer. Where specified, doors shall be galvanized and subsequently painted one coat of zinc chromate for adhesion of field coat.

2.05.00 Erection

Door shall be installed by the manufacturer or his authorized representative and all work shall be as per manufacturer's instructions. Any drilling or cutting

	to concrete, masonry etc. shall be made good after erection of shutters and all abrasion to shop coat shall be touched up. All electrical work shall be in strict accordance with the latest Indian Electricity Rules.	
3.00.00	ACCEPTANCE CRITERIA AND GUARANTEE	
3.01.00	Shop Inspection	
	After completing the manufacture of the different components of the rolling shutter, an arrangement for shop inspection by the Engineer shall be made to check the conformity with approved shop drawings.	
3.02.00	Field Inspection	
	After installing the shutters, the Contractor shall test the performance of the shutter in the presence of the Engineer. The doors shall be smoothly operable under all ambient conditions. All control and locking devices shall give fault free performance.	
3.03.00	Guarantee	
	The Contractor shall give one year's guarantee for the successful operation of the shutters. This shall be supported by a separate and unilateral guarantee from the manufacturer of the shutters.	
4.00.00	I.S. CODE	
	IS: 6248 - Metal rolling shutters and rolling grills.	
5.00.00	RATES AND MEASUREMENT	
5.01.00	Rates	
	Rates for rolling shutters and grill shall include the cost of the locks, guide channels, cost of drive as specified. In case of electrically operated rolling shutters, the rate shall also include the mounting of controls, wire and wiring from the nearest junction box, conduit and other electrical connections and cost of electric motor.	
5.02.00	Measurement	
	Supply and installation of rolling shutter and grill shall be measured in Sqm in net outer to outer (including frame) area of each type used as described in “Schedule of Items”.

MISCELLANEOUS METAL

1.00.00 SCOPE

This section covers supply, fabrication and erection of miscellaneous metal items of light nature in gates, balcony and stair hand rails, structural works, ladders, hangers, masonry anchors, anchor bolts, fasteners, chain link fencing, barbed wire fencing etc. as specified or shown on drawing or as instructed by the Engineer. The above items shall be of fabricated or cast of mild steel, aluminium, brass, cast iron, M.S.& galvanized M.S. sheets, aluminium sheets, expanded metal, wire mesh as shown on drawings or specified.

2.00.00 INSTALLATION

2.01.00 Fabrication/casting

2.01.01 General

All work shall be done according to approved shop drawings. All workmanship shall be equal to the best practice in modern structural or foundry shop.

2.01.02 Shop Connections

- a) All shop connections shall be riveted or welded except when noted otherwise on drawings.
- b) Welding of steel shall be done in accordance with IS: 816.
- c) Welding of aluminium shall be done accordance with IS: 2812, "Arc welding of Aluminium and Alloys." Special care shall be taken to grind smooth all welded surface that shall remain exposed to view. Welds shall be electrically continuous if so required by the Engineer.

2.01.03 Shop Coat

Before leaving the shop, all metal work shall be thoroughly cleaned by effective means of all loose mill seals, rust and foreign matter. Except where encased in concrete, all steelwork shall be given one coat of approved metal protective paint, applied by brush thoroughly and evenly, well worked into joints and other open spaces. All paint shall be applied to dry surfaces. When specified steel work shall be galvanised or painted with a coat of zinc chromate primer. Aluminium surfaces, which shall come in contact with masonry, shall be given one coat of bituminous paint.

VOLUME - II B			
SECTION - D		SUB-SECTION - D8	
REV.NO.	00	DATE	16/12/2017
SHEET	4	OF	9

2.02.00 Erection

2.02.01 Bracing

The Contractor shall provide all necessary temporary guys and braces to ensure alignment and stability of the members and to take care of all loads to which the structure may be subjected, including erection of equipment and operation of the same.

2.02.02 Temporary Bolting-Up

As erection proceeds the Contractor shall plum up and level all members and shall securely bolt up to take care of all dead load, wind load and erection stresses. Wherever erection equipment or other loads are carried by members during erection, proper provision shall be made to take care of the stresses resulting from the same.

2.02.03 Turned Bolt

For field connections where bolting is specified, holes for the turned bolts may be reamed in the field, if required. All drilling or reaming for turned bolts shall be done after the parts to be connected are assembled.

2.02.04 Welding

Where specified on drawings, welding shall be done in accordance with IS: 816 for steel and IS: 2812 for Aluminium & Alloys.

2.02.05 Cutting and Fitting

No cutting of sections, flanges, webs of angles shall be done without the approval of the Engineer. Where indicated on the drawings holes, cuttings, etc. shall be provided as required for installation, to the work by the other Contractors. No additional holes or cuttings, than those shown on drawings, shall be made without the approval of the Engineer.

2.02.06 Drifting

Correction minor misfits and a reasonable amount of reading and cutting of excess stock from rivets may be permitted. For this, light drifting may be allowed to draw holes together. Twist drills shall be used to enlarge as necessary to make connections, reaming that weakness the members or make it impossible to fill the holes properly or to adjust accurately after reaming shall not be allowed.

Any error in shop work which prevents the proper assembling and fitting of

parts by moderate use of drift pins or a moderate amount of reaming and slight chipping and cutting shall immediately be called to the attention of the Engineer and approval of the method of correction obtained. The use of cutting torches to enlarge or alter rivet holes shall not be permitted.

2.02.07 Spot Painting

All field rivets and bolts and also any serious abrasion to shop paint shall be spot painted with the same materials and used for the shop paint or equivalent.

2.02.08 Good

All cutting to concrete or masonry shall be made good to the satisfaction of the Engineer.

2.02.09 Grouting

All bearing plates, loose, lintels and beams, etc. shall be set to proper grade and level by the Contractor and the Engineer's approval obtained before proceeding with the grouting. Grouting shall be done in 1:1½:3 concrete with 6 mm down stone chips or as specified in schedule of items.

2.02.10 Anchor Fasteners

The anchor fasteners shall be of two type viz. light duty for carrying tensile load upto 0.5MT per fasteners and heavy duty for carrying tensile load of 0.5MT to 5.0MT per fasteners. These anchor fasteners shall be fixed into concrete. The Contractor shall submit the Manufacture's literature showing the average pull out and average shear value for anchor of various sizes. Anchors shall be fixed in position strictly as per the manufacturers instructions and as approved by the Engineer.

Heavy Duty Anchor Fasteners

The safe tensile load carrying capacity of the anchors shall be arrived by providing the minimum factor of capacity of 2.5 for the characteristic load of the anchor. Minimum size of anchor shall be M8 (8mm). All anchors shall be from the approved manufacturers like HILTI or equivalent.

- Anchor fasteners shall be supplied and fixed in position by the contractor. Anchor fasteners can be of mechanical bonding or chemical bonding.
- Capacity of the anchor shall be established after considering the effect of concrete grade, embedment depth, concrete thickness, anchor spacing and edge distance from the concrete edge.
- The selection for the particular type of bonding for the anchors shall be made after considering the concrete grade, available embedment depth, load to be transferred, space available for installing anchors.

TITLE:
TECHNICAL SPECIFICATION FOR
MISCELLANEOUS METAL SIDING

SPECIFICATION NO. PE-TS-999-600-C008			
VOLUME - II B			
SECTION - D		SUB-SECTION - D8	
REV.NO.	00	DATE	16/12/2017
SHEET	6	OF	9

- d) The mechanical bonding anchor are torque controlled anchors made from carbon steel of grade 8.8 as per IS:1367 part 3. Anchors in bolt as well as nut version are acceptable. The bolt version anchors consists of bolt washer, sleeves, plastic section, expansion sleeves and a cone. Nuts version anchor consists of nuts, threaded rod, washer, sleeves, plastic section, expansion sleeves and a cone. All steel component of anchor shall be electro galvanised to minimum 5 micron coating thickness. The plastic section shall be of polyacetal Derlin 100 or equivalent.
- e) Chemical bonding anchor shall consist of foil capsule and threaded rod. The foil capsule shall contain the resin and hardener. The threaded rod shall have chiselled tip. The behaviour of anchors under fire shall conform the heating curves as per ISO:834. Anchors of size M8 to M24 shall conform to grade 5.8 and anchors of size M27 to M39 shall conform to grade 8.8 as per IS:1367 part 3. All steel components of the anchors shall be electro-galvanised to minimum 5 micron thickness.

Light Duty Anchors

This anchor shall comprise of stud, nut, washers, expansion sleeve. The one end of the stud shall have thread and the other end shall have cold formed conical head. All steel components of the anchors shall be electro-galvanised to minimum 5 micron thickness. The expansion sleeve shall preferably be of stainless steel of SS316. The anchors shall conform to minimum grade 5.8 as per IS:1367 part 3.

2.02.11 Pipe Joints

MS pipes or GI pipes shall be joined by threaded sockets or by welding. Cast iron pipes shall be socket and spigot joined and caulked with hemp and molten head.

2.03.0 FENCING

2.03.01 Chain Link Fencing

The material requirement shall conform to IS: 2721 latest edition. The chain link fencing shall be woven from 3.15mm dia. wire with mesh size of 50mm. The mesh wire shall not vary from specified dia. by more then ± 0.05 mm. all steel wire shall be hot dipped galvanised wire. The dia shall be measured over the galvanised coating. The line wire shall be 4.0mm dia. mild steel. The stirrup wire for securing the line wire to the intermediate post (RCC/structural steel) shall be 2.5 mm diameter mild steel. The tying wire for securing the chain link fencing to the line wire shall be 1.6mm diameter mild steel. Hair pin chain staples for fastening down the bottom of galvanised chain line fencing to the concrete sill shall be 3.15mm wire. The ends shall be bent outwards for securing anchorage.

TITLE:
TECHNICAL SPECIFICATION FOR
MISCELLANEOUS METAL SIDING

SPECIFICATION NO. PE-TS-999-600-C008			
VOLUME - II B			
SECTION - D		SUB-SECTION - D8	
REV.NO.	00	DATE	16/12/2017
SHEET	7	OF	9

Cleat for eye bolts shall be of uniform size and shall consist of mild steel angle of 75 x 50 x 8 mm. The eye bolts strainer shall consist of bolt with welded eye sufficiently threaded and fitted with a nut and washer. Two-way eye bolt strainer shall have suitable ring nuts fitted after the wires have been strained on one side. Stretcher bar shall consist of mild steel flats 25 x 4.75 mm. They shall be secured to the cleats by steel bolts.

The chain link fencing shall be strained between each pair of straining posts and secured to each straining posts by means of a stretcher bar. One of top line wire shall be threaded through appropriate adjacent row of mesh, care being taken that no meshes in the row are bypassed by the line wire except where deviation is necessary at the straining posts. The second top line wire shall be strained in front of the fencing. The fencing shall be attached to the top and bottom line wire by wire ties spaced at 150mm apart and to the other middle line wire by wire ties spaced at 450mm apart.

The bottom of fencing shall be treated as follows:

Continuous concrete sill 125mm wide x 225mm high for full length between posts shall be cast with the top 25mm above GL and 25mm below the chain link fencing. Hair pin staples shall be threaded through the bottom row of mesh at 750mm c/c and set in the sill to a depth of 150mm.

2.03.02

Barbed Wire Fencing

The barbed wire shall be conform to IS:278 latest edition. The barbed wire shall be galvanised and galvanising shall conform to the requirement laid down for 'light-coated wire' of IS:4826 and it shall be smooth and relatively free of lumps etc. Wire with excessive roughness blisters, salammoniac spots shall be rejected. The barbed wire shall be made from two line wire and two point wire of 2.5 mm thickness each. The barbs shall have four point and shall be formed by twisting two point wires, each two turns, tightly around both or one line wire (Type A - around both line wire, Type B - around one line wire) making altogether four complete turns. The barbs shall be so finished that four points are set and located or locked as far as possible at right angle to each other. The barbs shall have a length of not less than 13mm and not more than 18mm. The distance between two barbs shall be 75 ± 12 mm.

Straining posts shall be provided at all ends and corners of fences or at changes in direction or acute variation in level and at intervals not exceeding 66 M on straight lengths of fence. Intermediate posts shall be spaced at regular intervals not exceeding 3.0m. Struts shall be fitted to all straining posts behind the chain link fabric in the direction of line of fence. There shall be four evenly spaced row of line wire in all. The top line wire shall be doubled, making five line wire in all. The bottom wire shall be closed to the ground. Each line wire shall be strained tightly by means of eyebolts strainers or winders at each straining points. Each line wire shall be secured to each intermediate post by a

SHEET	8	OF	9

wire stirrup passed through a hold in the post and secured to the line wire by three complete turns on each sides of the post. The barbed wire shall be fitted with one dropper at the centre of each bay, secured to the wire so that they could not be bunched together. Droppers for barbed wire shall be of mild steel of not less than 25 x 4.75 mm thick with 38 x 4.85 mm half round staples for fastening the barbed wire to them. Bracing for the rows of barbed wire shall be approved by the Engineer.

3.00.00 ACCEPTANCE CRITERIA

- a) All items shall be correct shape, size, weight etc. shown on drawings and schedule of items.
- b) For installed items, the tolerances shall be as follows
 - i) Permissible deviation from, straightness – 1 in 1000.
 - ii) Seats, stiffener connections etc. shall be as per approved drawings and shall not interfere with architectural clearances.
- c) All castings shall be free from blowholes, cracks, and other blemishes.
- d) All MS wire fencing shall be in true vertical plain, and shall not bulge.

4.00.00 IS CODES

IS:278	Specification for Galvanised Steel Barbed wire for fencing.
IS:816	Code of practice for use of Metal Arc welding for general construction in mild steel.
IS:1367	Industrial Fasteners – Threaded steel fasteners - Technical supply condition.
IS:2721	Specification for Galvanised Steel Chain Link fence fabric.
IS:2812	Arc welding of Aluminum and Alloy

5.00.00 RATES AND MEASUREMENTS

5.01.0 Rates

Rates shall include supply, fabrication and installation for misc. metals works as required for completion of works like gates, fencing, handrails, ladders, hangers, anchors etc., unless otherwise specified in Schedule of Items. Rate for fencing shall also include excavation, concreting and supply, erection

MASONRY AND ALLIED WORKS

1.00.00 SCOPE

This section covers furnishing, installation including handling, transporting, batching, mixing, laying scaffolding, centering, shuttering, finishing, curing, protection, maintenance and repair of common building materials till handing over of masonry and allied works for use in structures and locations covered under the scope of this package.

2.00.00 MATERIALS

a) Brick

Bricks for general masonry work shall be of class designation 7.5 of nominal dimensions as per standard specification under IS: 1077, well burnt, of uniform size, shape and colour, free from cracks, flaws or modules of free lime and emit clear ringing sound when struck. Fractured surface shall show uniform texture free from grits, lumps holes etc. Water absorption after 24 hours immersion shall not exceed 20% by weight for bricks. Dimensional tolerance shall not exceed 8% of the size shown in drawings for bricks. All bricks shall have rectangular faces and sharp straight edges. The bricks shall show no efflorescence after soaking in water and drying in shade.

Each brick shall have the manufacturer's identification marks clearly marked on the frog. Representative samples shall be submitted and approved samples shall be retained by the Engineer for further comparisons and reference. Any brick not found up to the specification shall be removed immediately from site at the Contractor's own cost.

Bricks shall not be dumped at site. They shall be stacked in regular tiers, even as they are unloaded; to minimize breakage and defacement of bricks. Bricks selected for different situation of use in the work shall be stacked separately.

b) Stone

All stones shall be obtained from approved quarries, hard, tough, durable compact grained, uniform in texture and colour and free from decay, flaws, veins, cracks and sand holes. The surface of a freshly broken stone shall be bright, clean, and sharp and shall show uniformity of texture, without

loose grains and free from any dull, chalky, or earthy appearance. Stone showing mottled colours shall not be used for face work. A stone shall not absorb more than 5 per cent of its weight of water after 24 hours immersion. The type of stone shall be as specified on drawings and/or instructed by the Engineer. Samples shall be submitted by the Contractor and approved samples shall be retained by the Engineer for comparison of bulk supply.

c) Cement

Cement used shall be Ordinarily Portland Cement or Portland Slag Cement or Portland Pozzolana Cement conforming to IS Codes and shall be fresh when delivered. In special cases, Rapid Hardening Portland Cement, Low Heat Cement etc. may be permitted or directed to be used by the Engineer. The Contractor shall submit the manufacturer's certificate for each consignment of cement procured to the Engineer. If at any time, the Engineer feels that the cement being used by the Contractor is not up to specification, he may stop the work and send the samples of the cement to a testing laboratory for standard tests and all expenses incurred thus shall be borne by the Contractor. The Contractor shall also have no claim for this type of suspension of work.

The cement shall be stored above the ground level in perfectly dry and watertight sheds. The bags shall be stacked in a manner so as to facilitate removal or first in first out basis. Any material considered defective by the Engineer shall not be used by the Contractor and shall be removed from the site immediately.

d) Coarse Aggregate

Coarse aggregates shall be as per IS: 383 latest editions, consisting of hard, strong and durable pieces of crushed stone and shall be free from organic or clay coatings and other impurities like disintegrated stones, soft flaky particles etc. and any other material liable to affect the strength, durability or appearance of concrete.

Aggregates other than crushed stone conforming to the provisions of specification may be used if permitted by the Engineer.

Washing of aggregates by approved means shall be carried out, if desired by the Engineer.

Grading of coarse aggregates shall generally conform to IS: 383 and shall be such as to produce a dense concrete or the specified proportions and strength and of consistence that will work readily into position without

segregation.

Aggregates shall be stored on brick soling or an equivalent platform so that they do not come in contact with dirt, clay, grass, or any other injurious substances at any stage.

Aggregate of different size shall be kept in separate stacks. If so desired by the Engineer aggregate from different sources shall be stacked separately with proper care to prevent intermixing.

e) Sand

Sand shall be hard, durable, clean, and free from adherent coatings or organic matter and shall not contain clay balls or pellets. The sand shall be free from impurities such as iron pyrites, alkalis, salts, coal, mica, shale or other laminated materials in such forms or quantities as to affect adversely the hardening, strength, durability or appearance of mortar, plaster or concrete or to cause corrosion to any metal in contact with such mortar, plaster or concrete. All sand shall be properly graded and shall be as per relevant IS Code. Sand for concrete shall conform to IS: 383.

f) Water

Water shall be clean, fresh and free from organic matters, acids or soluble salts and other deleterious substances which may cause corrosion, discoloration, efflorescence etc.

g) Reinforcement

Reinforcement steel shall be clean and free from loose mill scales, dust, loose rust, oil and grease or other coatings, which may impair proper bond. Structural steel shall conform to IS: 2062. Mild steel and medium tensile steel bars and hard-drawn steel wire for concrete reinforcement shall conform to IS: 432. Cold twisted steel bars shall conform to IS: 1786. Hand drawn steel wire fabric shall conform to IS: 1566. Hexagonal wire netting shall conform to IS: 3150. All steel bars including and above 10 mm diameter shall be of tested quality. All wire netting shall be galvanized.

Reinforcement bars shall be stored off the ground and under cover if so desired by the Engineer. If necessary, a coat of cement wash shall be given to the bars to guard against rusting.

3.00.00 INSTALLATION

3:01.00 Soling

3.01.01 Brick Soling

TECHNICAL SPECIFICATION FOR MASONRY AND ALLIED WORKS

SPECIFICATION NO. PE-TS-999-600-C009

VOLUME - II B

SECTION - D SUB SECTION - D9

REV.NO. 0 DATE : 30/11/2015

SHEET 6 OF 12

The ground shall be dressed, consolidated by ramming, or by light rolling and a 12 mm thick cushion of sand laid. On the sand cushion the bricks shall be laid with fine joints and placed firmly in position by hammering with wooden mallet. The surface shall be free from undulations. The 'frog' side shall be on the underside. The joints shall be broken the in all direction and bricks cut as required. The pattern of laying and number of layers shall be as per Schedule of item. Orientation shall be as desired by the Engineer. After laying of each layer of bricks sand shall be spread over and worked into the joints to pack the bricks tight.

3.01.02 Stone Soling

The stones for soling shall be selected on the basis of thickness of soling specified in the Schedule of Items. The larger stones shall be laid and the gaps filled by smaller stones. The interstices shall then be firmly packed with sand by flooding with water.

3.02.00 Brick-on-Edge

Excavation shall be done close to the brick dimensions and in perfect alignment. Bricks shall be firmly placed by hammering with wooden mallets and sides and joints packed firmly with earth so that the edging is not disturbed easily. Alignment and level shall be acceptable to the Engineer.

3.03.00 Masonry

3.03.01 General

All masonry work shall be true to lines and levels as shown on drawings. All masonry shall be tightly built against structural members and bonded with dowels, inserts etc. as shown on drawings.

3.03.02 Cement Mortar

Cement mortar shall be prepared with materials specified in clause 2.00.00. Sand for masonry mortar shall conform to IS: 2116. Cement and sand in the specified proportion shall be mixed dry thoroughly and minimum water added to attain required workability.

Surplus mortar droppings from masonry, if received on surface free from dirt may be mixed with fresh mortar if permitted by the Engineer who may direct addition of additional cement without any extra payment. No mortar, which has stood for more than half an hour, shall be used.

3.03.03

Brick Masonry

Bricks shall be soaked by submergence in clean water for at least two hours in approved vats before use. Bricks shall be laid in English bond unless specified otherwise. Broken bricks shall not be used. Cut bricks shall be used if necessary to complete bond or as closers. Bricks shall be laid with frogs upwards over full mortar beds. Bricks shall be pressed into mortar and tapped into final position so as to embed fully in mortar. Inside faces shall be buttered with mortar before the next bricks is placed and pressed against it. Thus all joints between bricks shall be fully filled with mortar.

Mortar joints shall be kept uniformly 10 mm thick. All joints on face shall be raked to minimum 10 mm depth using raking tool while the mortar is still green to provide bond for plaster or pointing.

Where plaster or pointing is not provided, the joints shall be struck flush and finished immediately. Brickworks two bricks thick or more shall have both faces in true plane. Brickwork of lesser thickness shall have one selected face in true plane.

3.03.04

Exposed Brickwork

Brickwork in superstructures, which is not covered by plaster, shall be as shown on drawing and executed by specially skilled mason. Courses shall be truly horizontal and vertical joints truly vertical. Wooden straight edges with brick course graduations and position of window sills and lintels shall be used to control uniformity of brick courses. Masons must check workmanship frequently with plumb, spirit level, rule, and string. All brickwork shall be cleaned at the end of days work. If face bricks are specified, the brickwork shall be in composite bricks, with face bricks on the exposed face and balance in routine bricks, but maintaining the bond fully. Where face bricks are not specified, bricks for the exposed face shall be specially selected from routine bricks. All exposed brickwork on completion of work shall be rubbed down, washed clean, and pointed as specified. Where face bricks are used carborandum stone shall be used for rubbing down.

3.03.05

Reinforced Brickworks

Reinforcements shall be as specified. All reinforcements shall be thoroughly cleaned and fully embedded in mortar. Where M.S. bars are used as reinforcement, these shall be lapped with dowels if left in R.C. columns or welded to steel stanchions.

3.03.06 Stone Masonry

Stones shall be thoroughly soaked before laying. Stones shall be laid on their natural quarry beds. Individual stones shall be fitted with mallet and properly wedged to reduce thickness of mortar joints. Thickness of joint shall be not less than 8 mm and not greater than 25 mm. At least two stones shall run the full width of the wall for every square meter of surface area.

3.03.07 Exposed Stone work

Stonework, which is to be kept exposed, shall be as shown on approved drawing. It shall be executed by specially skilled mason. Stones used for exposed face shall be specially selected. All exposed stone faces shall be kept clean and free from mortar and pointed up neatly as the work proceeds in a manner called for in the drawings or instructions. A sample wall, 10 Sq.M. area shall be built and approved by the Engineer and all works shall match with this sample.

3.03.08 Composite Masonry

Where stonework facing with brick masonry backing is specified the bond between them shall be achieved by bond stones of dimensions and frequency as desired by the Engineer.

3.03.09 Expansion & Separation Joints

Location of joints shall strictly be as shown on drawings or as instructed by the Engineer. Expansion joints shall be as shown on drawings and specified. Expansion joint filler boards and sealing strips shall have minimum transverse joints. Transverse joints shall meet the approval of the Engineer.

Separation joints shall be with standard waterproof paper or with alkathene sheets about 1 mm in thickness. Length and sealing of laps shall be to the satisfaction of the Engineer.

3.03.10 Mouldings, Cornices, Drip Course

These shall be made as shown in drawings. Bricks or stone shall be cut and

dressed as required. If no subsequent finish is envisaged, these shall be rubbed to correct profile with Carborundum stone.

3.03.11 Curing

Masonry shall be cured by keeping it wet for seven days from the date of laying. In dry weather at the end of days work top surface of masonry shall be kept wet by ponding.

3.03.12 Embedding of fixtures

All fixtures shall generally be embedded in mortar and masonry units shall be cut as required.

3.03.13 Encasing of Structural Steel

This shall be done by building masonry work round flanges, webs etc., and filling the gap between steel and masonry by minimum 12 mm thick mortar. Encased members shall be wrapped with chicken wire mesh when shown on drawings or instructed by the Engineer. The minimum lap in chicken wire mesh shall be 50 mm.

3.04.00 Damp Proof Course (DPC)

Unless otherwise specified Damp-proof course shall be 40 mm thick 'artificial stone' in proportion 1:1½:3 cement sand stone-chips (10 mm down) with admixture of a waterproofing compound as approved by the Engineer. The percentage of admixture shall be as per manufacturer's specifications but not less than 2% by weight of cement. The top surface shall be double chequered and cured by ponding for seven days.

3.05.00 Damp Proof Membrane

Damp proof treatment using fibre or hessian base bitumen felt shall be 6, 8 or 10 course treatment as specified in IS: 1609. The number of courses shall be as shown as drawings or as specified. Sequence of work shall be as directed by the Engineer. Extreme care shall be taken to prevent damage to felt during and after laying. The Contractor shall be obliged, at his own expense, to rectify any leakage appearing within 5 years of installation by removing and renewing the coats at the point of leakage.

Where shown on drawing, damp proof membrane with one layer bitumen paper or one layer alkathene sheet shall be laid with minimum 150 mm lap under slabs on grade.

3.05.00

Plinth Protection

Plinth of buildings shall be protected with brick-on-edge paving of minimum 750mm width unless otherwise shown on the drawings. The treatment shall consist of laying bricks in cement mortar 1:6 (1 cement: 6 sand) over a 75mm thick bed of dry graded brick aggregate, 40mm nominal size, grouted with sand. The top shall be finished with 1:2 cement mortar pointing (1 cement: 2 sand). Plinth protection shall be laid with a minimum outward slope of 1 in 50. The brick aggregate shall be well graded, broken from well burnt or slightly overburnt and dense brickbats. It shall be homogeneous in texture, roughly cubical in shape, clean and free from dirt or any other foreign matter.

The ground shall first be prepared to the required slope around the building. The high portions of the ground should be cut down; hollows and depressions filled up to the required level from the excavated earth and rammed so as to give uniform outward slope. The bed shall be watered and rammed with heavy iron square rammers. Surplus earth, if any, shall be disposed off beyond a lead of 50m or as directed by the Engineer.

Over this, 75mm thick bed of aggregate of 40mm nominal size, shall be laid with a minimum outward slope of 1 in 50. Aggregates shall be carefully laid and packed, bigger sized being placed at the bottom. The brick aggregates shall be consolidated dry with heavy iron rammers.

The aggregates shall then be grouted evenly with sand at the rate of 0.6 cubic metre per square metre area, adequately watered to ensure filling of voids by sand and again rammed with heavy iron rammers. The finished surface shall give uniform appearance. After the subgrade has been compacted thoroughly, brick flooring with bricks of specified strength in cement mortar 1:6 (1 cement: 6 sand) shall be laid.

The bricks shall be laid on edge in Diagonal/Herring Bone Bond or other pattern as specified or as directed by the Engineer. Bricks shall be laid on 12mm thick mortar bed and each brick shall be properly bedded and set home by gentle tapping with handle of trowel or wooden mallet. Its inside face shall be buttered with mortar before the next brick is laid and pressed against it. On completion of the portion of flooring, the vertical joints shall be fully filled from the top with mortar. The surface shall present a true plain surface with the required slope.

The pointing shall be done in cement mortar 1:2 (1 cement: 2 sand). The mortar shall be pressed into the joints and shall be finished off flush and level with the edges of the bricks so as to give a smooth appearance. The edges shall be neatly trimmed with a trowel and a straight edge. The mortar shall not spread over surface of the masonry.

TECHNICAL SPECIFICATION FOR MASONRY AND ALLIED WORKS

SPECIFICATION NO. PE-TS-999-600-C009

VOLUME - II B

SECTION - D SUB SECTION - D9

REV.NO. 0 DATE : 30/11/2015

SHEET 11 OF 12

Brick flooring & pointing shall be kept wet for a minimum period of seven days. These shall be protected from rain by suitable covering when the mortar is green.

4.00.00 I.S. CODES

Some of the important relevant codes for this section are:

- IS: 1127: Recommendations for dimensions and workmanship of natural building stones for masonry work.
- IS: 1597: Code of Practice for Construction of stone Masonry.
- IS: 1609: Code of Practice for laying Damp proof treatment using bitumen felts.
- IS: 2212: Code of Practice for Brickwork.
- IS: 2250: Code of Practice for preparation and use of masonry Mortar.
- IS: 5134: Bitumen Impregnated Paper & Board.

5.00.00 RATES AND MEASUREMENTS

5.01.00 Rates

Unit rate for masonry work shall include the following:

- a) Raking out joints for plastering or pointing or finishing the joint flush as the work proceeds.
- b) Preparing top sand sides of existing wall for joining old with new work.
- c) Providing, dismantling and removing the scaffolding.

Unit rate for DPC shall be inclusive of formwork and bitumen painting.

5.02.00 Measurement

Brickwork in wall of half brick thickness shall be measured separately in Sqm stating the wall thickness and more than half brick thickness shall be measured by volume. Plaster thickness shall not be considered for computation of volume.

TECHNICAL SPECIFICATION FOR MASONRY AND ALLIED WORKS

SPECIFICATION NO. PE-TS-999-600-C009

VOLUME - II B

SECTION - D SUB SECTION - D9

REV.NO. 0 DATE : 30/11/2015

SHEET 12 OF 12

Masonry work in sub structure and super structure shall be measured separately, unless otherwise specified in the Schedule of items.

No deductions shall be made and no extra payment shall be made for following:

- a) Opening upto 0.1 Sqm each in area. In calculating the area of the opening lintels or sills shall be included along with the size of the opening.
- b) Drainage holes and recesses for cement blocks to embed holdfasts for doors, windows etc.
- c) Pipe and fixtures upto 300mm dia. and nothing extra shall be paid for the mortar used for fixing.
- d) Ends of dissimilar materials (i.e. joists, beams, lintels, posts, girders, rafters, purlins, trusses, corbels, steps, etc); up to 0.1 sqm in section;
- e) Chases of section not exceeding 50 cm in girth;
- f) Iron fixtures, such as wall ties and hold fasts for doors and windows;
- g) Cement concrete blocks as for hold fasts and holding down bolts;
- h) Wall plates, bed plaros, and bearing of slabs, CHAJJAS and the like, where thickness does not exceed 10 cm and bearing does not extend over the full thickness of wall;

Reinforcement in masonry work shall be paid separately under respective items.

Damp proof course shall be measured in Sqm. No deduction shall be made and no extra shall be paid for opening upto 0.1 Sqm in area.

Plinth protection shall be measured under respective item of works executed required for completion of the work as specified.

FINISH TO MASONRY AND CONCRETE

1.00.00 SCOPE

This Section covers finishing, installation, repairing, finishing, curing, testing, protection, maintenance till handing over of finishing items for masonry and concrete. This shall also include the work to be done to make the surface suitable for receiving the finishing treatment.

Before commencing finishing items the Contractor shall obtain the approval of the Engineer regarding the scheduling of work to minimize damage by other trades. He shall also undertake normal precaution to prevent damage or disfiguration to work of other trades or other installation.

2.00.01 INSTALLATION

2.01.00 Preparation of Surface

All joints in masonry walls shall be raked out to a depth of at least 10 mm with a hooked tool made for the purpose while the mortar is still green. Walls shall be rushed down with stiff wire brush to remove all loose dust from joints and thoroughly, washed with water. All laitance shall be removed from concrete to be plastered.

For all types of flooring, skirting and dado work, the base cement concrete slab or masonry surface shall be roughened by chipping and cleaned of all dirt, grease or loose particles by hard brush and water. The surface shall be thoroughly moist to prevent absorption of water from the base course. Any excess of water shall be mopped up.

At any point, the level of base shall be lower than the theoretical finished floor level by the thickness of floor finish. Any chipping or filling to be done to bring the base in the required level shall be brought to the notice of the Engineer and his approval shall be taken regarding the method and extent of rectification work required.

Prior to commencement of actual finishing work, the approval of the Engineer shall be taken as to the acceptability of the base.

2.02.00 PLASTERING

2.02.01 Mortar

Mortar for plastering shall be as specified.

For sand cement plaster, sand and cement in the specified proportion shall be

mixed dry, on a watertight platform and minimum water added to achieve working consistency. The sand for plaster shall conform to IS: 1542.

No plaster, which has stood for more than half an hour, shall be used; plaster that shows tendency to become dry before this time shall have water added to it.

2.02.02 Application of Plaster

Plaster, when more than 12 mm thick, shall be applied in two coats a base coat followed by the finishing coat. Thickness of the base coat shall be sufficient to fill up all unevenness in the surface; no single coat, however, shall exceed 12 mm in thickness. The lower coat shall be thicker than the upper coat; the overall thickness of the coats shall not be less than the minimum thickness shown on the drawings. The undercoat shall be allowed to dry and shrink before applying the second coat of plaster. The undercoat shall be scratched or roughened before it is fully hardened to form a mechanical key. The method of application shall be 'thrown on' rather than 'applied by trowel'.

To ensure even thickness and true surface, patches of plaster about 100 mm to 150 mm square or wooden screed 75 mm wide and of the thickness of the plaster, shall be fixed vertically about 2000 mm to 3000 mm apart, to act as gauges. The finished wall surface shall be true to plumb, and the Contractor shall, without any extra cost to the Owner, make up any irregularity in the brickwork with plaster.

All vertical edges of brick pillars, doorjambs etc. shall be chamfered or rounded off as directed by the Engineer. All drips, grooves, mouldings and cornices as shown on drawing or instructed by the Engineer shall be done with special care to maintain true lines, levels and profiles. After the plastering work is completed, all debris shall be removed and the area left clean. Any plastering that is damaged shall be repaired and left in good condition at the completion of the job.

2.02.03 Finish

Generally, the standard finish shall be used unless otherwise Shown on drawing or directed by the engineer. Wherever any special treatment to the plastered surface is indicated, the work shall be done exactly as shown on the drawings, to the entire satisfaction of the engineer regarding the texture, color and finish.

a) Standard Finish

Wherever punning is indicated, the interior plaster shall be finished rough; otherwise the interior plaster shall generally be finished to a smooth surface.

The exterior surface shall generally be finished with a wooden float.

b) Neat Cement Finish

Immediately after achieving a true plastered surface with the help of a wooden straight edge, the entire area shall be uniformly treated with a paste of neat cement at the rate of one (1) kg. per Sq.M. and rubbed smooth with a trowel.

c) Coloured Plaster Finish

This shall be done in the same way as specified in Clause 2.02.02 but using Coloured cement in place of ordinary cement. When coloured plastering is specified in more than one coat, the topcoat only shall be made with coloured cement.

Coloured cement shall be either ready mixed material or may be obtained by mixing pigments and cement at site, as approved by the Engineer. The pigments to be mixed with cement shall conform to Appendix-A of IS: 2114 latest editions.

Samples of colouring material shall be submitted to the engineer for approval and material procured, shall conform in all respects to the approved samples, which shall remain with the Engineer. All coloured cement and/or pigments shall be stored in an approved manner in order to prevent deteriorations.

d) Pebble-dash Finish

Mortar of required thickness consisting of 1 part cement and 4 parts sand by volume shall be applied in the usual manner as described under plastering Clause 2.02.02. While the mortar is still plastic small pebbles or crushed stone of size generally from 10mm to 20mm as approved by the Engineer shall be thrown on the plastered surface. The aggregate shall be lightly tapped into the mortar with a wood float or the flat end of oil a trowel, in order to ensure satisfactory bond between the dashing and the mortar.

e) Rough-cast Finish

A wet plastic mix of 3 parts coloured cement 6 parts sand and 4 parts aggregate by volume (gravel or crushed stone of size from 6 mm to 12 as approved by the Engineer) shall be thrown on to the wall by means of a plaster's trowel and left in the rough condition.

f) Scraped Finish

Ordinary plaster as described under Clause 2.02.02 after being leveled and allowed to stiffen for a few hours, shall be scraped with a steel straight edge to remove the surface skin. The pattern shall be as approved by the Engineer.

g) Textured Finish

Mortar consisting of 1 part cement and 3 parts sand by volume shall be applied in a manner as specified under “Plastering” Clause 2.2.2 Ornamental treatments in the form of horizontal or vertical rib texture fan texture etc. shall be applied by means of suitable tools to the freshly applied plastered surface, as approved by the Engineer.

h) Sand Faced Plaster

The plaster shall be applied in 2 coats. The first coat or the scratch coat should be approximately 14mm and shall be continuously carried out without break to the full length of wall or natural breaking points such as doors, windows, etc. The scratch coat shall be dashed on the prepared surface with heavy pressure, brought to true and even surface and then lightly roughened by cross scratch lines, to provide bond for the finishing coat. The mortar proportion for this scratch coat shall be as specified in the respective item or work. The scratch coat shall be cured for at least 7 days & then allowed to dry. The second coat shall be 6mm thick and it shall not be applied until at least 10 days have elapsed after the application of scratch coat. Before application of the second coat, the scratch coat shall be evenly damped. This coat shall be applied from top to bottom in one operation & without joints; finish shall be straight, true, & even. The mortar of this coat shall be as specified under the respective item of work. White sand for finish shall be used for the second coat & for finishing work. Sand for finish shall be of even coarse size & shall be dashed on the surface & sponged.

2.02.04

Curing

All plastered surfaces after laying shall be watered, for a minimum period of seven days, by an approved method, and shall be protected from excessive heat and sunlight by suitable approved means. Moistening shall commence, as soon as the plaster has hardened sufficiently and not susceptible to damage. Each individual coat of plaster shall be kept damp continuously, for at least two days, and then dried thoroughly, before applying the next coat.

2.03.00

Pointing to masonry

All Joints of brickwork shall be raked out to a depth of 10 mm with a hooked tool made for the purpose while the mortar is still green. The brickwork shall

then be brushed down with a stiff wire brush, so as to remove all loose dust from the joints and thoroughly washed with water. Mortar consisting of 1 part cement and 3 parts clean, sharp, well graded sand by volume shall be pressed carefully into the joints and finishes with suitably tools to shape as shown on the drawings. Any surplus mortar shall be scalped off the wall face leaving the surface clean.

The pointed surface shall be kept wet for at least three days for curing.

2.04.00 Plaster with Metal Lath

The supports, hangers, brackets, cleats etc. shall be as shown on drawings and/or as approved by the Engineer. These shall have a coat of prime paint before and another coat of approved paint after erection.

The metal lath shall be expanded metal, with 12 mm x 38 mm mesh, 16 thick and 3 mm wide strands. Side laps shall be minimum 12 mm and end laps 25 mm minimum. The plastering shall be minimum 20 mm thick measured from the back of lath and applied in two-layers. The mortar for plastering shall consist of 1 part cement and 4 parts sand by volume mixed as specified in plastering, Clause 2.02.01. The application, finish etc. shall be as specified under relevant clause above. Where called for a 2 mm Plaster of Paris punting shall be applied over plaster as a finishing coat to give perfectly smooth and even finish.

2.05.00 Lime Punning

For plastered surfaces, where an even smooth surface is specified, lime punning with 5 parts of shell lime properly slaked, strained and aged, mixed with 1 part clean, washed, sieved, fine sand by volume shall be done. The thickness of lime punning shall be not less than 2 mm and more than 3 mm. The plastered surface shall be saturated with water before application of the lime punning. The punting shall be applied by skilled workman and given a smooth and even finish free from undulations, cracks etc. and to the satisfaction of the Engineer.

2.06.00 Plaster of Paris Punning

Plastered surfaces, where specified shall be finished with Plaster-of-Paris punning. The material shall be from approved manufacturers and approved by the Engineer. The thickness of the punning shall be 2 mm and shall be applied by skilled workmen. The finish shall be smooth, even and free from undulation, cracks etc.

Before bulk work is taken in hand, a sample of punning shall be done on roughly 10 Sq.M. areas and approval of the Engineer taken. The work shall

then be taken in hand as per approved sample.

2.07.00

Stone Facing

Stone facing where specified shall be done as shown on design drawings and approved shop drawings. The stone shall be as specified on drawings. Samples of stone shall be submitted to the Engineer for approval and then bulk purchase made. The Contractor shall submit three copies of shop drawings for the Engineer's approval before commencing the work.

The thickness of facing stone shall be not less than 25 mm unless otherwise specified on drawings.

The stone slabs shall be cut and finished to sizes as per pattern shown on drawings. They shall be fastened to wall with suitable non-corrodible anchorage as approved by the Engineer. Where mild steel clamps, stays etc. are used for anchorage, they shall be galvanized (weight of zinc coating shall not be less than 700 gms per square meter of surface) to prevent rust stains developing on the finished surface. There shall be at least 12 mm gap between the stone and masonry, which shall be filled up and packed by a mortar of 1 part cement and 3 parts of sand by volume. After the mortar is set and cured for at least four days, the exposed surface shall be rubbed and polished as approved by the Engineer.

The completed surface shall be neat, or uniform texture and acceptable to the Engineer.

Where pointing is specified on drawings it shall be done by mortar as specified on drawings.

3.00.00

ACCEPTANCE CRITERIA

Finish to masonry and concrete shall fully comply with the Specifications, approved samples and instructions of the Engineer with respect to lines, levels, thickness, colour, texture, pattern and any other special criteria as mentioned in the body of the specification or as shown on drawings.

4.00.00

I.S. CODE

All work shall be carried out as per this specification and shall conform to the latest revision and/or replacements of the following or any other Indian Standard (IS) Codes, unless specified otherwise. In case any particular aspect of work is not specifically covered by Indian Standard Codes, any other standard practice, as may be specified by the Engineer, shall be followed.

VOLUME - II B			
SECTION - D		SUB SECTION - D10	
REV.NO.	0	DATE : 30/11/2015	
SHEET	9	OF	9

IS: 1661: Code practice for cement and cement-lime plaster finish on wall & ceilings.

IS: 4101: code of practice for external facings and veneers.

5.00.00 RATES AND MEASUREMENT

5.01.00 Rates

Rates shall also include providing, dismantling and removing of scaffolding, surface preparation, curing and all type of surface, shapes/ profiles and at all elevations.

5.02.00 Measurement

All plastering shall be measured net (on surface area on which it is applied) in Sqm. Plaster work shall be classified according to the type used and shall be measured separately. Plaster on ceiling and walls shall be measured separately. Soffits of stairs shall measured as plastering on ceiling.

No deduction shall be made for opening not exceeding 0.5 Sqm and for ends of beams, joints, etc. also no payment shall be made for reveals, jams, soffits, sills of these openings.

50% deduction shall be made for opening exceeding 0.5 Sqm but not exceeding 3.0 Sqm each and no addition shall be made for reveals, jams, soffits, sills etc.

In case of opening exceeding 3.0 Sqm each, deduction shall be made for opening but jams, soffits, and reveals shall be measured and paid for.

PAINTING, WHITE WASHING, POLISHING, ETC.

1.00.00 SCOPE

This section covers painting, white washing, varnishing, polishing etc. of both interior and exterior surfaces of wood work, masonry, concrete plastering, plaster of paris, false ceiling, structural and other miscellaneous steel items, rain water down comer, floor and roof drains, soil, waste and service water pipes, and other ferrous and non-ferrous metal items.

Copper, bronze, chromium plate, Nickel, stainless steel and aluminium shall generally not be painted or finished except if otherwise specified.

Before commencing painting, the Contractor shall obtain the approval of the Engineer in writing regarding the schedule of work to minimize damage; disfiguration or staining to work of other trades or other installations.

2.00.00 INSTALLATION

2.00.01 Materials

Materials shall be highest grade products or well-known approved manufacture and shall be delivered to the site in original sealed containers, bearing brand name, manufacturer's name and colour shade, with labels intact and seals unbroken. All materials shall be subject to inspection, analysis and approved by the Engineer. It is desired that materials of one manufacturer only shall be used as far as possible and paint of one shade is obtained from the same manufacturing batch. Each and every supply of primer, finish paint etc. shall be accompanied by manufacturer's test certificate. All paint shall be subject to analysis from random samples taken at site from painters bucket, if so desired by the Engineer.

All prime coats shall be compatible to the material of the surface to be finished as well as to the finished coats to be applied.

All unspecified materials such as snellac, turpentine or linseed oil shall be of the highest quality available and shall conform to the latest IS standards. All such materials shall be made by reputable recognized manufacturers and shall be approved by the Engineer.

All colours shall be as per painting schedule and tinting and matching shall be done to the satisfaction of the Engineer. In such cases, where samples are required, they shall be executed in advance with the specified materials for the approval of the Engineer.

VOLUME - II B			
SECTION - D		SUB-SECTION – D11	
REV.NO.	00	DATE	30/11/2015
SHEET	4	OF	14

a) White Wash/Colour Wash

Shall be done from pure shell lime or fat lime, or a mixture of both as instructed by the engineer, and shall conform to IS: 712 latest editions. Samples of lime shall be submitted to the Engineer for approval, and lime as per approved sample shall be brought to site in unslaked condition. After slaking, it shall be allowed to remain in a tank for two days and then stirred up with a pole, until it attains the consistency of thin cream. 100 grams of gum to 6 liters of white wash water and a little of indigo or synthetic ultramarine blue shall be added to the lime. Mineral colour not affected by lime shall be added to white wash to get the required tint/shade approved by the Engineer.

b) Dry distemper

Shall be made from suitable pigments, extenders, lime proof tinters, water-soluble binders etc. and shall conform to IS: 427. The distemper shall be diluted with prescribed thinner in a manner recommended by the manufacturer. Only sufficient quantity of distemper required for a day's work shall be prepared.

c) Oil Bound Washable Distemper

Shall be of oil emulsion type containing suitable preservatives and shall conform to IS: 428. The distemper shall be diluted with prescribed thinner in a manner recommended by the manufacturer. Only sufficient quantity of distemper required for a day's work shall be prepared.

d) Waterproof Cement Paint

Shall be made from best quality white cement and lime resistant colours with accelerators, waterproofing agents and fungicides. The paint shall conform to IS: 5410.

e) Acrylic Emulsion Paint

Shall be water-based acrylic copolymer emulsion with rutile titanium dioxide and other selected pigments and fungicide conforming to IS: 5411 (Part-1). It shall exhibit excellent adhesion to plaster and cement surface and shall resist deterioration by alkali salts. The paint film shall allow the moisture in wall to escape without peeling or blistering. The paint, after it is dried, shall be able to withstand washing with mild soap and water without any deterioration in colour, or without showing flaking, blistering, or peeling.

TITLE:
TECHNICAL SPECIFICATION FOR
PAINTING, WHITEWASHING,
POLISHING

SPECIFICATION NO. PE-TS-999-600-C011			
VOLUME - II B			
SECTION - D		SUB-SECTION - D11

SHEET	5	OF	14

f) Synthetic Enamel Paint

Shall be made from synthetic resins and drying oil with rutile titanium dioxide and other selected pigments to give a smooth, hard, durable and glossy finish to all exterior and resist interior surfaces. White and pastel shades shall not yellowing and darkening with aging. The paint shall conform to IS: 2932 and IS: 2933.

g) Aluminium Paint

Shall be in two pack containers and shall resist weathering. The paint shall conform to IS: 2339.

h) Varnishing

Shall be best quality alkyd varnish suitable for brushing over the tint of paint or light natural wood and shall not darken or yellow with age.

i) French Polish

Shall be made from best quality shellac, denatured spirit and other suitable alcohol soluble ingredients and made by a well known approved manufacturer. The material shall conform to IS: 348.

French polish shall not be used on bare wood it shall only be used as finishing coat on wood after the woods pretreated with a liquid wood filler conforming to IS: 345 is applied and rubbed out.

j) Bitumen paint (black bituminous anti-corrosive paint)

Bitumen based anti-corrosive paint conforming to IS: 158 shall be used.

2.00.02

Storage

The Contractor shall arrange for safe and proper storage of all materials and tools. The storage space if allotted within the building shall be adequately protected from damage, disfigurement, & stains. Paint shall be kept covered at all times and mixing shall be done in suitable containers. All necessary precautions shall be taken by the contractor to prevent fire.

2.01.00

Preparation of surface

Before starting the work the Contractor shall obtain the approval of the Engineer regarding the soundness & readiness of the surface to be painted on.

TITLE:
TECHNICAL SPECIFICATION FOR
PAINTING, WHITEWASHING,
POLISHING

SPECIFICATION NO. PE-TS-999-600-C011			
VOLUME - II B			
SECTION - D		SUB-SECTION - D11	
REV.NO.	00	DATE	30/11/2015
SHEET	6	OF	14

2.01.02 Wood

All surfaces shall be free from, dirt and loose or peeling paints. The surface shall be rubbed down smooth. All nails & screws shall be sunk below the surface and filled with putty after applying an under coat. Small knots that do not justify cutting and sap streaks shall be covered with minimum 2 coats of pure shellace coating applied thinly & extended 25 mm beyond the area. All large, loose, or resinous knots shall be removed and filled with sound wood. All work shall be done as per IS: 2338.

2.01.02 Masonry, Concrete, and Plastered Surface

Surface shall be free from all oil, grease, efflorescence, mildew, loose paint, or other foreign and loose materials. Masonry cracks shall be cleaned out and patch filled with mortar similar to the original surface and uniformly textured. Where this type of resurfacing may lead to the finishing paint being different in shade from, the original surfaces, the resurfaces area shall be treated with minimum one coat of cement primer, which should be continued to the surrounding area for a distance of minimum 100 mm.

Surface with **Mildew or Efflorescence** shall be treated as below:

All mildewed surfaces shall be treated with an approved fungicide such as ammoniacal wash consisting of 7g of copper carbonate dissolved in 80ml liquor ammonia and diluted to water, or 2.5 percent magnesium silicofluoride solution and allowed to dry thoroughly before paint is applied.

2.01.03 Metal

The surface preparation shall be done in accordance with IS:1477(Part-1) 'Code of practice for painting of ferrous metals in building' and as directed by Engineer. All metal surfaces shall be absolutely clean, dry, and free from rust, scales, weld slag, flux deposit, wax, grease, dried soap films, foreign matters like cement mortar etc and free from existing loose red oxide zinc chromate primer and should be removed by means of wire brushes, hand scrappers, sand paper, emery cloth, emery papers, or by mechanical power tools etc. or as directed by Engineer. For exposed chemical resistant paints, surfaces shall be blast cleaned to near white metal. All galvanized iron surfaces shall be pretreated with a compatible primer according to the manufacturer's direction. Any abrasion in shop coat shall be touched up with the same quality of paint as the original coat. The actual painting work should be commenced only after obtaining clearance from the Engineer regarding proper cleaning of the surface.

TITLE:
**TECHNICAL SPECIFICATION FOR
PAINTING, WHITEWASHING,
POLISHING**

SPECIFICATION NO. PE-TS-999-600-C011			
VOLUME - II B			
SECTION - D		SUB-SECTION - D11	
REV.NO.	00	DATE	30/11/2015
SHEET	7	OF	14

2.02.00 Application

2.02.01 General

The method of application shall be as recommended by the manufacturer. In case of selection of special shades and colour (not available in standard shades) the Contractor shall mix different shades and prepare test panels of minimum size 1 meter square as per instruction of the Engineer and obtain his approval prior of application of finishing paints.

Proper tools and implements shall be used. Scaffoldings used shall be independent of the surface to be painted to avoid shade differences of the freshly repaired anchor notes.

Painting shall be done by skilled labours in a workmanlike manner. All materials shall be evenly applied so as to free of sags, runs, crawls, or other defects. All coats shall be of proper consistency. In case of application by brush, no brush marks shall be visible. The brushes shall be clean and in good condition before application of paint.

All priming undercoat for painting shall be applied by brush only, and rollers spray equipments etc. shall not be used.

No work shall be done under conditions that are unsuitable production of good results. No painting shall be done when plastering is in progress or is drying. Application of paint, which seals the surfaces to moisture shall only be done after the moisture on and below the surface has dried out.

All coats shall be thoroughly dry before succeeding coat is applied. Coats of painting as specified are intended to cover surfaces perfectly. In case the surface is not covered properly by applying the specified number of coats, further coats shall be applied by the Contractor when so desired by the Engineer.

All primers and undercoats shall be tinted to approximate the colour of the finishing coats. Finished coats shall be of exact colour and shade as per approved samples and all finish shall be uniform in colour and texture. All parts of mouldings and ornaments shall be left clean and true to finish.

Painting on ferrous metal surface shall, be done as per IS: 1477 (Part I & 2). The total dry thickness of film should not be less than 120 Micron.

2.02.02 White Washing

The surface where white washing is to be applied shall be cleared of all loose materials and dirt. All holes and irregularities of the surface shall be filled up

TITLE:
TECHNICAL SPECIFICATION FOR
PAINTING, WHITEWASHING,
POLISHING

SPECIFICATION NO. PE-TS-999-600-C011

SECTION - D		SUB-SECTION - D11	
REV.NO.	00	DATE	30/11/2015
SHEET	8	OF	14

with lime putty and shall be allowed to dry up before white washing.

One coat of whitewash shall consist of one stroke from top downwards, another from bottom upwards over the first stroke and another from left to right before the previous one dries up. Second coat shall be applied and in case the Engineer feels that one or more coats are required the Contractor shall do so without any extra cost to the Owner. No brush marks shall show on the finished surface.

2.02.03 Dry Distemper

New plastered surface shall be allowed to dry for at least two months. New lime or lime cement plastered surface shall be washed with a solution of 1 part Vinegar to 12 parts water or 1:50 sulphuric acid solution and for 24 hours after which the wall shall be thoroughly washed with clean water. For cement-plastered surface, the surface shall be washed with solution of 100 gms. of zinc sulphate to 1 litre of water and allowed to dry.

Dry distempering shall be done as per manufacturers instruction. In applying the distempers the brush, should first be applied horizontally and immediately crossed off perpendicularly. Brushing shall not be continued too long, otherwise brush marks may result.

2.02.04 Oil bound washable distemper

The distemper shall be applied after surface is primed with an alkali resistant primer, and followed by minimum two coats of oil bound washable distemper all as per manufacturer's instruction.

2.02.05 Waterproof Cement Paint

Surface to be coated with cement paint shall be washed and brushed down. As soon as the moisture has disappeared, the surface shall be given one coat of paint. Care shall be taken so that the paint does not dry out too rapidly. After 4 to 6 hours, the water shall be sprinkled over the surface to assist curing and prevent cracking. After the first coat has dried (24 to 48 hours) the second coat shall be applied in a similar manner. The finished surface shall be kept moist by occasional sprinkling with water for seven days after painting.

2.02.06 Acrylic Emulsion Paint

Paint shall be applied after providing one coat of cement primer solvent of approved quality and primer shall be conform to IS: 109. Lime gauged cement plastered surfaces shall not be painted for at least one month after plastering. A sample patch shall be painted to check alkali reaction if so desired by the Engineer. Painting shall be done strictly as per manufacturer's specification.

TECHNICAL SPECIFICATION FOR
PAINTING, WHITEWASHING,
POLISHING

SPECIFICATION NO. PE-TS-999-600-C011			
VOLUME - II B			
SECTION - D		SUB-SECTION – D11	
REV.NO.	00	DATE	30/11/2015
SHEET	9	OF	14

2.02.07 Synthetic Enamel Paint

Shall be applied on properly primed surface. Subsequential coat shall not be applied till the previous coat is dry. The previous shall be lightly sand papered for better adhesion of subsequent coats.

2.02.08 Aluminium Paint

The paint, supplied in two pack containers shall be mixed and applied strictly as per manufacturer's direction. When more than one coat of paint is required or indicated, the next coat shall only be applied after the previous coat become hard dry.

2.02.09 Clear Synthetic Varnish

The Varnish shall be applied on wood surface after (a) filling, (b) staining & (c) sealing operations are carried out. The application of a combination of filler and stain shall not be permitted.

For the finishing coats of varnish, the surface shall be allowed to dry and be rubbed down lightly, wiped off and allowed to dry. Careful attention to cleanliness is required for varnishing. All dust and dirt shall be removed from the surface as well as from the neighbourhood. Damp atmosphere and draughts shall be avoided, and exposure to extreme heat or cold & dampness shall not be allowed.

The varnish shall be applied liberally with a brush and spread evenly over a portion of the surface with light strokes to avoid frothing. It shall be allowed to flow on white the next section is being laid on excess varnish shall then be scrapped off the brush and the first section be crossed, recrossed and then laid off lightly. The varnish once it has begun to set shall not be retouched. In case of any mistake in application, the varnish shall be removed and the work started afresh.

The varnish shall be minimum of two coats, with the first coat being a flatting varnish. This shall be allowed to dry hard and be flatted down, before applying the next coat. Sufficient time must be allowed between coats to get a hard dry surface before next coat is applied. All work shall be as per relevant IS Code.

2.02.10 French polish

All unevenness of the surface shall be rubbed down to smoothness with sand paper and the surface shall well dusted .The pores in the shall be filled up with

a paste of whitening in water or methylated spirit with a suitable pigment like burnt siemme or umber.

After application of the filler paste, the French polish shall be applied with a pad of woollen cloth covered by a fine cloth. The pad shall be moistened with polish and rubbed hard on the surface in a series of overlapping circles so that the polish is sparingly but uniformly applied over the entire area to give an even surface. A trace of linseed oil may be used on the pad for case of application. The surface shall be allowed to dry before further coats are applied in the same manner. To finish off, the pad shall be covered with a fresh piece of clean fine cloth, slightly damped with methylated spirit, and rubbed lightly and quickly with circular motions to leave the finished surface with a uniform texture and high gloss.

2.02.11 Chemical Resistant Paint

For chemical resistant paints, epoxy, chlorinated rubber, or vinyl butryl paint system shall be used. Manufacturer's recommendation shall be followed regarding the paint system, exposed to moderately to severe corrosive condition and subject to acid/alkali spillage & fumes, shall be followed.

2.03.00 Protection

Furniture and other movable objects, equipment, fittings and accessories shall be moved, protected and replaced upon completion of work. All stationary equipment shall be well covered so that no paint can fall on them. Work finished by other agencies shall be well protected. All protections shall be done as per instructions of the Engineer.

2.04.00 Cleaning up

In addition to provisions in general conditions the Contractor shall, upon completion of painting etc. remove all marks and make good surfaces, where paint has been splashed or splattered, including all equipment, fixtures, glass, furniture, fittings etc. to the satisfaction of the Engineer.

3.00.00 ACCEPTANCE CRITERIA AND TESTING

- a) All painted surfaces shall be uniform and pleasing in appearance.
- b) All varnished surfaces shall be of uniform texture and high glossy finish.
- c) The colour, texture etc. shall match exactly with those of approved samples.
- d) All stains, splashes, and splatters of paints and varnishes shall be removed from surrounding surfaces.

Testing

- a) As, each part of the work is under progress, i.e. preparation of surface, providing primer, providing different coats of finishing paints, it shall be passed by the Engineer. Variation from the drawings or specification or standard etc. shall not be accepted. The Contractor shall ascertain from the Engineer as to which parts will be inspected and passed from time to time. The Contractor shall provide all necessary arrangement for inspection of the painting work during its different working phase. The Contractor shall provide necessary scaffolding, approach for inspection of the above as per direction and satisfaction of the Engineer. All the necessary cost for scaffolding, approach, platform, lighting arrangement testing and inspection shall be borne by the Contractor. Such inspection and testing will not, however, exonerate the Contractor from his responsibilities for proper workmanship, material etc.
- b) The Contractor shall carry out all sampling and necessary testing in accordance with the relevant Indian Standards and shall conduct such tests as called for by the Engineer. Where no specific testing procedure is mentioned in the relevant codes, the tests shall be carried out as per the prevalent accepted Engineering practice as per the direction of the Engineer. Tests shall be done in a laboratory, approved by the Engineer, and cost of testing shall be borne by the contractor.
- c) Material/workmanship unsuitable for acceptance shall be removed and replaced by the Contractor. The work shall be redone as per Specification of the contract and direction of the Engineer without extra cost to owner.

4.00.00

I.S. CODE

All work shall be carried out as per this specification and shall conform to the latest revision and/or replacements of the following or any other Indian Standard (IS) Codes, unless specified otherwise. In case any particular aspect of work is not specifically covered by Indian Standard Codes, any other standard practice, as may be specified by the Engineer, shall be followed.

IS: 348	Specification for French polish
IS: 427	Specification for Distemper, dry colour as required.
IS: 428	Specification for Distemper oil emulsion, colour as required.

5.00.00 RATES AND MEASUREMENT

5.01.00 Rates

Rates shall be unit rates for complete items described in the “Schedule of Items”.

Rate shall include cleaning, preparation of surface, supply and application of primer, painting and providing all protection and scaffolding required at site.

5.02.00 Measurements

Painting over the concrete/masonry/wooden surface shall be measured net (on the surface area on which it is applied) in Sqm.

No deduction shall be made for opening not exceeding 0.5 Sqm and ends of beams, joints, etc. also no payment shall be made for reveals, jams, soffits, sill of these openings.

50% deduction shall be made for opening exceeding 0.5 Sqm but not exceeding 3.0 Sqm each and no addition shall be made for reveals, jams, soffits, sills etc.

In case of opening exceeding 3.0 Sqm each, deduction shall be made for opening but jams, soffits, and reveals shall be measured and paid for.

Corrugated surfaces shall be measured flat and measured area shall be increased by 15%.

Painting of structural steel works shall be measured in M.T. of fabricated steel (as per section D-17 clause 6.02.00 i.e Mode of measurement of technical specification for fabrication of structural steel works) unless specified otherwise.

FLOOR FINISH AND ALLIED WORKS

1.00.0

SCOPE

This section covers furnishing, installation, finishing, curing, testing, protection, maintenance till handing over various types of floor finishes, and allied items of work as listed below

a) In Situ Finishes

- i) Integral finish to concrete base
- ii) Terrazzo finish
- iii) Granolithic finishes
- iv) Patent Stone
- v) Metallic Hardener like “Ironte”/Hardonate Finish
- vi) Mastic Asphalt finishes
- vii) Chemical Resistant finish

b) Tiled Finishes

- i) Terrazzo tile
- ii) Chequered tile
- iii) Glazed tile
- iv) Tesse rae (Mosaic etc.)
- v) Chemical Resistant
- vi) Rubber, Vinyl etc.
- vii) Stone Slab including Kota Stone.

1.01.00

Base

The base to receive the finish is covered under other relevant specifications.

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 4 OF 23

1.01.01 Sequence

Commencement, scheduling and sequence of the finishing works shall be planned in detail and must be specifically approved by the Engineer in view the activities of other agencies working in that area. However, the Contractor for the finishing items shall remain fully responsible for all normal precautions and vigilance to prevent any damages whatsoever till handing over.

2.00.00 INSTALLATION

2.00.01 Special Materials

Basic materials are covered elsewhere under the Specification. In general, all such materials shall be as per relevant Codes where available. In all cases these materials shall be of the best quality available indigenously unless specified otherwise.

The materials for finishing items must be procured from well-reputed specialized manufacturers and on the basis of approval of samples by the Engineer. The materials shall be ordered, procured and stored well in advance to avoid compulsion to use substandard items to maintain in the construction schedule.

2.00.02 Workmanship

Only workers specially experienced in particular items of finishing work shall be engaged, where such workers are not readily available, with the Engineer's permission, experienced supervisors recommended by the manufacturer shall be engaged. In particular cases where the Engineer so desires the Contractor shall get the finishing items installed by the manufacturer.

2.00.03 Preparation of the Base Surface

The surface to be treated shall be thoroughly examined by the Contractor. Any rectification necessary shall be brought to the notice of the Engineer and his approval shall be taken regarding method and extent of such rectification work.

For all types of flooring, skirting, dado and similar locations, the base to receive the finish shall be adequately roughened by chipping, raking out joints and cleaning thoroughly all dirt, grease etc. with water and hard brush and detergent if required, unless otherwise directed by the manufacturer of any special finishing materials or specifically indicated in this specification.

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 5 OF 23

To prevent of water from the finishing treatment the base shall be thoroughly soaked with water and all excess water mopped up.

The surface shall be bone dry where adhesives are used for fixing the finishes.

Prior to commencement of actual finishing work the approval of the Engineer shall be taken as per the acceptability of the surface.

2.01.00 In Situ Finishes

2.01.01 Integral Finish To Concrete Base

While the surface of the concrete laid as per specification for 'Cement Concrete' has been fully compacted and levelled but the concrete is still 'green' thick slurry, made with neat cement shall be applied evenly and worked in with iron floats. When the slurry starts to set it shall be pressed with iron floats to have a firm compact smooth surface without trowel mark or undulations. This finish shall be as thin as possible by using 2.2 kg. of cement per Sq.M. of area.

The surface shall be kept in shade for 24 hours and then cured for at least 7 days continuously by flooding with water. The surface shall not be subjected to any load or abrasion till 21 days after lying.

As desired by the Engineer the surface, while still 'green' shall be indented by pressing strings, the marking shall be of even depth, in straight lines and the panels shall be of uniform and symmetrical patterns.

2.01.02 Terrazzo Finish in Situ

It shall consist of an underbed and a topping laid over an already laid and matured concrete base.

a) Thickness

Unless otherwise specified the total thickness of the 'finish shall be minimum 40 mm for horizontal and 25 mm for vertical surface of which the topping shall be not less than 10 mm. While the topping shall be of uniform thickness the underbed may vary in thickness to provide necessary slopes. The vertical surface shall project out 6 mm from the adjacent plaster or other finish. Necessary cutting into the surface receiving the finish shall be done to acc ate the specified thickness. All junctions of vertical with horizontal shall be rounded neatly to uniform radius of 25 mm.

b) Mix

i) Underbed

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 6 OF 23

The underbed for floors and similar horizontal surfaces shall consist of a mix of 1 parts cement, 1½ parts sand and 3 parts stone chips by volume. For vertical surfaces the mix shall consist of 1 part cement to 3 parts sand by volume. The sand shall be coarse. The stone chips shall be 10 mm down well graded. Only sufficient water to be added to give a workable consistency.

ii) Topping

The mix for the topping shall be composed of cement, colour Pigment, marble dust and marble chips. Proportions of the ingredients shall be such as to produce the terrazzo of colour texture and pattern approved by the Engineer. The cement shall be white or gray or a mixture of the two to which pigment shall be added to achieve the desired colour. To 3 parts of this mixture 1 part marble powder by volume shall be added and thoroughly mixed dry. To 1 part of this mix 1 to 1½ parts of marble chips by volume shall be added and thoroughly mixed dry again.

The pigment must be stable and nonfading. It must be very finely ground. The marble powder shall be from White marble and shall be finer than IS Sieve No.: 30. The size of marble chips shall be between 1 mm to 20 mm. Sufficient quantity to cover each visible area shall be prepared in one lot to ensure uniform colour. Water to make it just workable shall be added to a quantity that can be used up immediately before it starts to set.

c) Laying

The underbed shall be laid in panels. The panels shall not be more than 5 Sq.M. in area of which no side shall be more than 2.5 M. long. For exposed locations the maximum area of a panel shall be 2.0 Sq.M. The panel shall be laid in alternate bays or chequered board pattern. No panel shall be cast in contact with another already laid until the latter has contracted to the full extent.

Dividing strips made of aluminium or glass shall be used for forming the panels. The strips shall exactly match the total depth of underbeds plus topping.

After laying, the underbed shall be levelled compacted and brought to proper grade with a screed or float. The topping shall be laid after about 24 hours while the underbed is still somewhat "green" but firm enough to receive the topping. A slurry of the mixture of cement and pigment already made shall be spread evenly and brushed in just before laying the topping. The topping shall be rolled for horizontal areas and thrown and pressed for vertical areas to

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 7 OF 23

extract all superfluous cement and water and to achieve a compact dense mass fully bonded with the underbed. The surface of the topping shall be trowelled over, pressed and brought to a smooth dense surface showing a minimum 75% area covered by marble chips in a even pattern of distribution.

d) Curing

The surface shall be left for curing for about 12 to 18 hours and then cured by allowing water to stand on the surface or by covering with wet sack for four days.

e) Grinding and Polish

When the surface has sufficiently hardened it shall be watered and ground evenly with rapid cutting coarse grade (no.80) grit blocks, till the marble chips are exposed and the surface is smooth. Then the surface shall be thoroughly washed and cleaned. A grout with already prepared mixture of cement and pigment shall be applied to fill up all pinholes. The surface shall be cured for 7 days by keeping it moist and then ground with fine grit blocks (no.: 120). It shall again be cleaned with water, the slurry applied again to fill up any pinholes that might have appeared and allowed to be cured again for 5 days. Finally, the surface is ground a third time with very fine grit blocks (no.: 320) to get smooth surface without any pinhole. A suitable machine shall do the grinding. Where grinding machine can not be used hand grinding may be allowed when the first rubbing shall be with carborundum stone of coarse grade (no.:60), second rubbing with medium grade (no.: 80) and final rubbing and polishing with fine grade (no.: 120). The surface shall be cleaned with water, dried, and covered with soil free, clean sawdust if directed by the Engineer. The final polishing shall be postponed till before handing over if desired by the Engineer. Just before handing over the surface shall be dusted with oxalic acid at the rate of 0.33 gm. per. Sq.M., water sprinkled on to it and finished by buffing with felt or hessian bobs. The floor shall be cleaned with soft moist rag and dried. However, all excess wax polish to be wiped off and the surface to be left glossy, but not slippery.

2.01.03

Granolithic Finish

Granolithic finish shall either be laid monolithically over base concrete or separately over hardened base concrete.

a) Thickness

The finish shall be average 20 mm and minimum 12 mm thick, unless specified otherwise.

b) Mix

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 8 OF 23

The mix shall consist of 1 part cement: 1 part coarse sand 2 parts coarse aggregate by volume. The coarse aggregate shall be very hard like granite and well graded between 6 mm and 12 mm. Minimum quantity of water to get workability shall be added.

c) Laying of Monolithic Topping

The concrete base shall be laid as per specification "Cement Concrete" and levelled upto the required grade. The form shall remain sufficiently protruding to take the finish.

Within about 3 hours of laying the base while it is still fully -green- the topping shall be laid evenly to proper thickness and grade. If considered necessary the surface ' of the base shall roughened by wire brushing. Unless manual operation is permitted by the Engineer, mechanical vibrators of suitable design shall be used to press the topping firmly and work vigorously and quickly secure full bond with concrete base.

The laitance brought to the surface during compression shall be removed carefully without disturbing the stone chips. The surface shall then the lightly trowelled to remove all, marks. When sufficiently set, hand trowelling shall be done to secure a smooth surface without disturbing the stone chips.

For large areas the laying shall be in panels of maximum 25 Sq.M. area. The panels shall be laid in chequered board pattern.

d) Laying of Topping Separately on Hardened Base

The base concrete shall be prepared as stated in clause 2.00.03 and a slurry of neat cement applied just prior to laying the granolithic concrete mix (1:1:2). The method of compaction etc. shall be same as for monolithic topping.

Curing

Immediately after laying, the finish shall be protected against rapid drying. As soon as the surface had hardened sufficiently, it shall be kept continuously moist for at least 10 days by means of wet gunny bags or pounding of water on the surface. The floor shall not be exposed to heavy traffic during this period.

f) Grinding

If grinding is specified, it shall start only after the finish has fully set. Clause 2.01.02 (e) shall be followed. However, the Engineer shall decide upon the ultimate polish required.

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 9 OF 23

g) Finishing

Where specified, sodium, silicate or magnesium or zinc silico fluoride treatment shall be done. The number of coats to be applied shall be as per approved drawings or as instructed. The concentration and method of application of the solutions shall be as specified in IS: 5491.

2.01.04

Patent Stone

It shall consist of an underbed and a topping laid on an already laid and matured concrete base.

a) Thickness

The patent stone finish shall have thickness as stipulated under clause 2.01.02 (a) except that the topping shall be 12 mm thick.

b) Mix

i) Underbed

The mix shall be as stipulated under clause 2.01.02 (b).

ii) Topping

The mix for the topping shall consist of 1 part cement and 2 part stone aggregate 6mm nominal size by volume.

c) Laying

The Patent Stone finish including the underbed shall be laid in alternate bays or in Chequered board pattern. No panel shall be cast in contact with another already laid till the contraction of the latter has already taken place.

The maximum area of each panel shall be 3 Sq.M. of which no side shall be more than 2 M. long.

A cement grout shall be applied and worked into the surface to receive the finish; the underbed then laid, compacted, and leveled to proper grade with a screed or float. The topping shall be applied evenly on the underbed while it is not fully set but firm enough and rolled and pressed to get full bond. The topping shall be trowelled to a dense finish to the satisfaction of the Engineer. All trowel marks shall be mopped out with a soft cloth to give a clean smooth surface.

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 10 OF 23

After the surface is sufficiently set, the finished floor shall be kept moist for 7 days for curing. If desired the finish shall be polished as directed by the Engineer.

2.01.05 Metallic Hardener Like 'Ironite'/'Hardonate' Finish

This will consist of a topping (incorporating iron particles) to bond with concrete base while the latter is 'green'.

a) Thickness

Unless otherwise specified the metallic hardener finish shall be of 12 mm depth.

b) Material

The hardening compound shall be uniformly graded iron particles free from non-ferrous metal impurities, oil, grease, sand soluble alkaline compounds or other injurious materials when desired by the engineer, actual samples shall be tested.

c) Mix

Proportion of the metallic hardener shall be as specified or as indicated by the manufacturer. However, in absence of any such direction 1 part metallic hardener shall be mixed dry, with 4 parts cement, by weight. To this mixture 6 mm nominal size stone chips shall be added in proportion of 1 part cement (mixed with hardener) to 2 parts of stone chips by volume and uniformly mixed. Minimum quantity of water shall be added to make it workable.

d) Laying

The concrete floor shall be laid as per specification 'Cement Concrete' and levelled upto required grade. The forms, if any, shall remain sufficiently projecting to make the finish. The surface shall be roughened by wire brash as soon as possible.

The finish shall be laid while the concrete underbed is still very 'green' within about 3 hours of laying of the latter. The finish shall be of uniform thickness and even dense surface without trowel marks, pin holes etc. This topping layer shall be pressed firmly and worked vigorously and quickly to secure full bond with the concrete base. Just when the initial set starts the surface shall be finished smoothened with steel trowel.

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 11 OF 23

The finished floor shall be cured for 7 days by keeping it wet.

2.01.06

Mastic Asphalt Finish

This is a one-layer treatment on concrete or brick base.

a) Thickness

The thickness shall be as specified in the drawing.

b) Materials

Bitumen shall be industrial Bitumen of the grade 90/15 and 75/15 conforming to IS: 702.

Mineral filler shall be dry stone dust passing through 75 micron IS Sieve.

Fine aggregate shall be crushed and graded natural limestone or other hard work.

Coarse aggregate shall be crushed siliceous stone or other approved aggregate 6 mm stone chips shall be used for finish upto 20 mm thick & 10 mm chips for thicker finish.

c) Composition

Bitumen mastic shall conform IS: 1195 and shall be either brought to site in blocks weighing about 25 Kg or prepared at site. If brought in blocks, these shall be remelted in mechanically agitated mastic cookers and coarse aggregate, preferably preheated fed in successive portions until the complete change is thoroughly, incorporated. At no stage during the remelting and mixing process, shall the temperature exceed 205°C.

d) Laying

The hot mastic shall be laid on dry base surface cleaned thoroughly by wire brushing and sweeping. The mastic shall be leveled and when cooled to some extent shall be finished with a wooden float with addition of small quantity of fine sand if required. No load shall be allowed till the finish has cooled to normal temperature.

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 12 OF 23

The mastic shall be laid in suitable panels of about 1.5 Sq.M. in area each formed by formers. Succeeding panels shall be laid overlapping the finish panel so as to melt its edges and form a continuous finish without joint.

2.01.07 Chemical Resistant in Situ Finish

Chemical resistant in situ finish shall be as epoxy resin with suitable filler material over a primer. The minimum thickness shall be 6 mm. About its performance the Engineer shall have to be fully satisfied by test results and examination of similar treatment already in existence. The contractor shall get it done by a specialized Manufacturer and get guarantee of performance from the organization and pass it on to the Owner in addition to his own guarantee.

2.02.00 Tiled Finish

These shall include finish tiles, stone slabs, and similar manufactured or natural items over already laid and matured base of concrete or masonry by means of an underbed or an adhesive layer.

2.02.01 Terrazzo Tile Finish

The finish will consist of manufacture terrazzo and an underbed.

a) Thickness

The total thickness including the underbed shall be minimum 40 mm for floors 30 mm for walls unless otherwise specified.

The skirting, dado and similar vertical surfaces shall project out 6 mm uniformly from the adjacent plaster or other wall finishes. The necessary cutting into the surface receiving the tiled finish, to accommodate the specified thickness shall be done.

b) Tiles: Terrazzo

The tiles shall, unless specifically permitted in special cases be machine made under quality control in a shop. The tile shall be pressed hydraulically to a minimum of 140 Kg. per Sq.cm.

Each tile shall bear on its back permanent and legible trademark of the manufacturer. All angles of the tiles shall be right angles all arises sharp and true, colour and texture of the wearing face uniform throughout.

**TITLE:****TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 13 OF 23

Maximum tolerance allowance length and breadth shall be ± 1 mm and the thickness ± 3 mm. Face of the tile shall be plane, free from pinholes and other blemishes.

The tiles shall be composed of a backing and topping. The topping shall be of uniform thickness not less than 10 mm.

The total thickness including the topping shall be as specified but not less than 20 mm in any case.

The backing shall be composed of 1 part ordinary gray cement and 3 parts of stone chips by weight mixed with water.

The topping shall be as specified under clause 2.01.02 (b).

The tile shall be cured at the shop for at least 14 days before delivery to the site. First grinding shall be given to the tiles at the shop before delivery. Tiles shall be packed properly to prevent damage during transit and storage. The tiles must be carefully stored to prevent staining by damp, rust, oil, and grease or other chemicals.

Tiles made in each batch shall be kept and used separately so that colour of each area of the floor may remain uniform.

The manufacturer shall supply along with the tiles the grout mix containing cement and pigment in exact proportions as used in topping of the tiles. The containers for the grout mix shall be suitably marked to relate it to the particular type and batch of tiles.

c) **Mix: Underbed**

The underbed for floor and similar horizontal surfaces shall be 1 part lime putty: 1 part surkhi: 2 parts coarse sand by weight mixed with sufficient water to form a stiff workable mass. For skirting and dado and all vertical surfaces it shall be about 12 mm thick and composed of 1 part cement and 3 parts coarse sand by weight.

d) **Laying**

The underbed mortar shall be evenly spread and brought to proper grade and consolidated to a smooth surface. The surface shall be roughened for better bond. Before the underbed had time to set and while it is still fairly moist but firm, cement shall be hand dusted over it or a cement slurry applied and the tiles shall immediately be placed upon and firmly pressed by wooden mallet on to the underbed until it achieves the desired level. The tiles shall be kept soaked for about 10 minutes just before laying. The

**TITLE:****TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 14 OF 23

joints between tiles shall be as close as possible and not more than 1.5 mm wide.

Special care shall be taken to check the level of the surface and the lines of the joints frequently so that they are perfect.

When tiles are required to be cut to match the dimensions these shall be sawn and edges rubbed smooth. The location of cut tiles shall be planned in advance and approval of the Engineer taken.

At the junction of horizontal surface with vertical surface the tiles on the former shall enter at least 12 mm under the latter.

After fixing, the floor shall be kept moist and allowed to mature undisturbed for 7 days. Heavy traffic shall not be allowed.

If desired dividing strips as specified under Clause 2.01.02(c) may be used for dividing the work into suitable panels.

e) Grinding and Polishing

Procedure shall be same as Clause 2.01.02(e). Grinding shall not commence earlier than 14 days after laying of tiles.

2.02.02**Chequered Tile Finish**

The finish shall consist of manufactured gray or coloured cement tiles or terrazzo tiles with chequered face and an underbed laid over concrete or brick surface.

a) Thickness

Thickness shall be same as in clause 2.02.01 (a).

b) Tiles: Chequered

The tiles shall have chequers not less than 2.5 cm. c/c and not more than 5 cm. c/c. Depth of grooves shall be not less than 5 mm. The grooves shall be uniform and straight.

The tiles shall conform to clause 2.02.01 (b) except that these may have the topping in terrazzo or plain gray cement or colour pigment added to cement.

c) Under-bed

As per clause 2.02.01 (c).

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 15 OF 23

- d) Laying
As per clause 2.02.01 (d).

- e) Grinding and Polishing

As per clause 2.02.01 (e) except that the tiles shall be ground and polished by hand and after laying taking special care in polishing the grooves properly and uniformly.

2.02.03 Glazed Tiles Finish

This finish shall be composed of glazed earthenware tiles with an underbed laid over a concrete or masonry base.

- a) Thickness

The total thickness shall be between 20mm and 25mm including the underbed.

The tile finish on vertical surface shall project out 6 mm uniformly from the adjacent plaster or other wall finishes. The necessary cutting into the surface receiving the finish, to accommodate the specified thickness shall be done.

- b) Tiles: Glazed

The tiles shall be of earthenware, covered with glaze white or coloured, plain or with designs, of 150 mm x 150 mm nominal sizes and 5.5 mm to 6 mm on thick unless otherwise specified. The tolerance shall be ± 1.5 mm for length and breadth and ± 0.5 mm for thickness specials like internal and external angles; beads, covers, cornices, corner pieces etc. shall match. The top surface of the tiles shall be glazed with a gloss or matt, unfading stable finish as desired by the Engineer. The tiles shall be flat and true to shape. The colour shall be uniform and fractured section shall be fine grained in textures, dense and homogeneous. The tiles shall be strong and free from flaws like cracks, craze, specks, crawlings, etc. and other imperfections. The edge and the underside of the tiles shall be completely free from glaze and the underside shall have ribs or indentations for better anchorage with the fixing mortar.

The coloured tiles, when supplied, shall preferably come from one batch to avoid difference in colour.

- c) Mix: Underbed

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 16 OF 23

The mix for the underbed shall consist of 1 part cement and 3 parts coarse sand by weight mixed with sufficient water or any other mix if specified.

- c) Laying
Same as clause 2.02.01 (d).

- e) Finishing

The joints shall be cleaned and flush pointed with white cement and cured for 7 days by keeping it wet. The surface shall be cleaned with soap or suitable detergent, washed fully, and wiped with soft cloth to prevent scratching before handing over.

2.02.04

Tesserae Finish (Mosaic etc.)

This finish consists of manufactured vitreous, glass, ceramic or similar hard small pieces set in an underbed over a concrete or masonry surface, already laid.

- a) Thickness

The total thickness including the underbed shall be between 16 mm & 25 mm.

- b) Tesserae Finish

These shall usually be 6 mm thick small piece of ceramic vitreous china, tinted glass, or similar hard wearing, strong, and durable material in desired shapes and sizes and patterns.

The supply shall come in the desired pattern in full or sections conveniently for handling, stuck to pieces of strong thick paper on the surface to be exposed. The gum used for this purpose must be water soluble and non-staining. The sections shall be properly marked to avoid mistakes and master drawing shall be available at the site for guidance.

- c) Mix: Underbed
Same as clause 2.02.03 (c)

- d) Laying

The specification for laying if given by the manufacturer of the item shall be followed provided it is approved by the Engineer. Otherwise clause 2.02.03 (d) shall generally be followed. However, instead of gray cement the slurry shall be made with white cement to fix the panels. The paper-mounted patterns in sections shall be carefully placed and pressed in position true to lines and levels. Earliest possible the paper shall be peeled

SHEET 18 OF 23

2.02.05 Chemical Resistant Tiled Finish

This shall include all varieties of special tiles used for specific chemical resistance function and an underbed over already laid concrete or masonry.

a) Tiles

The chemical resistant tiles shall be of the best indigenous Manufacture unless otherwise specified and shall be resistant to the chemical (both acid and alkali). The tiles shall have straight edges, uniform thickness, plain surface, uniform nonfading colour, and textures.

Usually the chemical resistant tiles shall not absorb water more than 2% by weight. The tiles shall have at least compression strength of 700 Kg/cm². The surface shall be abrasion resistant and durable.

b) Laying

The mortar used for setting or for underbed these tiles shall be durable, strong and chemical resistant epoxy mortar. The grout, which shall be to the full depth of tile, shall have equal chemical resistant properties. Joints shall be pointed if so desired. The setting and fixing shall be according to the manufacturer's specification approved by the Engineer.

2.02.06 Rubber, Vinyl, or Vinyl Asbestos Tiles Finish

This shall include various types of tiles manufactured from rubber, vinyl etc. set with an adhesive on concrete or masonry base. An underbed may be required to secure desirable surface and grade.

a) Thickness

The thickness of the tiles shall be as incorporated in drawing.

b) Tiles

Unless otherwise desired the tiles shall be squares of approved dimensions. The tolerance in dimensions shall be ± 1.5 mm.

The face of the tiles shall be free from porosity, blisters, cracks, embedded foreign matters or either physical defects which affect appearance or serviceability. All edges shall be cut true and square. The colour shall be nonfading and uniform in appearance, insoluble in water and resistant to alkalies, cleaning agents and usual floor polishes.

Each tile shall be marked on the back legibly and indelibly with

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 19 OF 23

manufacturer's trademark, the thickness, sizes, batch number, and date of manufacturer.

Tiles shall be delivered securely packed and stored in clean, dry well ventilated place at a temperature near about to that the tiles shall be called upon to stand ultimately.

Adhesive to be used for sticking the tiles shall be approved by the tile manufacturer. The adhesive shall have a short drying time and long life in addition to toughness.

c) Mix: Underbed

The underbed where required to make up the specified thickness or to give the required grade or to get the right type of surface shall be composed of 1 part like putty:1 part cement: 3 parts coarse sand mixed with just sufficient water to make it workable.

d) Laying

The tiles shall be kept in the room to be tiled for at least 24 hours to bring them to the same temperature as the room. For air-conditioned space, the air-conditioning shall be completed before tiling is taken up.

The surface to receive this finish shall be firm even textured but not too smooth, without undulations and other deficiencies. If an underbed is laid the same shall be cured for at least 7 days by keeping it moist and then fully dried.

The surface shall be thoroughly cleaned. All loose dust particles shall be removed. Oil and grease if any shall be completely cleaned by use of detergent.

The adhesive shall be applied to fully dry surface in desired thickness uniformly. The adhesive shall also be applied to the backs and edges of the tiles and allowed to surface dry. The tiles shall be placed neatly on the surface exactly to the approved pattern and set with a suitable tool. If the edges tend to curl, weights are to be used to keep the edges down. Special care shall be taken to avoid formation of air pockets under the tiles. The joints shall be very fine. Any adhesive squeezed out through the joints shall be removed immediately.

e) Finishing

If any adhesive mark is there on the surface a soft cloth soaked in solvent shall be used to wipe it off. The surface shall be cleaned with soft soap,

SHEET 20 OF 23

dried, and polished with an approved type of polish just before handing over.

2.02.07

Stone Slab Finish: Marble, Stone, and Similar Fine Grained Stone including Kota stone

a) Thickness

The underbed shall be minimum 12 mm and average 20 mm thick. The slabs will be 20 mm thick.

b) Stone Slab

The stone slabs shall be made from selected stock, which is hard, sound, homogeneous and dense in texture and free from flaws. Angles and edges shall be true, square, and free from chipping and surface shall be plane. The slabs shall preferably be machine cut to the required dimensions. Tolerance of ± 5 mm in dimensions and ± 2 mm in thickness will be allowed. Unless specified the slabs shall be minimum 300 mm x 300 mm.

The stone slabs shall come from specific regions and in specified quality with top surface fine chisel dressed. All sides shall also be fine chisel dressed to the full depth to allow finest possible joints.

The slabs shall be delivered to the site well protected against damages and stored in dry place under cover.

c) Mix: Underbed

Same as clause 2.02.01 (c).

d) Laying

The sides and top surface of the slabs shall be machine rubbed or table rubbed with coarse sand stone and washed before laying.

The underbed mortar shall be evenly spread and brought to proper level on the area under each slab. The slab shall be laid over the underbed, pressed, and tapped down with wooden mallet to the proper level. The slab shall then be lifted and the underbed corrected as necessary and allowed to stiffen a little. Next, thick cement slurry shall be spread over the surface. The edges of the slab shall be buttered with slurry of cement, gray / white / mixed with pigment matching the colour of the stone slabs. The slab shall be gently laid and tapped with wooden mallet to bed properly to a very fine joint and to the required level. All surplus cement slurry shall be removed and the surface mopped clean with wet soft cloth. The laid finish shall be cured for 7 days by keeping it wet.

TITLE:

**TECHNICAL SPECIFICATION FOR
FLOOR FINISH AND ALLIED WORKS**

SPECIFICATION NO. PE-TS-999-600-C012

VOLUME - II B

SECTION - D | SUB-SECTION - D12

REV.NO. 00 DATE 16/12/2017

SHEET 21 OF 23

e) Polishing, Finishing

Fine chiselling shall be done to remove the slight undulations that usually exist at the joints. The polishing and finishing shall be done as specified under clause 2.02.01 (e). However, the joints shall be so fine in the case of stone slabs that grouting shall not be called for.

2.02.08 Stone Slab Finish: Sand Stone and Similar Coarse Grained Stone Finish

Generally clause 2.02.07 shall be followed except that the workmanship and finish shall not be fine as which are explained hereunder.

The slabs shall be rough chiselled or fine chiselled as specified. Tolerance may be allowed upto ± 6 mm for rough finish, but no sharp unevenness and shall be allowed. For fine chiselling the unevenness shall be limited to ± 2 mm. The sides shall be chisel dressed at least to half slab depth so that the maximum deviation from straight line shall be within 25 mm. Beyond this depth the edge may be slightly splayed.

The joint thickness shall be kept limited to 5 mm in case of rough finish and 3 mm in case of fine finish unless wider joints are specified. The joints shall be grouted with white or coloured cement. If fine joints in the flooring are specified, the edges of slabs shall be cut in such a way that it shall form an inverted 'Y'.

3.00.00 ACCEPTANCE CRITERIA

The finish shall be checked specially for:

- a) Level, Slope, Plumb as the case may be
- b) Pattern and Symmetry
- c) Alignment of joints, dividing strip etc.
- d) Colour, texture
- e) Surface finish
- f) Thickness of joints
- g) Details at edges, junctions etc.

<u>SHEET WORK IN ROOF AND SIDING</u> 1.00.00 SCOPE This section covers supply, cutting & fabrication and erection of corrugated/plain asbestos, corrugated galvanized iron, aluminum, permanently colour coated troughed zinc-aluminium alloy coated M.S. sheet or other sheet for covering to roof and sides at various elevations as specified. 2.00.00 INSTALLATION 2.01.00 Storage of Materials All materials shall be stored by the Contractor in proper way to prevent all damage. 2.02.00 Workmanship The workmanship shall be according to best construction practice to give a watertight finish to the satisfaction of the Engineer. Fixing of gutters and down pipes shall be according to IS: 2527. 2.02.01 Asbestos Sheeting Asbestos sheets of profiles as specified shall be fixed with minimum 150 mm end lap and side laps as per manufacturer's specification. Hook bolts or J-bolts shall be 8 mm dia. at 305 mm centres. Six (6) mm dia. galvanized iron seam bolt and nut with G.I. flat washers and bitumen washers shall be used for stitching ridge cappings, corner pieces, ventilators, north light curves etc. 2.02.02 C.G.I. Sheeting and Aluminium Sheeting Side laps shall be 2 corrugations for roof and one corrugation for side sheeting. End laps shall be minimum 150 mm for roof and 100 mm for side sheeting. In ridges and hips where plain sheets are used, the end laps shall be minimum 100 mm. Holes in C.G.I. sheets shall preferably be made on the ground. The sheets should be placed on purlins/trestles and holes punched in the ridge of the corrugation from the outside inward for obtaining proper seating of limpet washers. Sheets shall be secured to sheet framing by 8 mm dia. galvanised iron hooks or J-bolts and maximum spacing of the bolts shall be 305 mm. The length of the hook or J-bolts shall be to suit the sections of the bearers. Sheets shall also be bolted at the ends at every third corrugation with 6 mm dia. galvanized iron seam bolts and G.I. flat washers and bituminous washers.

2.02.03

Fibre Glass Reinforced Plastic Sheeting

This shall be of thickness and profile as specified. Colour and light transmittance shall be as mentioned. Where used in conjunction with C.G.I. or asbestos sheeting, the end and side laps and fixing device shall be same as used for general sheeting. Where used in lieu of glass, the fixing shall be by means of timber or metal glazing beads. In all cases, the installation shall be completely watertight and able to withstand the designed wind-pressure.

2.02.04

PERMANENT COLOUR COATED (SANDWICHED INSULATED) METAL CLADDING SYSTEM

- Troughed zinc-aluminium alloy coated (both sides) M.S. sheet having 0.6mm minimum thickness (or high tensile steel sheet having minimum yield strength of 350 Mpa of 0.5mm minimum thickness) shall be used on external face (outer face) of cladding system. Weight of coating shall not be less than 150 gm/sq.m. The outer side (exposed face) shall be permanently colour coated with Polyfluro Vinyl Coating (PVF₂) of Dry Film Thickness (DFT) 20 microns (minimum) over primer. Inner side of external sheet shall be provided with suitable pre-coating of minimum 7 microns.
- Galvanised M.S. sheets of minimum 0.6mm thickness shall be used as inner liner (internal face) of cladding system. The exposed face shall be permanently colour coated with silicon modified polyester paint of DFT 20 microns (minimum) over primer. Inner face of external sheet shall be provided with suitable pre-coating of minimum 7 microns. The rate of galvanization shall not be less than 275 gm/sqm.
- The permanent colour coated sheet shall meet the general requirements of IS:14246 and shall conform to class 3 for the durability.
- Inner sheet shall be fixed directly to side runners and Z spacers made out of at least 2 mm thick galvanized steel sheet of grade 375 as per IS:277. Inner sheet shall be fixed at the rate not more than 1.50M centre to centre to hold the insulation and external sheeting. The fasteners shall be of high quality corrosion resistant grade of self tapping / self drilling type provided with suitable cap.
- The insulation shall be of bonded mineral wool of minimum thickness 50mm conforming to IS:8183, having a density of 32 Kg/cu.m. for glass wool & 48 Kg/cu.m. for rock wool.

2.02.05

PERMANENT COLOUR COATED (NON-INSULATED) METAL CLADDING SYSTEM

- Troughed zinc-aluminium alloy coated not less than 150 gm/sq.m M.S. sheets having 0.6 mm minimum thickness (or High tensile steel sheet having

TECHNICAL SPECIFICATION FOR SUSPENDED CEILING

SPECIFICATION NO. PE-TS-999-600-C014

VOLUME - II B

SECTION - D | SUB-SECTION - D14

REV.NO. 00 DATE 30/11/2015

SHEET 3 OF 7

SUSPENDED CEILING

1.00.00 SCOPE

This section covers supply and installation of suspended ceiling together with the suspension system as shown on drawing or specified in schedule of item with all materials, labour and equipments. The work shall also include providing of openings in the ceiling for lighting, air-conditioning diffusers etc. as shown on drawings or as instructed by the Engineer.

2.00.00 INSTALLATION

2.01.00 Suspension System

2.01.01 General

Suspension system shall consist of the grid supporting the ceiling panels, intermediate runner supports for the grid if any and hangers, wall angles etc. required to suspend the grid or the runners from structural works, slabs and beams.

All members of the suspension system shall be of sufficient strength and rigidity to carry, the ceiling boards or sheets in a true and level plane without exceeding a deflection of 1/360th of their span. All joints in ceiling panels shall run straight and cross joint shall be at perfect right angles. Angle moulds where shown on drawings shall be securely fixed to walls. All drillings of structural concrete and installation of suitable anchoring device for installation including welding of the suspension system shall be included in the rate. All M.S. sections used for supports etc. shall be given one coat of synthetic enamel paint over a coat of red lead primer.

2.01.02 Metal Grid Suspension System

Aluminium grid ceiling system shall be "Bead lock" as manufactured by W A Beard shell and Co. Pvt. Ltd. or Ajit India Limited or approved equal. Steel grid ceiling system shall be 'Jolly Snap Grid' as manufactured by Jolly Board Limited or approved equal.

Steel tees as intermediate members and steel channels, as end pieces will be assembled in the form of grid. Size of tees and channels shall be as required.

The cross-tees shall intersect main tee runners in pattern shown on drawing and positively locked together with intersection members. All perimeter areas shall have tee runners fixed to vertical wall surfaces and end channels shall be

SHEET 4 OF 7

fixed to runners leaving return air space between vertical wall and channels,

unless otherwise shown on drawings. Angle cleats or other suitable fixing device shall be fixed to the structural beams above for fixing of hangers. Main runners shall be hung by M.S. flats, angles, rods or 12G or heavier galvanized tie wire hangers at maximum 1.2 metre centres. Extra hangers shall be provided at light fixtures that are supported from the ceiling system. The spacing of main and cross runners shall be as shown on drawings. Turnbuckles shall be provided in M.S. rods for adjustment in levels.

2.02.00 Ceiling Panels**2.02.01 Material**

Ceiling panels shall be best quality material in thickness and properties called for in the "Schedule of items". The Contractor shall submit test certificates to the Engineer for approval before bulk supply. The ceiling panels may be of following type:

- a) Plaster of Paris board (decorative)
- b) Expanded polystyrene insulation board with plastic fascia.
- c) Fibre Insulation board.
- d) Bonded wooden particle board (Plain and decorative)
- e) Glass fibre reinforced polystyrene sheets.
- f) Flat asbestos sheets (with plastic fascia).

2.02.02 Installation of Ceiling Panels

Installation of Ceiling panels shall be strictly as per manufacturer's instruction.

For concealed grid system, tiles shall be fixed to the supporting grid in manner shown on drawing or as specified by the manufacturer. Where V joints in tiles are called for in drawings, these shall be in true lines. Where flush surface is required, the joints shall be filled with approved filler material and finished to give a neat uniform surface. Special care shall be taken to neatly finish the ceiling at junctions with walls, light fixtures, diffusers etc.

2.02.03 Aluminium Lineal Ceiling System

SHEET 5 OF 7

Aluminium lineal ceiling system shall be “Luxalon 84C ” or approved equal and the installation shall be strictly as per manufacturer’s instruction/ specification subject to approval of the Engineer.

Aluminium lineal ceiling shall comprise of plain panels, 84 mm wide and 12.5 mm deep with a 23.9 mm recessed flange, roll formed out of 0.5 mm thick aluminium alloy panels stove enamelled on both sides, fixed on roll-formed carriers made of enamelled 0.95 mm thick aluminium, 32 mm wide and 39 mm deep with prongs to hold panels in the module of 100mm, at maximum spacing 1.2 M centre to centre. The carriers shall be suspended from roof by 4 mm dia galvanised steel wire hangers with special height adjustment clips made out of spring steel at maximum spacing of 1.2 M c/c. Hangers shall be fixed to roof by ‘J’ hooks and nylon inserts. 25 mm thick resin bonded mineral wool (spintex 300 or equivalent) insulation bound in polythene shall be laid on top of panels. Lineal ceiling shall be fixed in pattern as per detailed drawings.

3.00.00

SAMPLES

Samples of Ceiling panels and metal suspension system components as noted below shall be submitted for Engineer's approval:

- Panels : 3 samples approximately 300 mm square/long each
- Suspension System : 3 samples of short length : each of main and secondary system

4.00.00

SHOP DRAWINGS

Shop drawings shall be submitted for approval as required and approval shall be obtained prior to delivery of suspended ceiling components. Shop drawings shall be co-ordinated with all related work and shall show the following information:

- A reflected ceiling plan of areas indicated to receive the ceiling showing electrical and mechanical features.
- Typical Intermediate framing for support where required.
- Hanger fastening details.
- Panels - unit support at ceiling penetrations.
- Details of splicing method for main and cross runners.
- A table indicating load bearing capacity of main and cross runner

5.00.00 ACCEPTANCE CRITERIA

Finished ceiling shall be at the correct plane and present a pleasing and uniform appearance, free from, sags, warps, disfigured, or damaged board. Cutouts for light fixtures, diffusers etc. shall be of exact dimensions and in exact locations.

6.00.00 RATES AND MEASUREMENT

6.01.00 Rates

Rates shall be for the complete item called for in the “Schedule of Items”. No extra payment will be made for alignment and adjustment of lighting fixtures, air-conditioning diffusers, access panels etc. The rate shall include all cutting and wastage from standard size sheets, runners/carries etc.

6.02.00 Measurement

Actual area of work shall be measured in Sqm correct to second place of decimal. However, no deduction will be made for opening upto 0.25 Sqm. each in area.

REV.NO. 00 DATE 30/11/2015

SHEET 3 OF 24

WATER SUPPLY, DRAINAGE AND SANITATION**1.00.00 SCOPE**

This section covers supply of all materials labour and incidentals required for supply, laying and installation of under/over ground pipes for water supply, drainage and sanitation with all fittings, fixtures and jointing, construction of ancillary works like manholes, drop connections, gully chambers, septic tank, soak pits, surface drain etc.

The supply and installation of water supply/sanitation fixtures and accessories like water closets, urinals, wash basins, sinks, mirrors, shelves, towel rail, soap container etc. with all fittings, fixtures, water supply/sanitation pipes and water storage tanks etc.

2.00.00 MATERIAL

All materials, fittings, fixtures, and appliances shall be of the best quality conforming to relevant Indian Standard and shall be procured from approved manufacturers. Unless specifically allowed by the Engineer, the Contractor shall submit samples of fittings and fixtures, which will be retained by him for comparison when bulk supplies are received at the site. Ultimate choice of type, model, and manufacturer lies completely with the Engineer.

It shall be the responsibility of the Contractor to procure the materials selected by the Engineer. Hence orders are to be placed with the manufacturers in time, so that the materials are available at the site well ahead of their requirement.

The materials brought to the site, shall be stored in a separate secured enclosure away from the building materials. Pipe threads, sockets, and similar items shall be specially protected till final installation. Brass and other expansive items shall be kept under lock and key. Fragile items shall be checked thoroughly when received at the site and items found damaged shall not be retained at the site.

2.01.01 Pipes and Pipe Fittings

For water supply, galvanised mild steel pipe of medium grade confirming to IS: 1239 shall be used. The galvanising shall not be less than 400gm/sqm of pipe surface area. Galvanising shall be smooth and shall be subjected to testing as per IS: 2633 for uniformity of coating. The zinc coating shall be free from defects.

For Roof drainage and building sanitation works following type of pipe are coved in this Section:

TITLE:

- a) Cast Iron pipe
- b) Steel pipe (lined, coated with bituminous composition, out coated with cement concrete or mortar or galvanized)
- c) Concrete pipe
- d) Asbestos cement pipe
- e) PVC pipe
- f) Stoneware pipe
- g) Vitrified pipe
- h) Lead pipe (not to be used for portable water)

2.02.01

Fixtures

All material, fittings, fixtures, appliances, accessories shall be of approved quality and shall be procured from reputed brands like Hindustan/Pasriware/Cera or equivalent or as approved by Engineer. The bidder shall procure the fixtures from the above named reputed manufacturers and shall mention in his bid the type & make of the fixtures he intends to use.

All items brought to the site must bear the manufacturer's identification mark. Procurements shall be made well in advance and should get inspected & approved immediately by the Engineer. All fixtures shall be adequately protected, covered, and plugged till handing over.

All fittings, gratings, fasteners, unless specified otherwise, shall be chromium plated. The chromium plating shall be of grade-2 (10micron thickness) confirming to IS: 4827. Powder coating shall be of approved colour and shall have minimum thickness (DFT) of 20micron. Stainless steel accessories shall be of grade SS-304 and from reputed manufacturer (like Salem Steel) and shall be polished bright finish.

Unless specified in the contract the fixtures shall be as specified hereinafter.

Water closet

a) European type

It shall consist of European type glazed vitreous china basin (confirming to IS: 2556, part-II), with siphon open front solid plastic seat and plastic

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

SHEET 5 OF 24

cover, low level glazed stoneware flushing cistern with valve less fittings, supply connections and necessary fittings. All fittings shall be chromium plated. Colour of basin, cistern, seat and cover shall be as approved by the Engineer.

b) Squatting type

It shall consist of Orissa pattern glazed vitreous china squatting pan with integral foot rests (confirming to IS:2556, part-III) and high level cast iron flushing cistern with valve less fittings, supply connections and necessary fittings. All fittings shall be chromium plated. The flushing cistern shall be painted as specified by the Engineer.

Urinals

It shall consist of wall type glazed vitreous china urinals (conforming to IS:2556), cast iron automatic flushing cistern complete with supply connections, flush pipe, lead pipes, gratings, traps and all other necessary fittings. Frequency of automatic flushing shall be approximately once every five minutes. For every four urinals (maximum) located together may be served by one cistern of adequately capacity. All fittings shall be chromium plated.

Wash Basin

It shall be made of glazed vitreous china conforming to IS:2556, part-IV. The basin shall be flat back, wall hung by painted cast-iron brackets and complete with hot and cold CP brass faucets with nylon washers, PVC connection pipe with CP brass nuts, CP brass chain with rubber plug, 32mm dia. Chromium plated brass waste of standard pattern, 32mm dia. CP brass trap union complete with necessary fittings.

Sink

It shall be made of glazed vitreous china conforming to IS:2556, part-V. It shall be wall hung by painted cast iron brackets and complete with one CP brass faucet with nylon washers, PVC connection pipe with CP brass nuts, CP brass chain with rubber plug, 40mm dia. chromium plated brass waste of standard pattern, 40mm dia. CP brass trap union complete with necessary fittings.

Bathroom mirror

It shall be made of the best quality 6 mm thick glass and produced by a reputed mirror manufacturer. It shall be wall mounted with adjustable revolving brackets. The brackets, screws, and other fittings shall be chromium plated.

TITLE:

FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 6 OF 24

Glass shelves

Class shelves shall consist of 6 mm thick clear glass with guardrails and shall be wall mounted with brackets. All brackets, guardrails, and screws shall be chromium plated.

Towel rail

Towel rails shall be 20 mm dia chromium plated MS pipes wall mounted with steel brackets. The brackets, screws etc. shall also be chromium plated.

Soap holder

It shall be made of chromium plated strong members. The holders shall be wall mounted with chromium-plated screws.

Liquid Soap Dispenser

It shall be round and easily revolving with removable threaded nozzle. The body, bracket for wall mounting and screws shall be chromium plated.

Toilet roll holder

It shall be made of glazed vitreous china with suitable cover cum cutter. Wall mounting screw shall be chromium plated.

Valve, cocks, Taps

All valves, stop cocks, taps etc. shall conform to relevant Indian standard specification and shall be of best quality from approved manufacturers. These shall be suitable for normal working pressures. Nominal size and material shall be as required / specified.

2.03.00 Water Storage Tank

Water storage tank shall be PVC of approved brand and make (Syntex or equivalent). Reservoirs made of concrete masonry or fabricated steel shall be covered by respective work specifications.

3.00.00 INSTALLATION

3.01.00 General

Basic layouts may be available in the drawings provided, the details might

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 7 OF 24

have to be supplemented by the Contractor and get the approval of the Engineer before installation. Special attention shall be given to economise the layout. Symmetry of layout is very important. Fittings meant for operation shall be located and oriented to allow easy reach and operation. Maintenance, repairs, and replacements of pipes, fittings, and fixtures must be conveniently possible. All pipe lines, locations of fittings and fixtures, etc. shall be as per drawings or as directed by the Engineer. Correctness of lines, plumb, orientation, symmetry, and levels shall be strictly ensured. All items shall be fully secured against movement in any direction and so located as to allow easy maintenance.

All pipelines, fittings, and fixtures shall be installed leak proof. When the works under scope of this specification linked up with works executed by others, the connections shall be such as to prevent any splashing or spilling or emission of foul odour and gases.

3.02.00 Portable water supply Pipe Lines

3.02.01 Laying

In addition to fulfilling the functional requirements all pipelines shall be laid true to line, plumb and level and shall run on the surface of the walls, ceiling or in chases. Any deviation shall need approval of the Engineer. Meticulous care shall be taken to avoid chances of airlock and water hammer.

Pipes shall be laid on continuous unyielding surface or on reliable supports at least one near each joint and spacing as directed by the Engineer. The support must be strong, neat and shall have provisions for securing the pipes in every direction and easy maintenance. All pipes used for water supply should be thoroughly and efficiently disinfected before taken in to use.

3.02.02 Back Flow

The layout of pipe work shall be such that there is no possibility of back flow towards the source of supply from any cistern or appliances, whether by siphonage or otherwise. All pipe works shall be so laid or fixed and maintained as to be and to remain completely watertight, thereby avoiding waste of water, damage of property and the risk of contamination of the water conveyed.

3.02.03 Contamination

There shall be no cross connection whatsoever between a pipe/fitting for conveying or containing wholesome water and a pipe/fitting for containing impure water or water liable to contamination or of uncertain quality of water which has been used for any other purpose. No piping shall be laid or fixed so

TITLE:

FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 8 OF 24

as to pass into or through any sewer, scour outlet or drain or any manhole connected therewith.

3.02.04 Underground Piping

Underground piping shall be laid at such a depth that it is not likely to be damaged by traffic and other loads and frost, where applicable. The size and depth of the trench shall be as approved by the Engineer. Back filling shall be done with selected fine earth, unless otherwise permitted, in 150 mm layers and carefully consolidated. Special care shall be taken while filling in the vicinity of the pipe to avoid damage. Before backfilling, the laid pipe shall be fully tested and approved.

Where the pipe rests on rock it may be bedded on a layer of fine selected material or concrete to avoid local point support. The trench shall be so treated by gradient and filling in the area that it does not act as a drainage channel.

3.02.05 Concealed Piping

Where desired by the Engineer or shown on the drawings the pipes shall be concealed in masonry or concrete of the structure. The Contractor may co-ordinate with the building Contractor for leaving the chases, openings, and conduits as necessary. However, the Contractor will rectify if required the chases, openings, and conduits, supplement and make good after laying and testing of the concealed pipelines.

3.02.06 Jointing of Pipes

All G.I. pipes shall be properly thread/weld jointed and made completely water tight and durable. Burr from the joints shall be removed after screwing. Union joints shall be provided for all required location to facilitate maintenance.

3.02.07 Painting

Where required, underground G.I. pipes shall be given 2 coats of bituminous paint on the outside after laying. When painting is to be done above ground G.I. pipes shall be given one coat of red lead or zinc chromate primer and top coats shall be minimum 2 coats of best quality paint as specified.

3.03.00 RAINWATER DOWN COMERS

3.03.01 Pipes

Rainwater down comers shall be standard Cast Iron or Asbestos Cement Pipes.

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 9 OF 24

In case where specifically desired, M.S. pipes may also be used. M.S. pipes shall be painted outside with two coats of anticorrosive paints under a coat of primer.

Rainwater down comers shall run along and be secured to walls, columns etc. Where desired by the Engineer these may have to be installed in chases cut in the structure. All pipes shall be well secured and supported by adequately strong brackets. The brackets may be wrought iron clevis type, split ring type, or perforated strap iron type as approved by the Engineer. For vertical runs each pipe shall hang freely on its brackets fixed just below the socket. Suitable spacer blocks shall be provided against the vertical surface to which the pipe is fixed.

All bends and junctions shall be supplied with watertight cleanouts.

Roof and floor drains and yard gullies shall be installed, if required, by cutting into the structure and grouted with 1:2:4 cement concrete. All gutters shall be provided with removable gratings.

All horizontal pipes shall have a minimum fall of 1 in 100.

3.03.02 Khurras

The khurras shall be constructed before the work in parapet wall is taken up and it shall be 45x45 cm in size, unless otherwise specified and shall be formed of cement concrete of M-20 grade.

3.03.03 Gutters

The gutters shall be made of G.I. or A.C and procured from reputed specialised manufacturers. Each section shall be sufficiently rigid, edges and corners straight and the slopes perfectly uniform. G.I. gutters shall have the edges strengthened by suitable means.

Unless noted otherwise the gutters shall have a minimum fall of 1 in 120. Adequate number of string supports shall be provided so that there is no sagging even when the gutter is full. Each joint must have a support. Unless otherwise specified the supports shall be fabricated M.S. brackets. All junctions shall be thoroughly watertight. The joints may be made by riveting, bolting or soldering. All joints between successive lengths of gutters shall have an overlap of at least 5 cm. The drop in the overlap shall always be in the direction of the fall of the gutter. Ends of gutters shall be closed watertight. Junction with rainwater down comers shall be made fully watertight and secured.

3.04.00 SOIL AND DRAINAGE PIPES

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 10 OF 24

3.04.01 Gradients

If not specified the minimum gradients of soil and drainage pipeline shall be as follows:

100 mm nominal dia	:	1 in 35
150 mm nominal dia	:	1 in 65
230 mm nominal dia	:	1 in 120
300 mm nominal dia	:	1 in 200

3.04.02 Relation with water supply pipelines

Unless specifically cleared by the Engineer, under no circumstances shall drainage and sewer pipes be allowed to come close to water supply pipelines.

3.04.03 Laying

Each separate pipe shall be individually set for line and for level. Where lengths of sewer or drain pipes are laid in trench, properly painted sight rails shall be fixed across the trench at a height, equal to length of the boning rod to be used, above the required invert level of the drain or sewer at the point where the sight is fixed. More sight rails shall be required at manholes, change of gradient and intermediate positions if the distance for sighting is more than 50 ft. apart. The excavation shall be boned in at least once in every 6 ft. The foot of the boning rod shall be set on a block of wood of the exact, thickness of the wall of the pipe. Each pipe shall be separately and accurately boned between sight rails.

3.04.04 Support and Protection of Pipelines

All pipes shall be laid with sockets leading uphill. Preferably the pipe shall rest on solid and even foundations for the full length of the barrel. However, the pipe manufacturer's instruction as approved by the Engineer shall be followed in the matter of support and jointing.

To achieve full and continuous support, concrete for bedding and packing is the best. Where pipes are not bedded on concrete, the floor shall be left slightly high and carefully placed so that the pipe barrels rest on undisturbed ground. If anywhere the excavation has been carried too low packing shall be done in concrete. Where laid on rock or very hard ground which cannot be easily excavated to a smooth surface, the pipes shall be laid on a cradle of fine concrete floor of gravel and crushed stone over laid with concrete or on a well consolidated gravel and crushed stone bed as desired by the Engineer. PVC or similar pipes shall be laid directly on stable soil and packed with selected soil.

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 11 OF 24

The minimum support and protection for glazed stoneware pipes shall be as follows:

- a) When cover is less than 2 metre below ground level and where pipes are unavoidably exposed above ground surface, the pipes shall be completely encased or surrounded with concrete.
- b) Where pipes are laid on soft soil with the maximum water table laying at the invert of the pipe, the sewer shall be bedded on concrete.
- c) Where the pipes have to be laid on soft soil with the maximum water table rising above the invert of the pipe, but below the top of the barrel, the pipe sewer shall be haunched.
- d) Where maximum water table is likely to rise above the top of the barrel or wherever the pipe is laid on soft soil the pipe sewers shall be completely encased or surrounded with concrete.

Vitrified clay pipes shall be laid on a bed of 150 mm thick cement concrete (1:3:6) nominal mix by volume.

Cast iron pipes and concrete pipes may be supported on suitable concrete or brick support, where specified. The supports shall be unyielding and strong enough. At least one support shall be located close to ends. Spacing of intermediate supports shall be as decided by the Engineer. Pipes shall be secured to the supports by approved means.

Anchoring of pipes where necessary shall be achieved by suitable concrete encasing designed for the expected thrust.

3.04.05 Entry into structures

For entry of the pipe lines into any building of structure suitable conduits under the structure or sleeves shall be used. The conduits and sleeves shall be such as to allow easy repairs and replacement of the pipes. When openings or chases are required to be made in the structure for entry of pipelines, locations and sizes shall be marked and checked by the Engineer. After laying of the pipeline the openings and chases shall be mended.

3.04.06 Ducts

Where solid, waste and ventilating pipes are accommodated in ducts, access to cleaning areas shall be provided. Connection to drain shall be through a gully with sealed cover to guard against ingress of sewer gas, vermin, or backflow.

3.04.07 Traps and Ventilating Pipes

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 12 OF 24

Pipes are carrying off the waste from water closets and waste water and overflow water from baths, wash basins, sinks to drains shall be trapped immediately beneath such fixtures. Traps shall have minimum water seal of 50 mm and shall be ventilated whenever such ventilation is necessary to maintain water seal of the trap. Ventilating pipes shall be carried up vertically from the drain to a height of at least 600 mm above the outer covering of the roof of the building or as shown on drawings. All vertical ventilating, anti-siphonage and similar pipe shall be covered on top with a cowl. The cowl shall be made of C. I. unless desired otherwise by the Engineer.

3.04.08 Manhole & Inspection Chambers

At every change of alignment, gradient or diameter there shall be a manhole or inspection chamber. The maximum distance between manholes shall be 30 meter unless specially permitted otherwise. However, for truck route (for pipes above 900 mm dia.) this distance can be increased to 45 M. The distance between manhole or inspection chamber and gully chamber shall not exceed 6 metres unless desired otherwise provision of IS: 4111 (Part-1) shall be followed for construction of a manhole. Manhole shall be constructed so as to be watertight under test. The change in alignment shall be carried out in such a manner as to provide no lodgement for any splashings in case of accidental flashing of the chamber. The channel or drain at the bottom of chamber shall be plastered with 1:2 cement, sand mortar and finished smooth to the grade. The channels and drains shall be shaped and laid to provide smooth flow.

Connecting to existing sewer lines shall be through a manhole.

Unless otherwise specified, 560 mm dia. circular cast iron manhole cover with frame, heavy-duty, conforming to IS: 1726 shall be provided. The covers shall be close fittings so as to prevent gases from coming out.

3.04.09 Cutting of Pipes

Manufacturer's instructions shall be followed for cutting of pipes where necessary. Suitable and approved tools shall be used for the cutting so as to leave surface clean and square to the axis of the pipe.

3.04.10 Jointing

Jointing of pipes shall be so planned as to avoid completely any movement or strain to the joints already made. If any joint is suspected to be damaged it shall be opened out and redone.

All joints between pipes, pipes and fittings and manholes shall be gas-tight when above ground and watertight when underground. Method of jointing

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 13 OF 24

shall be as per instructions of the pipe and fittings manufacturer and as approved by the Engineer. However, in the absence of any instruction available from the manufacturer the methods as detailed hereunder shall be used.

a) Cast Iron Pipes

Socket and spigot pipes shall be jointed by the cast lead joints. The spigot shall be centred in the socket of the pipe by tightly caulking in sufficient turns of tarred gasket or hemp yarn to have unfilled half the depth of socket. When the gasket or hemp yarn has been caulked tightly a jointing shall be placed round the barrel and tightened against the face of the socket to prevent airlock. Molten lead shall then be poured in to fill the remainder of the socket and caulked with suitable tools right round the joint to make up for shrinkage of the molten metal on cooling and shall be finished 3 mm behind the socket face.

Joints in cast iron pipes with special jointing arrangements like 'Tyton' Joints etc. shall follow the instructions of the manufactures.

In special cases if flanged joints are accepted by the Engineer the joints shall be made leak proof by inserting approved type of rubber gaskets. The bolts shall be secured in stages to avoid uneven strain.

b) Concrete Pipes

Jointing of concrete pipes shall be generally of rigid type. Unless otherwise stated collar type joint shall be provided. IS: 783 shall be followed for general guidance.

The two adjoining pipes shall be butted against each other and adjoined in correct position. The collar shall then be slipped over the joint, covering equally both the pipes. The angular space shall be filled with stiff mixture of cement mortar 1:2 (1 cement : 2 sand) which shall be rammed with caulking tool. After a day's work, any extraneous material shall be removed from the inside of the pipe and the newly made joint shall be cured for 7 days.

c) Glazed Stoneware Pipes

Tarred gasket or hemp yarn soaked in thick cement slurry shall first be placed round the spigot of each pipe and the spigot shall then be placed into the socket of the pipe previously laid. The pipe shall then be adjusted and fixed in the correct position and the gasket caulked tightly so as not to fill more than 1/4 of the total depth of the socket. The remainder of the socket shall be filled with a stiff mixture of cement mortar 1:1 (1 cement :

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 14 OF 24

1 sand). A fillet shall be formed round the joint with a trowel, forming an angle of 45 deg. with the barrel of the pipe. The newly made joints shall be protected, until set and shall be cured by covering with damp cloth or other suitable materials.

d) Vitrified clay pipes

The vitrified clay pipe shall be made from refractory clay mixed with crushed pottery and stone and burnt at a high temperature. These shall be hard, compact, and glazed to make them acid resistant and impervious, and shall be obtained from approved manufacturer.

Special care shall be taken in handling these pipes. The pipes shall not be jointed until the earth has been partly refilled over the portion of the pipe between the joint holes. Before laying the second pipe, the socket of the first pipe laid shall be thinly painted all round on the inside with cement slurry (1 part of cement and 2 parts of clean, sharp sand). A ring of rope yarn (closely twisted hemp or jute) dipped in neat cement paste or tar or bitumen, shall be inserted in the socket of pipe and driven home with caulking tools. The rope shall fully encircle the spigot with a slight overlap and shall not occupy more than one-fourth of the total depth of the socket. Where the spigot end of the pipe is made for receiving the gasket, it shall be wrapped with two or three turns of tarred spun, as close to the end as possible, before inserting into the socket. The joint shall then be completely filled with cement mortar (1:1), which shall have very little water. A fillet shall be formed round the joint with trowel, forming an angle of 45 degrees with the outside pipe. Special care shall be taken so that any excess mortar etc. left inside the pipe joints is neatly cleaned off immediately after each joint is made. A semi-circular wooden scrapper or a rubber disc to which a long handle is fixed could be used for this purpose.

e) Lead Pipes

The joints in lead pipes shall be made as wiped solder joint. The minimum and the maximum length of the wiped solder joints shall be 8 cm. and 9 cm. respectively. The solders shall generally consist of two parts of lead and one part of tin.

f) Polyethylene Pipes

The joints shall be thermo welded or bolted as per manufacturer's instructions.

g) Jointing Cast Iron Pipes with Stoneware Pipes

Where any cast iron drain pipe, ventilating pipe or trap is connected with a

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 15 OF 24

stoneware or semi-vitrified waste pipe, the beaded spigot end of such cast iron drain pipe, waste or ventilating pipe or trap shall be inserted into a socket of such stoneware pipe and the joint made with mortar consisting of one part of cement and one part of clean sand after placing a ratted gasket or hemp yarn soaked in neat cement slurry round the joint and inserted in it by means of a caulking tool.

h) Jointing Stoneware with Cast Iron Pipes

Where any water closet pan or earthware trap connected to such a pan is to be jointed with a cast iron soil pipe, the joint between the stoneware spigot and the cast iron socket shall always be of a flexible nature. Such joint shall be made with a mixture of bitumen and chopped asbestos fibre.

3.04.11 Trenches and other excavations

Width of the trench at the bottom shall be such as to provide 200 mm clearance on either side of the pipe for facility of laying and jointing.

Excavated material shall be stacked sufficiently away from the edge of the trench and the side of the spoil bank shall not be allowed to endanger the stability of the excavation. Spoil may be carted away and used for filling the trench behind the work.

Turf, top soil or other surface material shall be set aside, turf being carefully rolled and stacked for use in reinstatement.

All excavation shall be properly timbered, where necessary.

Efficient arrangements for dewatering during excavation and keeping it dry till backfilling shall be made to the satisfaction of the Engineer. Sumps for dewatering shall be located away from the pipe layout.

Where the excavation proceeds through roads necessary permissions shall be secured by the Contractors from the appropriate authorities.

Special care shall be taken not to damage underground services, cables etc. These when exposed shall be kept adequately supported till the trench is backfilled.

The backfilling shall be done only after the pipeline has been tested and approved by the Engineer. Special care shall be taken under and sides of the pipe during hand packing with selected material. At least 300 mm over the pipe shall also be filled with soft earth or sand. Consolidation shall be done in 150 mm layers. The surface water shall be prevented from getting into the filled up trench. Traffic shall not be inconvenienced by heaping up unduly the

	TITLE: TECHNICAL SPECIFICATION FOR WATER SUPPLY, DRAINAGE AND SANITATION	SPECIFICATION NO. PE-TS-999-600-C015 VOLUME - II B SECTION - D SUB-SECTION – D15 REV.NO. 00 DATE 30/11/2015 SHEET 16 OF 24
	backfilling material to compensate future settlement. All future settlements shall be made good regularly to minimize inconvenience of traffic where applicable. 3.04.12 Protection Open end of each pipe shall be protected during installation by suitable covers or plugs so that the ends, threads, sockets, or spigot are not damaged and no foreign material can find its way into the pipeline. Fittings and fixtures liable to be misused or stolen during the construction phase shall be fitted only before testing and handing over. 3.05.00 WATER STORAGE TANKS Overhead/loft type water storage tank shall be made of PVC. These tanks shall be provided for each toilet block and placed on the roof/loft of the building. Tank shall be installed with proper supports and anchorage for applicable wind and seismic condition. Installation of tank shall be carried out according to the recommendation of IS: 12701. These tanks shall rest preferable on flat surface so as to distribute the load evenly. The tank shall be leakproof and water tight. The outlet pipe shall be 50 mm above the bottom of the tank and provided preferably with strainers. The wash out or draining pipe shall be connected at the lowest point and flush with bottom of tank. Tank shall be provided with all fittings for inlet, outlet, overflow pipes and ball valves. 3.06.00 SEPTIC TANK AND EFFLUENT DISPOSAL 3.06.01 Septic tank Septic tank shall consist of the tank itself with inlet and outlets there from complete with all necessary earthwork and backfilling. The details of septic tank shall be as shown on drawings. This item shall also include ventilating pipe of at least 100 mm dia whose top shall be provided with a suitable mosquito proof wiremesh and cowl. Ventilating pipe shall extend to a height of about 2 meter when the septic tank is at least 15 meter away from the nearest building and to a height of 2 meter above the top of building when it is located closer than 15 meter. Ventilating pipes can be connected to the normal soil ventilating system of the building where allowed. 3.06.02 Effluent Disposal The effluent from the septic tank shall be disposed by allowing it into an open channel or a body of water if the concerned authority approves or into a soak	

	TITLE: TECHNICAL SPECIFICATION FOR WATER SUPPLY, DRAINAGE AND SANITATION	SPECIFICATION NO. PE-TS-999-600-C015 VOLUME - II B SECTION - D SUB-SECTION – D15 REV.NO. 00 DATE 30/11/2015 SHEET 17 OF 24
	pit for absorption by soil or shall be allowed to be absorbed by soil through open jointed SW pipes laid in a trench filled with broken bricks. 3.06.03 Soak pit The soak pit shall be complete. It shall consist of a 900 mm dia pit 1000 mm in depth below the invert level of the inlet pipe. The pit shall be lined with stone; brick or concrete blocks set in cement mortar (1:6) and filled with brickbats. Inlet pipe shall be taken down to a depth of 900 mm from the top as an anti-mosquito measure. 3.06.04 Open jointed SW Pipe/dispersion trenches Minimum dia of the SW pipes shall be 150 mm nominal. The trench for laying the pipes shall be a minimum 600 x 600 mm. The joints of the pipes shall be left unsealed. The entire length of the pipe within the trench shall be buried in a 250 mm layer gravel or crushed stone of uniform size. On top of gravel/crushed stone layer is a 150 mm bed of well-graded coarse aggregate. Ordinary soil is used for filling the top of trench. 3.06.05 Commissioning septic tank After the septic tank has been proved watertight and the sewage system is checked the tank shall be filled with water to its outlet level before the sewage is let into the tank. It shall be seeded with well digested sludge obtained from septic tank or sludge digestion tank. In the absence of digested sludge a small quantity of decaying organic matter such as digested cow-dung may be introduced. 3.07.00 Related Works All works, like earthwork, masonry, concrete, steelwork, cutting holes, chases, repairs and rectification associated directly with installation of water supply and sanitation systems shall come under scope of the Contractor unless specifically excluded. These works are not detailed out in this Section. 3.08.00 Regulation The work which is required to be carried out under this section, shall be executed by a licensed Plumber only (engaged by the Contractor) and he shall obtain all necessary sanctions, permissions, certificates etc., from Municipal and/or other Local Authorities and shall abide by all the rules of such Authorities. 4.00.00 TESTING AND ACCEPTANCE CRITERIA	

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 18 OF 24

4.01.00 Inspection Before installation

All pipes, fittings, and appliance shall be inspected, before delivery at the site to see whether they conform to accepted standards. The pipes and fittings shall be inspected on site before laying and shall be sounded to disclose cracks. Any defective items shall be clearly marked as rejected and forthwith removed from the site.

4.02.00 Testing of Water Supply pipe line**4.02.01 Testing of Mains After Laying**

After laying and jointing, the main shall be slowly and carefully charged with water, so that all air is expelled from the main by providing a 25 mm inlet with a stop-cock, allowed to stand full of water for a few days if time permits, and then tested under pressure. The test pressure shall be 5 Kg/sq.cm or double the maximum working pressure, whichever is greater. The pressure shall be applied by means of a manually operated test pump, or in the case of long mains or mains of a large diameter, by a power driven test pump, provided that the pump is not left unattached. In either case due precaution shall be taken to ensure that the required test pressure is not exceeded. Pressure gauges shall be accurate and shall preferably have been recalibrated before the test. The pump having been stopped, the test pressure shall maintain itself without measurable less for at least five minutes. The end of the main shall be closed by fitting a watertight expanding plug and the plug shall be secured by struts to resist the end thrust of the water pressure in the mains.

4.02.02 Testing of Service Pipes and Fittings

The service pipes shall be slowly and carefully charged with water allowing all air to escape avoiding all shock or water hammer. The service pipe shall then be inspected under working conditions of pressure and flow. When all draw-off taps are closed, the service pipes shall be absolutely watertight. All piping, fittings, and appliances shall be checked for satisfactory support and protection from damage, corrosion, and frost.

4.03.00 Testing of Drain and Sewerage Pipelines

All soil pipes, waste pipes, ventilating pipes and all other pipes, when above ground, shall be gas tight. All sewers and drainpipes laid below ground shall be tested water tight. The method of actual tests shall be decided by the Engineer. All test data shall be recorded and submitted to the Engineer for review and instruction. The Engineer's discretion regarding tolerance shall be final.

General guidance for the tests are given below:

TITLE:

**TECHNICAL SPECIFICATION
FOR WATER SUPPLY,
DRAINAGE AND SANITATION**

SPECIFICATION NO. PE-TS-999-600-C015

VOLUME - II B

SECTION - D | SUB-SECTION - D15

REV.NO. 00 DATE 30/11/2015

SHEET 20 OF 24

a) Smoke test

All soil pipes, waste pipes and vent pipes and all other pipes when above ground shall be approved gastight by a smoke test conducted under a pressure of 25 mm of water and maintained for 15 minutes after all trap seals have been filled with water. The smoke is produced by burning oily waste or tarpaper or similar material in the combustion chamber of a smoke machine. Chemical smokes shall not be used.

b) Water test

The pipes shall be subjected to a test pressure of at least 1.5 m head of water at the highest point of the section under tests. The tolerance figure of two litres per centimetre of diameter per kilometre may be allowed during a period of 10 (ten) minutes. The test shall be carried out by suitably plugging the low end of the drain and the ends of connections, if any, and filling the system, with water. A knuckle bend shall be temporarily jointed in at the top end and a sufficient length of the vertical pipe jointed to it so as to provide the required test head or the top end may be plugged with a connection to a hose ending in a funnel which could be raised or lowered till the required head is obtained and fixed suitably for observation.

Subsidence of test water may be due to one or more of the following cases:

- a) Absorption by pipes and joints
- b) Sweating of pipes or joints
- c) Leakage at joints or from defective pipes
- d) Trapped air.

Allowance shall be made for (a) by adding water until absorption has ceased and after which the test proper should commence. Any leakage and the defective part of the work shall be cut out and made good.

c) For straightness

- i) By inserting at the high end of the sewer or drain a smooth ball of a diameter 13 mm less than the pipe bore. In the absence of obstruction, such as yarn or mortar projecting through the joints, the ball will roll down the invert of the pipe and emerge at the lower end; and
- ii) By means of a mirror at one end of the line and lamp at the other. If the pipeline is straight, the full circle of light may be observed. The mirror

	will also indicate obstruction in the barrel if the pipeline is not straight. 4.04.00 Fittings and Fixtures etc. All fittings and fixtures shall be connected by water tight joints. No dripping of water shall be acceptable. 4.05.00 Testing Septic Tank The septic tank shall be tested for water tightness. It shall be filled up with water and allowed to soak for 24 hours. Then, it shall be topped up and allowed to stand again for 24 hours and loss of level recorded. The fall shall not be more than 15 mm in 24 hrs. 5.00.00 I.S. **Standard Technical Specification
For Road and Drainage**

1.00.00 Scope

The scope include all works required for the construction of road including construction of embankment, sub-base course, base course, tack coat, bituminous macadam, wearing course, liquid seal coat, shoulder and all incidental items of work specified or not shown but reasonably implied or necessary for the completion of the work etc.

The scope also include all works required for the construction of drainage including construction of road side drains, RCC culverts, pipe culverts, drainage pipes, manholes and all other incidental items necessary for the completion of the work etc.

1.01.00 Works To Be Provided By The Contractor

The works to be provided by the contractor unless specified otherwise shall include but not be limited to the following.

a) Construction of roads including providing all materials, labour, supervision, services, equipments, tools and plants, transportation etc all required for the completion of the work.

b) Submission of detailed scheme of all operations required for executing the work (e.g. material handling, placement, services, approaches etc) to the engineer for approval.

c) Carrying out tests whenever required by the engineer to assess the quality of work and submission of the test results to the engineer after completion of the same etc.

1.02.00 Work To Be Provided By Others

No work under this specification will be provided for by any agency other than the contractor unless specifically mentioned elsewhere in the contract.

1.03.00 Conformity With Designs

The contractor shall carryout the work as per the construction drawings, specification and as directed by the engineer.

- q) IS : 3117 - Specification for bitumen emulsion roads (anionic type)
- r) IS : 1200 - Method of measurement of building and civil engineering work (Part-17)- Road work including airfield pavements
- s) Other specifications mentioned elsewhere in this specification.

In case any particular aspect of work is not covered specifically by the specification/Indian Standard Code of practices, any other standard practice as may be specified by the engineer shall be followed.

2.01.00

Quality Control

The Contractor shall establish and maintain quality control for all materials, procedures, workmanship and equipments used. All works shall conform to the lines, grades, cross sections and dimensions shown on the drawings, specification and as directed by the engineer. Permitted tolerances for road works are described hereinafter.

a) Horizontal Alignment

Horizontal alignment shall be reckoned with respect to the centre line of the carriageway as shown on the drawings. The edges of the carriageway as constructed shall be correct within a tolerance of $\pm 25\text{mm}$ therefrom. The corresponding tolerance for edges of the roadway and lower layers of the pavement shall be $\pm 40\text{mm}$.

b) Longitudinal Profile

The finished levels of the sub-grade and different pavement courses as constructed shall not vary from those calculated with reference to the longitudinal and cross-profile of the road shown on the drawings or as directed by the engineer and shall not exceed the tolerances as mentioned below.

Sub-grade	$\pm 25 \text{ mm}$
Sub-base	$\pm 20 \text{ mm}$
Base course	$\pm 15 \text{ mm}$
Wearing course	$\pm 10 \text{ mm}$

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 6 OF 37

Tolerance in wearing course shall not be permitted in conjunction with the positive tolerance on base course if the thickness of the wearing course is thereby reduced by more than 6 mm.

c) Surface Regularity of Sub-grade and Pavement Courses

The surface regularity of the completed sub-base, base course and wearing surfaces in the longitudinal and transverse directions shall be within the tolerances indicated in Table - I. The longitudinal profile shall be checked with a 3m long straight edge at the middle of each traffic lane along a line parallel to the centre of the road. The transverse profile shall be checked with a set of three camber boards at intervals of 10m.

TABLE -I

PERMITTED TOLERANCE OF SURFACE REGULARITY FOR PAVEMENT COURSES

Sl. No.	Type of Construction	Longitudinal profile with 3m straight edge				Cross Profile	
		Maximum permissible Undulation (mm)	Maximum number of undulations permitted in any 300m length with undulation exceeding (mm)				Maximum permissible variation from specified profile under camber template (mm)
			18	12	10	6	
1	2	3	4	5	6	7	8
1.	Earthen sub-grade	25	30	-	-	-	15
2.	Granular sub-base	15	-	30	-	-	12
3.	Water Bound Macadam with oversize metal (40-90 mm size)	15	-	30	-	-	12
4.	Water Bound Macadam with normal size metal (20-50 mm and 40-63 mm size), Bituminous Penetration Macadam	12	-	-	30	-	8
5.	Surface dressing** (two coat) over WBM (20-50 mm or 40-63 mm size metal), Bituminous penetration macadam	12	-	-	20	-	8

Notes:

1. ** For surface dressing in all other cases, the standards of surface evenness will be the same as those for the surface receiving the surface dressing.
2. *** These are for machine laid surfaces. If laid manually due to unavoidable reasons, tolerance upto 50 percent above these values in this column may be permitted at the discretion of the Engineer. However this relaxation does not apply to the values of maximum undulation for longitudinal and cross profiles mentioned in columns 3 and 8 on the table.
3. Surface evenness requirements in respect of both the longitudinal and cross profiles should be simultaneously satisfied.

3.01.00 Setting Out

3.02.00 Clearing and Grubbing

**TITLE:****TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 8 OF 37

Before commencement of earthwork, the surface area of ground to be occupied shall be cleared of all fences, trees, logs, stumps, bushes, vegetation, rubbish, slush etc. Cutting of trees shall include trees having girth of any size and removing roots upto a depth of 600mm below ground level or 300mm below formation level whichever is deeper. After the removal of roots of trees, the pot holes formed shall be filled with good earth in 250mm layers (loose thickness) and compacted unless otherwise directed by the Engineer. The trees shall be cut into suitable pieces as instructed by the Engineer. Before earthwork is started, all the spoils and unserviceable materials and rubbish shall be burnt or removed from the site to the approved disposal areas as may be specified. Useful materials, saleable timbers, firewood etc shall be the property of the Owner and shall be stacked properly at the work site in a manner as directed by the Engineer.

3.03.00 Filling in Embankment**3.03.01 General**

The material used for constructing the embankment shall be earth, moorum, gravel or a mixture of the above or any other material approved by the Engineer. The material shall be free from lumps and clods, boulders and rock pieces, roots and vegetation, harmful salts and chemicals, organic materials, loose silts, fine sands and expansive clays in order to provide a stable embankment. The filling and compaction operation should be such that the best available materials are saved for the top portion and will result in an acceptable and uniform gradation of material and provide impermeability and stability to the embankment when compacted. The size of the coarse material in the mixture of earth shall ordinarily not exceed 75mm. However the Engineer may at his discretion permit the use of material coarser than the specified if he is satisfied that the same will not present any difficulty as regard to the placement and compaction of the fill material are concerned. Ordinarily, only the materials satisfying the density requirements as given below in Table-II shall be employed for embankment construction.

Table - II

Density Requirements of Embankment Materials

Sl. No.	Type of Work	Maximum laboratory dry density when tested as per IS: 2720 (Part - VII)
1.	Embankment upto 3m height	Not less than 1.44 gm/cc
2.	Embankment exceeding 3m height and embankment of any height subject to long period of inundation	Not less than 1.52 gm/cc
3.	Top 0.5m of the embankment below sub-base and shoulders (where earth shoulders are specified)	Not less than 1.65 gm/cc

Expansive clays exhibiting marked swell and shrinkage properties shall not be used for embankment construction.

The material for embankment construction shall be obtained from approved sources with preference given to the materials available from nearby road excavation or any other excavation under the same contract.

3.03.02 Setting Out

After the site clearance, the work shall be set out true to lines, curves, slopes, grades and sections as shown on the approved drawings or as directed by the Engineer. The contractor shall provide all labour, survey instruments and materials such as strings, pegs, nails, bamboo, stones, lime, mortar, concrete etc required in connection with the setting out of the works and establishment of the bench marks. The limits of the embankment shall be marked by fixing batter pegs on both sides at regular intervals as guides before commencing the earthwork. To ensure the safety, the pegs should normally be fixed about 500mm away from the actual limits of the fill and to be painted in a distinct colour. The centreline of the embankment shall be pegged at regular intervals of 25/30m and at all skewes/curves. The actual profile of the embankment shall be made at every third centre line peg with bamboo posts and strings. Preferably prototype profiles developed with wooden planks need to be fixed at every 200m and at the intersection points at curves. The profile shall be about 3m long.

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 10 OF 37

3.03.03 Stripping and Storing top soil

The construction of the earthen embankment by filling shall conform to the dimensions, slopes and other details shown in the approved drawings. Before commencement of the embankment construction, the surface area of ground to be occupied after clearing and grubbing shall be stripped off to a minimum depth of 150mm or more as directed by the Engineer in order to remove all perishable materials and any soil which may become unstable on saturation or may interfere with the development or proper bonding between the foundation and embankment. It is not necessary to remove all the soil containing fine hair like roots but only the rather heavy mats are to be removed. In localities where most of the available embankment fill materials are not conducive to plant growth or when so directed by the Engineer, the top soil suitable for plant growth existing over the embankment foundation areas shall be stripped to specified depths not exceeding 150mm and stored for covering the embankment slopes where revegetation is desired.

3.03.04 Compacting Original Ground

In all cases, the original ground after stripping shall be compacted by rolling with a minimum six passes of 8-10 tonne roller and as directed by the Engineer.

Where the height of the proposed embankment is less than 0.5m and the original ground does not already have a relative compaction of atleast 95 percent of Standard Proctor density (maximum dry density), the same shall be loosened upto a depth of 0.5m and filled in layers not exceeding 250mm in loose thickness and each layer shall be watered and compacted to 100% maximum dry density of the fill material determined in accordance with IS:2720, Part-VII. However before relaying and compacting the loosened material, the surface below this level shall be suitably compacted as directed by the Engineer with a minimum six passes of 8 - 10 tonne roller.

Where so directed by the Engineer, any unsuitable material occurring in the embankment foundation shall be removed and replaced with approved materials suitably compacted. Embankment work shall not proceed until the foundation soil of the embankment is inspected by the Engineer and approved.

3.03.05 Filling

The embankment material shall be spread uniformly over the entire width of the embankment in layers not exceeding 250mm in loose thickness. Successive layers of embankment shall not be placed until the layer under construction has been thoroughly compacted to the requirements set down hereunder. Moisture content of the fill material shall be checked at the source

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 11 OF 37

of supply and if found less than that specified for compaction, the same shall be made good either at the source or after spreading the soil in loose thickness for compaction. In the latter case water shall be sprinkled directly from a hose line or from a truck mounted water tank and flooding shall not be permitted under any circumstances. After adding required amount of water, the soil shall be processed by means of harrows, rotary mixers or by any other approved method until the layer is uniformly wet.

If the material delivered to the road bed is too wet, it shall be dried by aeration and exposure to the sun till the moisture content is acceptable for compaction. Should circumstances arise where owing to wet weather, the moisture content cannot be reduced to the required amount by the above procedure, the work on compaction shall be suspended.

Moisture content of each layer shall be checked in accordance with IS:2720, Part-II and unless otherwise specified shall be so maintained making due allowance for evaporation losses that during compaction, the moisture content shall be in the range of 1 percent above to 2 percent below the optimum moisture content as determined in accordance with IS:2720, Part-VII.

Clods or hard lumps of earth shall be broken to have a maximum size of 150mm when being placed in the lower layers of the embankment and a maximum size of 60mm when being placed in the top 0.5m portion of the embankment below sub-base.

Hauling equipment shall be dispersed uniformly over the entire surface of the previously constructed layer to minimise rutting or uneven compaction.

Where the embankment is to be constructed across a low swampy ground that will not support the weight of trucks or other hauling equipments, the lower part of the fill shall be constructed by dumping successive loads in a uniformly distributed layer to a thickness not greater than that necessary to support the hauling equipment while placing subsequent layers.

3.03.06

Compaction

Compaction equipment approved by the Engineer shall only be employed for construction. If directed by the Engineer, the Contractor shall demonstrate the efficiency of the plant he intends to use by carrying out compaction trials. Each layer shall be thoroughly compacted to the density as specified in Table-III. Subsequent layers shall be placed only after the finished layer has been tested and accepted by the Engineer.

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION – D16

REV.NO. 00 DATE 30/11/2015

SHEET 12 OF 37

Table - III

Compaction Requirements For Embankment

Sl. No.	Type of work/material	Field dry density as a percentage of maximum laboratory dry density as per IS : 2720, Part-VII
1.	Top 0.5m portion of embankment below sub-base and shoulders	Not less than 100
2.	Other portions of embankment	Not less than 95

When density measurements reveal any soft area in the embankment, further compaction shall be carried out as directed by the Engineer. If in spite of that the specified compaction is not achieved, the material in the soft area shall be removed and replaced with approved material and compacted to the density requirements and satisfaction of the Engineer.

3.03.07 Drainage

The surface of the embankment at all times during construction shall be maintained at such a cross fall as will shed water and prevent ponding.

3.03.08 Finishing Operations

Finishing operations shall include the work of shaping and dressing the shoulders, road bed and side slopes to conform the alignment, levels, cross sections and dimensions as shown on the drawings or as directed by the Engineer. Both the upper and lower ends of the side slopes shall be rounded off to improve the appearance and merge the embankment with the adjacent terrain.

3.04.00 Turfing With Sods

3.04.01 General

This work shall consist of furnishing and laying live sod of perennial turf forming grass on embankment slopes, shoulders or other locations as shown on the drawings or as directed by the Engineer. Unless otherwise specified the work shall be taken up following the construction of embankment provided the season is favourable for establishment of the sod.

3.04.02 Materials

TITLE:

TECHNICAL SPECIFICATION FOR ROAD AND DRAINAGE

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 13 OF 37

The sod shall consist of dense, well rooted growth of permanent and desirable grasses indigenous to the locality where it is to be used and shall be practically free from weeds and other undesirable matters. At the time the sod is cut, the grass shall have a length of approximately 50mm and the sod shall be free from any debris.

Thickness of the sod shall be as uniform as possible with about 50 to 80mm of soil covering the grass roots depending on the nature of the sod so that practically all the dense root system of the grass are retained in the sod strip. The sods shall be cut in rectangular strips of uniform width not less than 250mm x 300mm in size but not so large so that it is convenient to handle and transport without damage. During wet weather the sod shall be allowed to dry sufficiently to prevent rearing during handling and during dry weather it shall be watered before lifting to ensure its vitality and to prevent dropping of soil during handling.

3.04.03 Placing The Sods

The area to be sodded shall be previously constructed to the required slope and cross section. Soil in the area shall be loosened, freed from all stones larger than 50mm size, sticks, stumps and any other undesirable foreign matters etc and brought to a reasonably granular texture to a depth not less than 25mm for receiving the sod.

Where required, top soil shall be spread over the slopes. Prior to placing the top soil, the slopes shall be roughened and wetted in order to have a satisfactory bond. The depth of top soil (to be spread) shall be 75mm.

Following soil preparation and top soiling (if required), fertilizer and ground limestone when specified shall be spread uniformly. After spreading, the materials shall be incorporated in the soil by discing or other means. The prepared sod bed shall be moistened if not already sufficiently moist and the sod shall be placed thereon within 24 hours after the same has been cut. Each sod strip shall be laid in close contact with each other and shall be lightly tamped with suitable wooden or metal tampers so as to eliminate air pockets and to press it into the underlying soil. At points where water may flow over the sod, the upper edges of the sod strips shall be turned into the soil below the adjacent area and a layer of earth shall be placed over it followed by thorough compaction.

3.04.04 Staking the Sods

Where the side slope is 2 to 1 or steeper and the distance along the slope is more than 2m, the sods shall be staked with pegs or nails spaced approximately 500 to 1000mm along the longitudinal axis of the sod strips.

	TITLE: TECHNICAL SPECIFICATION FOR ROAD AND DRAINAGE	SPECIFICATION NO. PE-TS-999-600-C016 VOLUME - II B SECTION - D SUB-SECTION – D16 REV.NO. 00 DATE 30/11/2015 SHEET 14 OF 37
	Stakes shall be driven approximately plumb through the sods and to be almost flushed with them. 3.04.05 Top Dressing After the sods have been laid in position, the surface shall be cleaned of any loose sod, excess soil and other foreign materials. Thereafter a thin layer of top soil shall be scattered over the top dressed surface and the area shall be thoroughly moistened by sprinkling water. 3.04.06 Watering and Maintenance The turfing so laid shall be well watered and protected until final acceptance. Watering shall be done in such a way that no erosion or damage to the sodded areas/embankment occur. The Contractor shall erect necessary warning signs and barriers, repair or replace the sods which are failing to show uniform growth of grass or damaged by his operation and shall maintain the sod at his own cost until final acceptance. 3.05.00 Shoulder Construction 3.05.01 Description This work shall consist of constructing shoulder on either side of the pavement in accordance with the requirements of this specification and in conformity with the lines, grades and cross sections shown on the approved drawings and as directed by the Engineer. 3.05.02 Materials Shoulder shall be made of selected earth or granular material as specified conforming to relevant IRC standards. 3.05.03 Construction Operations Except in the case of bituminous pavements, the shoulders shall be constructed in advance to the laying of pavement courses. The compacted thickness of each layer of shoulder shall correspond to the compacted layer of pavement course to be laid adjacent to it. After compaction, the inside edges of shoulders shall be trimmed vertical and the area enclosed between the shoulders shall be cleaned of all spilled materials before proceeding with the construction of the pavement layer.	

 BHEL Bharat Heavy Electricals Limited	TITLE: TECHNICAL SPECIFICATION FOR ROAD AND DRAINAGE	SPECIFICATION NO. PE-TS-999-600-C016 VOLUME - II B SECTION - D SUB-SECTION - D16 REV.NO. 00 DATE 30/11/2015 SHEET 15 OF 37
	In the case of bituminous pavements, shoulder shall be constructed only after the pavement courses have been laid and compacted. Regardless of the method of laying, all shoulder construction material shall be placed directly on the shoulder. Any spilled material dragged on to the pavement surface shall be immediately removed without any damage to the pavement and the area so affected shall be thoroughly cleaned. During all stages of shoulder construction, the required crossfall shall be maintained to drain off surface water. 3.06.00 Kerb 3.06.01 Material Kerb if required for the construction of footpath shall consist of precast concrete blocks with concrete grade of M-20. The blocks shall be of 100mm thick and of suitable length. The depth of blocks unless otherwise mentioned elsewhere shall be 375mm considering 225mm height of footpath above the road level. 3.06.02 Laying The kerb shall be laid by cutting trenches of 150mm deep. The width of the trench shall be minimum and just sufficient to insert the kerbs. The inside faces of the kerbs shall be in plumb and the gap between the block shall not be more than 10mm. The gap shall be filled with cement mortar as specified. The kerbs shall be thoroughly packed with a mixture of stone chips (50%) and moorum (50%) at the outside face. The laying and packing shall be done in a proper workmanlike manner acceptable to the Engineer. 3.07.00 Sub-base (Granular Sub-base) 3.07.01 Description This work shall consist of laying and compacting well graded material on the prepared sub-grade in accordance with the specification. The material shall be laid in one or more layers as shown on the drawings and shall conform to the lines, grades and cross sections shown on the drawings and as directed by the Engineer. 3.07.02 Materials The materials to be used for the work shall be natural sand, moorum, gravel, crushed stone, crushed slag, crushed concrete, brick metal, laterite, kankar etc or combinations thereof depending upon the grading required. The mixed

REV.NO. 00 DATE 30/11/2015

SHEET 16 OF 37

materials shall be free from organic and other deleterious constituents and conform to one of the three grading given in Table - IV below.

**Table - IV
Grading for Granular Sub-base Material**

Sieve designation	Percent by weight passing the sieve		
	Grading 1	Grading 2	Grading 3
80 mm	100	100	100
63 mm	90 - 100	90 - 100	90 - 100
4.75 mm	35 - 70	40 - 90	50 - 100
75 micron	0 - 20	0 - 25	0 - 30
Minimum CBR value for the fraction of material passing 20 mm sieve.	30 %	25%	20%

Note : The materials passing 425micron sieve for all the three gradings when tested according to IS : 2720, Part V shall have liquid limit and plasticity index not more than 25 percent and 6 percent respectively.

3.07.03 Physical Requirements

The fraction of materials passing 20mm sieve shall give a CBR value as specified in Table – IV when tested in accordance with IS : 2720, Part XVI after preparing the samples at maximum dry density and optimum moisture content corresponding to IS : 2720, Part VII and soaking the same in water for 4 days.

3.07.04 Spreading and Compacting

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 17 OF 37

Immediately prior to laying of sub-base, the sub-grade already finished shall be prepared by removing all vegetations and other extraneous matters, lightly sprinkled with water if necessary and rolled with one pass of 8 - 10 tonne smooth wheeled roller.

The sub-base material shall be spread on the sub-grade with the help of a drag spreader, motor grader or other approved means. The thickness of loose layers shall be so regulated that the maximum thickness of each layer after compaction shall not exceed 150mm.

Moisture content of the loose material shall be checked in accordance with IS : 2720, Part II and shall be suitably adjusted by sprinkling additional water from a hose line, truck mounted water tank or other approved means so that at the time of compaction it shall be from 1 percent above to 2 percent below the optimum moisture content. While adding water, due allowance shall be made for evaporation losses. After water has been added, the material shall be processed by mechanical or other approved means if so directed by the Engineer until the layer is uniformly wet.

Immediately thereafter, rolling shall be done with 8 to 10 tonne smooth wheeled rollers or with any other approved plant. Rolling shall commence from the edges and progress towards the centre longitudinally except on super elevated portions where it shall progress from the lower to the upper edge parallel to the centre line of the pavement. Each pass of the roller shall uniformly overlap not less than one third of the track made in the preceding pass. During rolling, the grade and camber shall be checked and any high spots or depressions which become apparent shall be corrected by removing or adding fresh material.

Rolling shall be continued till the density achieved is at least 100% of the maximum dry density of the material determined as per IS : 2720, Part VII. The surface of any layer of material on completion of compaction shall be well closed, free from movement under compaction plant and from compaction planes, ridges, cracks or loose materials. All loose, segregated or otherwise defective areas shall be made good to the full thickness of layer and recompacted.

3.08.00 Water Bound Macadam Sub-base/Base Course

3.08.01 Description

Water bound macadam shall consist of clean crushed aggregates mechanically interlocked by rolling and bonded together with screenings, binding material wherever necessary and water, laid on the prepared sub-grade or sub-base as the case may be and finished in accordance with the specification and in

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SHEET 18 OF 37

conformity with the lines, grades and cross-sections shown on the approved drawings.

3.08.02

Materials

a) Coarse Aggregates - General Requirements

Coarse aggregates shall be either crushed or broken stone. The aggregates shall conform to the physical requirements set forth in Table - V.

Table – V

Physical Requirements of Coarse Aggregates for Water Bound Macadam

Sl.No.	Type of Construction	Test	Test method	Requirements
1.	Sub-base	Los Angeles Abrasion Value * or Aggregate Impact Value	IS : 2386 (Part IV) IS : 2386 (Part IV) or IS : 5640**	50 percent maximum 40 percent maximum
2.	Base	a) Loss Angeles Abrasion value* or Aggregate Impact Value b) Flakiness Index ***	IS : 2386 (Part IV) IS : 2386 (Part IV) or IS : 5640 ** IS : 2386 (Part I)	50 percent maximum 40 percent maximum 15 percent maximum

* Aggregates shall satisfy requirements of either of the two tests.

** Aggregates like brick metal, kankar and laterite which get softened in presence of water shall be tested for impact value under conditions in accordance with IS : 5640.

*** The requirements of Flakiness Index shall be enforced only in case of crushed or broken stone and crushed slag.

b) Crushed or Broken Stone

Crushed or broken stone shall be hard, durable and free from excess flat, elongated, soft and disintegrated particles, dirt and other objectionable matters.

c) Grading Requirements of Coarse Aggregates

The coarse aggregates shall conform to one of the gradings given in Table – VI. However the use of Grading-1 shall be restricted to sub-base courses only.

Table - VI
Grading Requirements of Coarse Aggregates

Grading	Size range	Sieve designation	Percent by weight passing the sieve
1.	90mm to 40 mm	100 mm 80 mm 63 mm 40 mm 20 mm	100 65 - 85 25 - 60 0 - 15 0 - 5
2.	63 mm to 40 mm	80 mm 63 mm 50 mm 40 mm 20 mm	100 90 - 100 35 - 70 0 - 15 0 - 5
3.	50 mm to 20 mm	63 mm 50 mm 40 mm 20 mm 10 mm	100 95 - 100 35 - 70 0 - 10 0 - 5

d) Screenings

Screenings to fill the voids in the coarse aggregate shall generally consist of the same material as the coarse aggregates. However where permitted, predominantly non-plastic material such as moorum or gravel (other than rounded river borne material) may be used for this purpose provided liquid limit and plasticity index of such material is below 20 and 6 respectively and fraction passing 75 micron sieve does not exceed 10 percent.

As far as possible, screenings shall conform to the grading set forth in Table-

VII. Screenings of Type-A in Table-VII shall be used with coarse aggregates of Grading-1 in Table-VI. Screenings of Type-A or B shall be used with coarse aggregates of Grading-2. Screenings of Type-B shall be used with coarse aggregates of Grading-3.

**Table - VII
Grading For Screenings**

Grading classification	Size of screenings	Sieve designation	Percent by weight passing the sieve
A	12.5 mm	12.5 mm	100
		10.0 mm	90 - 100
		4.75 mm	10 - 30
		150 micron	0 - 8
B	10 mm	10 mm	100
		4.75 mm	85 - 100
		150 micron	10 - 30

e) Binding Material

Binding material to be used for water bound macadam construction shall comprise of a suitable material approved by the Engineer having plasticity index value less than 6 as determined in accordance with IS : 2720, Part V. Application of binding material may not be necessary when the screenings used are of crushable type such as moorum or gravel.

3.08.03

Construction Operations

a) The sub-grade/sub-base to receive the water bound macadam coarse shall be prepared to the specified grade and camber and made free of any dust and other extraneous materials. Any ruts or soft yielding places shall be corrected in an approved manner and rolled until firm. Where water bound macadam is to be laid over an existing black topped surface, 50mm x 50mm furrows shall be cut at an angle of 45 degrees to the centre line of the road at 1m intervals in the latter before laying the coarse aggregates.

b) Inverted Choke

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 21 OF 37

If water bound macadam is to be laid directly over the sub-grade without any other intervening pavement course, a 25mm course of screenings (Grading-B) shall be spread on the prepared sub-grade before application of coarse aggregates is taken up.

c) Spreading Coarse Aggregates

The coarse aggregates shall be spread uniformly over the prepared surface in such quantities that the thickness of each compacted layer is limited to 100mm for Grading-1 and 75 - 100mm for Grading-2 and 3. The spreading shall be done from stockpiles along the side of the roadway or directly from the vehicles. In no case shall the aggregate be dumped in heaps directly on the surface prepared to receive the aggregates nor shall hauling over permitted. The surface of the aggregates spread shall be carefully checked with templates and all high or low spots remedied by removing or adding aggregates as may be required. No segregation of large or fine particles shall be allowed and the coarse aggregates as spread shall be of uniform gradation with no pockets of fine material. The coarse aggregates shall not normally be spread more than 3 days in advance of the subsequent construction operation.

d) Rolling

Immediately following the spreading of the coarse aggregates, rolling shall be started with three wheeled power rollers of 8 to 10 tonne capacity or with tandem or vibratory rollers of approved type. The weight of the roller shall depend upon the type of the aggregate and be indicated by the Engineer.

Except on super elevated portions where the rolling shall proceed from inner edge to the outer, rolling shall begin from the edges gradually progressing towards the centre. First the edge/edges shall be compacted with roller running forward and backward. The roller shall then move inwards parallel to the centre line of the road. Each pass of the roller shall uniformly overlap not less than one half the width of the track made in the preceding pass.

Rolling shall continue until the aggregates are thoroughly keyed and the creeping of aggregates ahead of the roller is no longer visible. During rolling slight sprinkling of water may be done if necessary. Rolling shall not be done when the sub-grade is soft or yielding or when it causes a wavelike motion in the sub-grade or sub-base course.

The rolled surface shall be checked transversely and longitudinally with templates and any irregularities found shall be corrected by loosening the surface, adding or removing necessary amount of aggregates and rerolled until the entire surface conform to the desired camber and grade. In no case shall the use of screenings be permitted to make up the depressions.

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 22 OF 37

e) Application of Screenings

After the coarse aggregate has been rolled, screenings to completely fill the interstices shall be applied gradually over the surface. These shall not be damp or wet at the time of application. Dry rolling shall be done while the screenings are being spread so that vibrations of the roller cause them to settle into the voids of the coarse aggregates. The screenings shall not be dumped in piles but be spread uniformly in successive thin layers either by the spreading motion of hand shovels or by mechanical spreader or directly from trucks. Trucks operating for spreading the screenings shall be so driven as not to disturb the coarse aggregates.

The screenings shall be applied at a slow and uniform rate (in three or more applications) so as to ensure filling of all voids. This shall be accompanied by dry rolling and brooming with mechanical brooms or hand brooms or with both. In no case shall the screenings be applied so fast and thick as to form cakes or ridges on the surface in such a manner as would prevent filling of voids or prevent the direct bearing of the roller on the coarse aggregate. These operations shall continue until no more screenings can be forced into the voids of the coarse aggregates.

The spreading, rolling and brooming of screenings shall be carried out in only such lengths of road which could be completed within one day's operation.

f) Sprinkling and Grouting

After the screenings have been applied, the surface shall be copiously sprinkled with water, swept and rolled. Hand brooms shall be used to seep the wet screenings into the voids and to distribute them evenly. The sprinkling, sweeping and rolling operations shall be continued with additional screenings applied as necessary until the coarse aggregates are thoroughly keyed, well bonded and firmly set to its full depth and a grout has been formed of screenings. Care shall be taken to see that the base or sub-grade does not get damaged due to the addition of excess quantity of water during construction.

g) Application of Binding Material

After the application of screenings, the binding material where it is required to be used shall be applied successively in two or more thin layers at a slow and uniform rate. After each application, the surface shall be copiously sprinkled with water and the resulting slurry shall be swept in with hand brooms or mechanical brooms to fill the voids properly and rolled during which water shall be applied to the wheels of the rollers if necessary to wash down the binding material sticking to them. These operations shall continue until the

TITLE:

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 23 OF 37

resulting slurry after filling the voids form a wave ahead of the wheels of the moving roller.

h) Setting and Drying

After the final compaction of water bound macadam course, the road shall be allowed to dry overnight. Next morning hungry spots shall be filled with screenings or binding material as directed, lightly sprinkled with water if necessary and rolled. No traffic shall be allowed on the road until the macadam is set. The Engineer shall have the discretion to stop hauling traffic from using the complete water bound macadam course if in his opinion it would cause excessive damage to the surface.

3.09.00 Tack Coat

3.09.01 Description

The work shall consist of application of a single coat of low viscosity liquid bituminous material to an existing road surface preparatory to another bituminous construction.

3.09.02 Materials

The binder used for tack coat shall be bitumen of a suitable grade as approved by the Engineer and conforming to IS-73, IS-217 or IS-454 as applicable or any other approved cutback.

3.09.03 Construction Operations

a) Preparation of Base

The surface on which the tack coat is to be applied shall be thoroughly swept and scraped clean of dust and any other extraneous materials before the application of the binder.

b) Application of Binder

Binder shall be heated to the temperature appropriate to the grade of bitumen used and approved by the Engineer and sprayed on the base at the rate specified below. The rate of spread in terms of straight run bitumen shall be 5 kg per 10 square metre area for an untreated water bound macadam surface. The binder shall be supplied uniformly with the aid of sprayers. The tack coat shall be applied just ahead of the oncoming bituminous construction.

3.10.00 Bituminous Macadam Binder Course

3.10.01 Description

This work shall consist of construction in a single course of 50mm/75mm thickness of compacted crushed aggregates premixed with a bituminous binder laid immediately after mixing on a base prepared previously in accordance with the specification and in conformity with the lines, grades and cross sections shown on the approved drawings.

3.10.02 Materials

a) Binder

The Binder shall be straight run bitumen of a suitable grade as directed by the Engineer complying with IS : 73.

b) Aggregates

The aggregates shall consist of crushed stone, crushed gravel (shingle) or other stones. They shall be clean, strong, durable, fairly cubical in shape and free from any disintegrated pieces, organic and other deleterious matter and adherent coats. The aggregates shall preferably be hydrophobic and of low porosity.

The aggregates shall satisfy the physical requirements set forth in Table - VIII.

Table – VIII

Physical Requirements of Aggregates For Bituminous Macadam

c) Proportioning of Materials

The binder content for premixing shall be 3.5 and 4.0 percent by weight of the total mix for aggregate Grading-A and B respectively unless directed otherwise by the Engineer. The quantity of aggregates to be used shall be sufficient to yield the specified thickness after compaction.

d) Variation in Proportioning of Materials

The Contractor shall have the responsibility for ensuring proper proportioning of materials and producing a uniform mix. A variation in binder content upto ± 0.3 percent by weight of total mix shall however be permissible for individual specimens taken for quality control tests.

3.10.03

Construction Operations

a) Weather and Seasonal Limitations

Bituminous macadam shall not be laid during rainy weather or when the base course is damp or wet.

b) Preparation of Base

The base on which the bituminous macadam is to be laid shall be prepared, shaped and conditioned to the specified lines, grade and cross sections as shown on the drawings and as directed by the Engineer. The surface shall be thoroughly swept and scraped clean and free of any dust and foreign matter.

c) Tack Coat

A tack coat shall be applied over the base.

d) Preparation and Transport of Mix

Hot mix plant of adequate capacity shall be used for preparing the mix. The temperature of binder at the time of mixing shall be in the range 150 Deg. - 165 Deg. C and to that of aggregates shall be in the range 125 Deg. - 150 Deg. C provided the temperature difference between the binder and the aggregate at no time exceeds 25 Deg. C. Mixing shall be thorough to ensure that a homogenous mixture is obtained in which all particles of the aggregates are

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 27 OF 37

coated uniformly. The mixture shall be transported from the mixing plant to the point of use in a suitable vehicle. The vehicle employed for transport shall be clean and be covered over in transit if so directed by the Engineer.

e) Spreading

After mixing, the mix shall be spread immediately by means of a self propelled mechanical paver with suitable screeds capable of spreading, tamping and finishing the mix to the specified lines, grade and cross sections. However in restricted locations and in narrow widths where the available plants cannot operate in the opinion of the Engineer may permit manual laying of the mix. The temperature of mix at the time of laying shall be in the range 110 Deg. - 135 Deg. C.

In multilayer construction, the longitudinal joint in one layer shall offset into the layer below by about 150mm. However, the joint in the topmost layer shall be at the centre line of the pavement.

Longitudinal joints and edges shall be constructed true to the delineating lines parallel to the centre line of the road. All joints shall be cut vertical to the full thickness of the previously laid mix and the surface painted with hot bitumen before placing fresh material.

f) Rolling

After spreading of mix, the rolling shall be done with 8 to 10 tonne power roller or with any other approved plant. Rolling should start as soon as the materials are spread. Rolling shall be done with care to avoid any undulation in the pavement surface.

Rolling on the longitudinal joint shall be done immediately after the paving operation. After this, the rolling shall commence at the edges and progress towards the centre longitudinally except on superelevated portions where it shall progress from the lower to the upper edge parallel to the centre line of the pavement.

The initial or breakdown rolling shall be done as soon as it is possible to roll the mixture without cracking the surface and no mix pick up on the roller wheels. The second or intermediate rolling shall follow the break down rolling as early as possible and be done while the paving mix is still at a temperature that will result in maximum density. The final rolling shall be done while the material is still workable enough for removal of roller marks.

When the roller has passed over the whole area once, any high spots or depressions which become apparent shall be corrected by removing or adding fresh materials. The rolling shall then be continued till the entire surface has

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION – D16

REV.NO. 00 DATE 30/11/2015

SHEET 28 OF 37

been rolled to compaction and there is no crushing of aggregates and till all the roller marks are eliminated. Each pass of the roller shall uniformly overlap not less than one third of the track made in the preceding pass. The roller wheels shall be kept damp if necessary to avoid the bituminous material from sticking on the wheels and being picked up. In no case shall fuel/lubricating oil be used for this purpose.

Rolling operation shall be completed in every respect before the temperature of the mix fall below 80 Deg. C.

Rollers shall not stand on the newly laid material as it may lead to undue deformation. The edges along and transverse of the bituminous macadam laid and compacted earlier shall be cut to their full depth so as to expose fresh surface which shall be painted with a thin surface coat of appropriate binder before the new mix is placed against it.

The bituminous macadam shall be provided with a final surfacing without any delay. If there is to be any delay the course shall be covered by seal coat before allowing any traffic over it.

3.11.00 Open Graded Premix Carpet

3.11.01 Description

This work shall consist of laying and compacting open graded carpet of specified thickness in a single course of suitable small sized aggregates premixed with bituminous binder on a previously prepared base to form wearing course in accordance with the specification.

3.11.02 Materials

a) Binder

The binder shall be bitumen of suitable grade as approved by the Engineer and satisfying the requirements of IS: 73, 217, 454 or any other approved cutback as applicable.

b) Aggregates

The aggregates shall consist of angular fragments of clean, hard, tough and durable rock of uniform quality throughout. They shall be obtained by crushing rock, gravel or river shingle and be free of elongated and flaky pieces, soft and disintegrated materials, vegetable and any other deleterious matter etc. They shall preferably be hydrophobic type. The aggregates shall satisfy the quality requirements set forth in Table-VIII except that the flakiness Index shall be limited to a maximum of 30.

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 30 OF 37

Total 14.6 Kg

3.11.03

Construction Operation

a) Weather and Seasonal Limitations

Open graded premix carpet shall not be laid during rainy weather or when the base course is damp or wet or when the atmospheric temperature in shade is 16 Deg. C or below.

b) Preparation of Base

The underlying base on which the bituminous carpet is to be laid shall be prepared, shaped and conditioned to the specified lines, grade and cross section in accordance with the drawing, specification and as directed by the Engineer. The surface shall be well cleaned by removing caked earth and other foreign matters with wire brushes, sweeping with brooms and finally dusting with sacks as necessary.

c) Tack Coat

A tack coat complying with clause 3.09.00 shall be applied over the base preparatory to laying of the carpet. However application of tack coat shall not be necessary when the laying of carpet follows soon after laying the bituminous course.

d) Preparation of Premix

Mixers of approved type shall be employed for mixing the aggregates with the bituminous binder. The binder shall be heated to the temperature appropriate to the grade of bitumen approved by the Engineer in boilers of suitable design avoiding local overheating and ensuring a continuous supply. The aggregates shall be dry and suitably heated to a temperature as directed by the Engineer before these are placed in the mixer. After about 15 seconds of dry mixing, the heated binder shall be distributed over the aggregates at the rate specified. The mixing of binder with chipping shall be continued until the chippings are thoroughly coated with the binder. The mix shall be immediately transported from the mixer to the point of use in suitable vehicles or wheel barrows. The vehicles employed for transport shall be clean and be covered over in transit if so directed.

e) Spreading and Rolling

The premixed material shall be spread on the road surface with rakes to the

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 31 OF 37

required thickness and camber or distributed evenly with the help of a drag spreader without any undue loss of time. The camber shall be checked by means of camber boards and inequalities evened out. As soon as sufficient length of bituminous material are laid, rolling shall be commenced with 6 to 8 tonne power rollers preferably with smooth wheel tandem type or with any other approved plant. Rolling shall begin at the edges and progress toward the centre longitudinally except on the superelevated portions where it shall progress from the lower to upper edge parallel to the centre line of the pavement.

When the roller has passed over the whole area once, any high spots or depressions which become apparent shall be corrected by removing or adding premixed materials. Rolling shall then be continued until the entire surface has been rolled to compaction and all the roller marks have been eliminated. In each pass of the roller, preceding track shall be overlapped uniformly by at least 1/3 width. The roller wheels shall be kept damp to prevent the premix from adhering to the wheels and being picked up. In no case shall fuel/lubricating oil be used for this purpose. Rollers shall not stand on newly laid material as it may lead to undue deformations.

The edges along and transverse of the carpet laid and compacted earlier shall be cut to their full depth so as to expose fresh surface which shall be painted with a thin surface coat of approved binder before the new mix is placed against it.

f) Seal Coat

A seal coat conforming to clause 3.12.00 shall be applied to the surface immediately after laying the carpet. No traffic shall be allowed on the road till the seal coat has been placed.

3.12.00 Seal Coat

3.12.01 Description

This work shall consist of application of a seal coat as specified for sealing the voids in the bituminous surface laid to the specified levels, grade and camber.

Type-A : Liquid seal coat comprising of an application of a layer of bituminous binder followed by a cover of stone chippings.

Type-B : Premixed seal coat comprising of a thin application of fine aggregate premixed with bituminous binder.

3.12.02 Materials

**TITLE:****TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 32 OF 37

a) Binder

The binder shall be bitumen of suitable grade as directed by the Engineer and conforming to the requirements of IS : 73, 217 or 454 as applicable or any other approved cutback.

The quantity of binder to be adopted in terms of straight run bitumen shall be 9.8 Kg and 6.8 Kg per 10 square metre area for Type-A and Type-B seal coat respectively.

b) Stone Chippings for Type A Seal Coat

The stone chippings shall consist of angular fragments of clean, hard, tough and durable rock of uniform quality throughout. They shall be free of elongated or flaky pieces, soft or disintegrated stone, vegetable or other deleterious matters etc. Stone chippings shall be of 6mm size defined as 100 percent passing through 10mm sieve and retained on 2.36mm sieve. The quantity used for spreading shall be 0.09 cu.m per 10 sq.m area. The chippings shall satisfy the quality requirements spelled out in Table- VIII except that the upper limit for flakiness Index shall be 30.

c) Fine Aggregate for Type B Seal Coat

The fine aggregate shall be sand or fine grit and shall consist of clean, hard, durable, uncoated dry particles and shall be free from dust, soft or flaky material, organic matter or other deleterious substances. The aggregate shall pass 1.7 mm sieve and be retained on 180 micron sieve. The quantity used for premixing shall be 0.06 cubic metre per 10 square metre area.

3.12.03**Construction Operations****a) Preparation of Base**

The seal coat shall be applied immediately after laying the bituminous course which is required to be sealed. Before application of seal coat, the surface shall be cleaned free of any dust or other extraneous matters.

b) Construction of Type-A Seal Coat

The binder shall be heated in boilers of suitable design to the temperature appropriate to the grade of bitumen approved by the Engineer and sprayed on the dry surface in a uniform manner preferably with the help of mechanical sprayers. Excessive deposits of binder caused by stopping or starting of the

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 33 OF 37

sprayer or through leakage or due to any other reason shall be suitably corrected before the stone chippings are spread.

Immediately after the application of binder, stone chippings in a dry and clean state shall be spread uniformly on the surface preferably by means of a mechanical grittier or otherwise manually so as to cover the surface completely. If necessary the surface shall be broomed to ensure uniform spread of chippings. Immediately after the application of the cover material, the entire surface shall be rolled with a 8 - 10 tonne smooth wheeled roller. Rolling shall commence from the edges and progress towards the centre except in superelevated portions where it shall proceed from the inner edge to the outer. Each pass of the roller shall uniformly overlap not less than one third of the track made in the preceding pass. While rolling is in progress additional chippings shall be spread by hand in whatever quantities required to make up the irregularities. Rolling shall continue until all aggregate particles are firmly bedded in the binder and present an uniform closed surface.

c) Construction of Type-B Seal Coat

Mixers of approved type shall be employed for mixing the aggregates with the bituminous binder. The binder shall be heated in boilers of suitable design to the temperature appropriate to the grade of bitumen approved by the Engineer. Also the aggregates shall be dry and suitably heated to a temperature as directed by the Engineer before the same are placed in the mixer. Mixing of binder with aggregates to the specified proportions shall be continued till the latter is thoroughly coated with the former. The mix shall be immediately transported from the mixing plant to the point of use and spread uniformly on the bituminous surface to be sealed. As soon as sufficient length has been covered with the premixed material, the surface shall be rolled with 6 - 8 tonne smooth wheeled power rollers. Rolling shall be continued till the premixed material completely seals the voids in the bituminous course and a smooth uniform surface is obtained.

3.12.04 Opening to Traffic

In case of Type-B Seal coat, traffic may be allowed soon after the final rolling when the premixed materials are cooled down to the surrounding temperature. However in case of Type- A seal coat, the traffic shall not be permitted until the following day.

3.13.00 Repair of Existing Water Bound Macadam Surfaces

Pot holes or patches and ruts in the water bound macadam base or surface course which is to be surface treated shall be repaired by removing all loose materials by cutting in rectangular patches and replacing with suitable materials. The repair shall be done as under.

**TITLE:****TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 34 OF 37

Pot holes, patches and ruts shall be drained of any water and cut to regular shape with vertical sides and then be filled either with i) coarse aggregates and screenings conforming to the specification for water bound macadam and compacted with rollers or other approved rammer etc or with ii) premixed material conforming to the specification for open graded premix carpet and compacted with rollers or other approved means after painting the sides and bottom of the holes with a thin application of bitumen or a combination of both as directed by the Engineer.

3.14.00 Road Side Drains**3.14.01 Drains**

The road side drains shall be made in sizes and slopes as shown on the approved drawings. The sides and bottom shall be neatly dressed after excavation. Proper connections shall be made to the culverts outside the plant area as per the drawings and instructions of the Engineer.

The excavated spoils other than that required for backfilling shall be transported and filled in low areas within the plant area or in embankments as instructed by the Engineer. The lining for drains shall be as per the drawings. Lining of drains may be of bricks or cement concrete blocks of specified grade as shown on the approved drawing or as directed by the Engineer. If shown on approved drawing, drains shall be of R.C.C. construction with necessary slopes.

3.15.00 Culverts

Excavation in trenches for foundation of culverts and wing walls shall be done with side slopes as per the drawings and instructions of the Engineer after clearing the site etc. As described in the "Specification for Earthwork in Excavation and Backfilling", backfilling in layers with watering and compaction shall be done after the construction of foundations. The construction of culverts shall be done true to the lines and levels as shown on the drawings. The specification for Masonry and/or Plain and Reinforced Cement concrete shall be followed as applicable.

3.16.00 Pipe Culverts and Drainage Pipes**3.16.01 Materials**

The drainage pipes shall be made of R.C.C and shall be either class NP-2 or NP-3 as shown on the approved drawings. Pipe culverts shall be made of reinforced concrete pipe and shall be of class NP4 or RDSO class for railways as shown in the drawing. All pipes shall meet the requirements of IS : 458 and

TITLE:

**TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 35 OF 37

shall be procured from approved manufacturers with collars as per manufacturer's specification. The tenderer shall specifically mention the particular manufacturer's product he proposes to use.

Cement shall be ordinary Portland Cement as per IS:269. Coarse Aggregates shall be as per IS:383. Maximum size shall not exceed one third the thickness of the pipe or 20 mm whichever is smaller. Fine aggregates for concrete shall be as per IS:383.

3.16.02

Laying of Pipes

Laying of concrete pipes shall correspond to IS:783 and as per the specification given below.

a) The foundation bed for pipe shall be excavated true to lines and grades shown on the drawings and as directed by the Engineer. When trenching is involved, its width on either side of the pipe shall not be less than 150mm and not more than one third the diameter of pipe unless otherwise instructed/permited by the Engineer. The sides of the trench shall be as nearly vertical as possible. Side slope, shoring, bailing out water etc as required shall be done by the Contractor.

Side slips if there be any shall be removed by the Contractor. After laying of the pipes are completed, backfilling of the trenches shall be done as per "Specification for Earthwork in Excavation and Backfilling" to the satisfaction of the Engineer. The surplus spoils shall be transported and filled in low areas within the plant area as instructed by the Engineer.

When bedrock or boulder stratum is encountered during excavation, the excavation shall be taken down to at least 200mm below the bottom of the pipe with prior permission of the Engineer and all rock/boulders in the area shall be removed and space filled with approved earth free from stone or fragmented materials, shaped to the requirements and thoroughly compacted to provide adequate support for the pipe.

Filling of trench shall be carried out simultaneously on both sides of the pipe in such a manner that unequal pressures do not occur and shall be done as per the "Specification for Earthwork in Excavation and Backfilling". When two or more pipes are to be laid adjacent to each other, they shall be separated by a distance equal to at least half the diameter of the pipe subject to a minimum of 450 mm. Laying of pipes shall start from the outlet and proceed towards inlet. All pipes and fittings shall be gradually lowered into the trench or placed on the supports by approved means taking due care to avoid any damage. Under no circumstances the pipes shall be dropped into the trench or on supports from heights.

**TITLE:****TECHNICAL SPECIFICATION FOR
ROAD AND DRAINAGE**

SPECIFICATION NO. PE-TS-999-600-C016

VOLUME - II B

SECTION - D | SUB-SECTION - D16

REV.NO. 00 DATE 30/11/2015

SHEET 36 OF 37

b) Pipe bedding shall be first class projection bedding for positive projecting pipes as per IS : 783 having a projection ratio not greater than 0.70. The pipe shall be carefully laid on bedding made up of fine granular materials in an earth foundation; the bedding shall be carefully shaped to fit the lower part of the pipe exterior for at least ten percent of its overall height and in which the fill material is thoroughly compacted in layers not exceeding 150mm in depth around the pipe for the remainder of the pipe laid in trench.

When indicated on the drawings or directed by the Engineer, the pipe shall be bedded on a cradle constructed of concrete having a mix not leaner than M-15. The shape and dimension of the cradle shall be as indicated on the drawing or as directed by the Engineer. The pipe shall be laid on the concrete bedding before the concrete is set.

c) The drop walls shall be made with first class brickwork in 1:4 cement mortar.

d) The pipe culverts shall be made with proper care with respect to the invert of the pipe, gradient if any etc as specified on the drawings and as instructed by the Engineer.

e) Where R.C.C pipes are encased in concrete at road crossings or at other places the pipes need be suitably supported avoiding reinforcements of concrete blocks, joints properly done before concreting is taken up. Concreting of total height of block may be done in a single operation or may be done upto some height for pipes to be properly laid in position and the balance height of the block shall be concreted subsequently.

f) The R.C.C. pipes shall be joined with cement mortar. Cement mortar shall consist of 1 part of cement and 2 part of clean sand with only enough water for workability. Procedure of jointing shall be as per IS : 783.

3.16.03 Relation With Water Supply Pipeline

Unless specifically cleared by the Engineer, under no circumstances shall the drainage pipes be allowed to come close to water supply pipelines.

3.17.00 Manholes and Inspection Chambers

The maximum distance between the manholes shall be 30m unless specifically permitted otherwise. In addition, at every change of alignment, gradient or diameter there shall be a manhole or inspection chamber. The distance between the manhole or inspection chamber and gully chamber shall not exceed 6 meters unless permitted otherwise. Manhole shall be constructed so as to be water tight under test. The channel or drain at the bottom of chamber shall be plastered with 1:2 cement sand mortar and finished smooth to the grade. The channels and drains shall be shaped and laid to provide a smooth

flow. Connection to the existing pipelines shall be through a manhole. Manholes shall be provided with standard covers usually of C.I. or as directed by the Engineer. The cover shall be closely fitted so as to prevent gases from coming out.

4.00.00 Testing and Acceptance Criteria

All testing as mentioned in the specification and as mentioned in Clause No. 900 of the “Specification for Roads and Bridge Works, 1983” published by IRC on behalf of Ministry of Shipping and Transport (Roads Wing) shall be carried out by the Contractor as per the direction of the Engineer.

5.00.00 MEASUREMENT

Method of measurement shall be as per the latest version of IS:1200, Part-17 and as directed by the Engineer.

FABRICATION OF STRUCTURAL STEEL WORK

1.00.00 SCOPE

This specification covers supply, fabrication, testing, painting and delivery to site of structural steelwork including supply of all consumable stores and rivets, bolts, nuts, washers, electrodes and other materials required for fabrication and field connections of all structural steelwork covered under the scope of the contract.

2.00.00 GENERAL

2.01.00 Work to be provided for by the Contractor

The work to be provided for by the Contractor, unless otherwise specified elsewhere in the contract, shall include, but not be limited to the following

- a) Preparation of complete detailed fabrication drawings and erection marking drawings required for all the structures covered under the scope of the contract based on the approved design drawings. As decided by the Engineer, some or all of these detailed drawings will have to be submitted for approval.
- b) To submit revised design with calculations and detailed fabrication drawings in case any substitution of the designed sections are to be made.
- c) To submit design calculations for joints and connections developed by the contractor along with detailed fabrication drawings.
- d) Furnish all materials, labour, tools and plant and all consumables required for fabrication and supply, all necessary rivets, bolts, nuts, washers, tie rods and welding electrodes for field connections,
- e) Furnish shop painting of all fabricated steelwork as per requirements of this Specification.
- f) Suitably mark, bundle, and pack for transport all fabricated materials.
- g) Prepare and furnish detailed Bill of Materials, Drawing Office Dispatch lists, Rivet and Bolt List and any other list of bought out items required in connection with the fabrication and erection of the structural steelwork.
- h) Insure, load and transport all fabricated steelwork field connection materials to site.

IS : 9595 - Recommendations for metal arc welding of carbon and carbon manganese steels. 2.04.00 Conformity with Designs The contractor shall design all connections, supply and fabricate all steelwork and furnish all connection materials in accordance with the approved drawings and/or as instructed by the Engineer keeping in view the maximum Utilization of the available sizes and sections of steel materials. The methods of painting, marking, packing and delivery of all fabricated materials shall be in accordance with the provisions of the contract and/or as approved by the Engineer. Provision of all relevant Indian Standard Specifications and Codes of Practice shall be followed unless otherwise specified in the contract. 2.05.00 Materials to be used 2.05.01 General All steel materials required for the work will be supplied by the contractor unless otherwise specified elsewhere in the contract. The materials shall be free from all imperfections, mill scales, slag intrusions, laminations, fittings, rusts etc. that may impair their strength, durability, and appearance. All materials shall be of tested quality only unless otherwise permitted by the Engineer and/or Consultant. If desired by the Engineer, Test Certificates in respect of each consignment shall be submitted in triplicate. Whenever the materials are required to be used from unidentified stocks, if permitted by the Engineer, a random sample shall be tested at an approved laboratory from each lot of 50 tones or less of any particular section. The arc welding electrodes shall be of approved reputed manufacture and conforming to the relevant Indian Standard Codes of Practice and Specifications and shall be of heavily coated type and the thickness of the coating shall be uniform and concentric. With each container of electrodes,

d) IS : 6649 - Hardened washers

2.05.07

Paints

Paints to be used for shop coat of fabricated steel under the purview of this contract shall conform to the Indian Standard Specification IS: 2074 - Ready mixed Paint, Red oxide Zinc Chromate Priming.

2.06.00

Coal Bin

2.06.01

Shape of bins shall be circular, polygonal, square, or rectangular in plan. Bottom hopper portion may have be conical-cum-hyperbolic or any other profile shape as shown in the drawing. Bin shall be termed as bunkers or silos according to their shape and plane of rupture of coal.

2.06.02

For general requirements, fabrication and construction details IS: 9178 (Pt.1 & 11) shall be followed as general guidance. The bins shall be fabricated and erected in segments.

2.06.03

The Coal bins shall be made of mild steel plates joined together with full strength butt weld and provided with stiffeners at regular interval. Stiffeners shall be provided on the external face and it may be welded with external face.

2.06.04

Bending of plates and rolled sections to the required shape for fabrication shall be done by plate bending machine or cold bending process Without resorting to heating, hammering, angle smithy and black smithy process.

2.06.05

Poking hole (manual or pneumatic) and striking plate shall be provided to facilitate coal flow. Poking holes shall have circular MS pipe and cover cap as detailed in the drawing.

2.07.00

New Erection Marks

2.07.01

Additional structures involving new erection marks may be required to be added at any stage of work.

2.07.02

All such new erection marks shall be detailed and included in marking schemes and fabrication carded out thereafter.

2.07.03

All such new erection marks shall be considered under item of original fabrication work. As a result of additional structures becoming necessary if the work is delayed beyond the time schedule stipulated, the Engineer shall give suitable extension of time provided he is satisfied about the reasonableness of the delay involved. However, no claim for extra payments or revision of rates due to delay shall be entertained.

 BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 11 OF 43
2.08.00	ELECTRO FORGED STEEL GRATINGS	
2.08.01	Factory made fabricated electro forged gratings unit with steel conforming to IS: 2062 shall be supplied, fabricated, transported, erected and aligned in floorings, platforms, drain and trench covers, walkways, passages, staircases with edge binding strips and anti skid nosing in treads etc.	
2.08.02	All grating units shall be rectangular in pattern and electro forged. The size and the spacing of the bearing bars and cross bars shall be as detailed in fabrication drawings. The contractor shall submit the grating design for different spans and load intensities along with fabrication drawings. The depth of the grating unit shall be 40 mm, unless specified otherwise.	
2.08.03	The gratings shall be made up in panel units designed to coincide with the span of the structural steel framing or openings as indicated in the design/scope drawings. Maximum possible standardization of the grating panel sizes shall be tried and designed.	
2.08.04	The grating unit shall be accurately fabricated and finished, free from wraps, twists, or any defects that would impair their strength, serviceability, and appearance.	
2.08.05	Grating work shall include cut outs and clearance opening for all columns, pipes, ducts, conduits or any other installation penetrating through the grating work. Such cut outs and clearances shall be treated as specified in subsequent clauses.	
2.08.06	The gratings shall be notched, trimmed and neatly finished around flanges and webs of the columns, moment connections, cap plates, and such other components of the steel structures encountered during the placement of the gratings. In all such cases, the trimming shall be done to follow the profile of the components encountered. After trimming, the binding strip shall be provided on the grating to suit the profile so obtained.	
2.08.07	Opening in gratings for pipes or ducts that are 150mm in size or diameter or larger shall be provided with steel bar toe plates of not less than 5mm thickness and appropriate width, set flush with the bottom of the bearing bars.	
2.08.08	Penetrations in gratings that are more than 50mm but less than 150mm in size or diameter shall be welded with plates of size shown in the detailed drawings set flush with the bottom of the grating panel.	
2.08.09	Unless otherwise indicated on the drawings, grating units at all penetrations shall be made up in split section, accurately fitted and neatly finished to provide for proper assembly and erection at the job site.	

 BHEL Bharat Heavy Electricals Limited	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 13 OF 43																		
	patches, bare spots, unevenness of coating, spelter that is loosely attached to the steel, blistered surface, flaking or peeling off etc. The presence of any of these defects noticed on visual or microscopic inspection shall render the material liable to rejection. 2.09.05 There shall be no flaking or loosening when struck squarely with a chisel faced hammer. The galvanized steel member shall withstand minimum four one minute dips in copper sulphate solution as per IS: 2633. 2.09.06 When the steel section is removed from the galvanizing kettle, excess spelter shall be removed by 'bumping'. The processes known as 'wiping' or 'scrapping' shall not be used for this purpose. 2.09.07 Defects in certain members indicating presence of impurities in the galvanizing bath in quantities larger than that permitted by the specifications or lack of quality control in any manner in the galvanizing plant, shall render the entire, production in the relevant shift liable to rejection. 2.09.08 All structural steel shall be treated with sodium dichromate or an approved equivalent solution after galvanizing; so as to prevent white storage stains. 2.09.09 If the galvanizing of any member is damaged, the Engineer shall be shown of the extent of damage, if so directed the galvanizing may have to be redone in the similar manner as stated above at no extra cost to the Owner. 2.10.00 STAINLESS STEEL HOPPERS (As per BOQ item) 2.10.01 Material In case SS Hopper is to be fabricated & erected as per BOQ item with SS415M, following specification shall be followed. Stainless steel hopper of grade SS 415M as manufactured by SAIL or equivalent shall be provided in the lower portion of bunker hopper. SS 415M having the following chemical composition shall be used. <table> <thead> <tr> <th>Material</th><th>%</th><th>Remarks</th></tr> </thead> <tbody> <tr> <td>Carbon</td><td>10.03%</td><td>Max.</td></tr> <tr> <td>Silicon</td><td>1.60%</td><td>Max.</td></tr> <tr> <td>Manganese</td><td>0.80% to 1.50%</td><td></td></tr> <tr> <td>Phosphorous</td><td>0.03%</td><td>Max.</td></tr> <tr> <td>Sulphur</td><td>0.03%</td><td>Max.</td></tr> </tbody> </table>	Material	%	Remarks	Carbon	10.03%	Max. Fabrication drawings shall be prepared by the contractor on the basis of the design / scope drawings furnished by Engineer. The fabrication and erection works shall be done as per the approved fabrication drawings. 2.10.03 Fabrication Drawings a) Fabrication drawing shall give the cutting plan for each hopper plate. Such, cutting plan shall be based on the size of the Stainless Steel plate available at store. In order to reduce the wastage and ensure the maximum utilization of stainless steel plate, the cutting plan shall take in the consideration of the reverse curvature and place the various elements of hopper plate in opposite fashion to reduce the end wastage. Similarly the hopper plate element having different radii shall be placed one inside the other, to optimize the stainless steel plate use. Such optimization may also required adjustment in the size of the each element of hopper plate and also additional weld joints. b) The bill of material of hopper plate shall indicate the inner surface area of the hopper, weight of the hopper based on the inner surface area, weight of each of the cut plate of hopper fabrication, weight of cut and scrap pieces	Chromium	10.80% to 12.50%		Nickel	1.50%	Max.  BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 15 OF 43
	generated. Contractor shall return to the Owner's store all unutilized (surplus) stainless steel plates and all waste and cut pieces generated. Non return of any part of the surplus/waste steel pieces to the Owner's store will call for the penal recovery at three (03) times the maximum procurement rate for the weight of stainless steel pieces not returned to the store. c) In case the contractor does the cutting of the stainless steel without approved cutting plan then all the wastage (i.e. the difference between the weight of stainless steel plate cuts and the actual finished weight considered for the measurement for payment) shall be subjected to the penal recovery at the rate mentioned above. 2.10.04 Cuffing Cutting may be affected by shearing, or by using plasma. The cut edges of all plates shall be perfectly straight and uniform through out. Cutting shall be done as per the cutting plan shown in the fabrication drawing. Should the Engineer find it necessary, the edges shall be ground smooth afterwards by contractor within the unit rates quoted by him. All the edge s shall be ground smooth before they are welded. 2.10.05 Jointing Welding shall join stainless steel. All weld joints (along the inclined plane) shall be staggered. Any common welding process can weld stainless steel viz. MIG, metal arc or plasma using the covered compatible electrodes as per IS: 5206 or by inert gas arc welding as per IS: 2811. Shielding gas shall be Argon + Hydrogen mixture or Argon + Oxygen mixture. However, Argon + Oxygen mixture shall be preferred. Carbon-di-oxide mixture shall be avoided. 308L and 315L electrodes/fillers shall be used for the welding of Stainless Steel to Stainless Steel and Stainless Steel to Mild Steel respectively. However, the welding process and the type of the electrodes to be used for welding shall be as per welding procedure, as approved by the Engineer. On the basis of the welding procedure, the Contractor shall conduct qualification test. 2.10.06 Bending The stainless steel plates shall be subjected to cold forming and bending in order to get the desired shape and profile. 2.10.07 Welding sequence The type of electrodes, welding sequence, preheat and interpass temperature and post weld heat treatment shall be as approved by the Engineer.	

 BHEL Bharat Heavy Electricals Limited	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 17 OF 43
	placed on this layer while it is still workable and the bearing is levelled. The bearing should not be displaced as the beam is lowered into position. When the mortar and adhesive are fully set and the beam slightly above the top of the bearing. The upper surface of the bearing shall then be coated with sufficient thickness of epoxy resin mortar so that when the beam is lowered on to the temporary supports it comes into full contact with the mortar and some is squeezed out. The surplus shall be troweled off and after the mortar is fully set the temporary supports removed. 2.12.00 Storage of material 2.12.01 General All materials shall be so stored as to prevent deterioration and to ensure the preservation of their quality and fitness for the work. Any material, which has deteriorated or has been damaged, shall be removed from the contractor's yard immediately, failing which, the Engineer shall be at liberty to get the material removed and the cost incurred thereof shall be realised from the Contractor. The Contractor shall maintain upto date accounts in respect of receipt, use, and balance of all sizes and sections of steel and other materials. In case the fabrication is carried out in contractor's fabrication shop outside the plant site where other fabrication works are also carried out, all materials meant for use in this contract shall be stacked separately with easily identifiable marks. 2.12.02 Steel The steel to be used in fabrication and the resulting cut-pieces shall be stored in separate stacks off the ground section wise and lengthwise so that they can be easily inspected, measured, and accounted for at any time. If required by the Engineer, the materials may have to be stored under cover and suitably painted for protection against weather. 2.12.03 Electrodes The electrodes for electric arc welding shall be stored in properly designed racks, separating different types of electrodes in distinctly marked compartments. The electrodes shall be kept in a dry and warm condition if necessary by resorting to heating. 2.12.04 Bolts, Nuts and Washers Bolts, nuts and washers and other fastening materials shall be stored on racks off the ground with a coating of suitable protective oil. These shall be stored in separate gunny bags or compartments according to diameter, length, and quality.	

	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 18 OF 43
2.12.05	Paints Paints shall be stored under cover in air tight containers. Paints supplied in sealed containers shall be used up as soon as possible once the container is opened. 2.13.00	
	Quality Control The Contractor shall establish and maintain quality control procedures for different items of work and materials to the extent he deems necessary to ensure that all work is performed in accordance with this specification. In addition to the Contractor's quality control procedures, materials and workmanship at all times shall be subjected to inspection by the Engineer or Engineer's representative. As far as possible, all inspection by the Engineer or Engineer's representative shall be made at the Contractor's fabrication shop whether located at Site or elsewhere. The Contractor shall co-operate with the Engineer or Engineer's representative in permitting access for inspection to all places where work is being done and in providing free of cost all necessary help in respect of tools and plants, instrument, labour and materials required to carry out the inspection. The inspection shall be so scheduled as to provide the minimum interruption to the work of the Contractor. Materials or workmanship not in reasonable conformance with the provisions of this Specification may be rejected at any time during the progress of the work. The quality control procedure shall cover but not be limited to the following items of work	
	a) Steel: Quality manufacturer's test certificates, test reports of representative samples of materials from unidentified stocks if permitted to be used.	
	b) Rivets, Bolts, : Manufacturer's certificate, dimension checks, Nuts & Washers material testing.	
	c) Electrodes : Manufacturer's certificate, thickness and quality of flux coating.	
	d) Welders : Qualifying Tests	
	e) Welding sets : Performance Tests	
	f) Welds : Inspection, X-ray, Ultrasonic tests	
	g) Paints : Manufacturer's certificate, physical inspection	

	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 19 OF 43
	reports h) Galvanizing : Tests in accordance with IS 2633 - Method for testing uniformity of coating on Zinc Coated Articles and IS : 4759 - Specification for Hot-Dip Zinc coatings on Structural Steel and other allied products. 2.14.00 Standard dimensions, forms and weights The dimensions, forms, weights and tolerances of all rolled shapes rivets, bolts, nuts, studs, washers etc. and other members used in the fabrication of any structure shall, wherever applicable, conform to the requirements of the latest relevant Indian Standards, wherever they exist, or, in the absence of Indian Standards, to other equivalent standards. 2.15.00 Fabrication Drawings The contractor shall within thirty (30) days after the award of the Contract submit to the Engineer the Schedule of Fabrication and erection of structural Steelworks, for approval. Within one week after receipt of approval on design of any steel structure (part or full) based on the approved design. As decided by the Engineer, six (6) copies each of some or all of the detailed fabrication drawings will have to be submitted for approval. The sequence of preparation of fabrication drawings shall match with the approved fabrication and erection schedule. The above-mentioned approval for fabrication drawings will be accorded only towards the general conformity with the design requirements as well as specifications. The approval of drawing however shall not relieve the contractor of his sole responsibility in carrying out the work correctly and fulfilling the complete requirements of contract documents. The fabrication drawings shall include but not limited to the following: a) Assembly drawings giving exact sizes of the sections to be used and identification marks of the various sections. b) Dimensional drawings of base plates, foundation bolts location etc. c) Comparison sheets to show that the proposed alternative section, if any, is as strong as the original sections shown on the Design Drawings. d) Complete Bill of Materials and detailed drawings of all sections as also their billing weights.	

	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 20 OF 43
	e) Any other drawings or calculations that may be required for the clarification of the works or substituted parts thereof. These drawings shall give all the necessary information for the fabrication, erection, and painting of the steelwork in accordance with the provisions of this Specification. Fabrication drawings shall be made in accordance with the best modern practice and with due regard to sequence, speed and economy in fabrication and erection. Fabrication drawings shall give complete information necessary for fabrication of the various components of the steelwork, including the location, type, size, and extent of welds. These shall also clearly distinguish between shop and field rivets, bolts, and welds and specify the class of bolts and nuts. The drawings shall be drawn to a scale large enough to convey all the necessary information adequately. Notes on the fabrication drawings shall indicate those joints or groups of joints in which it is particularly important that the welding sequence and technique of welding shall be carefully controlled to minimize the locked up stresses and distortion. Welding symbols used shall be in accordance with the requirements of the Indian Standard Specification. IS: 813 - Scheme of symbols for Welding, and shall be consistent throughout. Weld lengths called for on the drawings shall mean the net effective length. The Contractor shall be responsible for and shall carry out at his cost any alterations of the work due to any discrepancies, errors or omissions on the drawings or other particulars supplied by him, whether such drawings or other particulars have been duly approved or not in accordance with the Contract. 3.00.00 WORKMANSHIP 3.01.00 Fabrication 3.01.01 General All workmanship shall be equal to the best practice in modern structural shops, and shall conform to the provisions of the Indian Standard IS: 800 - Code of Practice for general construction in steel and other relevant Indian Standards or equivalent. 3.01.02 Straightening Material Rolled materials before being laid off or worked, must be clean, free from sharp kinks, bends or twists and straight within the tolerances allowed by the Indian Standard Specification on IS: 1552 - Specification for rolling and cutting tolerance for hot-rolled steel products. If straightening is necessary, it may be done by mechanical means or by the application of a limited amount of localized heat. The temperature of heated areas, as measured by approved methods, shall not exceed 600°C.	

 BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 22 OF 43
	provided that the holes are punched 3 mm less in diameter than the required size and reamed after assembly to the full diameter. Holes for rivets or black bolts shall be not more than 1.5 mm or 2.0 mm (depending on whether the diameter of the rivet or bolt is less or more than or equal to 25 mm) larger in diameter than the nominal diameter of the rivet or black bolt passing through them. Holes for turned and fitted bolts shall be drilled to a diameter equal to the nominal diameter of the shank or barrel subject to a tolerance grade of BS as specified in IS: 919. Parts to be connected shall be firmly held together by tacking welds or clamps and the holes drilled through all the thicknesses in one operation and subsequently reamed to size. Holes not drilled through all thickness in one operation shall be drilled to a smaller size and reamed out after assembly. Holes for rivets or bolts shall not be formed by gas cutting process. 3.02.02 Assembly All parts of riveted members shall be well pinned or bolted and rigidly held together while riveting. Drifting to enlarge unmatching holes shall not generally be permitted. In case drifting is permitted to a slight extent during assembly, it shall not distort the metal or enlarge the holes. Holes that must be enlarged to admit the rivets or bolts shall be reamed. Poor matching of holes shall be cause for rejection .The component parts shall be so assembled that they are neither twisted not otherwise damaged, and shall be so prepared that the specified cambers, if any, are maintained. Rivets shall ordinarily be hot driven, in which case their finished heads shall be approximately hemispherical in shape and shall be of uniform size throughout the work for rivets of the same size full, neatly finished and concentric with he holes. Rivets shall be heated uniformly to a temperature not exceeding 1 125°C they shall not be driven after their temperature has fallen below 540°C. Rivets shall be driven by power riveters, of either compression or manually operated type, employing pneumatic, hydraulic or electric power. Hand driven rivets shall not be allowed unless in exceptional cases specifically approved by the Engineer. After driving, rivets shall be tight, shall completely fill the holes and their heads shall be in full contact with the surface. In case of countersunk rivets, the countersinking shall be fully filled by the rivet, any proudness of the countersunk head being dressed off flush, if required. Riveted members shall have all parts firmly drawn and held together before and during riveting and special care shall be taken in this respect for all single	

	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 23 OF 43
	riveted connections. For multiple riveted connections, a service bolt shall be provided in every third or fourth hole. All loose, burnt, or otherwise defective rivets shall be cut out and replaced and special care shall be taken to inspect all single riveted connections. Special care shall also be taken in heating and driving long rivets. The Contractor shall prove the quality of riveting by cutting some rivets chosen at random by the Engineer. No extra payment will be made to the Contractor for such cutting and replacing. Riveting work, for any particular section or group, will be considered satisfactory when at least 90% of the corresponding cut rivets is found to be sound. If the ratio is below 75%, all the rivets in the particular section or group shall be cut, removed and replaced and tested again at the Contractor's expense. For cases between 75% and 90% the engineer shall have the option to instruct cutting and replacing any number of further rivets at the Contractor's cost as he deems necessary. Bolted construction shall be permitted only in case of field connections if called for on the Drawings and is subjected to the limitation of particular connections as may be specified. In special cases, however, shop bolt connections may be allowed if shown on drawing or directed by the Engineer. Washers shall be tapered or otherwise suitably shaped, where necessary, to give the heads and nuts of bolts a satisfactory bearing. The threaded portion of each bolt shall project through the nut at least one thread. In all cases the bolt shall be provided with a washer of sufficient thickness under the nut to avoid any threaded portion of the bolt being within the thickness of the parts bolted together. In addition to the normal washer one spring washer or lock nut shall be provided for each bolt for connections subjected to vibrating forces or otherwise as may be specified on the Drawings. 3.03.00 Welded Construction 3.03.01 General Welding shall be in accordance with relevant Indian Standards and as supplemented in the Specification. Welding shall be done by experienced and good welders who have been qualified by tests in accordance with IS: 817. 3.03.02 Preparation of material Surface to be welded shall be free from loose scale, slag, rust, grease, paint, and any other foreign material except that mill scale, which withstands vigorous wire brushing, may remain. Joint surfaces shall be free from fins and tears. Preparation of edges by gas cutting shall, wherever practicable, be done by a mechanically guided torch.

		VOLUME - II B
		SECTION - D SUBSECTION -D17
		REV.NO. 0 DATE 16/03/2016
		SHEET 24 OF 43
3.03.03	Assembling Parts to be fillet welded shall be brought in, as close contact as practicable and in no event shall be separated by more than 4 mm. If the separation is 1.5 mm or greater, the size of the fillet welds shall be increased by the amount of the separation. The fit of joints at contact surfaces, which are not completely sealed by, welds, shall be close enough to exclude water after painting. Abutting parts to be butt-welded shall be carefully aligned. Misalignments greater than 3 mm shall be corrected and in making the correction the parts shall not be drawn into a sharper slope than two degrees (2°). The work shall be positioned for flat welding whenever practicable.	
3.03.04	Welding Sequence In assembling and joining parts of a structure or of built-up members, the procedure and sequence of welding shall be such as will avoid needless distortion and minimize shrinkage stresses in the closing welds of a rigid assembly, such closing welds shall be made in compression elements. In the fabrication of cover-plated beams and built-up members, all shop splices in each component part shall be made before such component part is welded to other parts of the member. Long girders or girder sections may be made by shod splicing not more than three sub-sections, each made in accordance with this paragraph. When required by the Engineer, welded assemblies shall be stress relieved by heat-treating in accordance with the provisions of the relevant Indian Standard or any other Standard approved by the Engineer.	
3.03.05	Welding technique All complete penetration groove welds made by manual welding, except when produced with the aid of backing material not more than 8 mm thick with root opening not less than one-half the thickness of the thinner part joined, shall have the root of the initial layer gouged out on the back side before welding is started from that side, and shall be so welded as to secure sound metal and complete fusion throughout the entire cross-section. Groove welds made with the use of the backing of the same material, as the base metal shall have the weld metal thoroughly fused with the backing material. Backing strips need not be removed. If required, they may be removed by gouging or gas cutting after welding is completed, provided no injury is done to the base metal and weld metal and the weld metal surface is left flush or slightly convex with full throat thickness. Groove welds shall be terminated at the ends of a joint in a manner that will	

	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 25 OF 43
	ensure their soundness. Where possible, this should be done by use of extension bars or run-off plates. Extension bars or run-off plates need not be removed upon completion of the weld unless otherwise specified elsewhere in the contract. To get the best and consistent quality of welding, automatic submerged arc process shall be preferred. The technique of welding employed, the appearance and quality of welds made, and the methods of correcting defective work shall all conform to the relevant Indian Standards. 3.03.12 Temperature No welding shall normally be done on parent material at a temperature below (-) 5°C. However, if welding is to undertaken at low temperature, adequate precautions as recommended in relevant Indian Standard shall be taken. When the parent material is less than 40 mm thick and the temperature is between (-) 5°C and 0°C, the surface around the joint to a distance of 100 mm or 4 times the thickness of the material, whichever is greater, shall be preheated till it is hand warm. When the parent material is more than 40 mm thick, the temperature of the area mentioned above shall be in no case be less than 20°C. All requirements regarding preheating of the parent material shall be in accordance with the relevant Indian Standard. 3.03.13 Peening Where required, intermediate layers of multiple-layer welds may be peened with light blows from a power hammer, using a round-nose tool, peening shall be done after the weld has cooled to a temperature warm to the hand. Care shall be exercised to prevent scaling or flaking of weld and base metal from over peening. 3.03.14 Equipment These shall be capable of producing proper current so that the operator may produce satisfactory welds. The welding machine shall be of a type and capacity as recommended by the manufacturers of electrodes or as may be approved by the engineer. 3.04.00 Finish Column splices and butt joints of compression members depending on contact for stress transmission shall be accurately machined and close-butt over the whole section with a clearance not exceeding 0.1 mm locally at any place. In column caps and bases, the ends of shafts together with the attached gussets, angles, channels etc; after welding/riveting together, should be accurately machined so that the parts connected butt over the entire surfaces of contact. Care should be taken that those connecting angles of channels are fixed with such accuracy that they are not reduced in thickness by machining by more

		SHEET	26	OF	43
than 1.0 mm.					
3.05.00	Slab bases and caps				
Bases and caps fabricated out of steel slabs, except when cut material with true surface, shall be accurately machined over the bearing surface and shall be in effective contact with the end of the stanchion. A bearing face, which is to be grouted direct to a foundation, need not be machined if such face is true and parallel to the upper face. To facilitate grouting, holes shall be provided, where necessary, in stanchion bases for the escape of air.					
3. 12.00	Lacing bars				
The ends of lacing bars shall be neat and free from burns.					
3. 13.00	Separators				
Rolled section or built-up steel separators or diaphragms shall be required for all double beams except where encased in concrete, in which case, pipe separators shall be used.					
3.14.00	Bearing Plates				
Provision shall be made for all necessary steel bearing plates to take up reaction of beams and columns and the required stiffeners and gussets whether or not specified in Drawings.					
3.15.00	Floor Grating				
All grating units shall be rectangular in pattern and of pressure locked assembly. The size and spacing of bearing bars and cross bars shall be as approved in detailed drawings. Alternatively diamond pattern grating if approved may be used. The grating shall be made in panel units designed to span as indicated in structural steel framing drawing or as directed by the Engineer. The grating units shall be finished free from warps, twists, or any other defects. Grating work shall include cutouts and clearance openings for all columns, pipes, ducts, conduits etc. The gratings shall be notched, trimmed, and neatly finished around components of the steel structures encountered.

		SHEET	27	OF	43
		Binding strip shall be provided on the grating to suit the profile. Openings in gratings shall be provided with steel bar toe plates of not less than 5 mm thickness and 100 mm width. Unless otherwise indicated on drawings, all penetrations of grating units shall be made up in split section, accurately fitted, and neatly finished. Grating units shall be provided with all necessary clips, bolts, lock washers etc. for proper assembly and installation on supporting steel members. Maximum deviation in linear dimension shall not exceed 12 mm.			
3.10.00	Chequered Plates	Minimum thickness of chequered plate floorings, covers etc. shall be 6 mm O/P. Chequered plate shall be accurately cut to the required sizes and shapes and the cut edges properly ground. Stiffeners shall be provided wherever required from design consideration.			
3.11.00	Architectural Clearances	Bearing plates and stiffener connections shall not be permitted to encroach on the designed architectural clearances.			
3.11.00	Shop connections	a) All shop connections shall be otherwise riveted or welded as specified on the Drawings. b) Heads of rivets on surfaces carrying brick walls shall be flattened to 10 mm thick projection. c) Certain connections, specified to be shop connections, may be changed to field connections if desired by the Engineer for convenience of erection and the contractor will have to make the desired changes at no extra cost to the exchequer.			
3.13.00	Castings	Steel castings shall be annealed.			
3.14.00	Shop erection	The steelwork shall be temporarily shop-erected complete or as directed by the Engineer so that accuracy of fit may be checked before dispatch. The parts shall be shop-erected with a sufficient number of parallel drifts to bring and keep the parts in place. In case of parts drilled or punched using steel jigs to make all similar parts interchangeable, the steelwork shall be shop erected in

	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 31 OF 43
	not to injure the skin on galvanized surfaces during transport, handling, and erection. Damages, if occur, shall be made good in accordance or as directed by the Engineer. 4.00.00 INSPECTION, TESTING, ACCEPTANCE CRITERIA AND DELIVERY 4.01.00 Inspection Unless specified otherwise, inspection to all, work shall be made by the or Engineer's representative at the place of manufacture prior to delivery. The Engineer or his representative shall have free access at all reasonable times to those parts of the manufacturer's works which are concerned with the fabrication of the steelwork under this Contract and he shall be afforded all reasonable facilities for satisfying himself that the fabrication is being done in accordance with the provisions of this Specification. The Contractor shall provide free of charge, such labour, materials, electricity, fuel, water, stores, tools and plant, apparatus and instruments as may be required by the Engineer to carry out inspection and/or tests in accordance with the Contract. The Contractor shall guarantee compliance with the provisions of this Specification. 4.02.00 Testing and Acceptance Criteria 4.02.01 General The Contractor shall carry out sampling and testing in accordance with the relevant Indian Standards and as supplemented herein for the following items at his own Cost. The Contractor shall get the specimens tested in a laboratory approved by the Engineer and submit to the Engineer the test results in triplicate within 3 (three) days after completion of the test. 4.02.02 Steel All steel supplied by, the Contractor shall conform, to the relevant Indian Standards. Except otherwise mentioned in the contract, only tested quality steel having mill test reports shall be used. In case unidentified steel materials are permitted to be used by the Engineer, random samples of materials will be taken from each unidentified lot of 50 M.T or less of any particular section for tests to conform to relevant Indian Standards. Cost of all tests shall be born by the contractor. All material shall be free from all imperfections, mill scales, slag intrusions, laminations, fittings, rusts etc. that may impair their strength, durability, and appearance.	

	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 32 OF 43
4.02.02	Welding a) The weld surface shall be cleaned with steel wire brush to remove spatter metal, slag etc. and 100% of welds shall be inspected visually for size, length of weldment and external defects. Weld gauges shall be used for checking weld sizes. The surface shall be clean with regular beads and free from slags, cracks, blow-holes etc. b) Non-destructive examination shall be carried out to determine soundness of weldments as follows: i) 10% at random on fillet-joints. ii) 100% on all butt-joints. c) Should the ND tests indicate defects like improper root penetration, extensive blowholes, slag intrusion etc., such welds shall be back gauged, joints prepared again and rewelded. All defects shall be rectified by the Contractor at no extra costs. d) All electrodes shall be procured from approved reputed manufacturers with test certificates. The correct grade and size of electrode, which has not deteriorated in storage, shall be used. The inspection and testing of welding shall be performed in accordance with the provisions of the relevant Indian Standards or other equivalents. For every 50 tones of welded fabrication, the Engineer may ask for 1(one) test-destructive or non-destructive including X -ray, ultrasonic test or similar, the cost of which shall be borne by the Contractor.	
4.02.04	Rivets, bolts, nuts and washers All rivets, bolts, nuts, and washers shall be procured from M/s. Guest Keen William Ltd. or equivalent and shall confirm to the relevant Indian Standards. If desired by the Engineer, representative samples of these materials may have to be tested in an approved laboratory and in accordance with the procedures described in relevant Indian Standards. Cost of all such testing shall have to be borne by the Contractor. In addition to testing the rivets by hammer, 2% (two per cent) of the rivets done shall have to be cut off by chisels to ascertain the fit, quality of material and workmanship. The removal of the cut rivets and re-installing new rivets shall be done by the Contractor at his own cost.	
4.02.05	Shop painting All paints and primers shall be of standard quality and procured from approved	

	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 33 OF 43
	manufacturers and shall conform to the provisions of the relevant Indian Standards. 4.02. 12 Galvanizing All galvanizing shall be uniform and of standard quality when tested in accordance with IS: 2633 - Method for testing uniformity of coating on Zinc Coated Articles and 15: 4759 - specification for Hot-Dip Zinc Coatings on Structural Steel & other allied products. 4.03.00 Tolerance The tolerances on the dimensions of individual rolled steel components shall be as specified in IS: 1852 - specification for rolling and Cutting Tolerances for Hot-rolled Steel Products. The tolerances on straightness, length etc. of various fabricated components (such as beams and girders, columns, crane gantry girder etc.) of the steel structures shall be as specified in IS: 721 - Tolerances for Fabrication of Steel Structures. 4.04.00 Acceptance Should any structure or part of a structure be found not to comply with any of the provisions of this specification, the same shall be liable to rejection. No Structure or part of the structure once rejected, shall be offered again for test, except in cases where the Engineer considers the defects rectifiable. The Engineer may, at his discretion, check some of the tests at an appropriate laboratory at the contractors cost. When all tests to be performed in the Contractor's shop under the terms of this contract have been successfully carried out, the steelwork will be accepted forthwith and the Engineer will issue acceptance certificate, upon receipt of which, the items will be shop painted, packed and dispatched. No item to be delivered unless an acceptance certificate for the same has been issued. The satisfactory completion of these tests or the issue of the certificates shall not bind the Owner to accept the work, should it, on further tests before or after erection, be found not in compliance with the Contract. 4.05.00 Delivery of materials 4.05.01 General The Contractor will deliver the fabricated structural steel materials to site with all necessary field connection materials in such sequence as will permit the most efficient and economical performance of the erection work. The Owner may prescribe or control the sequence of delivery of materials, at his own

4.05.02	Marking Each separate piece of fabricated steelwork shall be distinctly marked on all surfaces before delivery in accordance with the markings shown on approved erection drawings and shall bear such other marks as will further facilitate identification and erection. 4.05.03	Shipping Shipping shall be strictly in accordance with the sequence stipulated in the agreed Programme. Contractor shall dispatch the materials to the e worksite securely protecting and packing the materials to avoid loss or damage during transport by rail, road or water. All parts shall be adequately braced to prevent damage in transit. Each bundle, bale or package delivered under this contract shall be marked on as many sides as possible and such distinct marking (all previous irrelevant markings being carefully obliterated) shall show the following: a) Name and address of the consignee b) Name and address of the consignor c) Gross weight of the package in tonnes and its dimensions d) Identification marks and/or number of the package e) Custom registration number, if required All markings shall be carried out with such materials as would ensure quick drying and indelibility. Each component or part or piece of material when shipped, shall be indelibly marked and/or tagged with reference to assembly drawings and corresponding piece numbers. Each packing case shall contain in duplicate in English a packing list pasted on to the inside of the cover in a water-proof envelope, quoting especially - a) Name of the Contractor b) Number and date of the Contract c) Name of the office placing the contract d) Nomenclature of stores

	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 36 OF 43
	e) A schedule of parts or pieces, giving the parts or piece number with reference to assembly drawings and the quantity of each. The shipping dimensions of each packing shall not exceed the maximum dimensions permissible for transport over the Indian Railways/Roads. After delivery of the materials at site, all packing materials shall automatically become the property of the Owner. Notwithstanding anything stated hereinbefore, any loss or damage resulting from inadequate packing shall be made good by the Contractor at no additional cost to the Owner. When facilities exist, all shipments shall be covered by approved Insurance Policy for transit at the cost of the Contractor. The contractor shall ship the complete materials or part on board a vessel belonging to an agency approved by the Owner or on rail and/or road transport as directed. The Contractor shall take all reasonable steps to ensure correct appraisal of freight rates, weights and volumes and in no case will the Owner be liable to pay any warehouse, wharfage, demurrage and other charges. If, however, the Owner has to make payment of any of the above-mentioned charges, the amount paid will be deducted from the bills of the Contractor. Necessary advise regarding the shipment with relevant details shall reach the Engineer at least a week in advance. 5.00.00 INFORMATION TO BE SUBMITTED 5.01.00 With Tender The following information is required to be submitted with the Tender: a) Progress Schedule The Contractor shall quote in his Tender a detailed schedule of progress of work and total time of completion, itemizing the time required for each of the following aspects of work. i) Preparation and approval of fabrication drawing ii) Procurement of Materials iii) Fabrication and shipping of all anchor bolts iv) Fabrication and shipping of main steelwork.	

	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 37 OF 43
	v) Fabrication and shipping of steelwork for bunkers, tanks and/or silos as applicable. vi) Fabrication and shipping of all other remaining steelwork including miscellaneous steelwork. vii) Final date of completion of all shipments. b) Shop Location of the Tenderer's fabrication workshop giving details of equipment, manpower, the total capacity, and the capacity that will be available exclusively for this contract shall be submitted. 5.02.00 After Award After award of the Contract the successful Tenderer is to submit the following: a) Complete fabrication drawings, material lists, cutting lists, rive and bolt lists, field welding schedules based on the approved design drawings prepared by him in accordance with the approved schedule. b) Monthly Progress Report with necessary photographs in six (6) copies to reach the Engineer on or before the 7th day o. each month, giving the up-to-date status of preparation of detailed shop drawings, bill of materials, procurement of materials, actual fabrication done, shipping and all other relevant information. c) Detailed monthly material reconciliation statements relevant to the Work done and reported in the Progress Report, giving the stock at hand of raw steel, work in progress, finished materials. d) Results of any test as and when conducted and as require by the engineer. e) Manufacturer's mill test report in respect of steel materials, rivets, bolts, nuts, and electrodes as may be applicable. 6.00.00 RATES AND MEASUREMENT 6.01.00 Rates 6.01.01 The items of work in the Schedule of items describe the work in brief. The various items of the Schedule of items shall be read in conjunction with these specifications including amendments and additions, general conditions of	

 BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 38 OF 43
	contract, special conditions of contracts, and other tender documents, if any. For each item of Schedule of Items, the bidder's rates shall include the activities covered in the description of the item as well as all necessary operations described in the Specifications. 6.01.02 The bidder's rates shall include cost of all minor details which are obviously and fairly intended and which may not have been included in the description in these documents but are essential for the satisfactory completion of the work. Rates shall also include for taking all safety measures. 6.01.03 The bidder's -rates for all items of schedule of items shall include complete cost towards plant, equipment, erection and dismantling of scaffolding, men, materials and consumables, skilled and unskilled labour, levies, taxes, royalties, duties, transport, storage, repair/rectification/maintenance until handing over, contingencies, overhead and all incidental items not specifically mentioned but reasonably implied and necessary to complete the work. 6.01.04 No claims shall be entertained, if the details shown on the 'Released for Construction' drawings differ from those shown on the bid/tender drawings. 6.01.05 Rates shall be inclusive of all leads and lifts/elevation. 6.01.06 The bidder's rates for Structural Steel shall include for fabrication and erection, transportation to site, preparation checking collecting and distributing of the fabrication drawings and design calculations, erection scheme, alignment, welding, including preheating and post heating, testing of welders, inspection of welds, visual inspection, non destructive and special testing, rectification and correction of defective welding works, production test plate, inspection and testing, erection scheme, protection against damage in transit, stability of structures, etc. The rates shall also be inclusive of providing and installing temporary structures, transport of Owner issue material from store, return of surplus/waste steel materials including cut pieces/waste steel, provision of additional butt/weld joint to reduce the wastage and all other general, special, such requirements as may be required, for the successful completion of the work. The rates for fabrication are inclusive of all tests on welds and material and no extra shall be payable for quality tests specified for fabrication of structure in shop or at site. Separate BOQ items for test on welds like radiography or Ultrasonic, DPT, magnetic particle tests are kept for tests on material/fabrication not covered under regular fabrication item of BOQ. 6.01.07 The bidder's rates for foundation bolts assembly shall include fabrication, threading, heat treatment, erection, installation, and alignment of complete bolt	

 BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 39 OF 43
	assembly with nuts, locknuts, anchor plates, stiffener plates, protective tape, etc. This shall also include the cost of all materials not issued by the Owner. Material issued by Owner will be specified in GCC. 6.01.08 The bidders rates for application of inorganic primer shall include surface preparation to near white metal surface by blast cleaning, abrasives, touch up painting, suitable enclosure to avoid contamination and the necessary statutory approval from the factory inspector/pollution control board etc. regarding the method of blast cleaning and abrasives used, and getting approval of the specialized agency supplying the primer specified. 6.01.09 The bidder's rates for application of finish painting system shall include surface preparation, application of intermediate (under) coat, finish coat and final finish coat, and getting approval of the specialized agency supplying the finish paint. 6.01.10 The bidder's rates for electro-forged gratings (if specified) shall include supply, fabrication, transportation to the site, erection and alignment of factory made electro-forged gratings, all taxes, duties thereon etc. The rates shall also include preparation of grating design for different spans and load intensifies, preparation of design and fabrication drawings, edge preparation, blast cleaning followed by finish paint. 6.01.11 The bidder's rates for galvanization of factory made electro-forged gratings (if specified) shall include the application of hot dipped galvanization as finish over the fabricated gratings and the treatment to be given for prevention of white storage stains, as per the technical Aspiration. 6.01.12 The bidder's rates for permanent mild steel bolts, nuts and washers shall include the supply and fixing of such bolts, nuts and washers in position, for various types of Structural Steel works, as per the technical specification. 6.01.13 The bidder's rates for high strength structural bolts, nuts and washers shall include the supply and fixing of such bolts, nuts and washers in position, for various types, of Structural Steel works, as per the technical specification. 6.01.14 The bidder's rates for dismantling, additions to, alterations in and/or modifications shall be inclusive of all operations such as lowering of material, carriage etc., as mentioned in the technical specification. Unutilised steel pieces cut/removed shall be returned to the project stores free of charge. Non-return of unutilized steel pieces to the Owner's store would be considered as wastage and recovery would be affected as per the provision of contract for structural steel consumption. This shall not include the weight of temporarily dismantled/supported members, connected member. The bidder should prepare an optimised cutting plan as per fabrication	

 BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 40 OF 43
	drawing to utilise the steel material upto maximum extent and minimise the wastage/scrap. Quantity of wastage/scrap of material should be limited to the percentage mentioned elsewhere in the conditions of tender/contract specifications. 6.01.15 The bidder's rates for re-erection of erection marks after additions to, alterations in and/or modifications shall be inclusive of all operations mentioned in technical specification for the calculated weight of the rectified/modified erection mark rejected at site. This shall not include the weight of temporarily dismantled/supported members, connected member. All the operations mentioned above for restoring such members shall be carried out at no extra cost. The work of erection of any erection mark which has not been dismantled but have been modified/rectified before erection shall not be paid under this item but shall be paid under relevant item of fabrication and erection of steel work of Schedule of items for the modified weight. 6.01.16 The bidder's rates for PTFE shall include design, supply, transportation of the complete assembly with guides and dust protection cover and installation of bearings in position drilling, bolting, erecting aligning etc. along with any taxes, duties thereon etc. 6.01.17 The bidder's rates for Stainless Steel hopper (if specified) shall include fabrication and erection, transportation to site, preparation checking collecting and distributing of the fabrication drawings and design calculations, all other operations mentioned in the technical specification. The rates shall also include for erection scheme, alignment, making cutting plan, cutting, jointing, bending, rolling, grinding, drilling, bolting, assembly, edge preparation, welding including pre-heating, post-heating, testing of welders, inspection of welds, inspection and testing, protection against damage in transit, stability of structures, installation of temporary structures etc. The rates shall also be inclusive of providing and installing temporary structures, transport of Owner issue material from store, return of surplus / waste steel materials including cut pieces/waste steel, provision of additional butt / weld joint to reduce the wastage and all other general, special, such requirements as may be required, for the successful completion of the work. 6.01.18 The bidders rates for preformed flexible open ended bellow strap of neoprene (if specified) shall include supply and transportation, installation in position, drilling, bolting, aligning etc. complete along with any taxes, duties thereon etc. 6.01.19 The bidder's rates for Stainless Steel Hand Rail (if specified) shall include complete Hand Rail including, materials, fabrication, grinding & finishing, stainless steel beading, stainless steel cleats, stainless steel fasteners, neoprene gaskets, preparation of shop drawing but excluding the cost of glazing. The Owner shall supply no material for this item of work.	

 BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 41 OF 43
6.02.00 MODE OF MEASUREMENT		
6.02.01	The measurement for the item of foundation bolts assembly including that of nuts; locknuts shall be based on the calculated weight of steel installed in Metric Tonne, corrected to second place of decimal. The weight of the foundation bolt shall be calculated in the same way as that done for the item of fabrication, erection, alignment of structural steel. The weight of the nut / locknut shall be taken as per actual weight supplied by the contractor and accepted by the Engineer.	
6.02.02	The measurement for the item of fabrication, erection, alignment, welding, etc. of structural steel work shall be based on the approved weight of steel nearest to a Kg, by applying the unit weight as adopted at the time of issue of structural steel on the measurements worked out as given below.	
6.02.03	For ISMB, ISMC, ISA, flats, round bars, square bars and pipes, length shall be taken as per distance between planes normal to the axis of the member passing through the extreme points of the section.	
6.02.04	Gussets plates in trusses, and bracings, brackets plates, stiffeners, and skew cuts if any in plates for butt welds, the area shall be assumed as the minimum circumscribed rectangle. However deduction for any notch/skew cut shall be made as mentioned in clause no-6.02.06.	
6.02.05	For bunker wall plates, the minimum-circumscribing rectangle of the individual plate/pieces out of which these wall plates are assembled by butt-welding, shall be measured. Care shall be taken to ensure maximum utilization of cut-pieces generated by providing extra butt joints (for which no extra payment shall be made).	
6.02.06	For all other plates, where the area of any notch/skew cut in the plate is less than 0.05 sq.m. the area of the plate shall be assumed as that of the minimum circumscribing rectangle for the purpose of measurement and calculation of area for the purpose of payment. However, if the area of any notch/skew cuts in a plate is more than 0.05 sq.m, the area of notch/skew cut shall be deducted from assumed minimum circumscribing rectangular area for the purpose of payment.	
6.02.07	No deduction shall be made for the hole in the members, if the area of individual hole is less than 0.05 sq.m. The weight shall be calculated by deducting the area of holes, if area of individual hole is more than 0.05 sq.m.	
6.02.08	All cut-pieces and scrap generated due to cutting of holes, skew-cuts of plates, gussets, brackets, stiffeners, etc. shall be stacked separately and handed over to the project stores without being considered for material accounting as the	

 BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 42 OF 43
	circumscribing rectangle has been considered for payment. 6.02.09 The splice plate shown in the fabrication drawing or approved by the Engineer shall only be measured for payment. 6.02.10 The weight of permanent bolts, washers and nuts and welds shall not be included in the weights of the members. No extra payment shall be made for welding/bolting. 6.02.11 The bolts and nuts required for erection purpose shall not be paid for and may be taken away by the Contractor after final welding for members. Erection boltholes left after removal of erection bolts shall be suitably plugged with welds. 6.02.12 The measurement for the item of application of inorganic primer including blast cleaning of steel surfaces shall be based on the weight on which the zinc silicate primer is applied, after blast cleaning in Metric Tonne, corrected to third place of decimal. The weight shall be the weight as approved, for erection mark/element of the mark painted, for payment of the item of fabrication and erection of structural steel works. 6.02.13 The measurement for the item of application of finish primer system shall be based on the weight on which the epoxy based finish primer is applied in Metric Tonne, corrected to third place of decimal. The weight shall be the weight as approved, for erection mark/element of the mark painted, for payment of the item of fabrication and erection of structural steel works. 6.02.14 The measurement for the item of gratings shall be based on the actual weight in Kgs, corrected to second place of decimal, as supplied by the Contractor, and accepted by the Engineer. Nothing extra shall be payable for making cutouts, notches, openings of any profile, trimming profiles etc. in the grating units. 6.02.15 The measurement for the item of hot dipped galvanization of gratings shall be based on the actual weight in Kgs, corrected to second place of decimal of gratings galvanized by the Contractor and accepted by the Engineer. 6.02.16 The measurement for the item of permanent bolts with nuts and washers shall be based on the actual weight in Kgs, corrected to second place of decimal, as supplied by the Contractor and accepted by the Engineer, and as per the approved bolts and nuts schedules. 6.02.17 The measurement for the item of High Strength Structural bolts with nuts and washers shall be based on the actual weight in Kgs, corrected to second place of decimal, as supplied by the Contractor and accepted by the Engineer, and as per the approved bolts and nuts schedules.	

 BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR FABRICATION OF STRUCTURAL STEEL WORK	SPECIFICATION NO. PE-TS-999-600-C017 VOLUME - II B SECTION - D SUBSECTION -D17 REV.NO. 0 DATE 16/03/2016 SHEET 43 OF 43
	6.02.18 The measurement for the item of the work of dismantling, additions, alterations, reerection etc. shall be as given below 6.02.19 For dismantling, the unmodified weight of the actually dismantled erection marks shall only be measured. 6.02.20 For the work of addition to, alteration in and / or modification of 'erection marks' either in erected position or in the fabrication yard, measurement of weight for payment purpose shall be calculated as the arithmetic sum of weight of steel cut and removed from the erection mark, weight of steel reutilised out of such cut and removed pieces and weight of additional new steel pieces added to the erection mark. 6.02.21 For re-erection the weight of the modified erection mark shall only be measured. 6.02.22 The weight shall be measured nearest to kg. and shall be arrived in a manner similar to the measurement for the item of fabrication, erection, alignment and welding of structural steel. 6.02.23 The measurement for the item of PTFE bearings shall be based on the load carrying capacity of PTFE in MT, corrected to third place of decimal, supplied by the contractor and as accepted by the Engineer and as per the approved bearing schedule, for the total vertical load carrying capacity, for all bearings. 6.02.24 The measurement for the item of stainless steel hopper shall be based on the actual finished weight of hopper weight in Kgs, corrected to second place of decimal. The hopper weight shall be arrived by multiplying of the inner surface area of the hopper with the unit weight of the hopper plate. 6.02.25 The measurement for the item of flexible open-ended bellows straps of neoprene shall be based in running meter, corrected to second place of decimal. Bellow Straps shall be supplied as per the requirement of the approved drawings. The measurement shall be done for the inner circumference of the bunker on which neoprene has been fixed and for the length supplied by the Contractor 'and as accepted by the Engineer. 6.02.26 The measurement for the item of Stainless Steel Hand Railing shall be based on finished weight of handrail in Kgs corrected to second place of decimal. The weight shall also include the weight of Stainless Steel fasteners, Stainless Steel beading, Stainless Steel cleats etc. The weight shall be the finished weight of Hand Rail, as accepted by the Engineer.

SHEET 3 OF 18

SUB-SECTION – D 18**ERECTION OF STRUCTURAL STEELWORK****1.00.00 SCOPE**

This specification covers the erection of structural steelwork including receiving and taking delivery of fabricated structural steel materials arriving at site, installing the same in position, painting and grouting the stanchion bases all complete as per Drawings, this Specification and other provision of the Contract.

2.00.00 GENERAL

2.01.00 Work to be provided for by the Contractor, unless otherwise specified in the Contract, shall include but not be limited to the following:

- a) The Contractor shall provide all construction and transport equipment, tools, tackle, consumables, materials, labour, and supervision required for erection of the structural steelwork.
- b) Receiving, unloading, checking, and moving to storage yard at Site including prompt attendance to all insurance matters as necessary for all fabricated steel materials arriving at Site. The Contractor shall pay all demurrage and/or wharfage charges etc. on account of default on his part.
- c) Transportation of all fabricated structural steel materials from Site storage yard, handling, rigging, assembling, riveting, bolting, welding and satisfactory installation of all fabricated structural steel materials in proper location according to approved erection drawings and/or as directed by the Engineer. If necessary suitable temporary approach roads to be built for transportation of fabricated steel structures.
- d) Checking center lines, levels of all foundation blocks including checking line, level, position and plumb of all bolts and pockets. Any defect observed in the foundation shall be rectified with Engineer's approval. The Contractor shall fully satisfy himself regarding the correctness of the foundations before installing the fabricated steel structures on the foundation blocks.
- e) Aligning, plumbing, leveling, riveting, bolting, welding and securely fixing the fabricated steel structures including floor gratings, chequered plates etc. in accordance with the Drawings or as directed by the Engineer.
- f) Painting of the erected steel structures.

TITLE:

**TECHNICAL SPECIFICATION FOR
ERECTION OF STRUCTURAL
STEELWORK**

SPECIFICATION NO. PE-TS-999-600-C018

VOLUME - II B

SECTION - D SUBSECTION - D18

REV.NO. 0 DATE 30/11/2015

SHEET 4 OF 18

g) All minor modifications of the fabricated steel structures as directed by the Engineer including but not limited to the following:

- i) Removal of bends, kinks, twists etc. for parts damaged during transport and handling.
- ii) Cutting, chipping, filling, grinding, etc. if required for preparation and finishing of site connections.
- iii) Reaming of holes for use of higher size rivet or bolt if required.
- iv) Refabrication of parts damaged beyond repair during transport and handling or refabrication of parts, which are incorrectly fabricated.
- v) Fabrication of parts omitted during fabrication by error, or subsequently found necessary.
- vi) Drilling of holes which are either not drilled at all or are drilled in incorrect location during fabrication.
- vii) Carry out tests in accordance with this specification.

2.02.00 Work by Others

No work under this Specification will be provided for by any agency other than the Contractor unless specifically mentioned elsewhere in the contract.

2.03.00 Codes and Standards

All work under this Specification shall, unless specified otherwise, conform to the latest revisions and/or replacements of the following or any other Indian Standard Specification and codes of Practice of equivalent:

IS: 800 - Code of practice for general construction in steel.

IS: 456 - Code of practice for main or reinforced concrete.

2.04.00 Conformity with Designs

The Contractor will erect the entire fabricated steel structure, align all the members, complete all field connections and grout the foundations all as per the provisions of this specification and the sequence and the design criteria laid down by the Engineer. All work shall conform to the provisions of this specification and /or instructions of the engineer. The testing and acceptance of the erected structures shall be in accordance with the provisions of this Specifications and/or the instructions o the Engineer.

The Tenderer must visit the site prior to submission of his tender to acquaint himself with the availability of land and the development necessary by way of filling, drainage, access roads, fences, sheds etc. all of which shall be carried out by the Contractor at his own cost as directed by the Engineer.

		SHEET 6	OF 18

2.06.03

Covered Store

All field connection materials, paints, cement etc. shall be stored on well designed racks and platforms off the ground in a properly covered store building to be built at the cost of the Contractor.

2.07.00

Quality Control

The contractor shall establish and maintain quality control procedures for different items of work and materials as may be directed by the Engineer to assure compliance with the provisions of the Contract and shall submit the records of the same to the Engineer. The quality control operation shall include but not be limited to the Following items of work :

- i) Erection: Lines, levels, grades, plumbs, joint characteristics including tightness of bolts.
- ii) Grouting: Cleaning and roughness of foundation, quality of materials used for grouting, admixtures, consistency, and strength of grout.
- iii) Painting: Preparation of surface for painting, quality of primers and paints, thinners, application and uniformity of coats.

2.08.00

Taking Delivery

The Contractor shall take delivery of fabricated structural steel and necessary connection materials from railhead/trucks as may be necessary and as directed by the Engineer. He shall check, unload; transport the materials to his stores for proper storing at his own cost. The Contractor shall submit claims to insurance or other authorities and pursue the same in case of loss or damage during transit and handling and all loss thereof shall be borne by him.

The Contractor shall also take all precautions against damage of the materials in his custody after taking delivery and till the same are erected in place and accepted. The Contractor shall salvage, collect, and deliver all the packing materials to the Owner free of charge.

3.00.00

WORKMANSHIP

3.01.00

Erection

3.01.01

Plant and Equipment

The suitability and adequacy of all erection tools and plant and equipment proposed to be used shall be thoroughly verified. They shall be efficient, dependable, in good working condition and shall have the approval of the

TITLE:

ERECTION OF STRUCTURAL
STEELWORK**

SPECIFICATION NO. PE-TS-999-600-C018

VOLUME - II B

SECTION - D SUBSECTION – D18

REV.NO. 0 DATE 30/11/2015

SHEET 7 OF 18

Engineer.

3.01.02 Method and sequence of erection

The method and sequence of erection shall have the prior approval of the Engineer. The Contractor shall arrange for most economical method and sequence available to him consistent with the drawings and specifications and other relevant stipulations of the contract.

3.01.03 Temporary Bracing

Unless adequate bracing is included as a part of the permanent framing, the erector during erection shall install, free of cost to the Owner, temporary guys and bracings where needed to secure the framing against loads such as wind or seismic forces comparable in intensity to that for which the structure has been designed, acting upon exposed framing as well as loads due to erection equipment and erection operations.

If additional temporary guys are required to resist wind or seismic forces acting upon components of the finished structure installed by others during the course of the erection of the steel framing, arrangement for their installation by the erector shall be made free of cost to the Owner.

The requirement of temporary bracings and guys shall cease when the structural steel is once located, plumbed, levelled, aligned, and grouted within the tolerances permitted under the specification and guyed and braced to the satisfaction of the Engineer.

The temporary guys, braces, false work, and cribbing shall not be the property of the Owner and they may be removed immediately upon completion of the steel erection.

3.01.04 Temporary Floors for Buildings

It shall be the responsibility of the Contractor to provide free of cost planking and to cover such floors during the work in progress as may be required by any Act of Parliament and/or bylaws of state, Municipal or other local authorities.

3.01.05 Setting Out

Positioning and levelling of all steelwork, plumbing of stanchions and placing of every part of the structure with accuracy shall be in accordance with the approved Drawings and to the satisfaction of the Engineer. For heavy columns,

TITLE:

**TECHNICAL SPECIFICATION FOR
ERECTION OF STRUCTURAL
STEELWORK**

SPECIFICATION NO. PE-TS-999-600-C018

VOLUME - II B

SECTION - D SUBSECTION - D18

REV.NO. 0 DATE 30/11/2015

SHEET 8 OF 18

etc. the Contractor shall set proper screed bars to maintain proper level. No extra payment shall be made for this.

Each tier of column shall be plumbed and maintained in a true vertical position subject to the limits of tolerance under this Specification.

No permanent field connections by riveting, bolting or shall be carried out until proper alignment and plumbing has been attained.

3.01.06

Field Riveting

All rivets shall be heated and driven with pneumatic tools. Hand passing or "throwing" of rivets are desirable. Any other method of conveying hot rivets from the furnace to the driving point must be approved by the engineer. No-cold rivets shall be driven. All other requirements of riveting including quality and acceptance criteria shall be in accordance with the relevant portions of the Specification for Fabrication of Structural Steelwork of the Project.

3.01.07

Field Bolting

All relevant Portions in respect of bolted construction of the Specification for Fabrication of Structural Steelwork applicable to the Project shall also be applicable for field bolting in addition to the following:

Bolts shall be inserted in such a way so that they may remain in position under gravity even before fixing the nut. Bolted parts shall fit solidly together when assembled and shall not be separated by gaskets or any other interposed compressible materials. When assembled, all joint surfaces, including those adjacent to the washers shall be free of scales except tight mill scales. They shall be free of dirt, loose scales, burns, and other, defects that would prevent solid seating of the parts. Contact surfaces within friction type joints shall be free of oil, paint, lacquer, or galvanizing.

All high tensile bolts shall be tightened to provide, when all fasteners in the joint are tight, the required minimum bolt tension by any of the following methods.

a) Turn-of-nut Method

When the turn-of-nut method is used to provide the bolt tension, there shall first be enough bolts brought to a "snug tight" condition to ensure that the parts of the Joint are brought into good contact with each other. "Snug tight" is defined as the tightness attained by a few impacts of an impact wrench or the full effort of a man using an ordinary spud wrench. Following this initial operation, bolts shall be placed in any remaining

TITLE:

**TECHNICAL SPECIFICATION FOR
ERECTION OF STRUCTURAL
STEELWORK**

SPECIFICATION NO. PE-TS-999-600-C018

VOLUME - II B

SECTION - D SUBSECTION - D18

REV.NO. 0 DATE 30/11/2015

SHEET 9 OF 18

holes in the connection and brought to snug tightness. All bolts in the joint shall then be tightened additionally by the applicable amount of nut rotation specified in Table-I with tightening progressing systematically from the most rigid part of the joint to its free edges. During this operation there shall be no rotation of the part not turned by the wrench.

TABLE-I

Bolts length not exceeding 8 times dia or 200 mm	Bolt length exceeding 8 times dia or 200 mm	Remarks
1/2 turn	2/3 turn	Nut rotation is relative to bolt regardless of the element (nut or bolt) being turned. Tolerance on rotation-30° over or under.

Bolts may be installed without hardened washers when tightening is done by the turn -of-nut -method. However, normal washers shall be used.

Bolts tightened by the turn-of-nut method may have the outer face of the match-marked with the protruding bolt point before final tightening, thus affording the inspector visual means of noting the actual nut rotation. Such marks can be made by the wrench operator by suitable means after the bolts have been brought up snug tight.

b) Torque Wrench Tightening

When torque wrenches are used to provide the bolt tensions, the bolts shall be tightened to the torques specified in TABLE-II (See Note below the Table). Nuts shall be in tightening motion when torque is measured. When using torque wrenches to install several bolts in a single joint, the wrench shall be returned to touch up bolts previously tightened, which may have been loosened by the tightening of subsequent bolts, until all are tightened to the required tension.

TABLE-II

Nominal Bolt Diameter (mm) (Kg.M) of IS:1367	Torque to be applied for bolt class 8.8
20	59.94

TITLE:

**TECHNICAL SPECIFICATION FOR
ERECTION OF STRUCTURAL
STEELWORK**

SPECIFICATION NO. PE-TS-999-600-C018

VOLUME - II B

SECTION - D SUBSECTION - D18

REV.NO. 0 DATE 30/11/2015

SHEET 10 OF 18

22

81.63

24

103.73

Note: The above torque values are approximate for providing tensions of 14.7 T for 20 mm dia.; and 21.2 T for 24 mm dia. bolts under moderately lubricated condition. The torque wrench shall be calibrated at least once daily to find out the actual torque required to produce the above required tension in the bolt by placing it in a tension indicating device. These torques shall be applied for tightening the bolts on that day with the particular wrench.

In either of the above two methods, if required, for bolt entering and wrench operation clearances, tightening may be done by turning the bolt while the nut is prevented from rotating.

Impact wrenches if used shall be of adequate capacity and sufficiently supplied with air to perform the required tightening of each bolt in approximately ten seconds. Holes for turned bolts to be inserted in the field shall be reamed in the field. All drilling and reaming for turned bolts shall be done only after the parts to be connected are assembled. Tolerances applicable in the fit of the bolts shall be in accordance with relevant Indian Standard Specifications. All other requirements regarding assembly and bolt tightening shall be in accordance with this sub clause.

3.01.08

Field Welding

All field assembly and welding shall be carried out in accordance with the requirements of the specification for fabrication work applicable to the project, excepting such provisions therein which manifestly apply to shop conditions only. Where the fabricated structural steel members have been delivered painted, the paint shall be removed before field welding for a distance of at least 50 mm on either side of the joints.

3.01.09

Holes, Cutting and Fitting

No cutting of sections, flanges, webs, cleats, rivets, bolts, welds etc. shall be done unless specifically approved and /or instructed by the Engineer.

The erector shall not cut, drill, or otherwise alter the work of other trades, unless such work is clearly specified in the Contract or directed by the Engineer. Wherever such work is obtain specified the Contractor shall obtain complete information as to size, location and number of alterations prior to carrying out any work. The Contractor shall not be entitled for any payment on account of any such work.

TITLE:

**TECHNICAL SPECIFICATION FOR
ERECTION OF STRUCTURAL
STEELWORK**

SPECIFICATION NO. PE-TS-999-600-C018

VOLUME - II B

SECTION - D SUBSECTION - D18

REV.NO. 0 DATE 30/11/2015

SHEET 11 OF 18

3.02.00

Drifting

Correction of minor misfits and reasonable amount of reaming and cutting of excess stock from rivets will be considered as permissible. For this, light drifting may be used to draw holes together and drills shall be used to enlarge holes as necessary to make connections. Reaming, that weakens the member or makes it impossible to fill the holes properly or to adjust accurately after reaming, shall not be allowed.

Any error in shop work which prevents the proper assembling and fitting of parts by moderate use of drift pins and reamers shall immediately be called to the attention of the Engineer and approval of the method of correction obtained. The use of gas cutting torches at erection site is prohibited.

3.03.00

Grouting of stanchion bases and bearings of beams and girders on stone, brick or concrete (Plain or reinforced)

Grouting shall be carried out with Ordinary Cement grout as described below:

The mix shall be one (1) part cement and one (1) part sand and just enough water to make it workable. The positions to be grouted shall be cleaned thoroughly with compressed air jet and wetted with water and any accumulated water shall be removed. These shall be placed under expert supervision, taking care to avoid air locks. Edges shall be finished properly. If the thickness of grout is 25 mm or more, two (2) parts of 6 mm down graded stone chips may be added to the above noted cement-sand grout mix, if required, by the Engineer or shown on the drawings.

No grouting shall be carried out until a sufficient number of bottom lengths of stanchions have been properly lined, leveled, and plumbed and sufficient floor beams are tied in position.

Whatever method of grouting is employed, the operation shall not be carried out until the steelwork has been finally levelled and plumbed, the stanchion bases being supported meanwhile by steel wedges, and immediately before grouting, the space under steel shall be thoroughly cleaned.

If required by the Engineer, certain admixtures like aluminium powder, "ironite" or equivalent, may be required to be added to the grout to enhance certain desirable properties of the grout. Approved non-shrink pre-mixed grout having required flowability and compressive strength may also be used with Engineer's approval.

3.04.00

Painting after Erection

Field painting shall only be done after the structure is erected, levelled,

TITLE:

ERECTION OF STRUCTURAL
STEELWORK**

SPECIFICATION NO. PE-TS-999-600-C018

VOLUME - II B

SECTION - D SUBSECTION – D18

REV.NO. 0 DATE 30/11/2015

SHEET 12 OF 18

plumbed, aligned and grouted in its final position, tested and accepted by the Engineer. Normally, final painting shall be done only after the floor slabs are concreted and masonry walls are built. However, touch up painting, making good any damaged shop painting and completing any unfinished portion of the shop coat shall be carried out by the Contractor free of cost to the Owner. The materials and specification for such painting in the field shall be in accordance with the requirements of the specification for fabrication of structural steelwork applicable for the project.

Painting shall not be done in frosty or foggy weather or when humidity is such as to cause condensation on the surfaces to be painted. Before painting of steel, which is delivered unpainted, is commenced, all surfaces to be painted shall be dried and thoroughly cleaned from all loose scale and rust.

All field rivets, bolts, welds, and abrasions to the shop coat shall be spot painted with the same paint used for the shop coat. Where specified, surfaces, which will be in contact after site assembling, shall receive a coat of paint (in addition to the shop coat, if any) and shall be brought together while the paint is still wet.

Surface, which will be inaccessible after field assembly shall receive the full, specified protective treatment before Bolts and fabricated steel members who are galvanized or otherwise treated and steel members to be encased shall not be painted.

The final painting shall be of tow coats of Synthetics Enamel painting or Aluminium paint of approved manufacture as per the approved “Schedule of Painting”. The shades shall also be as per the approved schedule. Synthetic enamel paint shall conform to IS: 2932.

3.05.00 Final cleaning up

Upon completion of erection and before final acceptance of the work by the Engineer, the contractor shall remove free of cost all false work, rubbish and all Temporary Works resulting in connection with the performance of his work.

4.00.00 TESTING AND ACCEPTANCE CRITERIA

4.01.00 General

Loading tests shall be carried out on erected structures, if required by the Engineer, to check adequacy of fabrication and/or erection. Any structure or a part thereof found to be unsuitable for acceptance as a result of the test shall have to be dismantled and replaced with suitable member as per the Contract and no payment towards the cost of the dismantled portion and any connected

TITLE:

**TECHNICAL SPECIFICATION FOR
ERECTION OF STRUCTURAL
STEELWORK**

SPECIFICATION NO. PE-TS-999-600-C018

SHEET 13 OF 18

work shall be made to the contractor. In course of dismantling, if any damage is done to any other parts of the structure or to any fixtures, the same shall be made good free of cost by the Contractor, to the satisfaction of the Engineer. The Cost of the tests specified hereinafter shall be borne by the Owner; but if the structure fails to pass the tests, the cost of the tests shall be recovered from the Contractor. Any extra claim due to loss of time, idle labour, etc. arising out of these testing operations shall not be entertained, however, only reasonable and appropriate time extensions will be allowed.

The structure or structural member under consideration shall be loaded with its actual dead load for as long a time as possible before testing and the tests shall be conducted as indicated in the following sub-clauses 4.01.01, 4.01.02 and 4.01.03. The method of testing and application of loading shall be as approved by the Engineer.

4.01.01 Stiffness Test

In this test, the structure or member shall be subjected, addition to its actual dead load, to a test load equal to 1.5 times the specified superimposed load, and this loading shall be maintained for 24 hours. The maximum deflection attained during the test shall be within the permissible limit. If, after removal of the test load, the member or structure does not show a recovery of at least 80 per cent of the maximum strain or deflection shown during 24 hours under load, the test shall be repeated. The structure or member shall be considered to have sufficient stiffness, provided that the recovery after this second test is not less than 90 per cent of the maximum increase in strain or deflection recorded during the second test.

4.01.02 Strength Test

The structure or structural member under consideration shall be subjected, in addition to its actual dead load, to a test load equal to the sum of the dead load and twice the specified superimposed load, and this load shall be maintained for 24 hours.

In the case of wind load, a load corresponding to twice the specified wind load shall be applied and maintained for 24 hours, either with or without the vertical test load for more severe condition in the member under consideration or the structure as a whole. Complete tests under both conditions may be necessary to verify the strength of the structure. The structure shall be deemed to have adequate strength if, during the test, no part fails and if on the removal of the test load, the structure shows a recovery of at least 20 per cent of the maximum deflection or strain recorded during the 24 hours under load.

4.01.03 Structure of same design

TITLE:

**TECHNICAL SPECIFICATION FOR
ERECTION OF STRUCTURAL
STEELWORK**

SPECIFICATION NO. PE-TS-999-600-C018

VOLUME - II B

SECTION - D SUBSECTION - D18

REV.NO. 0 DATE 30/11/2015

SHEET 14 OF 18

Where several structures are built to the same design and it is considered unnecessary to test all of them, one structure, as a prototype, shall be fully tested, as described in previous Sub-clauses, but in addition, during the first application of the test load, particular note shall be taken of the strain or deflection when the test load 1.5 times the specified superimposed load has been maintained for 24 hours. This information is required as a basis of comparison in any check test carried out on samples of the structure.

When a structure of the same type is selected for a check test, it shall be subjected, in addition to its actual dead load, to a superimposed test load, equal to 1.5 time the specified live load, in a manner and to an extent prescribed by the Engineer. This load shall be maintained for 24 hours, during which time, the maximum deflection shall be recorded. The check test shall be considered satisfactory, provided that the maximum strain or deflection recorded in the check test does not exceed by more than 20% of the maximum strain or deflection recorded at similar load in the test on the prototype.

4.01.04

Repair for subsequent test and use after strength tests

An actual structure which has passed the "Strength Test" as specified in Sub-clause 4.1.2 hereinbefore and is subsequently to be erected for use, shall be considered satisfactory for use after it has been strengthened by replacing any distorted members and has subsequently satisfied the 'Stiffness Test' as specified in Sub-clause 4.01.01 hereinbefore.

4.02.00

Tolerances

Some variation is to be expected in the finished dimensions of structural steel frames. Unless otherwise specified, such variations are deemed to be within the limits of good practice when they are not in excess of the cumulative effect of detailed erection clearances, fabricating tolerances for the finished parts and the rolling tolerances for the profile dimensions permitted under the Specifications for fabrication of structural steel work applicable to this Project and as specified below: The specified tolerance is mainly for welded erection. In case of bolted erection, no tolerance is desired so that all prefabricated bolt holes are matched on erection.

I. For Buildings Containing Cranes

REV.NO. 00 DATE 30/11/2015

SHEET 3 OF 7

ROOF DECKING

1.00.00 Scope

This section of the specification covers the supply, fabrication and erection of profiled light gauge Metal Decks (coated and painted) as roof decking to the main plant building and any other area as indicated in the drawings.

2.00.00 Material

2.01.01 Roof of main plant TG and Deareator bay and bunker building consists of permanently colour coated (on exposed face) galvanized MS trough metal sheet decking plate of approved colour over roof purlins for cast-in-situ roof slab as per IS: 14246 and conform to class 3. Thickness of deck plate shall be minimum 0.8mm and minimum trough depth of 44 mm and centre to centre of the valley shall be 130mm with minimum yield strength of 250 Mpa. Silicon modified polyester paint shall be used for permanent coating over galvanized surface with minimum rate of galvanization 150 gm/sqm. DFT of permanent colour coating shall be 20 microns. It shall serve as permanent shuttering for cast-in-situ roof slab. It should have adequate strength to support weight of green concrete and imposed load during construction. The thickness of the deck plate shall however be designed suitably according to the spacing of roof purlins.

3.00.00 INSTALLATION

The Contractor shall furnish all labour, equipment and materials as required for the design, fabrication, coating, erection and fixing of the decking over purlins, painting and for the complete performance of the work in accordance with the construction drawings and as described herein.

The description, which follows, gives a general indication of the nature and extent of the work but is not necessarily exhaustive and does not purport to cover all the details/operations which will be necessary in order to carry out the work.

3.01.00 Detailed Design of Roof Decking

The Contractor, in conjunction with the manufacturer, shall be responsible for the detailing of the profiled decking, fittings and fixtures and shall submit with his tender particulars of the proposed manufacturer and of the particular product proposed for use. The detailing is to be based on typical details furnished by the Engineer. The Contractor shall submit to the Engineer, two copies of the general arrangement and detailed working drawings for the proposed design, together with all calculations necessary to verify the adequacy and completeness of the design & detailing of decking sheets,

 Maharatna Company	TITLE:	SPECIFICATION NO. PE-TS-999-600-C019

		SHEET 4	OF	7
fixtures, flashings and trims. After approval he shall supply further eight copies. The Engineer will verify the correct interpretation of his requirements but may not necessarily check the design and details, and the Contractor shall be entirely responsible for the accuracy of the drawings and the correctness of the design and the suitability of the details. Manufacture of roof decking sheets shall not commence until the necessary approval of the Engineer has been obtained. 3.02.00 Erection & Fixing 3.02.01 Sequence of Manufacture/Erection Cutting Schedules, delivery to site and stacking arrangements in store shall ensure that sheets are erected in a sequence which follows that for the manufacture. The decking sheets shall be erected using an arrangement of sheets and joints to conform with the requirements of this specification. Decking erection for each elevation or feature shall commence at one end only and proceed towards the other end, in order to ensure tight fitting laps. 3.02.02 Position and Location of Laps Side and end laps of roof decking sheets shall be located and positioned in such a manner as to provide the maximum weather protection taking into account the direction of the prevailing wind. The lines formed by horizontal laps and fixing shall where possible, be continuous and coincide with the edges of large openings in the roof. 3.02.03 Alignment of Sheets and Fixings All roof decking sheets shall be fixed plumb and level with all fixings evenly spaced and accurately lined. All dirt and grease shall be removed from the surfaces of the sheets as the work proceeds. 3.02.04 Site Cutting Approval must be obtained before the roof decking sheets are cut at site. Generally cutting of sheets to length will not be permitted, only special cutting and trimming for small openings shall allowed. Where possible, site cut edges shall be concealed at laps. 3.02.05 Damaged Sheets Distorted, blemished or water stained sheets and any other fittings shall not be used.				

TITLE:

**TECHNICAL SPECIFICATION FOR
ROOF DECKING**

SPECIFICATION NO. PE-TS-999-600-C019

VOLUME - II B

SECTION - D | SUB-SECTION - D19

REV.NO. 00 DATE 30/11/2015

SHEET 5 OF 7

3.02.06 Laps

End laps and side laps to roof decking sheets shall be sufficiently large to ensure that the decking complies with the weather tightness and other requirements of this specification. The length of each decking sheet shall be adjusted so that the end laps shall bear on the purlins. In no case end laps shall not be less than 150 mm and side laps shall not be less than 53 mm.

3.02.07 End Lap Fixings

End lap fixings shall be located at least 25 mm from the end of each sheet.

3.02.08 Side Lap Fixings

The spacing of side lap fixings shall ensure compliance with this specification regarding tightness. The spacing of these fixing screws shall not exceed 500mm. The fixing shall be located in the bottom flat of the corrugation.

3.02.09 Holes

Holes in MS decking sheets shall be punched. In case holes are drilled holes, it is to be ensured that the holes do not go oversize due to the small thickness of the sheeting. All drilling swarf shall be removed from the surfaces of decking, supporting steel work, purlins etc.

3.02.10 Location and Spacing of Fixings

Fixings shall be accurately located in position in the centre of the corrugations to ensure that the heads of bolts, nuts and washers bear squarely down on the surface of the sheeting and are not located at the edge or on the joints in supporting purlins.

3.02.11 Fixings

The tenderer shall submit with his tender details of the proposed method for securing the roofing sheets to the metal purlins. The roof decking sheets are to be fixed to the roof purlins with hex washer head white zinc plated heat treated carbon steel self drilling / self tapping screws of minimum thread diameter of 5.6mm. These self drilling screws shall be drilled through the roofing sheets and purlins supporting the roofing sheets. These purlins shall be suitably spaced as per the requirement of roofing sheets and the roofing sheets shall not sag more than span/250 for the loads likely to be imposed during concreting and in future. The self-drilling screws are to be spaced at a maximum distance of 390mm centre to centre along the length of the purlins and top chord of truss. The screws are to be located preferably in the valley only and shall be

REV.NO. 00 DATE 30/11/2015

SHEET 3 OF 6

FALSE FLOORING

1.00.00 General

This section of the specification covers the supply, fabrication and installation of false flooring system having PVC top finish particle board, GI supporting system, painting etc. as per schedule of items in the main plant building and any other area as indicated in the drawings.

The scope of contractor covers supply of all materials, fabrication & installation works required to be carried out for completion of false flooring in the area specified in the drawings.

2.00.00 MATERIAL

2.01.00 Supporting structure

Supporting pedestals shall be made of steel and will be of height as required. Supporting pedestal shall be truly vertical and located at distances to conform with size of floor panels and shall be equipped with locking devices to prevent disturbances of finished elevation. Base of pedestal shall have integral load dispersion plate of size 100x100x8mm to transmit the load evenly to the base floor. Adjustment of pedestal shall be provided by threaded vertical rod of 25mm diameter and elevating nut. The pedestal head shall provide positive interlocking of the steel grid channels supporting system and shall prevent lateral shifting.

The grid channels shall be made of galvanised steel of 40mm x 40mm x 3.15mm thick and shall be placed at 610mm centre to centre both ways to support floor panels in uniform levelled elevations. Nominal height of the false flooring system shall be 600 mm unless otherwise indicated. Pedestal head shall be equipped with conducting grounding pad if so desired by the Engineer

2.02.00 Floor Panels

The floor panels shall be made of fire resistant particle board, phenol formaldehyde bonded. Size of each panel shall be 610mm x 610mm with all panel edges finished to a tolerance of ± 0.2 mm. Floor panel shall have 2mm thick non-static PVC on top, 2mm thick hard PVC strip lipping on four edges and 26 G aluminium sheet fixed with araldite at bottom. Minimum thickness of the panel shall be 35mm, unless otherwise noted. All panels shall be completely interchangeable and easily removable with a suction lift tool. Panels shall be square within a tolerance of ± 0.25 mm on the diagonal. The floor panels shall be cut, wherever required for providing suitable outlets for

VOLUME - II B

SECTION - D | SUB-SECTION – D20

REV.NO. 00 DATE 30/11/2015

SHEET 4 OF 6

cables and edges shall be lipped with hard PVC sheets.

2.02.01 Strength

Each 610mm x 610 mm floor panel must be capable of withstanding the designed service load. The ultimate strength shall provide a safety factor of 3. The false flooring shall be capable of carrying a axial load of 800 kg and uniform load of 2000 kg/sq.m with maximum deflection of 1/350. If required by the Engineer, the samples shall be accepted only after carrying out load tests. The Engineer may relax the test requirements with concentrated load in case cabinets are not handled with castor fitting arrangement.

One additional pedestal shall be provided under floor stringer along front panel area of each control board for taking possible additional load that may occur from time to time.

2.02.02 Surface finish

All removable panels shall have the top surface finished with 2 mm thick flexible PVC flooring conforming to IS:3462 and shall be fixed to the surface with compatible high-creep resistant adhesive. The PVC floor tile shall be in single piece for each floor panel. Under side of panels shall also be painted with suitable epoxy or oil based paint.

2.02.03 Damaged Floor Panels

Distorted, blemished or stained floor panels shall not be used.

2.03.00 Skirting

Skirting shall be 150 mm high and 2 mm thick, completely matching with false flooring surface finish materials and shall be fixed to the wall surface as per manufacturer's installation instructions.

3.00.00 INSTALLATION

3.01.00 Base

The system shall be placed over a base of RCC floor slab and beams. Any grouting etc. that is necessary to fix the supporting structure shall be done.

The concrete sub floor shall be sealed with two coats of polyurethane paint to prevent moisture from coming in contact with cables and to minimise dust problem.

The floor panels and channels shall be completely interchangeable and remain in position without screwing or bolting under working/imposed loadings.

 Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR FALSE FLOORING	SPECIFICATION NO. PE-TS-999-600-C020 VOLUME - II B SECTION - D SUB-SECTION – D20 REV.NO. 00 DATE 30/11/2015 SHEET 5 OF 6
	Any damage to the sub floor during installation of the false flooring system shall be made good by the contractor without any extra cost to the Owner. All steel surfaces are to be protected by two coats of polyurethane paint over a compatible primer and any damage to the paint during installation shall be made good. In case the loads exerted by the weight of machines are above the stated characteristics of floor finish material, the floor shall be protected by overlaying hard board during installation of machine or equipment. All installation work of the false flooring system shall be supervised by the manufacturer's authorised representative. 3.03.00 Painting After fixing the false flooring supporting system the sub floor shall be given a coat of polyurethane paint. 3.04.00 Protection during Construction All precautions shall be taken during the erection of the false flooring to ensure that partially erected flooring are protected and shall not be damaged before handing over to owner. 3.05.00 Damage Any damage of coating to supporting system caused during transportation is to be redone with the similar type of coating as per the manufacturer's specification at no extra cost to the Owner. 4.00.00 ACCEPTANCE CRITERIA The false flooring system shall only be accepted after completion of following checks : - Level - Alignment of joints - Thickness of joints - Surface finish - Colour and texture - Details of edges, junctions etc. - Performance

**TECHNICAL SPECIFICATION FOR INSTALLATION OF BORED
CAST-IN-SITU PILES**

1.00.00 SCOPE

This specification covers the installation of bored cast-in-situ reinforced concrete vertical piles of specified load carrying capacity and diameter for various structures. This specification also covers carrying out initial and routine load tests on piles to assess their vertical, horizontal and pull out load carrying capacities.

2.00.00 GENERAL REQUIREMENTS

2.01.00 This specification along with specific requirements under Annexure-A covers the technical requirements for piling work.

2.02.00 The work shall include supplying and providing necessary materials, mobilization of all necessary equipments (Annexure-B), providing necessary engineering supervision through qualified and technical personnel, skilled and unskilled labour, etc. as required to carryout the complete piling work, and submission of records as per schedule.

2.03.00 The Contractor shall carryout all works as mentioned in Scope above. All works shall be executed to the satisfaction of the Engineer.

2.04.00 Pile capacities in vertical compression, horizontal, pullout loads for various pile diameters are given in Annexure-A.

2.05.00 The Contractor shall confirm and guarantee the "Safe Load" capacities by conducting both initial and working load test on piles as mentioned in the specific requirements.

2.06.00 The Contractor shall submit along with tender documents his tender design of piles based on soil data furnished by the Owner along with this specification. The ultimate load capacity of a pile may be estimated using suitable static formula and the minimum factor of safety shall be 2.5. However, safe load carrying capacity shall be conformed and guaranteed by conducting initial and routine load tests.

2.07.00 In case of initial or routine load test piles, if the Contractor fails to establish the safe load capacity as per his design, the Owner has the right to either derate the pile capacity on prorata basis or insist the Contractor to modify the pile design, to achieve the desired safe load capacity at no extra cost to the Owner.

2.08.00 Derating is acceptable up to 90 percent. In such case, additional piles shall be installed as per the design requirements.

TITLE:
**TECHNICAL SPECIFICATION FOR
BORED CAST-IN-SITU RCC PILES**

SPECIFICATION NO. PE-TS-999-600-C021
VOLUME - II B
SECTION - D | SUB-SECTION - D21
REV.NO. 00 DATE 30/11/2015
SHEET 4 OF 27

- 2.09.00 The Owner shall decide whether to derate or modify the design based on the design considerations such as providing additional piles in the designed pile cap, provision for extending the pile cap size, etc.
- 2.10.00 In case the Owner decides to modify the design instead of derating the pile, the contractor shall carry out the same and install separate test piles and test the same to guarantee the safe load at no extra cost to the Owner. However no extra shall be charged for the additional test piles as well as testing of these piles as per agreed contract conditions.
- 2.11.00 In case of working piles, if the pile does not meet the guaranteed capacity or rejected due to any other reason, the Contractor shall install extra piles at no extra cost to the Owner. Further, the extra cost, due to the increase in the pile cap size if any, on account of extra piles, shall be borne by the Contractor.
- 2.12.00 It is essential that all equipment and instruments are properly calibrated both at commencement and immediately after the completion of tests so that they represent true values. Certificates to this effect from an approved institution shall be furnished to the Engineer. If the Engineer so desires the Contractor shall arrange for having the instruments tested at an approved laboratory at no extra cost to the Owner and the test report shall be submitted to the Engineer. If the Engineer desires to witness such tests Contractor shall arrange to conduct the test in his presence.
- 2.13.00 The Contractor shall make his own arrangements for locating the coordinates and position of piles as per drawings supplied to him and for determining the Reduced Levels (RL) of these locations with respect to the benchmark indicated by the Engineer. Two established reference lines in mutually perpendicular direction shall be indicated to the Contractor. The Contractor shall provide at site all the required survey instruments to the satisfaction of the Engineer so that the work can be carried out accurately according to specifications and drawings.
- 2.14.00 The contractor shall assure the quality of piling work including cleaning of pile bore, quality of concrete, integrity of piles, etc.
- 2.15.00 **AVAILABLE SUB-SOIL DATA**
- An abstract of the sub soil data is furnished in the tender document. However, the detailed soil investigation report shall be made available for reference of the bidder, if so required, at the office of the Owner. The soil data furnished is in good faith and only for the guidance of the Bidder, to arrive at design parameters and construction methods.

BORED CAST-IN-SITU RCC PILES**

SPECIFICATION NO. PE-TS-999-600-C021

VOLUME - II B

SECTION - D | SUB-SECTION - D21

REV.NO. 00 DATE 30/11/2015

SHEET 5 OF 27

3.00.00 MATERIALS

3.01.00 General

All materials viz cement, steel, aggregates, water, etc. which are to be used for pile construction shall conform to relevant IS codes for properties, storage and handling of common building materials. However, aggregates more than 20 mm size shall not be used.

3.02.00 CONCRETE

Concrete shall be manufactured either by central batching plant or Ready Mix concrete. However, for initial test piles suitable method as approved by the Engineer may be used. Concrete shall conform to IS: 10262 & IS: 456.

3.02.01 Technical Specification for Cement Concrete (Plain and Reinforced) works along with IS: 2911 Part I/Sec 2 shall be followed for concrete works of piles. Use of plasticiser to control the water cement ratio shall be permitted on specific approval from the Engineer. Water cement ratio shall not be greater than 0.5.

3.02.02 Grade and minimum cement content
Minimum grade of concrete shall be as per Annexure-A conforming to IS: 456. Minimum cement content of 400 Kg/M³ of concrete shall be used for M-20 grade concrete.

3.02.03 Slump of concrete
The slump of concrete shall vary between 150 to 180 mm.

3.03.00 REINFORCEMENT

3.03.01 Longitudinal reinforcement in pile shall be high strength deformed steel bars conforming to IS: 1786 unless specified otherwise. Lateral reinforcement in pile shall be of mild steel conforming to IS: 432 Part-1 or HYSD bars as per IS: 1786.

3.03.02 The longitudinal reinforcement shall be provided considering the combination of vertical (compression and tension) and horizontal loads. However, the minimum longitudinal reinforcement shall be 0.4 percent of the sectional area calculated on the basis of nominal pile diameter. Minimum six numbers of bars shall be provided for longitudinal reinforcement. The diameter of longitudinal reinforcement bars shall not be less than 12mm. The stipulated minimum reinforcement shall be provided for the full length of pile.

	TITLE:	SPECIFICATION NO. PE-TS-999-600-C021
	TECHNICAL SPECIFICATION FOR BORED CAST-IN-SITU RCC PILES	VOLUME - II B
		SECTION - D SUB-SECTION – D21
		REV.NO. 00 DATE 30/11/2015
	SHEET 6 OF 27	

3.03.03	The longitudinal reinforcement shall project 50 times its diameter above cut off level unless otherwise indicated.
3.03.04	The laterals shall be tied to the longitudinal reinforcement to maintain its shape and spacing. The laterals may in the form of links or spirals. The minimum diameter of the links or spirals shall be 6 mm and the spacing of the links or spiral shall not be less than 150 mm and in no case more than 250 mm.
3.03.05	Reinforcement cage shall be sufficiently rigid to withstand handling and installation without any deformation and damage. As far as possible number of joints (laps) in longitudinal reinforcement shall be minimum. In case the reinforcement cage is made up of more than one segment, these shall preferably be assembled before lowering into casing tube/pilebore by providing necessary laps as per IS: 456.
3.03.06	The minimum clear distance between the two adjacent main reinforcement bars shall normally be 100 mm for the full depth of cage.
3.03.07	The laps in the reinforcement shall be such that the full strength of the bar is effective across the joint and the reinforcement cage is of sound construction.
3.03.08	Laps shall be staggered as far as practicable and not more than 50% bars shall be lapped at a particular section. Lap joints shall be staggered by at least 1.3 times the lapped length (Centre to Centre).
3.03.09	Proper cover and central placement of the reinforcement cage in the pile bore shall be ensured by use of suitable concrete spacers or rollers, cast specifically for the purpose.
3.03.10	Minimum clear cover to the longitudinal reinforcement shall be 50 mm, unless otherwise mentioned.
3.03.11	Bundling of bars is not permitted.
4.00.00	PILE INSTALLATION Installation of piles shall be carried out as per pile layout drawings, installation criteria, and the direction of the Engineer.
4.01.00	Equipment and Accessories The equipment and accessories for installation of bored cast-in-situ piles shall be selected giving due consideration to the sub soil conditions, ground water conditions and the method of casting, etc. These shall be of standard type and shall have the approval of the Engineer.

 Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR BORED CAST-IN-SITU RCC PILES	SPECIFICATION NO. PE-TS-999-600-C021 VOLUME - II B SECTION - D SUB-SECTION – D21 REV.NO. 00 DATE 30/11/2015 SHEET 7 OF 27
	4.01.02 List and details of equipment and accessories proposed to be used for the job shall be submitted along with the bid. 4.01.03 The capacity of the rig shall be adequate so as to reach the specified founding level. 4.01.04 Provision shall be kept for chiselling within the pilebore, as specified elsewhere in this specification. Chiselling shall be carried out only with the approval of Engineer. 4.02.00 Installation Criteria 4.02.01 For determining the founding level of piles in soil as specified elsewhere, the Contractor shall have to perform Standard penetration test (SPT) as per IS: 2131 in a separate bore hole. The SPT shall be conducted at 1.0 m interval between the depths covering 5 metres each above and below the specified founding level. The bore shall be 100 mm diameter and method of boring shall conform to IS: 1892. 4.02.02 For determining founding level of piles in rock, as specified elsewhere socketing horizon shall be established by the Contractor by collecting rock cores of NX size in a separate borehole, and testing the same for uniaxial compressive strength (UCS). Cores shall be collected by double tube core barrel attached with diamond bit. Coring shall be done upto a depth as indicated in the "specific requirements." Coring in rock shall conform to IS: 6926. 4.02.03 In case it is not possible to test the cores so obtained for uniaxial compressive strength, cores shall be tested for point load strength index and correlated to obtain uniaxial compressive strength. 4.02.04 Number of boreholes for carrying out SPT in soil or uniaxial compressive strength in rock, shall vary from one in 100 to 150 piles or pile group of 150 Sqm depending on the site condition and as decided by the Engineer. However, at the location of initial load test piles, one such borehole shall be done. 4.02.05 A protocol between contractor and BHEL site shall be maintained regarding the strata at founding level. SPT value and UCS from the nearest borehole shall be indicated therein. 4.02.06 The founding level of the pile shall be decided based on the criteria elaborated in the specific requirements under Annexure-A. Concreting shall not be done until the above conditions for founding level are satisfied. 4.02.07 Approval of founding level by the Engineer shall in no way absolve the Contractor of his responsibility to guarantee the Safe load capacity of the piles as indicated in this document.	

TITLE:

**TECHNICAL SPECIFICATION FOR
BORED CAST-IN-SITU RCC PILES**

SPECIFICATION NO. PE-TS-999-600-C021

VOLUME - II B

SECTION - D | SUB-SECTION - D21

REV.NO. 00 DATE 30/11/2015

SHEET 8 OF 27

4.03.00 Control of position and alignment

4.03.01 Piles shall be installed as accurately vertical as possible. The permissible limits for deviation with respect to position and (inclination) alignment shall conform to IS: 2911 Part I/Sec. 2, which is reproduced below for ready reference.

- a) The maximum deviation of vertical piles shall not exceed 1.5 per cent in alignment.
- b) Piles shall not deviate more than 75 mm or D/4 whichever is less (75mm or D/10 whichever is more in case of piles having diameter more than 750mm) from their designed position at the working level.

4.04.00 Boring

4.04.01 Boring operations shall be done by rotary or percussion type drilling rigs using reverse mud circulation (RMC) method. Rotary hydraulic pulley shall be preferred.

4.04.02 The Contractor shall satisfy himself about the suitability of the method to be adopted for site. If DMC (direct mud circulation) or RMC is used Bentonite slurry shall be pumped through drill rods by means of high-pressure pumps. The cutting tool shall have suitable ports for the bentonite slurry to flow out at high pressure. If on mobilisation, the Contractor fails to make a proper bore for any reason, the Contractor has to switchover to other boring methods as approved by the Engineer at no extra cost to the Owner.

4.04.03 Working level shall be above the cut off level. After the initial boring of about 1.0m a temporary guide casing of suitable length shall be lowered in the pile bore. The diameter of guide casing shall be of such diameter, so as to give the necessary finished diameter of the concrete pile. The centre line of guide casing shall be checked before continuing further boring. Guide casing shall be minimum of 1.0m length. Additional length of casing may be used depending on the condition of the strata, ground water level etc.

4.04.04 Use of drilling mud (bentonite slurry) for stabilizing the sides of the pile bore is necessary wherever subsoil is likely to collapse in the pile bore. Drilling mud to be used shall meet the requirement as given in Annexure-C.

4.04.05 The bentonite slurry and the cuttings, which are carried to the surface by the rising flow of the slurry, shall pass through settling tanks of adequate size to remove the sand and spoils from the slurry before the slurry is recirculated to the

 BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR BORED CAST-IN-SITU RCC PILES	SPECIFICATION NO. PE-TS-999-600-C021
		VOLUME - II B
		SECTION - D SUB-SECTION – D21
		REV.NO. 00 DATE 30/11/2015
		SHEET 9 OF 27
	boring. The bentonite slurry mixing and recirculation plant shall be suitably designed and installed.	
4.04.06	The bentonite slurry shall be maintained at 1.5m above the ground water level during boring operations and till the pile is concreted. When DMC or RMC method is used the bentonite slurry shall be under constant circulation till start of concreting.	
4.04.07	The size of cutting tools shall not be less than the diameter of the pile by more than 75mm. However, the pile bore shall be of the specified size.	
4.05.00	Chiselling	
4.05.01	Chiselling may be resorted to with the permission of the Engineer below the socketing horizon. The chiselling tool or bit shall be of adequate size and weight so as to reach the desired depth.	
4.06.00	Cleaning of Pile bore	
4.06.01	On completion of the pile bore upto the required depth, the bottom of the hole shall be cleaned very carefully before concreting work is taken up. Cleaning shall ensure that the pile bore is completely free from sludge/bored materials, debris of rock/boulder etc. Necessary checks shall be made as given in clause 5.0 to confirm the thorough cleaning of the pile bore.	
4.06.02	Pile bore shall be cleaned by fresh drilling mud through tremie pipe after placing reinforcement and just before start of concreting.	
4.06.03	Pile bore spoil along with used drilling mud shall be disposed off from site as directed by the Engineer.	
4.06.04	Pile bore bottom shall be thoroughly cleaned to make it free from sludge or any foreign matter before and after placing the reinforcement cage.	
4.07.00	Adjacent Structures	
4.07.01	When working near existing structures care shall be taken to avoid any damage to such structures.	
4.08.00	Concreting	
4.08.01	The Contractor shall carry out concrete mix design in accordance with IS: 10262 and submit mix design calculations and get them approved from the Engineer well in advance for installation of piles. Adequate number of tests on cubes, etc. shall be carried out as mentioned in clause 5.0 to ensure concrete of the	

 BHEL Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR BORED CAST-IN-SITU RCC PILES	SPECIFICATION NO. PE-TS-999-600-C021

		REV.NO. 00 DATE 30/11/2015
		SHEET 10 OF 27
	minimum specified strength in accordance with IS: 456 at requisite workability (slump). 4.08.02 Concreting shall not be done until the Engineer is satisfied that the bearing strata (soil/rock) met with at the termination level of pile. 4.08.03 The time interval between the completion of boring and placing of concrete shall not exceed 6 hrs. In case the time interval exceeds 6 hrs the pilebore shall be abandoned. However, the Engineer may allow concreting provided the Contractor extends the pile bore by 0.5 m beyond the proposed depth, and clean the pilebore. The entire cost of all operation and materials for this extra length shall be borne by the Contractor. 4.08.04 Proper placement of the reinforcement cage to its full length shall be ensured before concreting. 4.08.05 Concreting shall be done by tremie method as specified by IS: 2911 (Part I /Sec.2). The level of drilling mud shall be maintained sufficiently above the ground water level. 4.08.06 The concreting operations shall not be taken up when the specific gravity of bottom slurry is more than 1.2 and sand content more than 7%. The drilling mud sample shall be collected from the bottom of pilebore as mentioned in clause 5. 4.08.07 Consistency of the drilling mud suspension shall be controlled throughout the concreting operations in order to keep the bore stabilized as well as to prevent concrete getting mixed up with the thicker suspension of the mud. 4.08.08 It shall be ensured that volume of concrete poured is at least equal to the theoretically computed volume of pile shaft being cast. 4.08.09 The temporary guide casing shall be withdrawn cautiously, after concreting is done upto the required level. While withdrawing the casing concrete shall not be disturbed. 4.09.00 Cut off level (COL) 4.09.01 Cut off level of piles shall be as indicated in drawings released for construction or as indicated by the Engineer. 4.09.02 The top of concrete in pile shall be brought above the COL to remove all laitance and weak concrete and to ensure good concrete at COL for proper embedment in to pile cap. 4.09.03 When the pile cut off level is less than 1.0 metre below the working level, concrete shall be cast to the piling platform level to permit overflow of	

	TITLE: TECHNICAL SPECIFICATION FOR BORED CAST-IN-SITU RCC PILES	SPECIFICATION NO. PE-TS-999-600-C021 VOLUME - II B SECTION - D SUB-SECTION – D21 REV.NO. 00 DATE 30/11/2015 SHEET 11 OF 27
	concrete for visual inspection. In case COL of pile is more than 1.0 metre below working level then concrete shall be cast to a minimum of one metre above COL. 4.10.00 Sequence of Piling 4.10.01 Each pile shall be identified with a reference number. 4.10.02 The convenience of installation may be taken into account while scheduling the sequence of piling in a group. This scheduling shall avoid piles being bored close to other recently constructed piles. 4.11.00 Building up of Piles 4.11.01 If any pile, already cast as per construction drawing, requires any extra casting due to any change in cut off level or the cast pile top level is less than the specified level or for any other reason, then the pile shall be built-up by using atleast one grade higher concrete than that used for concreting of the same pile, ensuring proper continuity with the existing concrete and to the satisfaction of the Engineer. Necessary reinforcement as per design requirement and suitable shuttering shall be provided before casting the concrete. Surrounding soil shall also be built up to the required level by proper compaction to ensure lateral capacity of the pile. 4.12.00 Breaking off of Piles 4.12.01 If any pile already cast, requires breaking due to lowering in cut off level or for any other reason, then the same shall be carried out, not before seven days of casting without affecting the quality of existing pile such as loosening, cracking etc. and to the satisfaction of the Engineer. 4.13.00 Preparation of Pile head 4.13.01 The soil surrounding the piles shall be excavated upto the bottom of the lean concrete below the pile cap, with provision for working space, sufficient enough to place shuttering, reinforcement, concreting and any other related operations. 4.13.02 The exposed part of concrete above the COL shall be removed/chipped off and made to a uniform level at COL, but not before seven days of casting of pile. 4.13.03 The projected reinforcement above COL shall be properly cleaned and bent to the required shape and level to be anchored into the pile cap. 4.13.04 The pile top shall be embedded into the pile cap by 50mm or clear cover to reinforcement, whichever is higher.	

 Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR BORED CAST-IN-SITU RCC PILES	SPECIFICATION NO. PE-TS-999-600-C021 VOLUME - II B SECTION - D SUB-SECTION – D21 REV.NO. 00 DATE 30/11/2015 SHEET 12 OF 27
4.13.05	All loose material, like debris due to chipping/breaking of pile head to the desired level, shall be removed and disposed off as directed by the Engineer.	
4.14.00	Rejection and Replacement of Defective Piles	
4.14.01	The Engineer reserves the right to reject any pile which in his opinion is defective on account of load capacity, structural integrity, position, alignment, concrete quality etc. Piles that are defective shall be pulled out or left in place as judged convenient by the Engineer, without affecting the performance of adjacent piles. The Contractor shall install additional piles to substitute the defective piles as per the directions of the Engineer, at no extra cost to the Owner.	
4.15.00	Recording of Piling Data	
4.15.01	The Contractor shall record all the information during installation of piles. Typical data sheet for recording pile data shall be as shown in Appendix D of IS: 2911 Part I/Sec.2. The pile data shall also include all the details as in Annexure-D. On completion of each pile installation, pile record in triplicate shall be submitted to Engineer within two days of completion of concreting of the pile.	
5.00.00	SAMPLING, TESTING AND QUALITY ASSURANCE	
5.01.00	Facilities required for sampling and testing of materials, concrete, etc. in field and in laboratory should be provided by the Contractor. The Contractor shall carry out all sampling and testing in accordance with the relevant Indian Standards and this Specification. Where no specific testing procedure is mentioned the tests shall be carried out as per the prevalent accepted engineering practice and as per the directions of the Engineer. Tests shall be done in the presence of the Engineer or his authorized representative. In case the Engineer requires additional tests, the Contractor shall arrange to get these tests done and submit to the Engineer the test results in triplicate within three days after completion of any test.	
5.02.00	The Contractor shall maintain records of all inspection and testing, which shall be made available to the Engineer. The Engineer at his discretion may waive some of the stipulations for small and unimportant concreting operations and other works.	
5.03.00	Materials found unsuitable for acceptance shall be removed and replaced by the Contractor. The work done by this unsuitable material shall be redone as per specification requirements & and to the satisfaction of the Engineer at no extra cost to the Owner.	
5.04.00	Quality Assurance Programme	

TITLE:

**TECHNICAL SPECIFICATION FOR
BORED CAST-IN-SITU RCC PILES**

SPECIFICATION NO. PE-TS-999-600-C021

VOLUME - II B

SECTION - D | SUB-SECTION - D21

REV.NO. 00 DATE 30/11/2015

SHEET 13 OF 27

- a) The Contractor shall submit and finalize a detailed Field Quality Assurance Programme within 30 days from the date of award of the contract, according to the requirements of this specification. This shall include setting up of a testing laboratory, arrangement of testing apparatus/equipment, deployment of qualified/experienced manpower, preparation of field quality plan, etc. On finalized field quality plan, the Owner shall identify, customer hold points, beyond which work shall not proceed without written approval from the Engineer. The testing apparatus/equipment installed in the field laboratory shall be calibrated/ corrected by the qualified persons as frequently as possible to give accurate testing results.
- b) Frequency of sampling and testing, etc. and Acceptance Criteria are given in Table - 1. The testing shall be done at field laboratory or any other laboratory approved by the Engineer. However, the testing frequencies set forth are the desirable minimum and the Engineer shall have the full authority to call for tests as frequently as he may deem necessary to satisfy himself that the materials and works comply with the appropriate specifications. The materials shall be tested to meet all the specified requirements before acceptance at manufacturers premises or at independent government approved laboratory. Tests indicated in the table are for cross checking at site the conformity of the materials to some of the specifications.

5.05.00 Testing of Concrete

5.05.01 Concrete and other materials shall be tested for quality, strength and other properties. Details of testing shall be as specified under technical specification for Cement concrete (Plain and Reinforced).

5.05.02 One sample consisting of six test cubes shall be made from the concrete used in each test pile, three to be tested after 7 days and three after 28 days.

5.05.03 For working piles, minimum one sample consisting of six test cubes shall be made from the concrete for the first ten piles, three to be tested after 7 days and three after 28 days. Thereafter, minimum one sample consisting of three test cubes for every 10 piles shall be tested for the 7-days & 28-days cube strength.

5.05.04 In preparation of test cubes or specimens vibrators shall not be used.

5.05.05 Concrete shall be tested for slump at every 1-hour interval during concreting of piles.

5.05.06 The frequency of sampling and testing of concrete and materials shall be done as per technical specification for cement concrete (Plain & Reinforced).

5.05.07 The acceptance criteria shall be as mentioned in Table-1.

5.06.00 Testing for position and alignment

	TITLE: TECHNICAL SPECIFICATION FOR BORED CAST-IN-SITU RCC PILES	SPECIFICATION NO. PE-TS-999-600-C021
		VOLUME - II B
		SECTION - D SUB-SECTION – D21
		REV.NO. 00 DATE 30/11/2015 SHEET 14 OF 27
5.06.01	Each pile shall be checked for its position with respect to specified location. Each pile bore shall be checked for its alignment.	
5.06.02	Permissible limits for deviation shall be as specified under clause no. 4.03.	
5.07.00	Properties of Drilling mud	
5.07.01	Properties of drilling mud shall be checked as per requirement under Annexure C. Prior to the commencement of piling work and thereafter minimum once in a week or as found necessary by the Engineer, one sample consisting of 3 specimens shall be tested. Acceptance criteria applicable are as specified else where with 5% variation. This relaxation is not applicable for properties of drilling mud before concreting.	
5.07.02	Density of the drilling mud shall be checked in each pile before concreting.	
5.08.00	Check for Pile bore	
5.08.01	On completion of boring and cleaning the bottom of each pilebore shall be checked from the sample collected from near the bottom of pile bore or by any other methods as approved by the Engineer, to ensure that it is free from pilebore spoil/debris and any other loose material, before concreting. Concreting shall be done only after the approval of the Engineer.	
5.08.02	For sampling of drilling mud from the pilebore the following method or any other suitable method shall be adopted.	
	a) A solid cone shall be lowered by a string to the bottom of pilebore. A sampler tube closed at top with a central hole (hollow cylinder) is lowered over the cone, and then a top cover shall be lowered over the cylinder. Care shall be taken for proper fittings of assembly to minimize the leakage while lifting the cone assembly to the ground surface. The slurry collected in the sampler tube shall be tested for density and sand content. b) Use of borehole camera for checking the pile bore spoil and strata is acceptable on approval of the Engineer.	
5.09.00	Pile Integrity test	
5.09.01	Low strain integrity test shall be conducted on 50% of the jobs piles and on all test piles or as directed by Engineer. The system shall have the computer readout facility and report on the findings of this shall be furnished to the Owner. This test shall be used to identify the job piles for routine load test.	

	TITLE: TECHNICAL SPECIFICATION FOR BORED CAST-IN-SITU RCC PILES	SPECIFICATION NO. PE-TS-999-600-C021 VOLUME - II B SECTION - D SUB-SECTION – D21 REV.NO. 00 DATE 30/11/2015 SHEET 15 OF 27
	Piles shall be trimmed to cut off level or sound concrete level. No pile cap blindage work should be undertaken prior to this test. The cast in-situ piles should not be tested before 14 days of casting. 5.09.02 The test shall be undertaken by persons trained and experienced and capable of interpreting the results with specific regard to piling. This test is limited to testing the integrity of the shaft and is not intended to replace the use of static load testing. 5.09.03 Low Strain Integrity Test Methodology: a) In this test, a low stress wave is set up in the pile shaft and is also known as Sonic Integrity or Sonic Echo test. b) A small metal/hard rubber hammer is used to produce a light blow on top of the pile. The shock wave travelling down the length of the pile is reflected back from the toe of the pile and recorded through a suitable transducer/ accelerometer in a computer for subsequent analysis. c) The primary shockwave, which travels down the length of the shaft, is reflected from the toe by the change in density between the concrete and sub strata. However, if the pile has any imperfections or discontinuities within its length these will set up secondary reflections, which will be added to the return signal. d) By analysis of the captured signal and knowledge of the conditions of the ground, age of concrete, etc. a picture of the locations of pile shaft defects can be built up. The observed signals are amplified into digital display as velocity versus length records providing information on structural integrity of piles. e) The stress wave velocity and approximate pile lengths are provided as input for the integrity testing. The stress wave velocity is dependent on the Young's Modulus and mass density of pile concrete. f) More than one recording of signals shall be done until repeatability of signals is achieved on the same pile. g) The tests shall be conducted at 3-6 locations to cover the entire cross section of the pile. 6.00.00 PILE TESTING Pile load test shall be carried out as per IS:2911 Part-4 (latest edition) or as directed by Engineer.	

TITLE:

**TECHNICAL SPECIFICATION FOR
BORED CAST-IN-SITU RCC PILES**

SPECIFICATION NO. PE-TS-999-600-C021

VOLUME - II B

SECTION - D | SUB-SECTION - D21

REV.NO. 00 DATE 30/11/2015

SHEET 16 OF 27

6.01.00 INITIAL LOAD TEST

Initial load test shall be carried out on separately cast piles for confirmation of estimated pile capacities and to fix a more accurate driving criteria viz. set/bow, total number of blows and approximate depth etc. of founding level. At least 2 nos. of tests shall be conducted for each mode (vertical compression, pull out and lateral). The maximum test load shall be as mentioned in bill of quantities.

6.02.00 ROUTINE LOAD TEST

Routine load tests shall be carried out on job (working) piles for 0.5% of total no. of piles (for each mode and type). Maximum test load shall be 1.5 times the design safe load capacity. Piles showing unsatisfactory results as per load test results shall be treated as defective piles. Defective piles shall be removed or left in place and replaced by additional piles as directed by Engineer at no extra cost to the owner. Any additional cost towards design implications, if any, due to above shall be born by the contractor.

7.00.00 CODES AND STANDARDS

All work shall be carried out as per this specification and shall conform to the latest revision and/or replacements of the following or any other Indian Standard (IS) Codes, unless specified otherwise. In case any particular aspect of work is not specifically covered by Indian Standard Codes, any other standard practice, as may be specified by the Engineer, shall be followed.

- IS: 432 - Specification for mild steel and medium tensile steel bars (Part 1 & 11) and hard drawn steel wire for concrete reinforcement.
- IS: 456 - Code of practice for plain and reinforced concrete.
- IS: 1200 - Measurement of Building and Civil Engineering works (Part 23) Piling.
- IS: 1786 - Code of practice for twisted steel high strength deformed bars for concrete reinforcement.
- IS: 1892 - Code of practice for Subsurface Investigation for foundation.
- IS: 2131 - Method of Standard Penetration Test for Soils
- IS: 2911 - Code of practice for design and construction of pile foundations - Bored cast-in-situ concrete piles.
- IS: 2911 - Code of practice for design and construction of pile

 Maharatna Company	TITLE: TECHNICAL SPECIFICATION FOR BORED CAST-IN-SITU RCC PILES	SPECIFICATION NO. PE-TS-999-600-C021 VOLUME - II B SECTION - D SUB-SECTION – D21 REV.NO. 00 DATE 30/11/2015 SHEET 17 OF 27
	Part IV foundation - Load test on piles. IS: 6926 - Code of practice for Diamond core Drilling for Site Investigation for River Valley Projects. IS: 10262 - Recommended guidelines for concrete mix design. 8.00.00 RATES AND MEASUREMENTS The clauses below shall apply for item rate contracts only. They shall not be applicable to turnkey/lump sum Contracts. 8.01.00 Rates 8.01.01 The items of work in the schedule of items, describe the work in brief. The various items in schedule of items shall be read in conjunction with the corresponding sections in the Technical Specifications, including amendments, and additions, if any. For each item in schedule of items, the unit rate shall include for the activities covered in the description of the item as well as for all necessary operations described in the specification and specific requirements. 8.01.02 The unit rates shall include for minor details which are obviously and fairly intended, and which may not have been included in the description in these documents, but are essential for the satisfactory completion of the work. Unit rates shall also include for all safety measures as required by codal provisions, local regulations, acts, bye-laws, etc. and for execution of work to the satisfaction of the Engineer. 8.01.03 The quoted rate for each item shall be inclusive of mobilization of all plant, equipment, scaffolding, labour, materials, skilled and unskilled labour, and demobilization after completion of work, supervision, establishing the level and coordinates at each work. 8.01.04 The quoted rate for piling for a particular diameter and capacity of pile shall remain valid for the actual lengths provided /to be provided irrespective of the minimum length specified elsewhere in this specification. 8.01.05 The quoted rate for piling as per description of item works shall be inclusive of providing all plant equipment, labour, materials, skilled and unskilled labour, making observations, establishing the ground level and coordinates at each location of pile by carrying levels from one established bench mark and distances from one set of grid lines furnished by the owner.

TECHNICAL SPECIFICATION FOR BORED CAST-IN-SITU RCC PILES

SPECIFICATION NO. PE-TS-999-600-C021

VOLUME - II B

SECTION - D | SUB-SECTION – D21

REV.NO. 00 DATE 30/11/2015

SHEET 18 OF 27

8.01.06	The quoted rate for piling shall be inclusive of bailing out all the pile bore spoil from the pilebore, keeping the borehole free from bored material/debris etc. and disposing the bored/chiselled material along with the drilling mud upto 2 Km. beyond plant boundary or as directed by Engineer, flushing the pile bore by fresh bentonite before concreting, collection of samples from bottom of pilebore, transporting to laboratory, testing and reporting of results.
8.01.07	The quoted rate for piling shall include shifting of plant and equipment from one pile location to another pile locations, providing temporary casing pipe and removal of the same after completing, concreting, supply of necessary materials, equipment and manpower, cost of boring by approved method as specified, circulation of bentonite slurry and cleaning of borehole free from sludge, as specified, etc.
8.01.08	The quoted rate for piling shall also include chiselling, if any, required for socketing the pile in rock.
8.01.09	The quoted rate for the piling shall include concreting by termite method, length of pile above COL, withdrawal of guide casing, cost for preparation of pile head and disposal of debris etc., resulting from breaking off of pile upto COL, upto a distance of 2 Km from the plant boundary or as directed by Engineer.
8.01.10	The quoted rate for piling shall also include providing reinforcement and its cleaning, straightening, cutting, bending, binding with annealed wire, welding, tackwelding, providing concrete cover blocks, spacers, placing the reinforcement cage in pile casing/bore and other cost of tools and plants, materials, labours, carting the steel from store to piling site and return of unused steel to the Owners storage point, etc.
8.02.11	Plasticiser/Admixture when used as directed by the Engineer shall be included in piling rates.
8.01.12	The quoted rate for piling shall include for all quality assurance requirements, but not limited to providing for technical inspection, transportation of samples to laboratory, testing samples, maintaining and submitting all test records, etc.
8.01.13	The quoted rate for boring in separate borehole shall be inclusive of performing of SPT at regular intervals as specified and collecting rock cores from boreholes, upto the depth as specified shall be inclusive of transporting to laboratory, testing and reporting of the results.
8.01.14	Unit rate for low integrity test shall be inclusive of mobilization of the entire set of equipment, computer readout, printer, and equipment which may not have been included in the description but are essential for the satisfactory completion of the work as per internationally accepted practice. The rate quoted shall be inclusive of repeatability of test, preparation of pile top surface etc.

8.01.07 The quoted rate for piling shall include shifting of plant and equipment from one pile location to another pile locations, providing temporary casing pipe and removal of the same after completing, concreting, supply of necessary materials, equipment and manpower, cost of boring by approved method as specified, circulation of bentonite slurry and cleaning of borehole free from sludge, as specified, etc.

8.01.08 The quoted rate for piling shall also include chiselling, if any, required for socketing the pile in rock.

8.01.09 The quoted rate for the piling shall include concreting by termite method, length of pile above COL, withdrawal of guide casing, cost for preparation of pile head and disposal of debris etc., resulting from breaking off of pile upto COL, upto a distance of 2 Km from the plant boundary or as directed by Engineer.

8.01.10 The quoted rate for piling shall also include providing reinforcement and its cleaning, straightening, cutting, bending, binding with annealed wire, welding, tackwelding, providing concrete cover blocks, spacers, placing the reinforcement cage in pile casing/bore and other cost of tools and plants, materials, labours, carting the steel from store to piling site and return of unused steel to the Owners storage point, etc.

8.02.11 Plasticiser/Admixture when used as directed by the Engineer shall be included in piling rates.

8.01.12 The quoted rate for piling shall include for all quality assurance requirements, but not limited to providing for technical inspection, transportation of samples to laboratory, testing samples, maintaining and submitting all test records, etc.

8.01.13 The quoted rate for boring in separate borehole shall be inclusive of performing of SPT at regular intervals as specified and collecting rock cores from boreholes, upto the depth as specified shall be inclusive of transporting to laboratory, testing and reporting of the results.

8.01.14 Unit rate for low integrity test shall be inclusive of mobilization of the entire set of equipment, computer readout, printer, and equipment which may not have been included in the description but are essential for the satisfactory completion of the work as per internationally accepted practice. The rate quoted shall be inclusive of repeatability of test, preparation of pile top surface etc.

**TECHNICAL SPECIFICATION FOR
BORED CAST-IN-SITU RCC PILES**

SPECIFICATION NO. PE-TS-999-600-C021

VOLUME - II B

SECTION - D | SUB-SECTION - D21

REV.NO. 00 DATE 30/11/2015

SHEET 19 OF 27

8.02.00 Measurement

8.02.01 Piling length shall be measurement by linear measurement from pile cut-off level to the tip of pile in meters upto second place of decimal separately for each diameter and capacity of pile. The length of pile to be cast above cut off level, as per specification, and as approved by Engineer, shall be considered for cement reconciliation only. Theoretical diameter of piles shall be considered for reconciliation of cement consumption. No extra payment shall be made for the length from existing ground to cut-off level.

8.02.02 Reinforcement steel shall be measured for reconciliation purpose only and the measurement shall be done for providing and placing reinforcement in piles, by weight in tones, up to third place of decimal in the following manner:

- i) The weight shall be arrived at by multiplying the actual length measured alongwith standard hooks, rings or spirals, spacers, cranks, bends, authorized laps, etc. by sectional weight. These shall be submitted with supporting documents giving the schedule of bars with sketches. The sectional weight to be adopted shall be IS code's sectional weight. Nothing extra shall be payable to the contractor on account of difference in weight, if any, due to different methods adopted for issue and measurement.
- ii) Standard hooks, cranks, bend, authorized laps, supports, hangers and chairs which are covered in approved bar bending schedule shall be measured in tones.
- iii) Dowels, neither shown on the drawings nor instructed by the Engineer, but required for construction facilities shall not be measured.

8.02.03 Breaking off of piles, due to subsequent change in design cut off level, shall be measured separately. This shall be measured in cubic metres upto second place of decimal. This will be payable only when the pile is cast and on the basis of written instruction of the Engineer for lowering of COL.

8.02.04 Measurements for the item of boring in a separate borehole shall be measured in metres from ground level upto the depth as specified, upto second place of decimal. Item of work of boring in soil and coring in rock shall be measured separately for the actual length of boring in soil and coring in rock.

8.02.05 The item for pile integrity test shall be measured in terms of no. of piles tested.

Specific Requirements for Bored Cast-in-situ RCC Piles

A1.0 Minimum cement concrete grade M-25

Minimum cement content 400 Kg/M³

A1.1 Safe load

Diameter of Pile

Diameter of Pile (mm)	Vertical/ Compression (MT)	Horizontal/ Lateral (MX)	Pull out/Tension (MT)
*	*	*	*
*	*	*	*

A2. Installation criteria

The installed pile(s) shall satisfy the following criteria.

A2.1 In Soil/weathered Rock

- Minimum length of the pile shall be _____* m below COL.
- The pile shall be terminated after penetrating through the strata having SPT penetration less than ____* cm for ____* blows, for a minimum length of _____* times the diameter of the pile.

A2.2 In Rock

- Piles shall be installed and socketed into the rocks for a length (socketing length) equal to _____* times the pile diameter subject to a minimum of _____* meter below the socketing horizon.
- Socketing horizon shall consist of rock strata having minimum uniaxial compressive strength of _____* kg/sq.cm.

A3. Average cut-off level for tender design and initial load test can be assumed as _____* m below ground level.

A4. A protocol shall be signed between BHEL site and contractor regarding,

Strata at the founding depth

ANNEXURE-C

Bentonite suspension used for piling work shall satisfy the following requirements

- a) Liquid limit of bentonite when tested in accordance with IS: 2720(Part V) shall be more than 300 percent and less than 450 percent.
- b) Sand content of the bentonite powder shall not be greater than 7 percent.
- c) Bentonite solution should be made by mixing it with fresh water using pump for circulation. The density of the freshly prepared bentonite suspension shall be between 1.034 and 1.10 gm/ml depending upon the pile dimensions and type of soil in which the pile is to be installed. However, the density of bentonite suspension after mixing with deleterious materials in the pilebore may be upto 1.25 gm/ml.
- d) The Marsh viscosity when tested by a Marsh cone shall be between 30 to 60 seconds.
- e) The differential free swell shall be more than 540 percent.
- f) The pH value of the bentonite suspension shall be between 9 and 11.5.

VOLUME - II B

SECTION - D | SUB-SECTION – D22

REV.NO. 00 DATE 30/11/2015

SHEET 3 OF 16

**GENERAL TECHNICAL SPECIFICATION
FOR
SITE LEVELLING AND GRADING**

1.00 GENERAL

This specification cover the works to be carried out for “**Site Levelling and Grading Works including Slope Protection**” etc for the entire plant and associated areas. The specified formation level(s) shall be achieved either by excavation or by raising with controlled fill with excavated/borrowed earth as the case may be.

2.00 SCOPE

2.01 The scope include all works involved in levelling the site to the lines, grades, cross sections and dimensions as shown on the approved drawings and/or as directed by the engineer including site clearance, setting out, earth work in excavation, stacking, loading, transportation, unloading, dewatering, drainage, filling, watering, compaction, turfing on slopes (if required), lighting, disposal of residual/surplus earth etc. It also include supplying and providing all labour, materials, supervision, services, equipments, tools and plants, testing and all incidental items of work not shown or specified but reasonably implied or necessary for the completion of the work etc.

2.02 All tools and plants, equipments and machineries to be used in this work shall be of standard quality and manufactured by reputed concerns conforming to Indian Standard (IS) codes or equivalent thereof.

2.03 Work to be provided by the Contractor

The works to be provided by the contractor unless specified otherwise shall include but not be limited to the following.

a) Supplying and providing all labour, supervision, services including as required under statutory labour regulations, materials, equipments, tools and plants, approaches, transportation etc required for the completion of the work.

b) Preparation and submission of detailed scheme of all operations required for executing the work (material handling, placement, services, approaches etc) to the engineer for approval.

c) Carrying out sampling and testing on fill materials/fills to assess the quality/moisture content/degree of compaction and submission of the test results whenever required by the engineer.

d) Design, construction and maintenance of Magazine of proper capacity for storage of explosives for blasting work and removal of the same after completion of the work etc.

TITLE:

**TECHNICAL SPECIFICATION FOR
SITE LEVELLING & GRADING
WORKS**

SPECIFICATION NO. PE-TS-999-600-C022

VOLUME - II B

SECTION - D | SUB-SECTION - D22

REV.NO. 00 DATE 30/11/2015

SHEET 4 OF 16

2.04 Work to be provided by others

No work under this specification will be provided for by any agency other than the contractor unless specifically mentioned elsewhere in the contract.

2.05 Codes and Standards

All work shall be carried out as per this specification and shall conform to the latest revision and/or replacements of the following or any other Indian Standard (IS) codes unless specified otherwise.

IS: 1200 Methods of measurement of building and civil engineering works,
Part-1: Earthwork

IS: 2720 Method of test for soils (Relevant parts)

IS: 3764 Excavation work- Code of safety

IS: 4081 Safety code for blasting and related drilling operations

IS: 4701 Code of practice for earthwork on canals

IS: 6922 Criteria for safety and design of structures subject to underground
Blasts

In case of conflict between this specification and those (IS codes) referred to herein, the former shall prevail. In case any particular aspect of work is not covered specifically by the specification or/and by the IS codes, any other standard practice as may be specified by the engineer shall be followed.

2.06 Conformity with Designs

The contractor shall carry out the work as per the approved drawings, specification and as directed by the engineer.

3.00 MATERIALS

All materials required for the work shall be of best variety and approved by the engineer.

3.01 Materials for Excavation

For the purpose of identifying the various strata met during the course of excavation, the following classification is to be followed.

**TITLE:****TECHNICAL SPECIFICATION FOR
SITE LEVELLING & GRADING
WORKS**

SPECIFICATION NO. PE-TS-999-600-C022

VOLUME - II B

SECTION - D | SUB-SECTION - D22

REV.NO. 00 DATE 30/11/2015

SHEET 5 OF 16

a) Soil

It include all type of soil including laterite, moorum etc with/without any percentage of kankars which can be excavated by normal means such as shovel, pick axe, crow bar, spade etc and those which do not fall under **clause 3.01 (b) and (c) etc.**

b) Soft Rock

It include the rocks (including weathered rock) which are removable by splitting with the help of crow bar, pick axe, wedges, pavement breakers, pneumatic tools, hammers or such implements etc and not requiring blasting (for excavation) in the opinion of the engineer.

c) Hard Rock

It includes the rocks, which require blasting for excavation in the opinion of the engineer. Where blasting is prohibited for any reasons, the excavation shall be carried out by chiselling or any other method as approved by the engineer. The mere fact that the contractor resorts to blasting shall not classify the soft rock under hard rock.

However, the engineer's decision on the type of strata encountered during excavation shall be the final and binding on the contractor.

3.02**Materials for Filling**

Any coarse grained or fine grained low plastic soil free from vegetation, roots, shingle, salts, organic matters, sod and any other harmful chemicals shall be used for filling. The contractor shall test the fill material to establish its suitability and submit the results to the engineer for approval. Fill material shall be got approved by the engineer. The following type of materials shall not be used for filling.

- a) Materials from swamps, marshes and bogs
- b) Expansive clays
- c) Peat, logs, sod and perishable materials
- d) Materials susceptible to combustion
- e) Any material or industrial and domestic produce which will adversely affect other materials of work
- f) Materials from prohibited areas

The earth available by cutting the high grounds within the project site and the materials (if) available from the road excavation or any other excavation under the same contract shall be used for filling depending upon its suitability as fill

**TITLE:****TECHNICAL SPECIFICATION FOR
SITE LEVELLING & GRADING
WORKS**

SPECIFICATION NO. PE-TS-999-600-C022

VOLUME - II B

SECTION - D | SUB-SECTION - D22

REV.NO. 00 DATE 30/11/2015

SHEET 6 OF 16

material. Filling with excavated rock (in the project site) shall be done only with

the written permission of the engineer in the following manner. The boulders shall be broken into pieces not exceeding 150mm size in any direction and mixed with fine materials consisting of decomposed rock, moorum or any approved earth to fill the voids as far as possible and the mixture shall then be used for filling. In case the earth required for filling is over and above the earth available from the compulsory excavations within the project area, then borrow areas for obtaining suitable fill material shall be arranged by the contractor himself from outside the plant boundary limits and all expenses including royalties, taxes, duties etc shall be borne by him. He shall obtain and submit the necessary clearances/permissions from the concerned authorities to the engineer for the borrow areas/materials acquired.

4.00**QUALITY CONTROL**

All works shall conform to the lines, levels, grades, cross sections and dimensions shown on the approved drawings and/or as directed by the engineer. The contractor shall establish and maintain quality control for the various aspects of the work, method of construction, materials and equipments used etc. The quality control operation shall include but not be limited to the following.

Sl. No.	Activity	Check
1	Lines, levels & grades	a) By periodic surveys b) By establishing markers, boards etc
2	Filling	(a) On quality of fill material (b) On moisture content of fill material (c) On degree of compaction achieved

5.00**EXECUTION**

The contractor shall prepare and submit the detailed drawings/schemes for excavation and filling works as proposed to be executed by him showing the dimensions as per the construction drawings and specification adding his proposal of approaches, dewatering (if any), drainage and compaction etc within 15 days of award of the contract to the engineer for approval.

5.01**Site Clearance**

Before the commencement of earthwork, the entire area of cutting and filling shall be cleared of all trees, stumps, bushes, grasses, vegetation etc with their roots, fences, logs, rubbish, water, slush etc. It is not necessary to remove all the soil containing fine hair like roots but only the rather heavy mats are to be removed. Cutting of trees shall include trees having girth of any size and removing roots upto a depth of 600mm below the existing ground level or 300mm below the formation level whichever is deeper. After the removal of

**TITLE:****TECHNICAL SPECIFICATION FOR
SITE LEVELLING & GRADING
WORKS**

SPECIFICATION NO. PE-TS-999-600-C022

VOLUME - II B

SECTION - D | SUB-SECTION - D22

REV.NO. 00 DATE 30/11/2015

SHEET 7 OF 16

roots of trees, the pot holes formed shall be filled with good earth in 250mm layers (loose thickness) and compacted unless otherwise directed by the engineer. The trees shall be cut in to suitable pieces as instructed by the engineer. Before earthwork is started, all the spoils, unserviceable materials and rubbish shall be burnt or removed and disposed off to the approved disposal area(s) as specified by the engineer. Useful materials, saleable timbers, fire woods etc shall be the property of owner and shall be stacked properly at the worksite in a manner as directed by the engineer.

5.02**Setting Out**

On receiving the approval from the engineer with modifications and corrections if any, the contractor shall set out the work from the control points furnished by the engineer and fix permanent points and markers for the ease of periodic checking as the work proceeds. These permanent points and markers shall be fixed at the interval as prescribed by the engineer and shall be got checked and certified by the engineer after whom the contractor shall proceed with the work. It should be noted that this checking by the engineer prior to the start of the work will in no way relieve the contractor of his responsibility of carrying out the work to true lines, levels and grades as per the drawings and specification. If any errors are noticed in the contractor's work at any stage, the contractor at his own risk and cost shall rectify the same. The contractor shall take spot levels of the area (with respect to the bench mark/ available source as provided by the engineer) to be excavated or to be filled at an interval of not more than 10m or as directed by the engineer before starting any earth work and shall be submitted to the engineer for prior approval.

5.03**Excavation**

Levelling by excavation shall be carried out where the existing ground levels are higher than the specified formation level. Excavation shall include removal of all materials whatever nature as may be and whether wet or dry shall be carried out exactly in accordance with the line, levels, grades and curves shown on the approved drawings and/or as directed by the engineer. All excavations shall be done to the minimum dimensions as required. The contractor shall obtain prior approval of the engineer for the method he proposes to adopt for excavation in different types of strata including dimensions, side slopes and dewatering if any, stacking or disposal etc. This approval however shall not in any way make the engineer responsible for any consequent loss or damage. The excavation must be carried out in the most expeditious and efficient manner. The work shall be carried out in a workmanlike manner without endangering the safety of nearby structures/services or works and without causing hindrance to any other activities in the area. **Prior to starting the excavation, the ground level at the location shall be checked jointly with the engineer.**

The rough excavation may be carried up to a maximum depth of 150mm above the final formation level. The balance shall be excavated with special care and the final surface shall be compacted by rolling with 6 passes of 8 to 10 tonne roller. If directed by the engineer, soft and undesirable spots shall be removed

SHEET 8 OF 16

even below the final level. The extra excavation shall be filled up with good earth in 250mm layers (loose thickness) and compacted unless otherwise directed by the engineer. The contractor shall be paid for the extra excavation and filling at the appropriate items of work.

If the excavation is done to a depth greater than that shown on the drawing or as directed by the engineer due to the contractor's fault, the excess depth shall be filled up to the required level with good earth in 250mm layers (loose thickness) and compacted unless otherwise directed by the engineer at the own risk and cost of the contractor.

Suitable slope in cutting as per the requirements and as directed by the engineer shall be adopted to withhold the face of earth. The contractor shall be held responsible for any damage to any part of the work caused by the collapse of the side of excavations.

5.03.01 Excavation in Hard Rock

Excavation in hard rock shall normally be done with blasting. In case where blasting is prohibited for any reasons, the excavation shall be carried out by chiselling or any other approved method as directed by the engineer. Personnel deployed for rock excavation shall be protected from all hazards such as loose rock/boulder rolling down and from general slips of excavated surfaces.

5.03.02 Blasting

a) General

Storage, handing and use of explosives shall be governed by the current explosive rules/regulations laid down by the Central and the State Governments. The contractor shall ensure that these rules/regulations are strictly adhere to. The following instructions are also to be strictly followed and the instructions wherever found in variance with the above said rules/regulations, the former (instructions) shall be superseded with the later (above said rules/regulations).

No child under the age of 16 and no person who is in a state of intoxication shall be allowed to enter the premises where explosives are stored nor they shall be allowed to handle the explosives. The contractor shall obtain licence from the District Authorities for undertaking the blasting work as well as for obtaining and storing the explosives as per Explosives Rules, 1940 corrected upto date. The contractor shall purchase the explosives, fuses, detonators etc only from a licensed dealer and shall be responsible for the safe custody and proper accounting of the explosive materials. The engineer or his authorized representative shall have the access to check the contractor's store of explosives and his accounts at any time. It is the full responsibility of the contractor to

transport the explosives as and when required for the work in a safe manner to

**TITLE:****TECHNICAL SPECIFICATION FOR

SHEET 9 OF 16

the work spot.

Further, the engineer may issue modifications, alterations and new instructions to the contractor from time to time. The contractor shall comply with the same without these being made a cause for any extra claim.

b) Materials

All materials such as explosives, detonators, fuses, tamping materials etc proposed to be used in the blasting operation shall have the prior approval of the engineer. Only explosives of approved make and strength are to be used. The fuses known as instantaneous fuse must not be used. The issue of fuse with only one protective coat is prohibited. The fuse shall be sufficiently water resistant as to be unaffected when immersed in water for 30 minutes. The rate of burning of the fuse shall be uniform and shall be not less than 4 seconds per inch of length with 10% tolerance on either side. Before use, the fuse shall be inspected. Moist, damaged or broken ones shall be discarded. When the fuses are in stock for long, the rate of burning of fuses shall be tested before use. The detonators shall be capable of giving an effective blasting of the explosives. Moist and damaged detonators shall be discarded.

c) Storage of Explosives

The current Explosive Rules shall govern the storage of explosives. Explosives shall be stored in a clean, dry and well-ventilated magazine to be specially built for the purpose. Under no circumstances should a magazine be erected within 400m of the actual work site or any source of fire. The space surrounding the magazine shall be fenced and the ground inside shall be kept clear and free from trees, bushes etc. The admission to this fenced space shall be through a single gate only and no person shall be allowed without the permission of the officer-in-charge. The clear space between the fence and the magazine shall not be less than 90m. The magazine shall be well drained. Two lightning conductors, one at each end shall be provided to the magazine. The lightning conductors shall be tested once in every year.

Explosives, fuses and detonators shall each be separately stored. Cases of explosives must be kept clear of the walls and floors for free circulation of air on all sides. Special care shall be taken to keep the floor free from any grains of explosives. Cases containing explosives shall not be opened inside the magazine and the explosives in open cases shall not be received into a magazine. Explosives which appear to be in a damaged or dangerous condition are not to be kept in any magazine but must be removed without delay to a safe distance and be destroyed.

Artificial light, matches, inflammable materials, oily cotton, rag waste and articles liable to spontaneous ignition shall not be allowed inside the magazine.

Illumination shall be obtained from an electric storage battery lantern. No

**TITLE:****TECHNICAL SPECIFICATION FOR
SITE LEVELLING & GRADING
WORKS**

SPECIFICATION NO. PE-TS-999-600-C022

VOLUME - II B

SECTION - D | SUB-SECTION - D22

REV.NO. 00 DATE 30/11/2015

SHEET 10 OF 16

smoking shall be allowed within 100m distance from any magazine. Magazine shoes without nails shall be used while entering the magazine. The persons entering the magazine must put on the magazine shoes which shall be provided at the magazine for this purpose and should be careful

* not to put their feet on the clean floor unless the magazine shoes on.

* not to touch the magazine shoes on ground outside the clean floor.

* not to allow any dirt or grit to fall on the clean floor.

Persons with bare feet shall dip their feet in water before entering the magazine and then step directly from the tub to the clean floor. No person having article of steel or iron with/on him shall be allowed to enter the magazine. Workmen shall be examined before entering the magazine to check none of the prohibited articles are with them. A brush broom shall be kept in the lobby of the magazine for cleaning the magazine. Cleaning shall be done immediately after each occasion whenever the magazine is opened for receipt, delivery or inspection of the explosives.

The mallets, levers, wedges etc for opening the barrels or cases shall be of wood. The cases of explosives are to be carried by hand and shall not be rolled or dragged inside the magazine. Explosives which have been issued and returned to the magazine are to be issued first; otherwise those which have been stored long in the store are to be issued first. Neither the magazine shall be opened nor any person shall be allowed in the vicinity of the magazine during any dust storm or thunderstorm. All magazines shall be officially inspected at definite intervals and a record of such inspections shall be kept.

d) Carriage of Explosives

Detonators and explosives shall be transported separately to the blast site. Explosives shall be kept dry and away from direct rays of the sun, artificial lights, steam pipes or heated metal and other sources of heat. Before explosives are removed, each case or package shall be carefully examined to ascertain that it is properly closed and shows no sign of leakage.

No person except the driver shall be allowed to travel on the vehicle conveying explosives. No explosive shall be transported in a carriage or vessel unless all iron or steel therein the carriage or vessel which are likely to contact the package containing explosives are effectually covered with lead, leather, wood, cloth or any other suitable material. No light shall be carried on the vehicle carrying explosives and no operation connected with the loading, unloading and handling of explosives shall be conducted after sunset.

e) Use of Explosives

The contractor shall appoint an agent who shall personally superintend the

**TITLE:****TECHNICAL SPECIFICATION FOR
SITE LEVELLING & GRADING
WORKS**

SPECIFICATION NO. PE-TS-999-600-C022

VOLUME - II B

SECTION - D | SUB-SECTION - D22

REV.NO. 00 DATE 30/11/2015

SHEET 11 OF 16

firing and all operations connected therewith. The contractor shall satisfy himself that the person so appointed is fully acquainted with his responsibilities. Holes for charging the explosives shall be drilled with pneumatic drills and the drilling pattern shall be so planned that the rock pieces after blasting will be suitable for handling. The hole diameter shall be of such a size that the cartridges can easily pass down through them and any undue force is not required during charging. Charging operation shall be carried out by or under the personal supervision of the shot firer. Wrappings shall never be removed from the explosive cartridges. Only one cartridge at a time shall be inserted in a hole and wooden rods shall only be used for loading and stemming the shot holes. Only such quantities of explosives as are required for a particular work shall be brought to the work site. Should any surplus remain when all the holes have been charged shall be carefully removed to a point at least 300m away from the firing point.

The authorized shot firer himself shall make all the connections. The shot firing cable shall not be dragged along the ground to avoid any damage to the insulation. The shot firing cable shall be tested each time for its continuity and possible short circuiting. The shot firer shall always carry the exploder handle with him until he is ready to fire shots. The number of shots fired at a time shall not exceed the permissible limits. Before any blasting is carried out it shall be ensured that all workmen, vehicles and equipment on the site are cleared from an area of minimum 300m radius from the firing point or as required by the statutory regulations at least 10 minutes before the time of firing by sounding a warning siren and the area shall be encircled by red flags.

The explosives shall be fired by means of an electric detonator placed inside the cartridge. For simultaneous firing of a number of charges, the electric detonators shall be connected with the exploder through the shot firing cable in a simple series circuit. Due precautions shall be taken to keep the firing circuit insulated from the ground, bare wires, rails, pipes or any other path of stray current etc and keep the lead wires short circuited until it is ready to fire. Any kink in the detonator leading wire shall be avoided. For simultaneous firing of a large number of shot holes, use of cordtex may be done. An electric detonator attached to its side with adhesive tape shall initiate cordtex connecting wire or string. Blasting shall only be carried out at certain specified times to be agreed jointly by the contractor and the engineer.

At least five minutes after the blast has been fired in case of electric firing or as stipulated in the regulations, the authorized shot firer shall return to the blast area and inspect carefully the work and satisfy himself that all the charged holes have exploded. Cases of misfired unexploded charges shall be exploded by drilling a parallel fresh hole at a distance of not less than 600mm from the misfired hole and by exploding a new charge. The authorized shot firer shall be

present during the removal of debris as it may contain unexploded explosives near the misfired hole. The workmen shall not return to the site of firing until at

**TITLE:****TECHNICAL SPECIFICATION FOR

VOLUME - II B

SECTION - D | SUB-SECTION - D22

REV.NO. 00 DATE 30/11/2015

SHEET 12 OF 16

least half an hour after firing.

Where blasting is to be carried out in proximity of other structures, controlled blasting by drilling shallow shot holes and proper muffling arrangements with steel plates loaded with sand bags etc shall be used on top of the blast holes to prevent the rock fragments from causing any damage to the adjacent structures and other properties. Adequate safety precautions as per building byelaws, safety codes, statutory regulations etc shall be taken during blasting operations.

5.03.04 Restrictions on Blasting

- a) Blasting which may disturb or endanger the stability, safety or quality of the adjacent structures/foundations shall not be permitted.
- b) Blasting within 200m of a permanent structure or construction work in progress shall not be permitted.
- c) Progressive blasting shall be limited to two third of the total remaining depth of excavation.
- d) No large scale blasting operations will be resorted to when the excavation reaches the last one metre and only small charge preferably black powder may be allowed so as not to shatter the parent rock.
- e) The last blast shall not be more than 0.50 m in depth.
- f) In rocky formations, at locations where specifically indicated or ordered in writing by the engineer, the use of explosives shall be discontinued and excavation shall be completed by chiselling or any other suitable method as approved by the engineer.

5.04 Sorting of Excavated Materials

The excavated material shall be carefully sorted for use in filling the areas in the project site by removing roots, grasses, organic matters and other objectionable materials and be sorted out into different types of materials for use and as directed by the engineer. The excavated material which is not considered fit for filling purpose shall be immediately removed and disposed at such a place and in such a manner as will be directed by the engineer. The material found unusable should be got approved by the engineer before actually disposing it off. The useful materials that cannot be used directly shall be heaped in separate area as stock piles. Stockpiles shall be of regular size as far as possible for ease of measurement. The materials heaped shall be utilised as and when required and as directed by the engineer. The cost of complete item of earthwork includes the cost of rehandling of the materials and temporarily heaped and reused.

5.05 Disposal of Surplus/ Waste Materials

Surplus and other waste materials shall be removed and disposed of from the construction site to the area demarcated by the engineer. No material shall be wasted unless approved by the engineer.

SECTION - D | SUB-SECTION - D22

REV.NO. 00 DATE 30/11/2015

SHEET 13 OF 16

5.06**Earth Work in Filling**

Levelling by raising with controlled fill of approved excavated/borrowed earth shall be carried out where the existing ground levels are lower than the specified formation level. After clearing site as per clause 5.01, the original ground shall be compacted by rolling subject to a minimum 6 passes of 8 to 10 tonne roller. The approved earth/fill material shall then be spread in horizontal layers not exceeding 300mm in compacted thickness. Each layer shall be watered and thoroughly compacted with proper moisture content and such equipments as may be required to obtain a minimum of 95% of its maximum dry density as determined by standard Proctor's test as per IS: 2720 part-VII or 85% of relative density as per IS:2720 part-XIV as specified. Moisture content of the fill material shall be controlled near optimum moisture content during compaction.

The fill material shall be tested for its optimum moisture content and maximum dry density as per IS: 2720, part-VII. Moisture content shall be checked at the source of supply in accordance with IS:2720 part- II and if found less than that required for proper compaction, the same shall be made good either at the source or after spreading the soil in loose thickness for compaction. In the latter case, water shall be sprinkled directly from the hose line or from the truck-mounted water tank etc making due allowance for evaporation losses and the fill material be thoroughly mixed by means of harrows, rotary mixers or by any other suitable approved method until the layer is uniformly wet. **Flooding shall not be permitted for watering purpose under any circumstances.** If the material delivered is too wet, it shall then be dried by aeration and exposure to the sun till the moisture content is suitable for compaction. Should circumstances arise owing to wet weather the moisture content cannot be reduced to the required amount by the above procedure, the work on compaction shall be suspended. Clods or hard lumps of earth shall be broken to have a maximum size of 150mm when being placed in the layers before compaction. For each of the above tests on the fill material, one sample for every 10,000cu.m shall be tested. Additional samples shall be tested whenever there is a change of source or type of material.

Before start of filling, the contractor shall submit the engineer his proposal for the methodology to be adopted for compaction. The compaction equipments as approved by the engineer shall only be employed to compact the different type materials encountered during construction. If directed by the engineer, the contractor shall demonstrate the efficacy of the plant he intends to use by carrying out compaction trials. Moisture content of the fill material shall be controlled near optimum moisture content during compaction.

The compacted layer shall be tested for its dry density as per IS:2720, part-XXVIII or XXIX as directed by the engineer. Samples shall be taken at the rate of one sample for every 10,000sq.m area of each compacted layer. In addition random checks shall be carried out in compacted layers by means of Proctor needle penetration test. Contractor shall submit all the test results to the engineer immediately after completion of the tests. A sample shall be deemed to have passed the test when the dry density of the compacted fill is equal to or more

TITLE:

VOLUME - II B

SECTION - D | SUB-SECTION - D22

REV.NO. 00 DATE 30/11/2015

SHEET 14 OF 16

than 95% of its maximum dry density. When field density measurements reveal any soft areas in the fills, further compaction shall be carried out as directed by the engineer. If in spite of that, the specified compaction is not achieved, the material in the soft areas shall be replaced with approved material compacted to the density requirements and satisfaction of the engineer.

Subsequent layers shall be placed only after the finished layer has been tested and accepted by the engineer.

Where the filling is to be done across low swampy ground that will not support the weight of trucks or other hauling equipments, the lower part of the fill shall be constructed by dumping successive loads in a uniformly distributed layer of a thickness not greater than that necessary to support the hauling equipment while placing subsequent layers.

5.07

Dewatering and Drainage

It shall be ensured that the area to be excavated/filled shall be free from water. The contractor shall remove the water (if any) by pumping or by any other means as approved by the engineer. At all times, the surface of cutting/filling during execution shall be maintained at such a cross fall as will shed water and prevent ponding. All existing drains/channels (if any) in the work area shall be suitably diverted by the contractor before taking up any excavation or filling. These diversions shall be such that it shall ensure effective disposal of water without any accumulation or flooding within the project site and in adjoining areas.

5.08

Finishing Operations

Finishing operation shall include the work of shaping and dressing the excavated/filled ground to the required grades, levels, lines, side slopes, crosssections and dimensions as shown on the approved drawings or as directed by the engineer.

5.09

Turfing

Turfing shall be provided at the slopes and other locations as shown on the drawings or as directed by the engineer. The turf shall be of approved quality of grass. The sod shall consist of dense, well rooted growth of permanent and desirable grasses indigenous to the locality where it is to be used and shall be practically free from weeds or other undesirable matter. The grass on the sod shall have a length of approximately 50mm and the sod shall be free of any

debris. Thickness of the sod shall be as uniform as possible with 50 to 80mm of soil covering the grass roots depending on the nature of the sod so that all the dense root system of the grasses are retained in the sod strip. The sods shall be cut in rectangular strips of uniform width not less than about 300mm x 250mm size but not so large so that it is convenient to handle and transport without

SHEET 15 OF 16

damage.

The area to be sodded shall be previously constructed to the required slope and cross section. Prior to placing the sods, the slopes shall be **roughened** and wetted in order to have a satisfactory bond. The strips of sod shall be laid in close contact with each other and be tamped firmly in place so as to fill and close the joints between them. The turfing so laid shall be well watered and protected until final acceptance.

5.10 Approaches

The contractor shall provide proper approaches for workmen and inspection.

5.11 Lighting

Full scale lighting are to be provided if night work is permitted or directed by the engineer. If no night work is in progress, red warning lights should be provided at the edges of excavations and fills.

6.00 RATES AND MEASUREMENTS

6.01 Rates

a) The item of work in the schedule of quantities describe the work very briefly. The various items of the schedule of quantities shall be read in conjunction with the corresponding sections in the technical specification including amendments and additions if any. For each item in the schedule of quantities, the bidder's rate shall include all the activities covered in the description of the items as well as for all necessary operations in detail as described in the technical specification.

b) No claims shall be entertained if the details shown on the released for construction drawings differ in any way from those shown on the tender drawings.

c) The unit rate quoted shall include minor details which are obviously and fairly intended and which may not have been included in these documents but are essential for the satisfactory completion of the work.

d) The bidder's quoted rate shall be inclusive of supplying and providing all labour, men, materials, equipments, tools and plants, supervision, services, approaches, schemes etc.

6.02 Measurements

Method of measurements are specified in the proceeding sections. Where not so

**TITLE:****TECHNICAL SPECIFICATION FOR
SITE LEVELLING & GRADING
WORKS**

SPECIFICATION NO. PE-TS-999-600-C022

VOLUME - II B

SECTION - D | SUB-SECTION - D22

REV.NO. 00 DATE 30/11/2015

SHEET 16 OF 16

specified, the latest version of IS:1200, Part-1 shall be applicable.

a) The length, breadth and depth shall be measured correct to the nearest centimetre if measurements are taken by tape. Rounding of numericals shall be as per relevant IS Codes. If the measurements are taken with staff and level, the levels shall be recorded correct to 5mm. The area and volume shall be worked out in square meter and cubic meter correct to the nearest of two decimal places.

b) For earth work in excavation, the ground levels shall be taken before and after completion of the work in the actually excavated area. The quantity of earth work in cutting shall be computed from these levels in cubic meter.

c) Where soft rock and hard rock are mixed, the measurement shall be done as follows. The two types of rock shall be stacked separately and measured in stacks. The net quantity of each type of rock shall be so arrived by applying a deduction of 50% for looseness/voids in the stacks. If the sum of net quantity of the two types of rock so arrived exceeds the total quantity of excavation then the quantity of each type of rock shall be worked out from the total quantity (from excavation) in the ratio of net quantities in stack measurements of the two types of rock. If stacking is not feasible, the method as suggested by the engineer shall be followed.

d) Where soil, soft rock and hard rock are mixed, the measurement shall be done as follows. The soft and hard rock shall be removed from the excavated material and stacked separately and measured in stacks. The net quantity of each type of rock shall be so arrived by applying a deduction of 50% for looseness/voids in stacks. The difference between the entire excavation and the sum of the quantities of soft and hard rocks so arrived shall be taken as soil.

e) For earth work in filling, the actual measurements of fill shall be calculated by taking levels of the original ground before start of the work but after site clearance and after compaction of fills. The quantity of earth work in filling shall be computed from these levels in cubic meter.

f) For turfing, the measurement shall be made on the finished work in square meter.

1.0 <u>INTRODUCTION</u> Two volumes VI A & VI B of this specification cover site survey, soil investigation, site development works, complete design engineering and construction of Civil, Structural and Architectural works associated with all Plants Turnkey Package. The scope of works covers complete Civil, Structural and Architectural Works including supply of all materials, labour, tools and plants as required for successful execution of the turnkey package. This section – I of Volume VI A lists Codes and Standards to be adopted and the principal structures of the plant and briefly describes the basic concept, requirements and features pertinent to each. Documents to be submitted have also been brought out in this section along with the procedure to be followed for the same. Volume VI B covers technical specification for different items of work. If there is any ambiguity and/or contradiction between Volumes – VI/A and Volumes – VI/B, the provisions/requirements laid in Volumes – VI/A shall prevail. In case of any contradiction between any part of the Bid Document with the other, requirement of most stringent one shall be applicable. 2.0 <u>CODES AND STANDARDS</u> Following is a general listing of Codes and Standards to be used in the design of the Plant. Specific applicable codes and standards will be identified in System Design Descriptions/Technical Specifications as appropriate. The latest editions/revision of following codes and standards along with addendums/amendments, if any, shall be followed: 2.1 <u>GENERAL</u> (a) Indian Codes OR Internationally accepted design Codes and Standards (American codes, British codes, German codes, Japanese codes only), where Indian Codes are not available.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

	(b) Indian Codes OR Internationally accepted design Codes and Standards (American codes, British codes, German codes, Japanese codes only), which are stringent or at least equivalent to Indian Standards. (c) National Building Code of India. "Accepted Standards" and "Good Practice" listed in the appendix to National Building Code of India. (d) IS-1200 : Method of measurement of Building and Civil Engineering Works. (e) IS-1256 : Code of Practice for Building Byelaws.	
2.1.1	Earthwork (a) IS-1498 : Classification and identification of soils for General Engineering purposes. (b) IS-3764 : Safety Code for excavation work. (c) IS-7293 : Safety Code for working with construction machinery. (d) IS-9759 : Guide lines for dewatering during construction (e) IS-10379 : Code of practice for field control of moisture and compaction of soils of embankment and sub grade (f) IS-4701 : Code of practice for earthwork on canals	
2.1.2	Concrete (a) IS-269 : Ordinary and low heat Portland cement (b) IS-383 : Coarse and fine aggregate from natural sources for concrete (c) IS-432 : Mild Steel and medium tensile steel bars and hard drawn steel wire for concrete reinforcement

(d) IS-455 : Portland Slag Cement (e) IS-456 : Code of Practice for Plain and reinforce concrete. (f) IS-460 : Test Sieves (all parts). (g) IS-516 : Methods of test for strength of concrete (h) IS-1199 : Methods of sampling and analysis of concrete (i) IS-1566 : Specification for Hard-drawn Steel Wire Fabric for Concrete Reinforcement (j) IS-1786 : High strength deformed steel bars and wires for concrete reinforcement (k) IS-1834 : Hot applied sealing compounds for joints in concrete. (l) IS-2386 : Methods of test for aggregates for concrete (all parts). (m) IS-2502 : Code of practice for bending and fixing of bars for concrete reinforcement. (n) IS-3370 : Code of practice for concrete structures for storage of liquids (all parts). (o) IS-3414 : Code of practice for design and installation of joints in buildings. (p) IS-4948 : Welded steel wire fabrics for general use (q) IS-6452 : High Alumina Cement for Structural use (r) IS-7320 : Concrete slump test apparatus (s) IS-7861 : Code of practice for extreme weather concreting (all parts).

3.0 <u>SCOPE OF CIVIL WORKS</u> The scope of civil work comprises all necessary investigations, survey, foundations, building, superstructures and infrastructure required for the complete power station. All Civil /Structural works of this package, related to (Mechanical, Electrical and others) new 1 X 660 MW Unit are in the scope of bidder. The bidder shall visit the site to acquaint himself regarding all site features and existing facilities and scope & extent of Civil/Structural works to be carried out for this purpose to amalgamate with the new facilities in consultation with Owner. Financial impact due to these works shall be included in the offer. Any claim by the bidder of any ignorance, whatsoever in this regard will not be entertained by MSPGCL at later stage. 3.1 The work under this Section consists of Civil, Structural and Architectural works, but not limited to items mentioned below. (a) Area Grading, levelling & dressing (finished grade levels shall be as mentioned in Plot plan and Area Grading Drawings. UCR/RCC retaining wall shall be provided as per requirement to retain the soil. If space permits, slope (1:3) shall be provided between two different grade levels. However slopes shall be protected with stone pitching with cement mortar (1:4). (b) Preliminary geo-technical investigation work is carried out at site by the Owner. However, for soil characteristics and parameters to be adopted in final design, the contractor is required to do detail geotechnical investigation work as part of the contract to verify/ generate data so required. It should be noted that nothing extra whatsoever on account of variation between soil data annexed in this specification and that found by detailed geotechnical investigation to be carried out by bidder shall be payable. (c) Demolition of existing over ground structures (including foundation)/ facilities, if any, and site clearance.

(d) Piling work if necessary. (e) Boundary walls around any buildings/area, if required from statutory point of view. (f) The UCR compound walls along with gates wherever required shall be provided as per attached bid drawing and/or as directed by Engineer-in-charge as per site requirements. The scope under this includes as below (i) Dismantling of existing compound walls shown in the drawing or as directed by Engineer-in-charge. (ii) Providing new UCR compound wall with anti-climbing arrangement as per drawing and /or as directed by Engineer-in-charge. Wherever required, retaining wall below compound wall shall also be included in the scope of the contract. (iii) Providing chain link fencing between 2 x 500 MW and 1 x 660 MW plant as per clause no. 4.20 of Section I and as per Bid drawing or as directed by Engineer in-charge. (iv) The suitable arrangement at crossing of compound walls with pipe lines, drains nallas, railway lines etc. shall also be provided by the bidder. (v) The gate of suitable size alongwith compound wall on either sides at grid N'400 across existing 10.0 m wide road The scheme should be submitted for approval of the owner before execution at site. (g) In plant Roads and Culverts within this specification and as shown in the plot plan bid drawing shall be provided by the bidder. (h) Drainage network (storm water drains, oils/effluent & sewage water) (i) Foot over bridge for railway crossing near wagon tippler.

(j) Road over bridge (ROB) for Railway siding including approaches on both sides upto existing roads as shown in bid drawing shall be provided as per railway norms. The engineering of bridge, clearances and permission of railway authorities, construction, erection of bridge & approaches etc are included in the scope of bid. (k) Complete railway siding facilities for the project. The brief scope of railway siding consists of following works. (i) In Railway siding area Grading, levelling & dressing (finished grade levels shall be as mentioned in Plot plan and Area Grading Drawings) but in the rail track portion if required necessary excavation, filling shall be carried out for base formation below rail track, toe wall, retaining wall, drain and other foundation etc and other related activity as per prevailing standard engineering practices of Railways. (ii) Scope also includes coordination with Railway Department & preparation of design & drawings for construction of all buildings such as TNC building, Central panel building etc station works such as cabins, relay rack, battery rooms, DG room, signaling and telecommunication room, drain works, cross drainage works goomties etc. along with electrification works and with all materials, equipments machineries etc. The works not elaborated specifically but are essential for supply, installation, testing and commissioning the BG railway siding are deemed to have been included in the scope and the same will be as per prevailing standard engineering practices of Railways. (iii) All works related to Railway siding facility (including feasibility study, soil investigation, system study, basic Engineering, Detail Engineering, necessary labour, all materials, plants/ equipments, construction, erection, testing and commissioning.) (iv) Modification/alteration works such as tapping point of rails & at dry ash silo locations, if any. (v) Engineering of railway siding as per railway norms.

necessary including ash disposal pipeline upto VELHALA. The existing ash bund is about 10 Kms from the proposed power station. The bidder shall visit the site to acquaint himself regarding all site features and scope & extent of Civil /Structural works to be carried out for this purpose to amalgamate with the new facilities in consultation with Owner. (o) Remote dry fly ash silo utility room. (p) Ash slurry disposal pipe lines shall be routed above overhead trestles within Plant area. Pipe lines shall be routed supporting on pedestals upto ash disposal area. A 5.0 m wide WBM service road along with drains wherever required shall also be provided for maintenance purpose of these Ash slurry disposal pipe lines. The required cross drainage works for crossing these pipe lines & service roads are also to be provided. (q) All buildings, foundations & structures for coal handling plant along with earth mat, as necessary. (r) R.C. Chimney with single steel flue and with elevator. (s) Raw water storage tank, raw water Pump House, Raw water Pipe Line supporting structure & Equipment foundation (t) Raw water pre-treatment plant covering Clarifloculators, Gravity Filters, chemical house, filtered water tanks & pump house, equipment, pipe support foundations along with earth mat etc (u) Raw water/Fire water pump house with gates and stop logs, trash racks maintenance facilities, switch gear/MCC rooms, equipment foundations along with earth mat including incoming water pipe line from Raw water tapping from proposed water line for 2 x 500 MW unit to Raw water storage tank which is about 1 Km away from RWST. The bidder shall visit the site to acquaint himself regarding all site features and scope & extent of Civil/Structural works to be carried out for this purpose to amalgamate with the new facilities in consultation with Owner.

(v) Filter water storage tank for D M & Non DM. (w) Post water treatment plant including DM plant building, Equipment foundation along with earth mat, DM water storage tanks and foundations, neutralization pit, chemical lab, including all necessary piping. (x) Centralized Effluent Treatment Plant including central monitoring basin, coal pile runoff settling pond, oil water separator including complete plant waste water collection and disposal system. (y) Complete Compressed Air system with Air Compressor & DG building, Equipment foundation, DG foundation etc with earth mat. (z) The HFO & LDO will be transferred from the Oil tanks of existing 500 MW units with help of HFO & LDO transferring pumps and stored in the fuel oil Day tanks. The oil will be supplied to boiler with the help of pressurizing pumps. The system downstream of Oil Tanks of 500 MW units including Oil Transfer Pump House, Day tank, pressurizing pump House, piping etc shall be in the scope of bidder. (aa) Complete fire water/foam Pipe networking system (bb) Centralized sewage treatment plant including complete sewage water collection and disposal system. (cc) Plant Rain Water Harvesting Scheme. Rain water harvesting scheme which is statutory requirement mandated by MOEF is to be executed as per the recommendations of the Central Ground Water Authority/Board. Obtaining the necessary statutory approvals for the Rain water harvesting scheme to be implemented shall be in the scope of EPC contractor. Rain water harvesting scheme shall be designed for reuse as well as recharge of ground water.

plumbing, roof treatment, etc., for plant/non plant building, auxiliary & ancillary building. The scope shall also include setting up by the Contractor a complete testing laboratory in the field to carry out all relevant tests required for the civil works for the project. Grading level of entire plant area and extent of area grading under this package is shown in bid area grading drawings. Construction and drinking water will be supplied by the Owner at a single point within the battery limit of existing plant and the Bidder shall have to construct storage tanks at supply points. Pumping arrangement and distribution system shall be in the scope of bidder. A list of Civil Field Quality Assurance Plans and List of Laboratory Apparatus is enclosed in ANNEXURE-II of Section II. The Bidder shall visit the site and assess the involvement of demolition and site clearance, if required, within the plant area to construct the project & accordingly the cost is to be considered in his offer. The work shall have to be carried out both below and above the ground level. The work shall be executed in accordance to the relevant Indian Standard Code, and in its absence, the work shall be executed according to the best prevailing local Public Work Department (PWD) practices or as per the recommendations of relevant American and British Standards or as per the instructions of the Owner's Engineer. This shall prevail in respect of civil works for which no specification has been prescribed in this section. The work shall be carried out according to the design/drawings to be developed by the Contractor and approved by the Owner/Owner's authorised Consultant. For all building, structures, foundations, etc., necessary terraced layout and details are to be developed by the Contractor keeping in view the statutory & functional requirement of the plant & facilities and providing enough space & access for operation, use and maintenance. The land for project will be handed over to the Contractor by the Owner

as is where basis. Additional site investigations, surveys, grading and levelling and other additional works shall be carried out by the Contractor, if necessary. The layout and levels of all structures shall be made by the Contractor at his own cost from the general grid of the plot and the nearest GSI bench mark or other acceptable bench mark of Govt. Dept. The Contractor shall be solely responsible for the correctness of the layout and levels. All necessary statutory clearances/any other body i.e. railway etc. shall be obtained by the Bidder prior to execution of work under scope of this specification. The necessary expenses shall be borne by the bidder. All the quality standards, tolerances, welding standards and other technical requirements shall be strictly adhered to by the Contractor. 4.0 <u>PLANT STRUCTURES/COMPONENTS:</u> The description of some of the major structures/components of system covered under the Package is given below: 4.1 <u>POWER HOUSE BUILDING:</u> The Turbine Hall is an enclosed insulated, weather-tight steel framed structure which houses the turbine generator and related equipments. The building consists of an operating floor, mezzanine floor and a ground floor as per layout. The roof is supported by steel trusses. The structure is braced in the direction of the crane travel but provided with suitably designed rigid joints at roof level and framing at other floor levels. Two (2) E.O.T. Cranes (capacity shall be as specified elsewhere in this specification) will operate in the Turbine Hall for handling equipments. For rigging and positioning of the Turbo-Generator and condensers, building frame shall not be of any hindrance and temporary openings in the building claddings and cladding supporting structures shall be maintained till completion of the rigging and positioning of the condensers and TG. Within the building, the concrete pedestal for supporting the turbine generators and Boiler Feed Pumps/motors will be completely isolated from the building floors for vibration control. The foundation for Turbo generator

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 50 of 639
and Boiler Feed Pumps/motors shall rest on suitable vibration isolation system consisting of springs and visco dampers. The concrete operating floor will be designed for construction and maintenance loadings of TG. Hatchways with removable chequered plates or grating floor covers will provide access to equipment on lower floor and will be within turbine hall crane access. The intermediate floors will be of concrete with hatchways as necessary. All front external sides shall generally be cladded with factory assembled double skin insulated metal cladding made up of 0.50mm TCT colour coated profiled galvalume steel sheets. The outer skin profile depth is 28 mm and the inner skin shall be slightly ribbed steel sheet. The core in between the outer profiled sheet and the inner profiled sheet shall be polyurethane foam in 30 mm thickness having a density of 40 – 45 kg/cum. The foam shall be filled in between the outer and inner sheet at factory using highly dedicated foaming machine. The fasteners to be used for these factory made panels shall be of adequate sizes, self-drilling and self-tapping type, compatible with galvalume steel sheets. This shall be used from 3M (approx) above ground floor up to roof. Brickwork shall generally be provided from ground floor to 3M (approx) height. Permanently colour coated single metal cladding sheet (non-insulated) shall be provided over fly ash brickwork above 3M (approx) from ground floor only when brickwork is technically required and unavoidable. All internal walls shall be of fly ash brickwork. Windows, doors, claddings and finishing shall be as laid down in Volume VI/A Section – IV of this specification. The roof over Turbine Hall shall be flat with a gentle slope of about 1 in 100 towards the transformer yard. The roofing will be done by cast-in-situ RCC slab over permanently colour coated (on exposed face) galvanized M.S. troughed metal decking of approved profile supported by steel purlins which are spanning between two adjacent roof trusses. The thickness of sheet shall as per the design requirement considering worst load combination subject to a minimum thickness of 0.8mm. The roof will be insulated by providing 75 mm thick foam concrete. Roof water proofing treatment shall be done as per Architectural Part Cl. No. 2.24 of Vol. VI/A Section – IV. All floors except roofs of Turbine Hall will be cast-in-situ RCC over removable shuttering with hatchways as required. RCC slab-on-grade (200 min.) on ground floor shall rest on well-compacted

earth-fill with approved quality earth as specified elsewhere in this specification. Ground floor slab will have drainage trenches covered with steel grating. Stairs and platforms shall be provided as required for maximum utility and safety. Stairs shall have to be provided as per TAC regulations and any other statutory requirements. Troughed Metal decking sheet for roof shall consist of permanently colour coated galvanized M.S. sheet and silicon modified polyester paint of approved make shall be used for permanent coating on exposed surface. The galvanization shall be 275gm/sqm and DFT of permanent colour coating shall be 20 micron (approx). Primer coat shall be provided on inner side. 4.2 MILL BUILDINGS These buildings house coal pulverisers, coal bunkers, tripper conveyors, Coal feeders, ducts and piping. The bunker shall be circular in plan and cylindrical at top portion and conical at sloped hopper portion. Bunker shall be designed as per capacity specified elsewhere. A comprehensive flow ability study shall be conducted by the Bidder for the coalbunker hopper to ensure smooth flow of coal in all seasons with different moisture contents and different percentage of fines. Geometric parameters of hopper shall be decided considering the findings of flowability study. 5 mm stainless steel liner plates conforming to 304M Grade, fitted without allowing any projections in coal flow path shall be provided for conical hopper portion only. On sides of the bunker, necessary openings shall have to be provided for bunker ventilation/dust extraction. Minimum thickness of M.S. skin plate for both conical and cylindrical portion shall be 12 mm. Specification for Liner Material (a) Material : 304M grade stainless steel plates manufactured by SAIL. (b) Thickness : 5 mm

Fastening System: The edges of stainless steel plates shall be ground smooth after cutting. The inner plate should be plug welded to the mother plate. The plug welding shall be done by drilling 20 mm diameter holes @300 mm c/c both ways without puncturing the mother plate. The welding is to be done by using specialized stainless steel electrodes such as 308L / 309L. Shielding gas shall be Argon + Oxygen mixture or Argon + Hydrogen mixture. CO₂ mixture shall be avoided. Testing: The stainless steel 5 mm thick, 304M grade, test samples shall satisfy the following mechanical and chemical properties. 4.2.1 Mechanical Properties (Annealed) <table> <tr> <td>(a)</td><td>Hardness R'B'</td><td>90</td></tr> <tr> <td>(b)</td><td>Yield Strength (Min.) Due to constant development, the above properties are liable to change. Hence, the clarification from the Engineer regarding the exact properties shall be required to be taken before placement of order for procurement in case of any change only.

Before commencing regular fabrication of the bunker, trial assembly of the bunker including hopper shall be made at least for one bunker.

The framing shall be of structural steel. This shall be designed as a moment connected framing in the transverse direction and braced in the longitudinal direction. These structures primarily support coal bunkers, coal feeders and tripper arrangement to feed the coal into coal bunker. Supporting structure for Mill maintenance arrangement are connected to this structure. Handrails shall be provided on all sides of Feeder floor. Slit openings are to be provided in Tripper floor for entry of coal from Tripper into bunkers. Framing arrangement for structural steel platform at various levels around the bunkers shall be provided, as required, with proper access ladder for poking, striking and attending to air cannons.

All floors will be of reinforced concrete with hatchways as required. Ground floor slab will have drainage trenches covered with steel grating.

Building roof will be of Cast-in-situ R.C.C. over permanently colour coated (on exposed face) galvanized M.S. troughed metal decking of approved profile supported on steel beams/girders and the sides will be cladded with permanent colour coated sandwiched insulated metal cladding system from Tripper floor to roof. The remaining portion of the building below Tripper floor up to ground floor shall generally be uncladded. However, brick cladding shall have to be provided, if required, as per TAC and any other statutory requirements.

Floors shall be of cast-in-situ RCC over removable shuttering.

Stairs and platforms shall be provided as required for maximum utility and safety as per TAC regulations and any other statutory requirements. Stair should be provided from ground up to roof. Minimum two (2) stairs shall be provided in each Mill Building. Proper toilets and drinking water

arrangement shall be provided over tripper and feeder floor. Arrangement for disposal of waste coal from all floors shall be provided. 4.3 FLUE GAS DRAUGHT SYSTEM STRUCTURES Flue gas draught system structures include electrostatic precipitators, ID fans, ductwork and chimney. The equipment structures are outdoor construction type supported by exposed steel structures consisting of beams, columns and bracings. The precipitators will be elevated to allow a good arrangement of gas ducts from the air heaters and to facilitate removal of fly ash in the event of equipment breakdown. Minimum clearance for truck (small) entry below hopper shall be provided as per requirements described elsewhere in the specification. Precipitator control room will be housed in a building with R.C. column and beam framing. At the paved ground level, drainage trenches covered with steel grating at intervals shall be provided for final discharge into the drainage system/sump pit. 4.4 ASH HANDLING PLANT Ash handling system shall comprise of bottom ash, coarse ash and fly ash handling systems, ash slurry pump house, ash water pump house, HCSD Pump House, ash pipe supports including pipe racks, pipe trenches, culverts, bridges etc. Works shall include bottom ash slurry pipe supports, bottom ash extraction equipment supports, ash slurry pipe supports from ash slurry pump house to existing ash dyke area at VELHALA, dry fly ash pipe supports from ESP to remote fly ash silo via HCSD fly ash silo, remote fly ash silos, development of silo area (including paving, fencing, access roads, office block and watchman cabin), pump and equipment foundations, compressor house, MCC room, ash water pump house, ash water pipe supports, RCC thrust blocks, sump, miscellaneous tanks supporting structures, One (1) in plant Tube settler to receive water from bottom ash overflow pump discharge vacuum pump drain water , & any other drains the contractor intends to route to this plant for clarification & feeding the cleaner water to Ash water sump for reuse in

Ash handling system & the supporting structure, facilities required etc. to complete the system. Civil work shall also include HCSD pipe supporting structure from HCSD Silo area upto ash disposal area & HCSD related foundation & structure. Fly ash remote silo storage area shall be provided with the sump, for collection of ash water. The compressor house and ash water pump house shall be provided with toilet facility. Structural arrangement, foundation system, cladding interior and exterior finishes, area paving etc., shall be as per total plant building design and finish schedule furnished elsewhere in the specification. Pipelines shall generally be supported on saddle type RCC pedestals and foundations. A suitable pad play in between pipe and pedestal shall be provided to prevent for wearing of pipe bottom surface due to thermal expansion. The top level of the pipe pedestals shall be 600 mm (minimum) above the formation level. Pipes shall be suitably anchored with RCC pedestals to resist lateral and vertical movements. The compressors and their associated equipments shall be housed in RCC building along with requisite MCC room. Crane / monorail of adequate capacity shall also be provided in all pump / compressor house. Ash Slurry Disposal Pipe line: The bidder shall visit the site to acquaint himself regarding all site features and scope & extent of Civil/Structural works to be carried out for this purpose to amalgamate with the new facilities in consultation with Owner. Scope include site survey, soil investigation, site development works, complete design engineering and construction of Civil, Structural. obtain necessary various approvals from Railways, other Departments/agencies well in advance including necessary charges for permission part born by the EPC contractor Pipe lines shall be routed supporting on pedestals up to ash disposal area. A 5.0 m wide WBM service road along with drains wherever required shall also

be provided for maintenance purpose of these Ash slurry disposal pipe lines. The required cross drainage works for crossing these pipe lines & service roads , permanent approaches to farmer over pipe lines on existing and new proposed lines wherever required as per requirement of Owner are also to be provided For crossing of the pipe lines and maintenance road with nallahs, canals, lake etc and/or for road/rail crossings, pipe shall be laid through RCC box culverts/bridges. In railway crossing and high way crossing RCC box culverts by push back method shall be use. 4.4.1 Following shall be considered for laying of the pipe lines: (a) All the specials such as bends, tees, laterals etc. shall be of cast basalt lined. (b) The sleeves coupling shall be provided at every 30 M Centre line with twin supports. (c) The unsupported length of the all pipelines shall not be more than 6.0 meters. (d) Minimum thickness of the M.S. Pipe line shall not be less than 9.50 mm. (e) The ash disposal pipeline shall be painted with 2 coats of epoxy paint of approved make over a coat of epoxy primer. Total DFT shall not be less than 240 microns. (f) The pipe lines shall be provided with all specials such as bends, tees, lateral etc., and appurtenances such as sluice valves, air/vacuum release valves, drain valves with isolation sluice valve as per design and functional requirements. (g) Thrust blocks to resist the thrust at bends/tees etc. shall be provided for full load. (h) Pipe support shall be designed considering pipe dragging force in addition to all other forces.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 57 of 639
(i) The pipelines shall be laid in down ward gradient as far as possible irrespective of ground formation level, so as to avoid the ash deposition in the pipelines. (j) For supporting ash pipelines in the power plant area, pipe rack along with 750 mm wide walkway shall be provided. 4.4.2 The following buildings shall be provided to accommodate the equipments: (a) Ash slurry sump & ash sludge sumps with pump house. (b) Ash water sump with pump house (c) Compressor room (d) Ash handling system main control room. (e) AHP tube setter with associated Civil Works as applicable (f) Silo utility cum control room near HCSD silo & remote fly ash silo, ash silos and related civil work. (g) HCSD pump house. Pipe Rack/trenches/pedestals etc in the plant area and upto ash disposal area.		
4.5 <u>COAL HANDLING PLANT</u> The work to be performed under this specification for civil, arch. and structural items include works for sub-structures and super structures for the entire coal handling plant including auxiliary system/services and shall generally comprise (but not limited to) detailed design and preparation of design and detailed drawings including getting the same approved by owner consultant/railway authorities for construction, fabrication, erection as per approved drawings and specification, supply of materials and labour etc, for the following. The Coal Handling Plant shall consist of crusher house, transfer towers, tunnels, pent houses, conveyor galleries, trestles, main		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 58 of 639
control building with MCC room, stacker reclaimer foundation, coal stock pile, stack yard, water sprinkler system, Wagon tippler complex etc. (a) All transfer towers, crusher house, drive house shall be provided with RCC foundation with steel frame and RCC floor/roof. Fly ash brick wall cladding up to first floor for crusher house and up to 3 M from finish floor level for all junction towers and drive house shall be provided. Remaining portion of the towers/drive house/crusher house shall be clad with permanently colour coated metal sheeting. All external staircases shall be provided with permanently colour coated metal sheeting. Steel doors, louvers window and staircase shall be provided for access and ventilation. Two number staircases (one internal and one external) shall be provided for crusher house. Flooring for crusher house shall be RCC with 40 mm thick cement concrete flooring with ironite topping. The crusher shall be RCC deck supported on steel helical spring units and viscous damper, which in turn shall be supported on steel frame. The thickness of top RCC deck shall not be less than 1.0 M. Dynamic analysis shall be done for the top deck and the natural frequencies and amplitudes of vibration shall be determined. A mathematical model of the top deck shall be formulated with three-dimensional beam/plate finite element for the purpose of analysis with the springs idealized with vertical and horizontal stiffness. The mass of the machine together with that of the top plate shall be considered for the analysis. Single degree of freedom systems may be used for evaluating the rigid body nodes. Natural frequencies up to at least 20% above the operating frequencies shall be checked. Forced response dynamic analysis shall be carried out for the operating condition unbalanced forces using sinusoidal forcing function. The vibration isolation system shall be designed for at least 90% isolation efficiency. A ratio of at least 10 (ten) shall be ensured between the stiffness of the supporting structure and the stiffness of the spring system in each supporting structure (the stiffness of the spring system being lower). This ensures that the supporting structure is relatively "Rigid" with respect to the springs and the vibration isolation system can be conveniently assumed to be rigidly supported for the purpose of dynamic analysis.

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 59 of 639
In addition the first bending mode frequency of the top deck shall be at least 20% above the operating speed of the motor. (b) All over ground and on ground conveyor gallery shall be enclosed type steel structure with two lattice girder having rigid jointed portal frame at both ends. The lattice shall be braced together in plan at top and bottom and roof truss shall be provided at regular interval. The gallery shall be covered in sides and top with permanently colour coated metal sheeting as per system requirement. (c) All electrical buildings shall be of RCC frame structure with RCC roof and floor and plastered fly ash brickwork. Glazed aluminum door, windows, false ceiling, partition wall shall also be provided. The roof water proofing as per civil and architectural work specification shall be provided as given elsewhere. Outdoor transformer foundation with oil pit & fencing with gate shall be provided. The control room building shall be complete with toilet, drains, plumbing, sanitary drainage, painting etc. (d) Wagon tippler hopper shall be under ground RCC construction (Concrete Grade M30). Wagon tippler hopper shed shall be covered with steel framed structure shed for the full length with roof and side cladding with permanently color coated metal sheeting. Steel stair shall be provided as required. The WT hopper and conveyor tunnel shall be provided with adequate slopes and sumps at suitable locations, fitted with pumps for dewatering. (e) Stacker Reclaimer shall rest on RCC foundation and grading with drainage shall be as per system requirements. Proper slope and drainage system shall be provided for track of stacker / reclaimer area. Underground cross tie beam shall be provided to avoid settlement of supporting columns of stacker / reclaimer. (f) Coal Stock Yard: Entire area shall be excavated to average 250 mm depth and given slope of 1 in 100 in suitable directions as approved. Entire excavated area shall be watered and rammed and compacted with 10 tonne roller. 100 mm thick river sand cushion layer shall be placed over compacted sub grade and consolidated by flooding 150

	mm thick boulder soling shall be laid over sand cushion, joints filled with river sand. Over boulder soling, 75 mm thick lean concrete (1:4:8) shall be spread. Final layer shall be minimum 150 mm thick RCC slab M20 with double layer reinforcement. Slope is to be maintained through all layers. The coal stack area shall be graded with suitable slope for draining the surface by longitudinal drains that shall be of RCC trenches with graded gravel packets at about 1.5 m intervals on the sides to trap coal dust. Weep holes shall be provided in the trench walls at the locations of filter pockets for collecting surface water in the longitudinal drains for discharging into the mains surface drain by the side of the road. Retaining wall, 1m height shall be provided around the crushed coal pile to prevent coal spillage into the drain. Necessary control joints in the grade slab shall be considered to avoid temperature and shrinkage cracks in the slab. The design of coal stack area should take care of loads arising due to dozer movement and shall be designed to sustain coal water pressure. (g) All main roads in CHP area shall be as per road layout drawing. Roads shall be of WBM with bituminous topping as per specification given else where. Covered drains/pipe drains with adequate number of manholes shall be provided in dust prone areas. RCC box culverts / pipe culverts with dead wall and aprons shall be provided at road and drain crossings as required. (h) Steel structures shall be designed by working stress method as per IS: 800 (latest). However, the connection of vertical bracings with connecting members and diagonals of truss members shall be designed for full tensile capacity of the bracing member. (i) The various materials for structures shall conform to the following Indian Standards (Latest): (i) Rolled Section – IS – 2062 (ii) Plates of various thickness – IS – 2062 (iii) Chequered plate of various thicknesses – IS – 3502 and min. thickness shall be 6 mm O/P.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 61 of 639
	(j) Factor of safety of foundation/structure during and after construction shall be as under: (i) Sliding and overturning As per IS: 456 (latest) Minimum F.O.S. shall be 1.20 considering dead weight of structure as 0.9 times the actual value. (ii) Uplift of shallow foundations due to tension in building column Minimum F.O.S. shall be 2.0. (k) For design purpose the ground water table shall be considered at 1.00m depth below F.G.L. (l) For design of RC structures, Bulk density and angle of repose for coal shall be considered as 1.20 MT/Cu.M, 37° for (crushed coal) and 35° for (uncrushed coal) respectively. However for storage volume consideration, density 0.8 MT/Cu.M shall be considered. (m) All reinforced concrete work shall be M-25 as per IS 456-2000 with a minimum cement content 300 Kg/cum and maximum free water cement ratio shall be 0.5. Wagon tippler, under ground tunnels shall be constructed with minimum M-30 grade concrete. (n) All hoppers shall be designed under the following load conditions. (i) The hopper is full up to its full capacity with top surface horizontal at grating level. (ii) The hopper is partially empty with the highest level of coal at grating level and making an angle as specified elsewhere. The above conditions are to be analyzed for the case where the whole content of coal within the hopper is supported by the hopper only without taking support from any other structures below.

	The hopper shall also be designed for lateral coal pressure, frictional forces during filling and emptying and forces due to impact and failing of arches of coal within the hopper, etc. (o) In addition to dead load, live load, wind/seismic loads all steel structures specially conveyor galleries and trestles shall be designed for thermal loads for a difference of temperature of 40⁰ C and transverse deflection of trestle shall be as per IS: 11592 (latest). (p) Vertical bracing members which are connected to the beam shall be analyzed for all the vertical loads which the beam is subjected to along with lateral loads. (q) Shear force in steel columns shall be transferred to the pedestals/ foundations exclusively either through foundations bolts or through shear key arrangement. (r) All underground RCC structures shall be provided with acrylic based polymer modified cementations composite coating system 'Tapecrete' of CICO or equivalent on exterior and interior both faces of walls, raft, slabs etc. Concrete surfaces of sub-structure exposed to earth shall be painted with two coats of bitumen paint of approved make. Water proofing shall be provided as per requirement. (s) Wagon Tippler structure shall be analyzed and designed for the worst load combinations. However, it shall be analyzed for the following load combination also : Combination -1 (i) Hopper full. (ii) Maximum load from railway track. (iii) Earth pressure without surcharge and sub-soil water pressure. (iv) Maximum load from steel column for shed. (v) Maximum load from paddle feeder support.

(vi) Maximum load from coal tray. Combination- 2 (i) Hopper full. (ii) Maximum load from railway track. (iii) Earth pressure with surcharge and sub-soil water pressure. (iv) Maximum load from steel column for shed. (v) Maximum load from paddle feeder support. (vi) Maximum load from coal tray. Combination- 3 (i) Hopper full. (ii) No load from railway track. (iii) Earth pressure with surcharge and sub-soil water pressure. (iv) No load from steel column for shed. (v) DL only from paddle feeder supporting structure. (vi) DL only from coal tray. Wagon Tippler Hopper shall have removable type steel grating cover. The opening size for grating shall be as per mechanical requirement. Bar grid shall be fabricated and made of rolled sections and flats of minimum thickness of 20 mm. (t) Load considered for grating design: Wagon Tippler: 1.0 M high of coal and wheel loader operating with bucket carrying boulders/oversize ROM coal.

Fire and Noise proofing shall be taken care as per applicable TAC and environmental regulations. 4.6 <u>CHIMNEY</u> 4.6.1 (a) General Arrangement A single flue reinforced concrete chimney shall be provided. The flue gas emission point shall be minimum 275 meters above the plant grade level. The chimney shell (wind shield) shall be constructed using slip form shuttering. Flue shall be of M.S. conforming to IS 2062 Gr.A and of hung type with multiple supports and expansion compensator. Openings shall be provided in windshield to accommodate the flue supporting platform beams. The liner shall have resin bonded mineral wool type thermal insulation. The liner portion above rooftop shall be constructed from stainless steel. Internal platforms of structural steel shall be provided for enabling access to various elevations of the stack and to support the steel liners. Platforms with minimum clear width of the platforms as 1.0 M, shall be spaced at a minimum spacing of 40.0 M. The platform beams shall rest on electrometric bearing blocks, supported on concrete shell in the pockets provided for the purpose. Openings in the concrete shell for flue duct entry, access doors at platform levels, access door & truck entry door at the bottom of the chimney, air ventilation etc shall be provided. Hand railing shall be provided all around the external platforms, internal staircase & around the ventilation voids in the internal using min. 32 mm galvanized pipes medium grade of IS:1239/ IS:1161. Spacing of railing posts shall not be more than 2000 mm centre to centre with a minimum height of 1250 mm. The thermally insulated transition duct, supported from bottom, to be connected to horizontal rectangular duct outside the chimney shall be suitably profiled to circular shape up inside the chimney through suitable (nonmetallic) fluoroelastomeric fabric expansion joints. External platforms shall be of RCC with pipe-galvanized handrail. Chimney roof shall be of RCC slab with rainwater drainage system over a grid of structural steel beams. An internal structural steel staircase with grating floor panels and handrails of tubular section shall be provided for full height of the chimney and internal ladder for a small height, over last staircase

landing, to access the chimney roof through a roof access hatch. The inside surface of the chimney shell above roof, horizontal surface of the shell at top, underside of roof slab, inside and outside surfaces of mini-shell, top exposed surface of external platforms etc shall be painted with acid & heat resistant black bituminous paint conforming to IS:158 (not less than four coats). Total dry film shall not be less than 150 micron. The entire outside surface of chimney shell shall be painted with alternate bands of signal red and bright white colours, out of which top 50 M shall be painted with acid & heat resistant polyurethane paint and rest of the outside surface shall be painted with synthetic enamel paint. The other components of the chimney include cast iron caps, liner test ports (for continuous pollution monitoring), liner hatches, grade level slab of RCC with metallic hardener floor finish, a large electrically operated grill type rollup door at grade level and personnel access metallic doors at all floors, roof drain basin, rain water down comer pipe (150 mm dia galvanized pipe), connection to plant drains, louvers with bird screens for ventilation openings and all gaps in the wind shield, galvanized mild steel discrete strake embedments, painting of balance chimney shell surfaces and painting/coating of all structural steel works and miscellaneous ferrous components (for a maintenance free life of at least ten years), all finishing works, electrical power distribution boards, lighting panels, power and control cabling and wiring systems. stair and platforms lighting, socket outlet, lightning protection and grounding system, aviation obstruction lighting, communication system, a rack and pinion elevator, chimney emission monitoring system analyzer panel room and other items of work, though not specifically mentioned but reasonably implied and necessary to complete the job in all respects. (b) Design Requirements (i) Design and construction of various components and systems of the chimney shall be in accordance with relevant Indian Standard and where provisions are not covered in IS, reference shall be made to ACI, BS, CICIND and other international standards. In case of any conflict between this document and the Indian and International Standards, the stipulations of this document shall prevail. Imposed loading for design of all		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 66 of 639
	chimney components shall not be less than 5 KN/Sqm. Additional 25% of liner load shall be taken as impact loading for liner erection. Deflection of girders shall not exceed span/ 325. The min. thickness of web for girders carrying the load of steel flues shall be kept as 12 mm. Seismic forces on the chimney system shall be as per site specific seismic information & IS : 1893-2002. Wind forces on the chimney system shall be determined in accordance with IS: 875 (relevant part). The chimney and its components shall be designed to resist the most onerous forces resulting from all the possible combinations of the various loadings. Design of all chimney components shall be based on working stress method. Design check by the limit state method may be carried out additionally, if so desired by the supplier and/or asked for by the Owner/Owner's Consultant. (ii) Wind Shield The windshield shall be designed for vertical loading, cross wind loading, seismic loading, circumferential wind loading, thermal gradients. The various loading combinations shall be as detailed in IS: 4998 (Part-I) 1992 & the permissible stresses shall be as per IS: 4998 (Part-I), 1975. The windshield shall be analyzed for cases with and without flue liner loads. Forces/ stresses in the wind shield due to eccentricity effects of local (e.g. corbel) loadings, insulations effects, rotation of chimney foundations, construction tolerances and moments of second order shall also be considered. Seismic response of the chimney shall be computed by the response spectrum method. At least, the first five modes of vibrations shall be used for this analysis. The crosswind analysis of the chimney shall be carried out irrespective of the value of the Scruton Number for the chimney and other empirical considerations, which suggest structural immunity to cross wind oscillations. The effect of the openings/ cut-outs in the shell wall shall be duly considered in the design of the windshield. The minimum vertical reinforcement shall be 0.3% of the concrete area. The maximum spacing of the reinforcement bars shall not be more than 250 mm on each face. The minimum circumferential reinforcement shall be 0.2% of the concrete area. The circumferential reinforcement in the top 3	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 67 of 639
	meters of the windshield shall be twice that required from design forces. The maximum spacing of the reinforcement bars shall not be more than 200 mm on each face. The clear cover to shell reinforcement shall be 50 mm & for raft it shall be 75mm. Grade of concrete for chimney shell, and other super structure shall be minimum M 30. The final design will be checked & verified by 'Wind Tunnel Test' and shall be conducted at a reputed institution. Dynamic interference effects due to additional chimney (s) located in the area or in the future expansion shall be determined along with the other topographical features of the local area through model test. (iii) Steel Liners The flue diameter shall be so sized to ensure that the flue gas exit velocity meets the environmental regulation requirements. Two manholes placed diametrically opposite shall also be provided in the flue at all platform levels. The supporting/restraining arrangements of the liners should be such that expansion of the liners longitudinally or circumferentially is not restrained. The liner thickness shall be determined from structural and corrosion potential considerations. However, the minimum thickness of the liner, determined from structural conditions alone shall not be less than 6 mm and the corrosion allowance adopted shall not be less than 2 mm. Therefore, minimum installed thickness of the mild steel liners shall not be less than 8 mm in any case. The portion of liner with stainless steel shall be provided with a grade of steel conforming to the requirements of AISI type 316 L or equivalent and the minimum thickness of the stainless steel liner shall be 8 mm. The bidder shall test all welds in the presence of OWNER to meet the following requirements	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 68 of 639
	a. The bidder shall test at random at least 10% of the butt-weld by radiographic/ultrasonic testing method. b. At least 10% of the fillet welds shall be tested at random by dye penetration tests. c. 10% of the root welds for butt-welding shall be tested at random by dye penetration tests. All tests shall be conducted in the presence of the ENGINEER- IN -CHARGE. If any test fails, the weld shall be cut out, remade and retested to the Engineer's satisfaction. (iv) Miscellaneous systems The other electrical components/systems of the chimney like electrical power supply system, distribution boards, lighting panel/transformers, socket outlets, power & control cabling, cabling raceway systems, normal & emergency lighting system in stair, platform & shell, lighting protection system, grounding system, stack elevator, gas sampling ports for measuring concentration of particulate matters, NO_x & SO_x in the flue gas etc. shall be supplied & installed as per the approved Drawings /Documents. (v) Transition Ducting The duct work profile and the guide vanes shall be so configured and sized to achieve the desired flue gas flow characteristics and to minimize flue gas pressure losses. The duct work and its supporting structures shall be designed for the most onerous of the possible combinations of gravity loading (accounting for ash accumulation), seismic loading, flue gas pressure loading and thermal loading. Like in the case of steel liners, the minimum thickness of duct plates shall not be less than 10 mm in any case from structural condition and corrosion allowance point of view. Clean-out door shall be provided below the each flue for the removal of ash.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 69 of 639
(vi) Stainless steel Liners Stainless steel liners shall be provided up to a minimum height of 5 m above the roof top. (vii) Internal Platforms The interior platforms shall be provided at intermediate levels. Distance between two platforms shall not be more than 40M. The platforms for the steel flue chimney include a grillage of M.S. beams provided for supporting the roof slab, supporting the flue cans, restraint platforms for flues and for access within the shell. Except for the roof slab, all the platforms shall be provided with M.S grating. The platforms shall be designed for self weight vertical/horizontal liner loads and a live load of 5 kN/m². The members of the beams grillage shall be assembled by high precision bolted connections only. The member dimensions shall be made to suit with the as built conditions within the wind shield. The grating shall be fabricated from M.S. flats comprising of 25x5 thick bearing bars spaced at 25mm c/c and 12x5 thick space bar. The grating shall be hot dip galvanized and shall be procured by the contractor. The Hand railing shall be of medium quality 32 mm NB GI pipe conforming to IS 1161 in 3 rows with railing post of 40 mm NB GI pipe spaced at approximately 1300 centre to centre. Hand railing shall be provided for all platforms. Handrails shall be provided with kick plates along the platform edges. Hand rails shall be provided at all staircase ladder access points.

(viii) External Platforms External Platforms, with a clear walking space of not less than 1000 mm, shall also be provided along the chimney height to match the levels of the internal platforms. Suitable provisions shall be made in the shell for enabling access to the external platform for inspection and maintenance of external surface of the chimney. 32 mm dia GI drainage spouts shall be provided in external platforms for drainage of rainwater. (ix) Internal Staircase The staircase shall have a clear passage way width of not less than 900 mm. The risers and treads shall not be more than 150 mm and 225 mm respectively. The staircase shall be supported on steel frame work independent of shell with all members connected with suitable bolted connection only. (x) Soot Hopper Soot Hopper shall be of MS and lined with acid resistant brick work of minimum 75mm thick in acid-resistant mortar. Only shaped acid-resistant bricks shall be used. Laying and joining shall conform to the requirements laid down for acid-resistant brick lining. In addition to the above, insulation layer of minimum thickness 50 mm shall be provided on the external face of the hopper and suitably covered with aluminum foil of minimum thickness of 1 mm. The acid resistant bricks shall conform to Class-I of IS-4806 and the mortar for this brickwork shall conform to IS: 4832 part-I Silica type with potassium silicate liquid binder. Curing of mortar joints with 25% dilute HCl shall be done for a minimum thickness of 1 mm. The acid resistant bricks shall conform to Class-I of IS-4806 and the mortar for this brickwork shall conform to IS: 4832 part-I Silica type with potassium silicate liquid binder. Curing of mortar joints with 25% dilute HCl shall be done for a minimum		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 71 of 639
of three days and as per Manufacturers recommendation after which exposed face shall be thoroughly cleaned. At the bottom of the hopper, a flanged pipe of specified diameter and length shall be welded. Inside of this pipe sleeve shall be coated with sodium silicate. (xi) Foundation and Shell The chimney foundation shall be designed for the most critical combination of forces and moments, resulting from all possible combinations of the various loadings from the chimney system during all stages of constructions. However the following minimum requirement shall be adhere to: - Minimum of depth of top of foundation shall be based on geotechnical report. - Minimum thickness of raft shall neither be less than 0.09 times dimension of raft or 0.3 times the overhang of the foundation beyond shell whichever is greater. - The raft/pile cap shall be designed as rigid member with uniform thickness and no tapering of this shall be allowed. A circular raft/pile cap foundation, preferably annular shall be provided. The effect of water table shall be considered and the foundation shall be checked for overturning for minimum and maximum vertical loads. There should be no uplift under any portion of the foundation for any loading condition. Since chimney is a wind sensitive structure, no allowance shall be made in the load carrying capacity of the bearing strata/piles under wind loading. No allowance shall be made in the stresses for design of foundation in seismic loading. The design conditions for the concrete shell shall be as follows:		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 72 of 639
	a. The concrete shell shall be designed for natural phenomena and loads combinations as specified. Working stress method shall be used for design of shell. The modular ratio shall be calculated as per Annexure –B of IS 456-2000. b. The concrete shell shall support all platforms, which in turn provide support for three independent liners. The beams supporting the platform shall be made to rest on the shell by making a pocket in the shell. Below steel beam and above concrete surface, electrometric bearing pads are to be provided. Individual pads for separate floors are to be designed against temperature load and horizontal shear due to seismic loads. c. The permissible stress in concrete and reinforcement shall be limited to as specified. The stress in concrete at the junction of shell and foundation will be limited to $0.32 F_c$ where F_c is the characteristic compressive strength of weaker concrete between shell and foundation. d. The thickness of RCC shell shall be provided as required by stress calculations, however, the thickness of shell has also to be determined on the basis of wind tunnel model studies and any increase in the thickness of shell or quantities required to be made as per report shall be followed without any extra cost. e. The maximum deflection at the top of the chimney for both static and dynamic cases shall not be more than $H/500$ where H is the total height of the windshield above top of the pile cap. f. The dynamic modulus of elasticity of concrete for various concrete grades shall be taken as lower values in the range of values specified in IS: 4998 (part –I) –1992.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 73 of 639
	g. The static modulus of elasticity of concrete shall be taken as under: $5000 \sqrt{F_{ck}}$ for instantaneous loadings where F_{ck} is the characteristic compressive strength of concrete as per clause 6.2.3 of IS: 456-2000. h. Minimum thickness of the shell shall not be less than 400 mm. Reinforcement in the shell shall be provided as per IS: 4998 (Part – I) – 1975. However, the maximum spacing of reinforcement shall not be more than 250 mm both ways in the shell. (xii) Thermal Insulation The insulation shall be semi-rigid, resin bonded type, in the form of slabs and shall conform to IS: 8183. Blanket type insulation shall not be used. The density of insulation shall not be less than 80 kg/cu.m for resin bonded glass wool insulation and 100 kg/cu.m for resin bonded rock wool. The insulation thickness shall be determined based on the maximum ambient temperature, surface air velocity worked out based on the draught of ventilation air in the annular space between the flue liner and chimney shell, insulation surface emissive of 0.3 and the insulation cold face maximum temperature not exceeding 55° C. The draught of air in the annular space shall be the natural draught created by the heating of air by the flue liner and the air being vented out through the openings in the chimney shell. The increase in the annulus air temperature due to the rising heated air shall be taken into account while calculating the insulation thickness. The insulation thickness shall not be less than 100 mm, in any case, and shall be provided in two layers with the second layer of insulation covering the joints of the first layer. The insulation shall be wrapped on the outer-most surface with galvanized wire mesh.	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 74 of 639
The design of the steel flue shall be as per the requirement of "Task committee report on steel chimney liners, ASCE, New York 1975" and the insulation shall be adequate to ensure the temperature rise in the annular space is less than 5 °C above outside air temperature. 4.6.2 Codes and Standards (a) IS:456-2000 : Code of practice for plain and Reinforced Concrete (b) IS:4998 (Part 1-1992) : Design Criteria for Reinforced Concrete Chimney (Read in-conjunction with IS 4998 Part-I -1975.) (c) IS:875 (Part 1 & 3-1987 : Code of Practice for Wind Load (d) IS:1893,2002 (Part-1 & IS : Criteria for Earthquake Resistant 1893 - 2005 Part-4) Design of Structures. (e) IS:432 (Part-I) : Mild steel and Medium steel Bars (f) IS:1786 : Cold twisted steel bars for Concrete Reinforcement (g) IS:800 : Use of Structural steel in general Building Construction (h) ACI Standards (i) Reference may also be made to ACI: 307 "Specification for design and construction of R.C. Chimney" if some items are not covered in India Codes. 4.6.3 Materials To Be Used Chimney foundation shall be in concrete grade M-25 with minimum cement content of 365 kg/m³. Chimney shell shall be of min. concrete grade M-30 with minimum cement content of 400 Kg/m³. The cement shall be 43 grade

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 75 of 639
OPC. Reinforcement shall be Fe- 500 steel. Only one grade of concrete shall be used throughout the height of the shell. 4.6.4 Loading on the Structure and their Combination (a) Dead Load All permanent loads due to the weight of chimney shell, internal platforms and linings supported on them, flue ducts, staircases, ash hopper, elevators & other accessories, etc. (b) Imposed Loads (i) Imposed load on service platform around Chimney shell, shall be taken as 500 kg/m². Design live load during construction/ erection shall be considered as 1000 kg/m². (ii) Imposed loads from duct joining the Chimney shall be considered. (c) Wind Load The wind loading shall conform to IS: 875 (Part-3): 1987. Dynamic analysis shall be carried out and stability ensured under such condition. The details shall be as per the design basis. Wind parameters shall be considered for calculating design wind speed and pressure shall be as follows: Basic wind speed = 39 m/s (Up to 10m above normal ground level) K1 = 1.07 as per IS: 875 Table-1 K2 = (Table 2, Category-2, Class-C) The final design will be checked and verified, as per wind tunnel test, by a reputed institute and if needed, modifications to be carried out at no extra cost.

(d) Seismic/Earthquake Load Earthquake forces acting on the Chimney and analysis for the same shall be carried out as per IS: 1893 (Part 1 & 4) using the Response Spectrum Method and 5% damping shall be considered for the analysis. The importance factor of 1.75 shall be used. The analysis shall be furnished for a combination of five modes (minimum). (e) Thermal Effect The vertical and circumferential thermal stresses are developed. These stresses induced in the concrete shall not exceed values given in IS: 4998. (i) Flue Gas Data: To be supplied by Boiler manufacturer and got approved from the owner before starting chimney engineering. Recommended Exit gas velocity at top of the Chimney (Total height of the Chimney above grade level shall be 275m) = 25 m/s Parameters : (a) No. of Boilers : One (1) (b) Maximum ambient temperature : 47.8° C. (c) Minimum ambient temperature : 3.9° C. (d) Top of foundation : 2.0m below grade level (min) (e) Allowable Soil Bearing capacity (NETT) (Additional soil investigation to be carried out) : Ref : Soil Report (f) Minimum top internal shell diameter : To suit exit velocity (25m/s)		

CONSULTANT : PROCON ENGINEERS

(g) Minimum bottom internal : Bidder to decide shell Diameter The temperature gradient ΔT across the shell thickness will be calculated as per IS: 4998 (Part-I) – 1975 but subject to a minimum of 30°C. Temperature stresses will be calculated according to the procedures given in ACI-307 and IS: 4998 (Part-1) - 1975. Vertical and circumferential reinforcement shall be provided for temperature stresses. (f) Local Loads The effect of following local loads is considered: (i) Local moment produced by corbels (if any). (ii) Local moment due to platforms. (iii) Local moment due to occurrence of ovaling. (iv) Local moment produced by thermal gradient. (g) Load Combination Various load combinations for calculation of stresses shall be as under: (i) Dead load + Wind load (ii) Dead load + Earthquake forces. (iii) Dead load + Temperature effect. (iv) Dead load + Wind load + Temperature effect. (v) Dead load + Earthquake force + Temperature effect. (vi) Circumferential stresses due to temperature effect.

(vii) Circumferential tensile stresses due to wind inducing ring moment. (viii) Circumferential compressive stress due to wind induced ring moment combined with temperature In Load combinations (i) to (v) above, dead load considered shall be with or without the weight of lining, whichever condition is more critical, shall be adopted for design. Across wind loads shall be combined with co-existing along wind loads. The combined design moment at any section shall be taken as SRSS of the moments due to across wind loads and co-existing along wind loads. 4.6.5 Permissible Stresses For Chimney Shell The stresses in steel reinforcement and concrete shall not exceed the limits as prescribed in clause 7.0 of IS 4998 (Part I)-1975 for various combinations of loads. Except for case of dead load + wind load the maximum permissible stress in concrete in this case shall not exceed 0.32 FC where FC= Characteristic compressive strength of concrete in kg/cm². 4.6.6 Analysis 4.6.6.1 Free Vibration Characteristics of Shaft Calculation of Natural Frequencies and mode shapes shall be carried out. For this purpose the chimney shaft shall be idealized as a vertical cantilever with lumped masses at different nodes. The nodes shall be provided at each platform level. Minimum 5 mode shapes shall be considered. 4.6.6.2 Wind Analysis (a) Along Wind or Static Analysis The basic wind speed V_b at Bhusawal according to IS 875 (Part-3) – 1987 is 39 m/sec. The terrain category is 2 with K₁ = 1.07, K₂ as per		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

table 2 of IS-875 (Part-3) 1987 for class C structure and K3 shall be determined by taking into near by plant. The “gust factor” will be calculated according to the method given in IS-4998 (Part-1) – 1992. Dynamic modulus of Elasticity of concrete as recommended in IS: 4998 (Part-1) 1992 will be used for calculating the natural frequencies of the chimney. C_d will be taken as 0.8 for the concrete shell in general. It will be increased as per table-1 of IS: 4998 over the portion covered with strakes, if required. Along wind response of chimney shall be calculated both by gust factor method in A-5.1 and simplified method in A-4.1 of IS: 4998 part-1, 1992. For design, higher of the along wind loads shall be used. (b) Across Wind The across wind response of the Chimney will be evaluated as per the method given in Section A-4 as well as A-5 of IS: 4998 (Part-I)-1992. C_L will be taken as 0.16 and $S=0.2$. Higher of the two moments shall be considered for design of the Chimney. (c) Ring Moments Due to Wind The circumferential ring moment due to wind will be calculated in accordance with clause 5.4 of IS: 4998 (Part-1) –1992. The wind induced stresses in concrete and steel shall be calculated in accordance with cl no D-2.2.7, D-2.2.8 and D-2.2.9 of IS 4998 (part 1) –1975. 4.6.6.3 Seismic Analysis The Seismic Analysis will be carried out using the response Spectrum Method according to IS: 1893 taking the first 5 modes of vibration into account. Bhusawal is in Zone III of IS 1893. The importance factor of 1.75 and 5% damping shall be considered for the analysis.

4.6.7 Soil Data and Bearing Capacity

All recommendations for soil data are to be considered as per soil report and specifications.

4.6.8 Galvanised Steel Strakes

Based on actual parameters, arrived at after detailed analysis and design, aerodynamic studies shall be carried out. The arrangement of the galvanized steel strakes, if needed, shall be decided, based on these studies.

4.6.9 Outer Platforms

4.6.9.1 Number of outer platforms to be provided are governed as per the requirements of aviation obstruction lights which are required to be provided at various levels so as to meet the requirements of IS: 4998 (latest edition). I.C.A.O. regulations and instructions issued by the Director General of Civil Aviation.

4.6.9.2 The minimum clear width of the platforms shall be 1000 mm and a live load of 500 kg/m² shall be considered for their design.

4.6.9.3 At 270 m level platform, on upper surface 20 mm thick acid resistant tiles conforming to IS: 4457 over water proofing shall be provided, using acid resistant mortar conforming to IS 4832 Part-I. The average thickness of mortar bed shall be 10 mm and it shall be sloping outwards.

4.6.9.4 Hand railing shall be provided all around external platforms, including hood platform using 32 mm G.I. pipes. The spacing of railing posts shall not be more than 2000 mm centre to centre. The height of hand railing shall not be less than 1250 mm. There shall be three handrails at about 450 mm and 850 mm & 1250 mm respectively above platform level.

4.6.9.5 32 mm dia. G.I. drainage spouts shall be provided in platforms for drainage of rain water.

4.6.9.6 150 mm dia MS (galvanized) RWDC pipe conforming to IS 4985 shall be provided to carry rainwater from Hood platform to discharge point at ground level. The number of down take pipe shall be decided as per design.

4.6.10 Enclosure Walls 4.6.10.1 Reinforced concrete walls shall be provided at grade level around staircase and elevator to make the enclosed space airtight and free from ash and dust for the comfort and safety of personnel who are required to go inside the chimney for maintenance and inspection purposes. 4.6.10.2 All materials to be used and design of wall shall be as per relevant I.S. Codes. 4.6.11 Roll-Up Door 4.6.11.1 A rolling steel chain operated door of size 4.0m x 5.0m shall be installed at the base of the chimney shell so that a truck could go inside the chimney in case of emergency. The door shall be installed complete with guides hood hardware, weather baffles combination end locks and wind locks mechanisms and accessories, as required for proper operation and weather protection. The complete details of rolling shutter shall conform to IS: 6248 (latest edition) "Metal Rolling Shutters & Rolling Girds" and to these specifications. 4.6.11.2 The door shall be installed in accordance with the details and the manufacturer's directions. When installed, the door shall be free from warp twist, or distortion and shall be lubricated and adjusted to operate freely and smoothly. 4.6.12 Personnel/ Access Doors 4.6.12.1 A steel personnel door of size 1200 x 2100 shall provide access to the chimney at grade level. 4.6.12.2 Personnel doors of size 1200 x 2100 shall be provided for access to each airtight enclosure at grade level inside the chimney (i.e. enclosures for staircase and elevator) and also in chimney shell at external platforms levels so that civil aviation lights mounted on these platforms could be approached for maintenance and replacement purposes. 4.6.12.3 The doors shall be hinged and provided with positive locking device. The hinges required for connecting the door with door frame shall be either heavy

	weight. Butt Hinges conforming to IS: 1341 (latest) "Steel Butt Hinges & Strap Hinges". The size and number of hinges required for each door shall be decided as per the overall weight of the door and it shall be ensured that door shall remain in its perfect position after installation under service conditions. The minimum size of the hinges shall not be less than 150 mm. 4.6.13 Inspection/ Maintenance Doors 4.6.13.1 Two steel leak proof doors of size 750 x 1000 mm and 750 x 600 mm shall be provided diametrically opposite in each steel liner at all those levels where external platforms are provided. 4.6.13.2 Proper sealing arrangement using asbestos ropes shall be provided in the doors so that there is no leakage of flue gases from steel flues into the annular space between liners and shell through these doors. 4.6.13.3 The doors shall be constructed of two outer sheets not less than 6 mm thick mild steel, reinforced inside with steel stiffeners not more than 600 mm centers. Hollow space between two plates shall be filled up with insulating material such as bonded glass wool/ mineral wool. The doors shall be hinged and shall be provided with locking device such as swivel studs with wing nuts. 4.6.13.4 All surfaces of doors & frames internal as well as external shall be painted with one coat of primer and finish painted with two coats of acid and heat resistant paint. 4.6.14 Hatches 4.6.14.1 A mild steel hatch shall be provided as an access to the hood of the chimney. 4.6.14.2 The hatches shall be constructed of two outer sheets not less than 3 mm thick mild steel, reinforced inside with steel stiffeners not more than 600 mm center. In addition, they shall also be designed to withstand a live load of 300 kg/m². 4.6.14.3 Hatches shall be painted with one coat of primer and finish painted with two coats of acid and heat resistant paint on both sides.

4.6.14.4	Other requirements with regard to design and construction shall be same as for Personal/access doors.	
4.6.14.5	The hatches shall be flat type and shall be operational upwards. They shall be provided with locking arrangements from under side for the hatch for hood.	
4.6.15	Bearings A fully moulded electrometric bearing shall be provided to accommodate thermal movements and to provide a suitable distribution of load between liner support platform beams and the platforms.	
4.6.16	Elevator It is required to accommodate the elevator and staircase within the R.C.C. shell. The travel of the lift shall be upto the last but one platform which shall be about +270 m from 0.0 m level. Detail specification of elevator in chimney structure is mentioned in relevant volume.	
4.6.17	Flue Openings And Duct Work The concrete shell at flue duct entry shall be adequately protected against high temperature by cast able refractory lining and the gap between the shell and duct shall be properly sealed off by asbestos/or any other suitable seal. The openings in the windshield shall be sufficiently reinforced to withstand design loads. Similarly the openings in steel flues shall be properly reinforced for receiving the flue ducts. The R.C.C. shell shall provide support for duct work from the expansion joint to the chimney liner. Exposed ductwork shall be insulated and lagged to protect equipment & prevent injury to personnel. The insulation and wire mesh shall be secured to the lagging by means of pins or prongs welded to the exterior sheet and spaced on intervals not exceeding 450 mm in both the directions. The insulation shall be impaled over the pins or prongs, wire mesh applied over

4.6.18	the insulation and the insulation and mesh shall be held in place with speed clips. Chimney Painting The entire inner surface of shell for full height shall be painted with acid and heat resisting black impregnated bit mastic paint(not less than four coats)to give a paint DFT not less than 150 micron. The entire outside surface of concrete shell shall be painted with alternate bands of signal red & white colour, out of which top 50m shall be painted with acid heat resistant paint and rest of the outside surface, shall be painted with synthetic enamel paint conforming to IS: 5410. All structural steel works inside chimney such as internal platforms, stair case, ladders etc. excluding grating, flue, treads of stair shall be painted with 2 coats of zinc phosphate 2 pack epoxy primer, DFT 50 microns per coat, applied on dry surface cleaned by sand blasting & two coats of two pack Epoxy finish with micaceous iron oxide pigments having DFT 75 microns for each coat. 4.6.19 Specific Construction Requirements 4.6.19.1 Concrete (a) Batching of concrete For controlled concrete, only weigh batching shall be allowed. All concrete ingredients except water shall be batched by weight, using an approved make of weigh batcher. Batching shall be accurate to 1/2 Kg. The batcher shall be tested for accuracy of calibration, first before commencement of work and at least once a fortnight or as directed by the Engineer thereafter. Water shall be batched by weight or by volume measures, as approved by the Engineer. (b) Construction Joints In concreting the chimney shell, one full ring lift shall be completed in a day's pour. Before the formwork for the following pour starts, the

horizontal surface of the Chimney shell shall be chipped, cleaned and washed with water, and when the formwork is complete, the surface shall be cleaned and washed again and covered with 1:2 sand cement slurry before fresh concrete is placed. The horizontal construction joints shall be so arranged and made that they are regular and neat. No vertical joint shall be allowed. No separate payment shall be allowed to the Contractor for forming joints or chipping and cleaning them or cover with slurry prior to concreting. The number of construction joint shall be kept minimum and the spacing should not exceed three (3) meters. The Contractor shall submit to the Engineer, any proposal of providing construction joints to facilitate his work, for the study and approval of the Engineer well in advance. 4.6.19.2 Construction by Slip-Form Method (a) Slip Form The RCC shell of the chimney shall be constructed by using slip form technique. The slip form shall consist of a central ring and tower system. Normally the slip form shall be of radial beam system having two levels of beams, upper and lower level beams, radiating out from the central ring beams to the slip form yokes equally spaced around the circumference of the structural wall. The lower beams shall be made up of hand able standard unit trusses bolted together to make up the required start diameter. To accommodate the wall taper the beams are shortened by removing units as the slide proceeds. The bottom beams shall be further supported by under trussing. A Radial Control gear by which the radius of the concrete shell is controlled shall be attached to the outer ends of the upper and lower beams. This shall be activated automatically or manually linked to the upward movement. The slip form shall preferably have at least two working platforms at lower radial beam level as a main working deck and for access to the hoist cage and at the upper radial beam level as a control point for the radial and batter adjustments at the yoke positions.

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 86 of 639
Access to the shutters and to the concrete surface shall be provided by a circular platform under the lower radial beam for the inner surface and by a three level circular platform supported from the outer yoke post for the outer surface. A special safety net consisting of man carrying mesh with a smaller mesh for materials shall be provided to envelope both the outer platforms and the inner hung platform. Shuttering shall be of standard lap sheets hung from high tensile steel rod walers, threaded through holes drilled in the yoke posts. Steel embedment, chases and openings as per approved drawings shall be fixed or formed in the shell where steel frames are used for openings, they shall be rigid, reassembled and fixed in position. For small openings wooden frames may be used. The spacing of jack rods shall not be more than 1 m or as approved by Engineer. The jack rods shall be left (no retrieval of jack rods is allowed) in concrete and they shall not be figures as reinforcement. Jacks used in Hydraulic Jacking system for slip form shall conform to relevant Indian Standards. An accurate height measure shall be installed. The Contractor shall furnish with his bid complete details and literature of the slip form he proposes to use for the concreting of the shell. The Contractor shall be responsible for the safe operation of the slip form and the safety of the labour, supervisory staff, others during the concreting of the shell by providing hand railing around the platforms, lighting (500 to 1000 lamps with reflectors shall be provided, fixed on scaffold tubes attached to the yokes, 3m to 4.5 m above the working deck and 4.5m to 6 m apart), Intercom arrangement, etc. In case of power failure, battery operated emergency lights on working deck shall be provided.

The Contractor shall also provide all arrangements like hoists, winches, chutes etc. required for the transport of the materials to the working platforms. Ambient temperature and the resultant impact on the concrete temperature at the time of placement shall be taken into account while deciding the speed of the slip form. If slip forming is to be carried out in summer, (May to September) slip-forming speeds up to 250 mm per hour may be used. In case lesser values are contemplated, retarders conforming to relevant Indian Standard Codes and approved by the Engineer shall be used. The Contractor shall ensure that no dragging of concrete with the upward movement of the slip form shall occur. Twisting in the horizontal plane of the slip form assembly and tilting. In the vertical plane of the slip form assembly shall not be allowed. The Contractor shall be responsible for any such occurrences and he shall have to make good for these as per the directions of the Engineer at no extra cost. The minimum compressive strength of concrete immediately below the bottom of the form panel as the slip form proceeds shall under no circumstances be less than 1.5 kg/cm². The Contractor shall submit to the Consultant/Owner within two months after the award of the work, a construction methods statement indicating the following in his statement: (i) Description of equipment for slip forming and for concreting operation. (ii) Structural analysis regarding the adequacy of slip form equipment. (iii) Standby arrangements for equipment. (iv) Requirement of quantity of materials for each stage of construction.

4.6.19.3 Chimney Steel and Metal Work All workmanship shall be of best practice in modern structural shops, and shall conform to the provisions of the IS: 800 and other relevant IS Specifications, unless otherwise specified. 4.6.19.4 Galvanizing All steel including threaded bolts, nuts and washers, unless specified otherwise in contract, shall be hot dip galvanized in accordance with IS Specification or American Society for Testing and Material Specification ASTM 123. All members to be galvanized shall be cleaned thoroughly, to the satisfaction of the Engineer, by the process of pickling. Pickling shall be carried out in an acid bath containing sulphuric or hydrochloric acid of suitable and adjusted concentration and temperature. Pickling process shall be completed by rinsing the members thoroughly in warm water. Galvanizing shall be carried out by hot dip process in a proper and uniformly heated bath and it shall meet all the requirements when tested in accordance with IS: 2633. The zinc coating shall be of uniform thickness with an acceptable minimum value of 610 gms/m² for structural steel. If the galvanizing of any member is damaged, the Engineer shall be shown the extent of damage and if so directed, the galvanizing may have to be redone in the similar manner stated above. 4.6.19.5 Erection Erection of structural members and C.I. Chimney caps shall be done as per requirement of IS: 800. The Contractor shall submit to the Engineer a programme of erection for his approval. All plant, equipment, tools, tackle and any other accessories required for the erection shall be provided by the Contractor. Storing and handling of fabricated materials for erection, setting out of members, providing temporary supports, bracing, fasteners, bolts, nuts etc. shall be the responsibility of the Contractor and shall be taken into account in quoting the rate.

4.6.19.6 Insulation and Packing All packing and insulation material shall be of thickness, diameter and type as per design requirement. The packing and insulating material shall be made of asbestos rope, vermiculite concrete, slag or mineral wool and asbestos mill-boards. (a) Asbestos Rope The diameter of the rope shall be as per drawing. The material shall be of best quality available in the market and shall be purchased after a sample is approved by the Engineer. The rope shall be plain, Grade-I, conforming to IS: 4687-1968. The strand shall be long, well twisted and no torn thread shall stick out. The rope shall be firmly packed so as to prevent gas leakage. (b) Slag or mineral wool The thickness of packed slag wool shall be as shown in the drawing. The packed density of the wool shall be within the range of 175 to 200 Kg/m³ and the co-efficient of thermal conductivity shall be within the range of 0.025 to 0.035 kcal/hr.m.°C at a mean temperature of 150°C. The material shall be well packed in position where possible. IS: 3677 for Rock and Slag wool mats for thermal insulation may be referred for guidance. The co-efficient of thermal conductivity and packed density shall be tested according to IS: 3677 and IS: 3346. (c) Vermiculite Concrete Vermiculite concrete shall be made by mixing exfoliated vermiculite, Portland cement and water. It shall be of Grade-B, having a density of 210 Kg/m³. The vermiculite aggregate size shall be maximum 6 mm. The mix shall be 1 cement and 8 vermiculite by volume. (d) Asbestos Mill Board Asbestos mill board shall be of thickness as per design requirement. It shall be of best quality of standard make available in the market and samples shall be submitted to the Engineer for approval. It shall be

plain, dense and homogeneous texture, without cracks, flaw and any other manufacturing defect. It shall be laid directly onto the concrete bed after removing any loose material or any aggregate. The concrete shall be prepared without mortar so that the board can have a good seating. 4.6.19.7 Information to be Submitted (a) After Award The following information and data including samples where necessary shall be submitted by the Contractor, progressively during the execution of the Contract. (b) Design Mix Design mix as per details of this specification giving proportions of ingredients, sources of aggregates and cement along with accompanying test results of trial mixes as per relevant IS Specifications shall be submitted to the Engineer, for his approval, before it can be used on the work. (c) Detail Drawings Following items shall be provided by the Contractor, which are to be approved by the Owner. (i) Detail drawings and designs of formwork including scaffolding to be used. If slip form method of construction is adopted, then detail drawings showing all the arrangements for slip form technique including methods for reducing internal diameter and providing required slopes on outer diameter. (ii) Detail drawings and bar bending schedules for concrete components. (iii) Shop drawings for steel and metal work, including inserts etc. (iv) Detail drawings for templates and temporary supports for

embedment. 4.7 <u>NATURAL DRAUGHT COOLING TOWER</u> 4.7.1 Intent of Specification A single Natural Draught Cooling Tower (NDCT) with dedicated cooling water basin, outlet channel, sludge removal sump and valve pit, etc. shall be provided for the 1 x 660 MW unit. This specification covers the requirements of design and construction of natural draught reinforced concrete hyperbolic cooling tower. This section of bidding document deals with the technical specifications for the design and preparation of detailed working drawings and getting them approved by the owner and civil construction works. The provisions of these technical specifications are general in nature and cover broad aspects. Technical specifications outline the minimum requirements. However, it would be the absolute responsibility of the contractor to collect, interpret, analyze all necessary information/data for the successful design and construction of the cooling tower. Structural safety and successful operation of the tower shall be the total responsibility of the contractor notwithstanding the approval of the owner. 4.7.2 Scope of Work The scope of this work shall consist of, but not limited to, the design and construction of reinforced concrete double curvature hyperbolic shell, raker columns, ring beams, foundations including piling work if necessary, cold water basin with partition walls, hot water ducts, drain sumps, external drain chamber with associated pipe work, cold water channels with slide gates and removable screens as specified elsewhere, hoists & monorails, primary and secondary hot water distribution troughs, fill support systems including columns & beams, drift eliminators (if required), testing of cold water basin for water tightness, external stairs, cage ladders, handling facilities at tower top with walkway platform and CW channel, platforms, walkways as specified or required for operation and maintenance, access doors, MS handrails, steel fittings, fixtures, inserts including fabrication, galvanizing and erection of associated steel work and other chemicals on the completed

structures etc. all complete as per functional requirements and as per directions of Owner. The scope of work under this specification shall include providing thermal design, structural engineering design and drawings, all labour, supervision, materials, shuttering and scaffolding, construction equipments including tower cranes, hoists, batching plants etc, tools and plant, supply and transportation of all incidental items not shown or specified but reasonably implied for successful completion of the work. The nature of the work shall generally involve foundation/piling, excavation, dewatering, shoring and strutting, backfilling around underground structures and plinth filling, sand filling, disposal of surplus soil outside plant boundary, concreting of grade as specified, formwork including automatic climb form, laser beam instruments, fabrication, galvanizing and erection of steel structures and inserts, finishing anchor bolts, RCC sump/duct, laying and testing of hot water pipe line, water proofing, providing PVC water stops and joint filters, drainage and other ancillary items connected with cooling towers as approved. The surface protection that would include all inner face of hyperbolic shell, raker column faces, inner faces of cold water basin, fill support structures, hot water distribution ducts & channels, cold water channels etc. This list is indicative and the scope shall also include the preparation and supply of all working drawings required for this work. 4.7.3 Cooling Tower Structure 4.7.3.1 The minimum clear distance between the two NDCT's shall be 0.5 times the base diameters as per BS 4485 (not applicable). 4.7.3.2 The cooling tower shell shall be hyperbolic paraboloid. The shell of the cooling tower shall be supported by a set of diagonal columns, which shall be supported by piles and a peripheral pile cap or open foundation as the case may be. 4.7.3.3 Hot water inlet shall be through a pair of MS pipes separately for each compartment of basin, suitably protected. The pipes shall have butterfly valves and also required numbers of thermowell with RTD, pressure and flow measuring instruments. Blow-down shall be tapped from the HW piping.

4.7.3.4 4.7.3.5 4.7.3.6 4.7.3.7 4.7.3.8 4.7.3.9 4.7.3.10 4.7.3.11 4.7.3.12	Separate piping for hot water inlet from ACW circuit into the NDCT shall be provided by the side of hot water inlet piping for CCW circuit. The ACW piping shall also have butterfly valves. Painting and protection of hot water piping shall be done as per relevant IS codes. By pass arrangement alongwith isolation valve for approximately 20% of total circulating water flow shall be provided from main Hot water C.W.Pipeline @ G.L to cold water channel including horizontal base plate at bottom of cold water channel. By pass arrangement alongwith isolation valve for 50% water flow from ACW pipe line to cold water basin shall be provided for each compartment of cold water basin. To control the hydraulic forces at the change of alignment of the hot water (HW) inlet pipe, a RCC thrust block shall be provided at ground level near the cooling tower along with suitable other supports for pipes above ground level including structural steel works. The hot water distribution shall be by RCC main and secondary ducts which carry the lateral distribution pipes fitted with nozzles for uniform distribution through the fill. The concrete main distribution ducts shall be accessible and are to be provided with non-corroding, pressure-sealed inspection openings. Cleaning and sludge-removal openings are to be included on each run at the end of the duct in the main distributor. The HW distribution arrangement shall be supported independent of the shell by internal columns supported on the floor of the cold water basin. The hot water main and secondary distribution ducts shall be designed for minimum 120% of design flow indicated in the specification with at least 150 mm free board. The profile of the drift eliminators is to be selected to ensure a maximum degree of precipitation and a minimum of air pressure loss. Access to the hot water distribution platform and further access to the shell top should be provided with two Galvanized Steel cage ladders.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

4.7.3.13 The material used for access facilities including steel components for steps, ladders, platforms, catwalks, railings, doors, base frames, mountings, etc must be galvanized and resistant to corrosion. 4.7.3.14 All bolted connections and attachments to concrete must be made out of suitable stainless steel material. 4.7.4 The basin shall be designed with a free board of at least 0.3 m above maximum water level. The cooling tower basin shall be divided into two equal parts by watertight RCC partition for the cleaning and maintenance of one half while the other half is in service. Arrangements for water drainage shall also be provided. Suitable overflow arrangement (Vent of minimum width 600 mm), to maintain the maximum water level at 300 mm below the sill in both the compartments, shall be provided. Minimum 500 mm dead storage shall be considered above invert level of the basin i.e. minimum water level in the basin shall be at least 500 mm above invert level of basin bottom slab. The basin holding capacity shall be minimum 16 minutes between maximum & minimum water level. The bottom of the basin shall be provided with minimum slope of 1:500 towards periphery. The basin shall be provided with the peripheral drain of width 0.50 m with 1:400 slope towards drain sump. The size of drain sump shall not be less than 1.0 m x 1.0 m with required depth. 4.7.5 The cold water from the basin shall be taken out through an opening connected to the main CW closed Channel/duct, which in turn leads to a fore-bay of the CW sump. The cold water from the basin shall flow by gravity to open approach channel leading to the fore-bay. The cold water channel shall be provided with a slide gate. Suitable handling arrangements with a monorail and a chain-operated hoist with a travelling trolley shall be provided for handling of the slide gate. In front of the outlet structure, provision shall be made for de-sludging facilities so that sediments can be withdrawn from the basin. In order to clean the cooling tower basin, sludge drain are to be provided along its perimeter with suitable sludge sump of minimum size 1.0 M x 1.0 M, from where the sludge will be taken out to sludge box/chamber outside the basin for pumping out. The size of Box		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 96 of 639
	chamber out side shall not be less than 4.5 m x 2.0 m and shall be provided with suitable sump pits for sludge pumps. The chamber shall be provided with man hole cover not less than size 0.50 m x 0.90 m. Two number sluice gates of suitable size for 300 mm dia opening shall also be provided in the chamber to control the draining from the basin with hand wheel to be operated from the top. Two submersible sludge pumps shall be provided for the removal of sludge from the NDCT to ETP drain. All the drains shall be terminated in the ETP. Out side drain chamber bottom level shall be at least 1.00 m below the bottom level of the inside drain sump bottom level. The necessary drainage opening of at least 300 mm dia shall be provided on both the sides of partition wall. The bottom of the basin shall be provided with at least 1.0 m depression for the area not less than 15.0 m x15.0 m on each side of partition wall of the basin before the basin opening leading to cold water channel. Paving of minimum 2.0 m width with 150 mm thick RCC slab of M20 grade all around the cooling tower with gutter leading to drain chamber shall be provided. 4.7.6 Fill Supporting Arrangement The supporting of the fill is to be achieved by a series of RCC columns arranged in suitable grid spacing and RCC beams in orthogonal directions. Loads from fills, hot water ducts, pipes including water load, wall blocks, etc. shall be considered for column-beam design. To take care of horizontal loads due to seismic and thrust from hot water header, a suitable system of vertical bracings is to be designed and provided in either direction. 4.7.7 Concrete, which is impermeable to water, is to be used for all components, including reinforced concrete components. The composition of the concrete and the cement are to be chosen depending on the chemical analysis of the cooling tower water/cooling tower make-up water.

4.7.8 Aviation Obstruction Lights In accordance with ICAO regulations, aviation warning lights are to be installed on top of NDCT along its perimeter. Operating and reserve aviation warning lights are to be positioned next to each other. They are to be connected to completely separate power circuits and to be monitored by relays. Suitable photo-electric sensors, alarm and annunciation systems, etc. shall also be provided along with the required auxiliaries for completing the system in all respects. 4.7.9 Earthing and Lightning Protection A suitable system of earthing and lightning protection, including required hook-up with the plant grid/system, etc. shall be provided completely. All the electrical requirements, including cables shall be as per plant electrical specifications/ Drawings. 4.7.10 Guaranteed Particulars The contractor shall guarantee the following parameters: 4.7.10.1 Cold water temperature At the design point of the cooling tower, the cold water temperature guaranteed by the Contractor in accordance with the performance curve (cooling tower characteristic curve) shall be achieved. The fundamental parameter for the design value of the cold water temperature during acceptance measurement shall be that measured at the cooling tower basin outlet. 4.7.10.2 Drift losses At the design point, the total water mass flow entrained in the air shall not exceed 0.01% of the mass of water circulating. In case the drift eliminator packing is to be used for achieving the specified drift loss then, the same shall be provided by the bidder. If drift eliminators are provided then the drift shall be measured at the top of the drift eliminators.

4.7.17 It should be noted that nothing extra whatsoever on account of variation between soil data provided by MSPGCL & that found by detailed geotechnical investigation to be carried out by bidder shall be payable. General Design Criteria 4.7.17.1 Design data: (a) Quantity : One (1) (b) Type of tower : Counter flow with PVC film fill (c) Design inlet wet bulb : 27°C Temperature (d) Relative humidity : 40% 4.7.17.2 Design Consideration The cooling tower shall be designed for continuous operation. The hot water distribution system shall be designed to ensure equal distribution of heat load and flow all over the fill area. Wood/timber material shall not be used in any part of the cooling tower. 4.7.17.3 Loading The following loads shall be considered for the design of cooling towers: (a) Dead loads (b) Wind loads (c) Earthquake forces (d) Loads due to temperature and shrinkage effects. Temperature effects due to solar radiation shall also be considered.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 101 of 639
(e) Construction load (f) Foundation settlement etc. (g) Any other load likely to come on cooling tower.		
4.7.17.4 Dead Load For assessing the self weight of the structure, the specific weight of the concrete shall be taken as 2500 kg/m³. All other dead loads shall be assessed in accordance with relevant codal provision. Dead load shall include the self weight of structure, weight of fill material, weight due to plugging/chocking of fills, weight of falling water, weight of hot water pipe, weight of water in hot water channel and distribution system including the self weight of channel and distribution system, weight of drift eliminators etc. Secondary stresses, if any, due to permanent fixtures on the shell shall also be considered. In addition, live load on the supporting structure due to maintenance activities related to fills/ducts/distribution system shall be considered. 4.7.17.5 Wind Pressure The wind pressure on the towers shall be assessed on theoretical basis as well as with the help of AERO elastic Model tests in a wind tunnel of turbulent boundary layer as per stipulations of BS 4485:1996 (Part 4). All the theoretical methods outlined hereunder for estimating wind load on cooling tower shell shall be valid only if the towers spaced at clear distance of greater than 0.5 times the base diameter at the finished graded ground level. The theoretical method outlined herein forms the basis only for assessing lowest limit of wind forces and shell structure interaction. For conducting model tests, bidders should survey the whole terrain and make their own assessment of likely critical wind forces & wind structure interaction. It would be the responsibility of the bidder to collect necessary meteorological data duly vetted from the recognized govt. agencies/institutions. After collection of necessary meteorological data, most critical wind speed, wind pressure distribution and other necessary parameter shall		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 102 of 639
be determined by the bidder and get the same vetted by the above agency/ appropriate agency(s). Then with the help of physical model tests in a wind tunnel, offering appropriate aerodynamic similitude, the bidder shall obtain the most critical forces, stresses etc. with cooling tower at various levels and locations. Such model test shall also include all adjacent topographical features, buildings and other structures which are likely to influence the wind load pattern on the tower significantly. The model test shall be carried out in a well reputed institute/testing laboratory after obtaining prior approval from the Owner. The testing agency selected by the bidder shall have requisite experience and should have successfully carried out tests in the past for at least one cooling tower of similar capacity. The model tests shall be duly witnessed and approved by the Owner/consultant. The model test results shall be made available before final approval of the design. The complete cooling tower shall be designed for all possible wind directions and on the basis of worst load conditions as obtained from Model test and theoretical methods. Under the theoretical method, the circumferential net wind pressure distribution and wind pressure coefficient (p_1) for the tower shell (without meridional ribs) shall be obtained from the "Criteria for structural design of Reinforced concrete Natural Draught Cooling Towers IS: 11504-1985. The above circumferential wind pressure coefficient (p_1) shall be increased by multiplying it by 1.43 to account for turbulence in the incident wind and load intensification due to turbulence induced by the adjacent cooling tower or the other structures of significant dimensions. Therefore, the actual design circumferential net wind pressure coefficient (p) shall be computed as $p=1.43(p_1)$, where (p_1) is the wind pressure coefficient as per IS: 11504-1985. Enhancement factor 1.43 is considered to take the interference effect of adjacent structures of significant dimensions into account. 10% increment shall be considered for imperfection in construction as per IS: 11504. This factor shall be increased further by 10% during foundation design in absence of model test results. If the model is for C/L of shell, wind load shall be appropriately augmented to cater the increase in diameter of the shell (O.D.). This design net pressure coefficient (p) and the distribution along the circumference of tower shall be used at all heights of the tower. The above design net pressure coefficient (p) shall include the effect of internal suction.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 103 of 639
In order to compute the quasi-static design wind pressure at a given height along the circumference of the tower, the net design pressure coefficient (p) shall be multiplied by the wind pressure acting at that height [P(z)]. For details, reference shall be made to “Criteria for Wind Resistant Design of Structures and Equipments” and as given below. The wind pressure at a given height [P(z)] shall be computed as per the stipulations of IS: 875 (Part 3)-1987. For computing the design wind pressure at a given height, the basic wind speed (Vb) shall be taken as Vb=39 m/sec at 10.0 meters height above mean ground level. For computing design wind speed (Vz) at a height z, the risk co-efficient K1=1.06 shall be considered. For coefficient K2, Terrain category 2 as per table 2 of IS: 875 (Part-3) – 1987 shall be considered. Coefficient K3 shall be determined by taking into account nearby plant site and other features of the station & topography. The wind direction for design purposes shall be the one which would induce the worst load conditions. However, coefficient K3 shall not be less than one under any circumstances. The wind pressure at a given height shall be computed theoretically in accordance to the IS Codal position given as under : $P_z = 0.6 V_z^2 \text{ N/m}^2$ The bidder shall also compute the wind pressure (Pz) along the wind direction by Gust Factor (GF) or Gust effective factor method (GEF). Method for estimating the wind load on the tower and other elements, shall be based on IS: 875 (Part-3)-1987. While calculating the gust factor, the term “b” shall be taken as the diameter of the throat in Fig. 10 of IS: 875 (Part-3)-1987. Design of the tower shall satisfy quasi-static method & GEF method. Dynamic effects on the tower due to wind action shall also be investigated to ascertain the wind induced oscillation such as ovaling and excitation along and across the wind direction. Bidder shall carry out detailed analysis for the tower and consider the worst combination of static & dynamic effects. In case the bidder proposes to adopt aerodynamic rough surface such as provision of meridional ribs in the cooling tower shell, the pressure coefficients as given in the VGB-BTR KUHLTUMRE GERMAN SPECIFICATIONS (latest) (structural design of cooling towers) shall be permitted. The provisions of BTR may be adopted for choosing the value of circumferential wind pressure coefficient (p1) only. The wind pressure coefficient (p1), as obtained from BTR after accounting for internal suction		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 104 of 639
shall be multiplied by a factor 1.43 to arrive at the net design pressure coefficient (p). The bidder shall furnish authorized English Translation of VGB-BTR KUHLTURME GERMAN SPECIFICATIONS (latest) for the review of the Owner. All other stipulations as specified in these specifications shall be met with. Entire analysis and designs adopted shall be fully supported with authenticated literatures/documents along with relevant references where the same has been successfully implemented. 4.7.17.6 Earthquake Forces The seismic analysis shall be carried out in accordance with IS:1893 (all latest parts) by modal analysis for the hyperbolic cooling towers or any other method as approved by the Owner. The earthquake analysis of the shell and its support columns including the foundations shall be carried out by response spectrum method. For the fill supporting structures (RCC frames) response spectrum method is permitted. The modulus of elasticity for concrete shall be obtained from IS: 456-2000 Clause 6.2.3.1 with an Age Factor of 1.0. All the analysis shall be carried out as per the theory of elasticity. Entire analysis and designs adopted shall be fully supported with authenticated literatures/documents along with relevant reference where the same has been successfully implemented. 4.7.17.7 Loads due to temperature effects Stresses due to temperature effects: The cooling tower shell shall be designed for stress due to axi-symmetric temperature distribution corresponding to external ambient temperature variation from 12°C to 50°C. However, the detailed analysis of actual thermal gradient by considering temperatures inside the tower and external ambient temperatures shall be carried out furnishing detailed references and justification for the same. The shell shall also be checked for thermal stresses arising due to partial operation of the tower in case the operational philosophy so demands. The analysis for the stresses resulting from non-axi-symmetric temperature loading shall be carried out. In such non-symmetric temperature loading, the		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 105 of 639
calculation shall be based upon the operating specification. Besides, the shell shall also be designed for one sided solar radiation effect. Nevertheless an effective temperature difference of at least 25°C across the shell thickness constant over the height and follow a sine functions along half the circumference shall be considered. Entire analysis and designs adopted shall be fully supported with authenticated literatures/documents along with relevant references where the same has been successfully implemented. 4.7.17.8 Constructional Loadings The method of construction and the type of formwork to be used shall be decided by the bidder in advance and should be enclosed in the bids submitted. Construction loadings that may occur during execution of work shall be considered in the design of the cooling tower structure. Factors causing temporary loading may include the following depending upon the method of construction. (a) Barrowing of concrete (b) Scaffolding and formwork (c) Loads produced by anchoring devices of climbing scaffolds. (d) Hoist fixings (e) Storage of materials on scaffolding (f) Temporary access (g) Tower crane fixings (h) Works temporarily omitted for access purposes. Any other load such as foundation settlement, etc. All loads likely to act on cooling tower but not specified herein shall also be considered for the design of cooling tower structures.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 106 of 639
In case different degrees of subsoil stiffness exist, effect of the same shall be taken into account. In such a case, for computing settlements, load distributing capacity of the shell may be considered. Differential settlement between adjacent sections of foundation shall be considered under most unfavourable load combination. 4.7.18 Load Combinations Following minimum load combinations shall be considered for the design of cooling towers structures. (a) DL + WL + SL (b) DL + Se L (c) DL + TL (d) DL + WL + TL + SL (e) DL + Se L + TL + SL (f) 1.0 DL + 1.5 WL (g) 0.9 DL + 1.5 WL (h) 0.9 DL - 1.5 WL Where DL = Dead Load WL = Wind Load SL = Settlement Load Se L = Seismic Load TL = Thermal Load		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 107 of 639
In addition to above, construction loads shall be duly accounted for. Under TL various types of thermal loads, as described above, shall be considered separately. Besides above load combination, other load combinations as per relevant IS codes shall also be followed. 4.7.19 Permissible Stresses For load combination (a) to (e), the stresses in concrete and reinforcement shall be designed as per working stress method of IS: 456 with maximum crack width limited to 0.3mm. For the load case (f) to (h), the shell of cooling towers shall be checked by limit state method as per IS: 456. The stress in the reinforcement steel shall not exceed 87% of the specific characteristic strength of reinforcement steel and the compressive stress in the concrete shall not exceed 45% of the specified 28 days cube strength of the concrete as per IS: 456. In the design of the cooling tower shell, column, pile caps, pedestals, ring beams etc, no increase in the strength with the age of the concrete shall be permitted. Permissible stress for steel structures shall be as per IS: 800 (latest) based on working stresses. 4.7.19.1 The cooling tower is more a wind predominant structure, increase in permissible stresses in structure under working stress design & increase in safe bearing capacity for design of foundation under wind load combination shall not be permitted. 4.7.20 Tower Design Consideration 4.7.20.1 General The complete cooling tower, including the shell, columns, ring beam and foundation, shall be structurally analyzed using a proven finite element modeling technique or an approved alternative method including validation of software used for analysis. For elastic analysis, concrete may be assumed to be uncracked, homogenous and isotropic. The design geometric profile,		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 108 of 639
thickness variation and support conditions of shell shall be considered in the structural analysis. Regardless of analysis method adopted, the equilibrium checks of internal forces and external loads shall be performed. Analysis based on a recognized bending theory of the elastic shells shall be adopted for the design of the tower and supporting structures. Geometric imperfections, if exceed the permissible limit, then the analysis of shell shall take into account of such imperfections and resubmitted for Owner"s approval. Boundary conditions shall be realistic and based on actual configuration. The magnitude of the calculated displacements should be within limits of the applied theory. A detailed dynamic analysis shall be carried out for complete tower for seismic forces by response spectrum method. Cooling tower shall also be designed for cross wind oscillations (wind induced vibration) if the fundamental natural frequency of the tower is less than or equal to 1 Hz. Frequency calculation for free vibration analysis shall also be furnished by bidder during detailed engineering. 4.7.20.2 Size and Shape The base diameter, air intake opening height, tower height and throat diameter shall be determined by thermal design consideration by the bidder and submitted to Owner for approval. As the range of possible hyperbolic shell shapes is infinite, the same shall generally conform to the following major proportions, which have been extensively adopted in cooling tower constructions. $H/D = 1.2 \text{ to } 1.55$ Where H is the total tower height above basin sill level. $H_b/H = 0.75 \text{ to } 0.85$		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 109 of 639
Hb is the vertical distance from the throat to basin sill level and 'D' is the base diameter at basin sill level. However, other proven profiles may be permitted subject to approval from the Owner. Bidders shall submit along with the offer complete details of the profile, in case the profile is not within the limits stated above, and the names of the sites where such shell profiles have been successfully constructed. Notwithstanding what is stated above, the Owner reserves the right to accept /reject the shell profile. 4.7.20.3 Tower Shell Boundary Conditions (A) Shell Analysis and Design The following boundary conditions shall be assumed for the design of cooling tower shell: (a) At Upper Edge The top edge of the shell shall be gradually thickened to form a ring beam to guard against possible instability of the top of the shell due to high velocity wind gusts. Top edge shall be considered as a free edge in the analysis. (b) At Lower Edge The lower edge of the shell shall be thickened to form a lower ring beam. The thickness transition from shell to lower ring beam shall be smooth and shall be considered as an integral part of the shell. The lower boundary of the shell shall be considered as elastically supported by discrete columns. The influence of both support structure flexibility and foundation settlement shall be considered in the analysis and design of cooling tower shell. The shell analysis should include following information at 10° plan angle and of not more than 0.05 of the shell height.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 110 of 639
	(i) Meridional and circumferential direct stress resultants and the tangential shear stress resultants. (ii) Meridional and circumferential bending moments. (iii) Displacements normal to the shell mid-surface. (B) Buckling of Tower Shells Critical dynamic pressure (wind pressure) at buckling shall be calculated from BS: 4485 Part-4:1996. Buckling of Cooling Tower shell shall be checked as per Finite Element Analysis using software such as NISA 2, Ansys etc. The factor of safety for snap through buckling shall be more than 5. This requires non linear analysis including simulation of opening in the model. Alternatively bifurcation buckling factor can be calculated using linear Eigen value analysis with modulus of elasticity $E=0.8E_c$, to account for cracked section, with factor of safety more than 7. Besides above, a buckling analysis with wind forces should be made using the theoretical tower geometry and boundary conditions, including the influence of dead weight, by the method of buckling stress state (BSS) approach in accordance with the provisions of VGB/ BS 4485. The buckling safety factor shall be at least 5.0 for load combinations of dead load + wind load. When imperfections in the shell geometry are larger than specified tolerances, the analysis should be rechecked to account for such imperfections and ensure that the desired buckling capacity remains. (C) Opening in Shells Opening through the shells should be avoided as far as possible. They should be of smallest required dimensions and shall be shaped such that stress concentration is minimized at the boundary of the opening.

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 111 of 639
Should thickening of the edges be necessary, it shall be smoothly tempered back to the shell thickness. Openings shall be provided with additional edge reinforcement of a minimum cross sectional area at each edge equal to 75% of the reinforcement intercepted by the openings in the direction parallel to the edges. In addition, diagonal reinforcement shall be provided at each corner as close as possible. The total cross-sectional area in cm² of this reinforcement shall be 0.5d, at each corner where d is the shell thickness in cm. No horizontal thrust due to the inlet piping shall be transmitted to the shell. (D) Minimum Thickness of Shell The minimum thickness of the shell excluding ribs shall not be less than 300 mm. (E) Minimum Reinforcement in Shell Spacing and Placement The reinforcement used shall be cold worked steel high strength deformed bars of grade Fe 415/500 conforming to IS: 1786 – latest. All reinforcement steel shall be corrosion resistant steel/HCRM. The minimum reinforcement to be provided shall be as follows: Top one third portion of shell: 0.4% of concrete cross sectional area along circumferential direction and 0.35% of concrete cross sectional area along meridional direction. Remaining two-third portion: 0.35% of concrete cross sectional area of shell in both meridional and circumferential directions. Minimum bar diameter shall be 10 mm in transverse direction and 12 mm in meridional direction. Spacing of reinforcing bars should not exceed 200 mm in circumferential direction and 250 mm in meridional direction.

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 112 of 639
	The two layers of reinforcing meshes shall be adequately joined by S-hook over the total shell surface. At least two S-hooks in each square metre area of shell surface shall be provided. The hooks shall be of minimum 8 mm diameter bars. The concrete cover shall be 50 mm minimum. The relevant provisions of IS: 2210 – Criteria for the design of reinforced concrete shell structures and folded plates and IS: 2204 – Code of Practice for construction of reinforced concrete shell roof shall also be deemed to be applicable. All other design criteria for the cooling tower shell which are not specified above shall be in accordance with BS: 4485 Part 4 and BTR. (F) Provision of meridional ribs in Cooling Tower Shell Meridional ribs in the cooling tower shell may be provided subject to the following conditions: (a) Minimum thickness of shell excluding ribs shall not be less than 300 mm. (b) Co-efficients for pressure distribution around the cooling tower circumference including suction may be taken as per VGB-BTR KUHLTURMEN SPECIFICATIONS (latest). All other factors including load intensification factors shall be as specified else where in these specifications. (c) Shell buckling and strength shall be checked as per clause-III B above without considering the effect of ribs. (d) All other stipulations as specified in these specifications shall be met with. (e) Bidder shall furnish an authorized English translation of the VGB-BTR KUHLTURME GERMAN SPECIFICATIONS (Latest) during detailed engineering stage.

4.7.20.4 Raker Columns Inclination of the column shall closely match the meridional slope at the shell so that the load transfer to foundation takes place through predominantly axial force in columns. Raker columns shall be designed for the most critical forces transferred to an individual rake column from superstructure considering various load combinations as specified in this document. For selecting effective length of the raker columns, following restraints shall be considered: (a) In case columns restrained at both the ends, the effective length shall be 0.8 and 0.6 times the length of the column radially and tangentially respectively. (b) In case columns are restrained at one end only, the effective length of columns shall be 0.9 and 0.7 times the length of columns radially and tangentially respectively. (c) The columns shall be designed based on working stress method except for the forces from DL + 1.5 WL which shall be designed as per limit state of strength method of IS: 456. 4.7.20.5 Crack Width Control Under working stress method the maximum crack width of tower shell, lintels, raker columns and fill support structure shall be controlled up to 0.3 mm on basis of formulas as per IS:456 and relevant British codes. Fill support structures and Drift Eliminators shall be designed as per the load combinations specified in this document. Appropriate Live Loads and imposed loads shall also be considered in addition. The design shall confirm to limit state method as per IS: 456. For fill support structure, the design shall be done considering the weight of fills, falling water, plugging/scaling load and the live load due to the maintenance activities. 4.7.20.6 Prestressed Concrete Members: Design construction and workmanship of prestressed concrete, members shall be in accordance with IS: 1343 (Latest revision). Steel wire for		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 114 of 639
prestressing shall conform to IS: 1785 (Part 1) (latest edition) or IS: 6003 (latest edition). Crack width control shall be limited to 0.1 mm. Particular attention shall be paid to achieve an effective bond of the wires in pretensioned concrete units. For this purpose, indented wire shall be used. Wires shall be corrosion resistant or should have coating system fit for seawater duty condition. 4.7.20.7 Liquid Retaining Structures:- (a) The cold water basin including sludge pits, cold water channels, shall be designed as per IS: 456 (latest) with crack width control of 0.1 mm for outer face of the wall and inside face of the wall shall be designed as per IS 3370. The structures shall be designed for the following conditions: (i) Water filled inside up to maximum level and no earth outside. (ii) Earth pressure with surcharge load of 2.5 t/m², as applicable, and with/without ground water table at 1.0 m below finished ground level outside and no water inside. (b) The basin and associated structures shall be checked against uplift for basin empty condition. Stability shall be checked during construction stage as well as maintenance stage. The factor of safety shall be as per IS: 3370. (c) Loads during construction, erection and maintenance stage shall also be considered. (d) Temperature fluctuations from operation shall be obtained from the design data. Hot water temperature inside and cold air temperature outside shall be considered. (e) Basin floor slab shall be designed to rest on piles or raft/mat foundation including fill-pack support structures. The stiffness of the subsoil shall be taken into account. The founding level of the raft/mat shall be either on virgin ground level or shall be placed at higher level		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 115 of 639
only after scooping out filled up soil up to virgin ground and then filling back with well compacted sand (80% of relative density) up to the founding level of the raft/mat. The bidder shall ascertain the safe bearing capacity of the stratum at the founding level and may adopt the same subject to Owner's approval. (f) Minimum thickness of basin slab shall be 300 mm with minimum reinforcement 0.35% of gross sectional area in both the directions. Reinforcement shall be placed in two layers, top and bottom surface. The effect of provision of flap valves/pressure release valves shall not be considered in the design of CW basin. In the space underneath the basin floor slab a layer of at least 100 mm thick PCC of mix 1:3:6 shall be provided. (g) All reinforcements used shall be corrosion resistant steel/HCRM. 4.7.20.8 Water Distribution System The structural design of the water distribution system shall consider the worst combination of following loads: (a) Self weight, other imposed loads and live load. (b) Hydraulic pressures during normal operations including pressure surges. (c) Hydraulic pressure due to mal-operation of the tower or supply pumps. The water distribution system shall be provided with adequate pressure surge relief facilities to prevent pressure loading in excess of values used in the design. If such facilities are not provided, a further increase in loading shall be considered in the design. For the structural design, the pressure level to be considered shall not be less than 1.5 times the design pressure. The design of water distribution system and its supports shall be capable of accommodating all thermal stresses and movements due to changes in inlet water temperature and ambient temperature.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 116 of 639
The possibility of vibrations being imposed on the distribution system shall be investigated in the design. Seismic loading on the water distribution system shall also be taken into account. The design shall be carried out based on uncracked section as per IS: 3370 under normal operating conditions. Strength check for worst loading including malfunctioning shall be carried out with stress limitations as per IS: 3370. The construction shall be completely water tight without the use of fillets, sealing compounds etc. The method of construction shall be such so as to avoid excessive rise in temperature of concrete due to release of heat of hydration. 4.7.20.9 Platforms, Walkways, Stairways, Staircases, Internal Grillage etc. These shall be designed as per working stress method IS: 456-2000 and IS: 800 (Latest). The crack width in all RCC structures shall be limited to 0.3 mm. A minimum live load of 400 kg/sqm shall be considered for the design of all platforms, walkways, staircases etc. in addition to their own weight. 4.7.20.10 Steel Structures These structures shall be designed, fabricated and erected as per IS: 800 (latest revision) and other relevant Indian Standard codes for structural steel work. All steel structures shall be coated with anti-corrosive system. 4.7.20.11 Slide Gates and Screens Slide Gates and Screens, as per IS: 5620 conforming to IS: 2062 Gr. A shall be designed for worst combination of operating and maintenance condition. All steel components shall be coated with anti-corrosive paint system. However, all guides of slide gates and screens shall be of stainless steel of Grade AISI 304L 4.7.20.12 Foundations The design of the cooling tower foundation structures shall be based on IS: 456 as per working stress method for worst load combination as specified in IS code In case of load combination DL + 1.5 WL, the limit state method as per IS: 456 shall be adopted.

Foundation shall be checked for safety against overturning, sliding and uplift. While checking stability of the structures, neglect favorably acting loads from water fill, soil cover beyond the edge of the foundation. Ground water table shall be considered at 1.0 m below Finished Grade Level of that particular area for design of foundations and all underground water retaining structures. The foundation shall be of minimum M-25 grade concrete resting over 100 mm thick PCC 1:3:6 layers. Clear cover of concrete shall not be less than 50 mm. Pile foundation if adopted shall be designed in accordance with IS: 2911 (Part-I / Sec-I, II and III). Generally net tension should be avoided in the foundations/piles for the shell support foundation unless specifically permitted by the Owner. While accounting for over burden of the soil for checking the foundation against up-lift, dead weight of the soil directly above the pile cap or ring raft, as the case may be, shall only be considered, neglecting the weight of soil in the cone of up-lift above the foundation. The foundation structures will be subjected to following loading and extreme load combination case shall be considered for design. (a) Most critical forces transferred from superstructure for the various load combinations. (b) Uplift forces (c) Loading due to foundation settlement (d) Concentrated local loading from column nodes (e) Thermally induced local loading where supply culverts pass through the foundation structures without structural isolation. (f) Surcharge of 2.5 t/sq.m.

CW basin surcharge load shall also be considered in addition to the other relevant loads for the design.

4.7.20.13 Fill Support Structures and Other Structures

The self weight of the pack support structures shall be based on the weight of the packing including weight of standing, running and dripping water, other operation and plugging/chocking (debris/scaling) loads, etc. in accordance with manufacturer's data. In addition, a live load of 100 kg/m² shall also be considered for the design of supporting structures.

For other structures like walkways, platforms, etc. a live load of 400 kg/sq.m shall be considered. Hand railings shall be designed for horizontal load of 60 kg/m².

Wind deflector walls and any other structural elements shall be designed for a horizontal wind load of 80 kg/sqm or as per manufacturer's recommendations, whichever is higher. Thermal loading shall be as per manufacturer's recommendations. Earthquake loading shall be considered based on criteria given for cooling tower. Response spectrum analysis shall be considered.

Design of RCC members shall be based on IS: 456:2000 with limiting crack width of 0.3 mm.

The cold water basin slab/raft shall form the common foundation for the pack support structures. The foundation shall be designed for the most critical forces transferred from CW basin & fill supporting structures including loads introduced by constructional equipments and crane deployed for fill supporting structure or shell erection.

4.7.20.14 Requirements for Concrete and Reinforcement

Cement: - 43 Grade ordinary port land cement shall be used unless otherwise specified.

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A																					
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1

Structural concrete shall be of design mix complying with the relevant provisions of IS codes or any International Code of Practice as approved by the Owner. Durability of the concrete shall conform to severe exposure category as per Table 3 of IS: 456 except noted specifically otherwise. Minimum cement content of all RCC structures shall be 360 kg/cum except in case of concrete blended with GGBS specified above & piling. Reinforcement shall conform to grade Fe 415/500 as per IS: 1786 except noted otherwise. All reinforcements used in RCC structure shall be corrosion resistant. Column reinforcing bars shall be carefully anchored in the shell and foundation. The anchoring length shall not be less than 80 times the diameter of the bars. All foundation structures shall be provided on all sides with a minimum reinforcement of 0.12% of gross cross-sectional area distributed over top and bottom faces. The minimum grade of concrete of structural components of cooling towers shall be as follows in accordance with IS: 456. <table border="0"> <tr> <td>(a)</td><td>Shell and Raker Columns</td><td>: M-40 grade</td></tr> <tr> <td>(b)</td><td>Pre-cast pre-stressed elements</td><td>: M-35 grade</td></tr> <tr> <td>(c)</td><td>All other RCC concrete</td><td>: M-30 grade</td></tr> <tr> <td>(d)</td><td>PCC encasement concrete except piles</td><td>: M-25 grade</td></tr> <tr> <td>(e)</td><td>Piles (with OPC/PPC)</td><td>: M 25 grade</td></tr> <tr> <td>(f)</td><td>Tower foundation</td><td>: M-25 grade</td></tr> <tr> <td>(g)</td><td>Mud mat PCC</td><td>: M-10 grade</td></tr> </table> Coarse and fine aggregates shall be specially selected to ensure that they are not susceptible to alkali/chloride attack or prone to disintegration at high temperatures. In particular, limestone aggregates shall never be used.  MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 120 of 639
maximum size of coarse aggregate shall not be larger than 1/8th narrowest dimension between reinforcement bars not more than 20 mm. Washing and screening of coarse and fine aggregates to remove fines, dirt or other deleterious materials shall be carried out by approved means as directed by the Engineer-in-charge. The water cement ratio by weight shall be 0.45 maximum including free moisture in the aggregates and slump should be suitably decided to provide good quality concrete work. 4.7.20.15 Admixtures Admixtures may be permitted to be used in accordance with relevant IS codes to modify the rate of hardening or setting, to improve workability or as an aid to control concrete quality. The Owner reserves the right to direct the contractor to conduct laboratory tests or use test data, or other satisfactory reference before granting approval. The cost of all tests conducted shall be borne by the contractor. The admixture shall be used in strict accordance with the manufacturer's directions and/or as directed by the Owner. No extra payment will be made to the contractor on account of using admixtures. Particular attention must be given to concrete placement because of the thin wall section and the presence of reinforcing steel. Consolidation of concrete shall be by vibration. Removal of air and water at the form surface shall be by vibration and rodding. Particular attention shall be paid to accurately shape the corners at all openings. Point of discharge of the concrete in to the forms be 1500 mm max. above the concrete surface. Concrete shall be deposited in approximately level layers not greater than 400 mm deep unless permitted otherwise. Concrete in the cooling tower shell in each lift shall be so laid that the no. of vertical or inclined construction joints are minimized to the extent possible. Horizontal construction joints shall be maintained at uniform spacing throughout the height of the cooling tower as per the directions of the Owner. Special attention shall be paid to proper curing of vertical faces of the cooling tower shell so that these do not remain dry. All thin walled structural members shall be protected by means of curing agents. It is recommended to use a curing agent for the cooling tower shell providing additional protection		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 121 of 639
like a single transparent cooling with a material based on vinyl mixed polymer. Inside face of the shell should be protected by a second pigmented coating of the same base material. Any other method of curing, if permitted by the Owner may be used. Sampling and testing of concrete shall be carried out as stated in Technical Specification elsewhere and as per relevant Indian Standard Codes. However, following minimum tests shall be carried out, irrespective of whatever stated otherwise: Test of compressive strength Columns – 1 Set of 3 cubes per column Shell- 2 sets of 3 cubes per climbing section 4.7.20.16 Cover to Reinforcement Unless indicated otherwise the clear concrete cover for reinforcement shall be as per IS Codes. The correct cover shall be maintained by cement mortar spacers/cubes or other approved means, reinforcement for footing/pile caps, grade beam, and slabs on sub-grade shall be supported on pre-cast concrete cover block as approved by Engineer-in-charge. The use of pebbles or stones as cover blocks shall not be permitted. The 28 days crushing strength of cement mortar cubes/pre-cast concrete cover blocks shall be at least equal to the specified strength of concrete in which the cubes/blocks are embedded. The minimum clear distance between reinforcing bars shall be in accordance with IS: 456 (latest edition) or as specified elsewhere in this specification. All lapping of reinforcement bars in the cooling tower shell shall be by lapping as per relevant codal provisions. Prior approval of the Owner shall be taken for deciding the method of lapping the reinforcement bars in the shell.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 122 of 639
Tolerances for the cooling tower construction shall be in accordance with the following: (a) Shell wall centerline in horizontal plane measured radially at mid point on a 3m wide chord is + 15 mm. (b) Shell wall centerline in meridional plane measured over a height of 1m is + 10 mm. (c) Shell thickness is + 10 mm or -5mm. (d) Horizontal radius of shell at any section other than shell base is ± 50 mm. (e) Horizontal radius at shell base is ± 40 mm. 4.7.20.17 Checking of shell geometry Check for absolute positions may be carried out from ground stations arranged at not more than 10 degree plan angle apart. Readings of horizontal radius shall be taken at every 6m height or weekly during construction period whichever is more frequent. If the permissible dimensional tolerance are exceeded the Owner will instruct the contractor, in writing, to stop construction of the shell. The Contractor shall then examine the situation and submit a report to the Owner who may require the contractor to demonstrate by calculations that the structural integrity of the shell will not be impaired as a result of the imperfections. The calculations shall be submitted to the Owner, for approval, before construction will be permitted to proceed. If in the opinion of the Owner the calculations show that the integrity of the shell could be threatened, the Contractor will be required to submit to the Owner detailed arrangement and supporting calculations to set right the shell geometry for approval, before construction will be permitted to proceed. The cost of carrying out the calculation, any remedial work required and idle time or any delays to the construction programme as a result of dimensional tolerances being exceeded will be borne by the contractor.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 123 of 639

Adjustment to the tower shell line on the basis of the survey results shall be made gradually; limiting the maximum change of direction from the existing vertical shell profile to be not more than an angular change of 10 mm measured over 1m of height. Any such adjustment shall be made with full knowledge and consent of the Owner.

The contractor shall carry out an as-built-survey of each lift of the shell. The results of these checks will be recorded on a suitably developed drawing of the shell from which it will be possible to locate the survey check point. A copy of these results will be presented to the Owner prior to commencing the next shell pour.

The contractor's shell construction procedures shall include for providing the Owner with the facilities and a reasonable time period as may be required to carry out an independent check of the completed works.

Suitable communication system such as telephone, wireless equipments, etc. shall be provided by the contractor so that the communications are possible at different elevations of the tower from the ground during construction.

All piling work shall be carried out by specialist subcontractor approved by the Owner. Initial pile load test shall be carried out for at least 3 sets of piles for direct compression and lateral load.

Since the effective action of the piles will depend on the adopted method of construction, the contractor shall guarantee that the piles, as constructed by the sub-contractor, shall effectively transmit the maximum loads which can be imposed on the foundation soil and corresponding maximum deflections.

4.7.20.18 General Requirements

- (a) The basin slab shall be divided into two equal parts by a partition wall designed to withstand full hydrostatic pressure, with one side empty. The basin construction joints shall be made watertight by injection of chemical grout through nipples. The basin construction shall be tested for water tightness, in accordance with IS: 3370 (Part I) (Latest edition). The cost of the test and any rectification and re-test if required is deemed to be included in the contractor's quoted price. Any cost of

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

	filling and emptying of the basin and to rectify defects shall also be borne by the contractor. (b) PVC ribbed water stops with central bulb shall be used where expansion joints are envisaged. The minimum thickness of PVC ribbed water stops with central bulb will be 10 mm and minimum width 250 mm. (c) The basin floor of each compartment shall be provided with a slope of not less than 1 in 500 towards sump for dewatering. From sump, the water will be drained by C.I. drain pipe, embedded below the basin floor, into a drain chamber outside the tower basin or as per the arrangements described elsewhere in the tender document. Suitable sluice gates (rising spindle type) conforming to IS: 3042 or sluice valves shall be provided in the drain chamber or any other arrangement specified elsewhere in the tender document. Suitable operating platform with access ladders for operating the gates or valves and pipes, shall be provided in the drain box.. (d) A 250 mm high sill shall separate the pond floor from the tower outlet. (e) Uniform surface on the top of basin floor shall be provided. In case undulated surface is observed, a top of layer of minimum 25 mm thick 1:3 mix mortar to be provided to achieve uniform surface. (f) Fill will be of film type supported on RCC beam. Film fill should be characterized by reduced air pressure losses, and shall not susceptible to clogging. Design and facing of the film fill shall be such as to expose high air/water surface with minimum air pressure drop. The sluice gates shall be of structural steel with anti-corrosive coating specified elsewhere. Number of sluice gates and removable screen shall be two (2) per tower. Proper rubber seal shall be provided so as to avoid any leakage of water. The rubber seal provided for the sluice gates be tested in accordance with the relevant Indian Standard Code. Sluice gates shall be checked for water tightness and smooth operation in dry and wet conditions.

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 125 of 639
Suitable facilities, as approved by the Owner, shall be provided for handling of sluice gates and screens. A screed or concrete layer not less than 100 mm thick and of grade not weaker than 1:3:6 mix conforming to IS: 456-2000 shall be provided below the cold water basin and other liquid retaining structures. Lean concrete below other foundations and underground structures, unless noted otherwise shall be 1:3:6 nominal mix (with aggregate of nominal size 40 mm maximum) and shall be at least 100 mm thick. All exposed surfaces of concrete, i.e. inside surface of tower basin, entire inner surface of shell, fill supporting beams, columns and bracings, raker columns etc. which are in contact with water/moisture shall be given three coats of water proof bituminous paint of approved make. Unless noted otherwise all concrete surface which are in contact with the earth shall be applied with anticorrosive coat system. Water proofing and plasticizer admixtures conforming to relevant IS codes may be added as per manufacturer's instruction to the concrete subject to approval of the Owner. The tower shall be provided with two numbers external RC staircase, leading to a heavy duty door giving access to the distribution system. Staircase shall be minimum 1000 mm wide (clear), with landings of minimum width of 1000 mm at not more than 2500 mm height intervals unless approved otherwise. The steps shall have a rise of about 125 mm and tread of about 250 mm. Anti-skid nosing at each step shall be provided. Minimum size of all doors shall be 2100 mm high (clear) and 1200 mm wide (clear). The door shall be of steel with anti-corrosive coating of polyurethane as specified elsewhere. However, FRP material or equivalent may also be used subject to approval of the Owner. The door shall be air tight when closed. The hand railing on both sides of the staircase shall be galvanized with three rails of 32 mm NB pipes conforming to medium class as per IS:1239, and posts conforming to medium class as per IS:1239 of 32 mm dia galvanized		

CONSULTANT : PROCON ENGINEERS

pipes spaced not more than 1.2 m centers. The top hand rail shall be at 1000 mm above the steps. Complete hand rails shall be applied with anti-corrosive coating system as specified elsewhere. All galvanization work shall have 610 gm/sq.m of deposit. Approved walkways and platforms shall be provided inside the tower at distribution pipe level. These walkways and platforms shall provide safe and clear access to all sprayers and all distribution pipes. A reinforced concrete platform of 1500 mm clear width shall be provided around the tower valves. Other walkways shall be at least 600 mm wide with 50 mm (minimum) safety kerbs along each edge. Access ways shall be clear of all obstructions such as distribution pipe support beams, drift eliminator support beams etc. The walkways shall be provided with transverse slots or other opening which will permit the free passage of air and water. Hot double dip galvanized handrails shall be provided on all sides where there is a risk of falling through the fill. Reinforced concrete platforms 1.2 m clear width all around the tower circumference shall be provided on the tower for fixing of aviation warning light at levels specified elsewhere. Two diametrically opposite galvanized M.S. cage ladder (as per IS: 3696) with Fall protection system on the outside of shell upto full height of cooling tower shall be provided. The fall protection system/vertical fall arrest anchorage system (conforming to EN 353-1:2002) shall be provided as an integrated fall arrest solution made of a vertical Aluminium Alloy Notched Guide Rail over which glides a Guided – Type Fall Arrest Trolley. The trolley shall move up and down accompanying the user who is connected with it with the help of small shock absorbing lanyard. The full body Harness shall be provided. The trolley shall be made of stainless steel with wheels made of brass to prevent corrosion and to enable smooth working. The trolley shall immediately lock over the rail, in case of sudden fall with provision of the Uni-directional locking system which does not allow it to free fall down the rail.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 127 of 639
The cage ladder shall have 600 mm. wide, 20 mm dia rungs at 300 mm c/c with stays at every 1800 mm, connected to the concrete shell and galvanized Horizontal M.S. cage ring of 50mm x 6mm thick consisting of 50 mm x 6 mm vertical cage flats on the exterior surface of cooling tower up to top of the tower. In addition to the top platform, intermediate landings of 1.0m x 1.0m with handrails shall be provided at every 8 to 10 m height of the MS ladders throughout. Some of these landing levels shall be suitably adjusted to give access to aviation warning beacons for maintenance. Handrails shall be provided on all platforms. The ladder leading to the top platform shall have approach from ground via the RCC staircase. In order to provide approach for maintenance of shell, all Landing platforms shall have 70 mm internal diameter puddle flanged C.I. pipes for passing ropes during maintenance of tower shell. Steel gratings, where required, shall be fabricated out of steel flats with minimum thickness of 6 mm. Thickness of fabricated grating shall be 32 mm with flats so arranged as to have a maximum opening of 25 mm or less. Treads for staircases, where needed, shall be of similar grating construction but provided with toe flats of 6 mm thick, and non-skid nosing in an approved manner extending up to 100 mm above the walkway surface. All steel gratings shall be galvanized and applied with anticorrosive coating as specified elsewhere. The mild steel parts of structures used in cooling towers shall be hot double dip galvanized unless it is coated with a separate anti-corrosive coating system. The minimum coating shall be 610 gm/sq.m and shall comply with relevant IS codes. Galvanizing shall be checked and tested in accordance with IS: 2629. All welding shall be done before galvanizing. Any site joints required to be carried out after galvanizing shall be either flanged or screwed joints. Nails, nuts, bolts and all components coming in direct contact with water shall be of stainless steel of AISI 304 or equivalent. The finished ground level shall be paved for 2.0m width all round the outer edge of the cold water basin. The paving shall consist of 150 thick RCC slab of M-20 grade. The minimum reinforcement shall be 10 mm dia spaced 150 mm center to center both ways top and bottom. The RCC slab shall be overlaid 100 mm thick M-10 PCC mat and 300 mm well compacted sand layer. All

latches, hardware etc complete as per specifications or as directed by Engineer-in-charge (p) Minimum two (2) 300 NB flanged CI pipes of Class 'A' type confirming IS: 1536 as directed by Engineer-in-charge shall be provided in the drain sumps for sludge removal. (q) At least two (2) 300 mm dia. Sluice gates conforming to IS: 3042 Class-I as directed by Engineer-in-charge shall be provided for sluice operations. (r) All the MS piping conforming to IS: 3589 and MS plates as per IS: 2062 including bends, T's, elbows, reducers etc. complete with all the necessary HDGS hardware, gaskets etc. including fabrication, cutting, aligning, welding, lowering, laying, hydro-testing etc. shall be provided as per specifications or as directed by Engineer-in-charge for all diameter pipes. (s) Two (2) Double Flanged Butterfly valves of suitable diameter and of approved make conforming to AWWA C-504 / BS: 5155 with mating flanges and complete accessories and hardware as per specifications including aligning, erecting, testing etc. complete in all respects shall be provided separately in the CCW and ACW HW piping respectively. (t) Suitable MSHDG drain nipple with suitable drain plug for flushing of Primary HW ducts and complete with accessories and hardware as per specifications including aligning, erecting, testing etc. all as directed by Engineer-in-charge. (u) Required numbers of 80NB x 200mm long MS heavy duty Stub connections as per IS: 1289 with isolating ball valves as per IS:9890 of threaded type for flow measurement in HW pipes and complete with accessories & hardware as per specifications including aligning, erecting etc. and as directed by Engineer-in-charge. (v) At least four nos. of Dial type pressure gauges of 6" dial size as per IS:3624 including stub connection with isolation ball valve as per IS:9890 and complete accessories, hardware as per specifications

	including erecting, testing etc necessary for installing & operating the system shall be provide. (w) All the under-ground piping shall be suitably surface prepared and “coated and wrapped” with epoxy and fiberglass 'RP' tissue as per relevant specifications and as directed by the Engineer-in-charge. (x) All the above-ground piping shall also be surface prepared and painted on outside surface as per relevant specifications and as directed with approved make and type of paints, all as directed by Engineer-in-charge. (y) The PVC film fills made from virgin PVC shall be UV stabilized and of approved make in black colour having 17/19 mm cross flutes with 0.25 mm uniform thickness and double edge folding to meet the requirements of CTI code STD-136. It shall have a heat transfer area not less than 148 m²/m³. UV test shall be conducted as per ISO 4892 and impact test as per ASTM-D-256. The required amount of gluing compound to make modules of fills shall also be provided by the bidder. (z) AC pipes of suitable diameters and of class 15 grade as per IS: 1592 with spigot and including drilling of holes for fixing nozzles, hoisting, grouting in RCC ducts, erecting, jointing with required accessories, testing etc. including end caps complete as per specification and as directed for the full functionality of the system shall be provided. (aa) PVC pipes of suitable diameter, 6kg/ cm² rated conforming to IS: 4985 including drilling of holes for fixing nozzles, erecting, jointing with required accessories, testing etc. including end caps complete as per specification and as directed for the full functionality of the system shall be provided. (bb) Required number of Polypropylene Nozzles of suitable opening sizes to cater to varied water flow rate as per specification or as directed by Engineer-in-charge, complete with all the necessary hardware required for fastening the nozzles to the AC pipes including accessories, hardware etc. shall be provided.	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 133 of 639
(cc) Thermal performance Test involving measurement of water flow as per BS:1042 using pitot tube confirming to ISO:3966, air temperatures (WBT & DBT) using mechanically aspirated Psychrometer, water temperatures (HWT & CWT) using mercury in glass thermometers, air flow using anemometer as per specifications and as directed by the Engineer-in-Charge shall be done by the bidder. All the instruments shall be calibrated (at IIT/IISC) within 6 months prior to test. (dd) Minimum eight nos. of high intensity white flashing type aviation obstruction light at each level as per fig no 6.6 of appendix 6 of annexure 14 of ICAO regulations and Director General of civil aviation requirements and with corrosion resistant aluminum casting finished in stove enameled control gear suitable for 200/240V, 50Hz supply, complete as per specification shall be provided. Access should be provided to all aviation warning lights & flashing lights shall be flashed simultaneously. The life of AOLs shall be more than 10 years and with all the necessary fixing accessories as directed by Engineer-in-charge. The AOL system shall be provided with Photoelectric light detectors to monitor north sky for controlling the aviation warning lights. The lights should be switched on when the ambient light goes below 35 candelas and switched off when the intensity is more than 58 candelas. The lights should not be switched off due to momentary increases in light intensities due to lightning flashes or any other short bursts of light. The detectors should be complete with all the accessories, hardware etc. necessary for installation. The facility for Auto/Manual operation shall be provided. AOL distribution board shall be fed from emergency power distribution board. If high intensity lights are not available indigenously then Bidder shall import the same. (ee) All cables shall be heavy duty PVC insulated, GI wire / flat armored, PVC sheathed, 650/1100V grade FRLS copper cable as per IS: 1554 Part-I with owner's approval. The cable shall be clamped at every 750 mm along its run and will include all the hard ware required for its fixing and terminations etc. The Junction/Terminal boxes should be provided wherever required. The cable schedule shall be as under: 4C x 10 sq.mm Copper Cable for aviation warning lights

	4C x 6 sq.mm Copper cable for power receptacles, stair case lighting and tail end aviation warning lights etc. 2C x 2.5 Sq.mm copper cable for local connection from local Junction box to aviation warning lights. (ff) The bidder shall also provide 240V x 15A single phase 3-pin outdoor, weather proof, industrial type switch- -socket outlets with inter-lock switches and fitted with metal cap. Required nos. of weather & dust proof (IP-55) 200 mm x 150 mm x 100 mm deep junction box (2/3/4 way) made out of 2mm thk G.S. with ELMEX type terminals, glands etc. complete shall also be provided. (gg) A Lighting Distribution Board and Control Panel for Aviation Warning Lights fabricated from 2 mm thk sheet steel, dust and vermin proof and removable gland plates at top and bottom with ELMEX type connectors and with suitable earthing including 2 nos. 32A TPN incomers, HRC fuses and 2 nos. 32A outgoing connections with HRC fuses and Common Flasher shall be provided. Two inputs will be provided by the Owner – one the main supply and the other as stand by. Automatic change over with suitable delay timers with Auto/ Manual operation shall be provided by the bidder. (hh) To care of ICAO and DGCA requirements, the bidder shall provide Temporary Aviation Warning Lights during construction above the 50m level from general ground level. (ii) The earthing and lightning protection system shall be as per IS: 3043 in general. Air terminators made out of 2m long 40 dia MSHDG round bar with pointed top and clamped at minimum 3 points with heavy duty G.I. clamps shall be provided. It shall be ensured that 1.2 m of the air terminator shall be projecting above the top of the cooling tower. (jj) A 50 x 6 thk GI flat Coronal band connecting all air terminator on one side and to the down conductor on the lower side complete with all the necessary fixtures, hardware etc. required for installation shall be provided. The clamps used shall be GI and heavy duty and shall be fixed approx 1m below the top of the cooling tower and clamped at the spacing not more than 1m C/C. Also, a 50 x 6 thk GI flat down

	conductor complete with all the necessary fixtures, hardware etc. required for installation shall be included. The down conductors on the top shall be connected to the coronal band and on the lower side they shall be connected to the test links. The clamping shall be at 1m C/ C with heavy duty GI clamps. The down conductors shall be in one piece as far as possible. The necessary joints shall be of fully welded type and not bolted type except at the test link. These conductors shall be embedded in the concrete of the shell with a minimum cover of 50mm and shall come out of the concrete at the top and bottom of ring beam. (kk) The Earth conductor to be provided by the bidder shall be made out of 40 mm Dia. MS round bar complete with all the necessary fixtures, hardware etc. required for installation and shall be supplied and installed between test link on one side and to the earth mat on the other side. Earthing electrode of dia. 40 mm MS rod x 3m long and making of earth pit as per IS:3043 complete with all the necessary fixtures, hardware etc. required for installation and connection to the earth mat shall also be in the scope of the bidder. (ll) Temporary lightning protection system during construction to meet ICAO and DGCA requirements shall be provided by the bidder, complete with all the necessary fixtures, hardware etc. required for installation. (mm) The bidder shall conduct tests on circuit as per specification or as directed by Engineer-in-charge. (nn) Required nos. of thermowell complete with all the necessary fixtures, hardware etc. required for installation shall be provided by the bidder and he shall also provide required nos. of Temperature and Pressure Gauges, RTDs, Flow Measuring Devices, etc. complete with all the necessary fixtures, hardware etc. required for installation. (oo) The butterfly valves shall be provided with 2NO+2NC potential free limit switches for BF valves complete with all the necessary fixtures, hardware etc. required for installation.

(pp) (i) Butterfly valve specification (REFER VOLUME III-F,SECTION 3) All the butterfly valves shall be complete with graduated position indicator, arrow indicating the flow direction. The valves shall be suitable for erection in any position (Horizontal/Vertical, etc.). The operating mechanism shall be mounted directly on or supported from valve body. All the butterfly valves shall be provided with hand wheel. Butterfly valves of size 350 NB and above shall be provided with reduction gear units. Valves shall close in clockwise direction. The hand controls shall be dimensioned to guarantee an easy maneuver under most severe conditions. The hand controls shall be provided with locking systems to avoid the disk assuming a not desired position during operation. The pulling force required on the hand wheel-rim shall not exceed 30 Kg. when operating the valve under full flow and operating pressure. The reduction units shall be watertight, complete with lubrication and position indicator. Only one type of valve shall be provided, either cast or fabricated type. Mixing of two types of valves is not considered acceptable. (ii) Ball valve specification (REFER VOLUME III-F, SECTION 2) (qq) Flanges For valves designed as per AWWA C-504, valve flanges shall conform to ANSI B16.1 Class 125 for CI valves and AWWA C-207 Class D for fabricated steel valves. The counter flanges shall conform to AWWA C-207 Class D. For valves designed as per BS: 5155 the flanges shall be as per BS: 4504. All the flanges shall be of slip-on and flat-face type. Flanges shall be fabricated from steel plates conforming to IS: 2062. 4.7.21 The bidder has to furnish the thermal design calculations in the form of design basis with necessary calculations, curves, references etc. of the cooling tower for approval of the owner/consultant. The bidder has to provide NDCT as per the actual thermal design calculations.

4.7.22 Performance Guarantee Performance/Acceptance test shall be carried out for determination of the thermal capability and verification of the guarantee of the cooling tower constructed at the project. (a) Test shall be conducted by accredited representatives of the contractor and owner. The contractor shall be given permission to inspect the tower in advance. Contractor's representatives shall witness all phases of the test and record the data jointly with Owner's representative. (b) The responsibility for conducting the test shall be with the contractor. (c) All test instruments required for the Performance test shall be provided by the contractor. The calibration of the test instruments shall be the responsibility of the contractor. (d) Calibration of the test instruments shall be carried out by an approved independent agency. The calibration of the equipment should not be older than six months before the test and should be valid at the time of testing. (e) The performance of cooling tower shall be compared with the performance required on the basis of the Performance curves for 80%, 90%, 100% and 120% of design water flow. (f) The performance test shall be generally as per CTI Code ATC-105 / BS: 4485 Part-II using characteristic curve method. (g) Every effort shall be made to conduct the test when the conditions are very close to the design condition. The station power load will be maintained near at its maximum. (h) The performance test shall be taken two times viz. at the end of May when the atmospheric temperature is maximum & in the month of July/August when it is wettest. However, no credit will be given for any uncalled improvements in the guarantee performance and to this extent contractor will not be eligible to receive any payment for interpretation of the performance clause in opposite direction.

In case the contractor refuses to carry out any modifications in spite of the initial performance test having shown definitely incorrect results, it shall be rightful for owner to take over the entire cooling tower along with all plants and tools made available by him at site of work and modify the cooling tower in accordance with that of Owner's own notions about adjustments/redesign as required and in that case contractor will have no claim on the Owner. It shall also be rightful for the Owner to appoint at contractor's risk and cost any separate consulting and/or contracting agency in respect of such adjustments/modifications. Contractor will be considered not to have acted in positive manner in respect of the failure to give the goods during the initial performance test in the event of contractors not having taken definite action within a period of one month of such initial performance test. (i) ACCEPTANCE CRITERIA shall be in terms of percentage capability of cooling tower as per PG test report. 4.7.23 Layout and Levels The layout fixing the location and levels of all structures shall be made w.r.t. plant's grids and bench marks given by the Owner. 4.7.24 Approval of Design and Drawings The bidder shall submit detailed thermal design basis and calculations in the form of a report to meet BS: 4485 requirements. The Owner/Consultant shall check and approve the thermal design. Once the thermal design is approved, the bidder shall submit detailed analysis & design calculations with 3 hard copies of each of the drawings for the cooling tower structures including design assumptions along with general arrangement drawings for the approval of the Owner/Consultant. The theoretical background utilized for developing the computer programmes shall be made available to the Owner. This shall be given by the bidder before approval of designs. One set of analysis & design calculation/drawings duly approved/marked with comments by the Owner shall be returned to the bidder. After receipt of approval from the Owner, the bidder shall submit copies of final detailed construction/fabrication drawings as per Distribution Schedule for the approval of the Owners. One set of drawings shall be returned duly

approved which will become the basis for taking up construction. The bidder shall also furnish to the Owner one good quality permanent negative (film type) of each of the final approved drawings. Additionally, all drawings shall be prepared in AUTOCAD and CD's shall be submitted to the Owner for record. The approval of the Owner shall not relieve the bidder from the responsibility of adequacy of the design and correctness of the drawing. 4.7.25 Vendor List for NDCT For vendor list of NDCT REFER MASTER SPECIFICATION VOLUME –II SECTION 11. 4.8 <u>RAW WATER SYSTEM AND OTHER PUMP HOUSES :</u> <u>RAW WATER & FIREWATER PUMP HOUSE</u> 4.8.1 Pump House shall be provided for housing raw water/fire water pump. Separate bays shall be provided for each pump by providing intermediate dividing RCC piers between the pumps. 4.8.1.1 (a) All pump houses shall be provided with minimum two sets of stop logs for the respective pump bay dimensions along with electrically operated hoisting arrangements. Steel embedments required for stop logs shall be provided for all bays. (b) All bays of pump houses shall be provided with a removable trash rack including electrically operated hoisting arrangements and cleaning arrangements. Moreover, one spare trash rack of respective pump bay dimension shall also be supplied for each pump house. (c) Stop logs, trash racks and hoists shall be supplied in accordance with the specifications given elsewhere. (d) The fire water pumps shall have positive suction. The raw water and fire water pumps shall draw water from the raw water reservoir. The arrangement for intake of raw water to the raw water pump house shall be such that all pumps shall be operative even if either of the compartments of the reservoir is under maintenance.

(e) All pump houses shall be adequately equipped with drinking water and toilet facilities. 4.8.1.2 The sub-structure of all pump houses shall be RCC with M-30 grade of concrete conforming to IS: 456. The superstructure of all pump houses shall consist of either structural steel frames or RCC portals with minimum M 25 grade of concrete. 4.8.1.3 All pump houses shall be provided with a separate maintenance bay for maintenance of various equipment and an electrical switchgear room. Length of maintenance bay shall be adequate for one pump maintenance. Pump house where flow regulation is required, suitable steel gate stop logs along with the electrically operated hoisting arrangement shall also be provided. 4.9 <u>PLANT WATER SYSTEM STRUCTURES/COMPONENTS</u> The description of some of the major structures/components covered under the Plant Water System Package is given below: 4.9.1 Raw Water Treatment Plant (a) The stilling chamber aerator, flash mixer, raw water channel shall be of RCC and shall be partly underground and partly over ground. These shall be watertight structures. (b) The clariflocculators shall be of RCC construction including inlet, outlet channels & distribution chamber. (c) The sludge sump & dirty backwash sump shall be an underground RCC pit., Part of the pit shall be covered with RCC slab for supporting the vertical sludge pumps. Sludge from clarifier should be taken to ash slurry sump & Water from dirty backwash sump shall be taken to stilling chamber. For all the pump houses, roof shall be RCC form finish. Filter house building shall have RCC roof. The pump house shall be complete with brickwork, plastering, doors, windows, rolling shutters, flooring, painting and all other items necessary for satisfactory performance of the building. Brick masonry

	wall with suitable windows and doors will be provided in accordance with Architectural concept described in Section-IV of this Volume. (d) Pretreatment chemical house shall be a two storeyed concrete framed building having chemical storage area, ozonization system in ground floor & chemical solution tank on 1st floor. The building shall be complete with brickwork, plastering, doors, windows, rolling shutters, flooring, plaster, painting, roofing, etc. and all other items necessary for satisfactory performance of the building. The building shall have toilets, drinking water overhead tank and the scope shall include supply and fixing W.C.'s urinals, showers and all plumbing sanitary and other work required for satisfactory completion of the above building. The tanks and parts of floor slabs shall be lined with Acid/Alkali proof tile lining. (e) Filtered Water reservoir shall be of watertight R.C.C. construction and form finished having two compartments covered with RCC roof form finish. It shall be partly underground and partly over ground. Vent pipes shall be provided at roof. Filtered Water reservoir including RCC roof shall be designed as uncracked structure as per IS: 3370. Food grade protective coating as per BS 1881 part I to IV shall be applied to internal surface & soffit of water reservoir. Total Capacity of Filtered water reservoir excluding freeboard shall be 45000 m³. A free board of 500mm shall be provided. Filtered Water pump house shall be complete with brickwork, plastering, doors, windows, rolling shutters, flooring, painting and all other items necessary for satisfactory performance of the building. MCC room, if required as per system design, shall also be provided. Brick masonry wall with suitable windows and doors shall be provided in accordance with Architectural concept described in Section-IV of this Volume. (f) All water tight structures shall have smooth finish in concrete and shall be given cement wash for decent appearance. All open pits at ground level shall be provided with handrail made with 32 NB galvanized pipe. All open pits shall be provided with 150 high RCC kerb. All drainage and trenches shall be provided with

	removable RCC slab at top. These trenches at rail/road crossing, if any, shall be designed for appropriate heavy loading. For all outdoor trenches, the side walls shall project 300 mm above finished ground level. All trenches & precast RCC covers shall be provided with edge angle. (g) All E&M equipments such as pumps, blowers, centrifuge etc in water pre-treatment plant, DM Plant, Effluent Treatment Plant, Sewage Treatment Plant etc shall be provided with permanent housing arrangement with RCC roof, side cladding, flooring, doors/windows, ventilation arrangement, lifting arrangement etc." 4.9.2 CW Treatment cum Ozonization Building & Side Stream Filtration Plant: CW treatment cum Ozonization building shall be a RCC framed single storey building with brick cladding. Foundation for equipment shall be RCC construction. 4.9.3 D.M. Plant (a) Dimension and height of the building shall be decided based on equipment layout and height of the vessels accommodated inside. The DM plant building, adjoining control room and laboratory shall be provided in an RCC framed building with RCC roof form finish with brick cladding. Control room and switch gear room shall have a cable vault below. Control room and laboratory shall be air conditioned. False ceiling with gypboard shall be provided in this area. Underdeck insulation shall be provided in the A/C area as well as in the Air washer room. Staircase in the Control static room Complex shall be extended to the roof also. Flooring on Control room shall be anti-static PVC tiles. Toilet shall be provided in the ground floor. In case a transformer yard is provided, the wall in front shall be designed to satisfy fire rating as per TAC. (b) Floor where acid/alkali spillage are expected shall be isolated with RCC kerb and the flooring inside shall be of acid/alkali resistant tile. The drains inside the building carrying acid/alkali mixed discharge shall be provided with anti corrosive epoxy lining. Outside the building upto neutralising pit, these drains shall be provided with	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 143 of 639
Acid resistant brick lining. Specification for lining is given elsewhere in this document. Acid/alkali unloading and storage area outside the building shall also be provided with kerb with a sump inside. This area shall also be provided with Acid resistant brick lining. (c) Neutralizing pit shall be designed as a water retaining structure with external damp proofing. Floor and walls of the pit shall be given Polypropylene glass reinforced lining. Ceiling as well as floor, supporting pumps for pumping the clear water from neutralising pit shall be given heavy duty epoxy screed lining. (d) D M water storage tank outside the DM plant shall be supported on sand pad with ring wall. (e) Walls inside the DM plant area shall be provided with chlorinated rubber based painting. Main door shall be rolling shutter of adequate size to permit entry of the largest vessel. All doors and windows in the D.M. plant area shall be of aluminum glazed type. Windows shall be of sliding type. 4.9.4 Pipe/Cable Trestles and Foundations No cable/pipe trench is envisaged. All cables & pipes in outdoor area shall run above ground over steel trestles or other supporting structures for easy inspection & maintenance except in some localized area where the same can run in R.C.C. trenches. In case over ground routing is not feasible due to site constraints, the pipe/cable shall be routed through duct-banks. A minimum clearance (clear head room) of 8.5 m shall be kept for all over ground pipe/cable trestles for all road/rail crossings. In other areas, the clear height shall be 4.0m (minimum) from ground/grade level except in pipe corridor between main plant and plant water system which shall be 5.0m (minimum) from ground/grade level. All trestles shall be provided with continuous walkway of minimum 750mm width with handrail and toe-guards all along the length of the trestle along with approach ladder near roads, passageways etc.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 144 of 639
Before and after the rail/road crossing, a barrier of suitable height shall be constructed so as to prevent the approach of cranes (having height more than 8.5m) etc. up to the pipe/cable rack trestles. Four-legged trestles & foundations are to be provided for supporting the pipe/cables at suitable intervals. Four legged trestles are to be provided mainly at intercepting location of branch pipe rack (maximum distance 100 m) Crossover, operating platform & necessary trussed resisting arrangement at pipe bend shall be provided as required. 4.9.5 Raw water reservoir Raw water reservoir shall be developed in designated area (as shown in plot plan) for collection & storage of raw water. Storage tank shall be of RCC Construction with two compartments in which one shall be operative & other in maintenance. In case of emergency both the compartment will be operational. Sufficient freeboard shall be provided above FRL. Each compartment shall be 24000 m³ capacity. Necessary arrangement should be made in tank for in coming & outgoing & overflow pipes. The Inlet arrangement shall be such that the energy of the incoming water is sufficiently dissipated before entering the reservoir to avoid erosion and necessary concrete erosion treatment work shall be in the scope. The tank shall be provided with adequate handrails at the top bench with the 2 m wide pathway for approach/inspection/maintenance/safety purpose. Storage tank structure shall be designed as per IS-3370 & considering water level at GL. No pressure relief valve arrangement shall be considered to counter uplift pressure. 1 m wide walkway with hand railing shall be provided over the central divide wall. 4.10 <u>WASTE WATER SYSTEM STRUCTURES/COMPONENTS</u> All necessary civil/structural work for wastewater treatment plant described in Volume VI B of this specification shall be under scope of bidder. The description of some of the major structures/components covered under the Waste Water System Package is given below:		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 145 of 639
Coal pile area run-off shall be led to a R.C.C settling tank with two (2) compartments. Top of tank shall be 500mm above surrounding finished grade level to restrict ingress of storm water from adjacent areas. The pond shall have adequate capacity as per design requirement as specified in sec II of VOLUME VI B of this specification. At the downstream of pond, RCC overflow weir and sump shall be provided. Design and detailing of pond shall be as per good engineering practice so as to satisfy functional requirement as specified in Section-II of VOLUME VI B of this specification. Necessary arrangement shall be provided in inlet drain carrying coal pile area run-off so that one settling pond can be operative while the other one under maintenance. In case of exigency, both the settling tanks will be operational. The tank shall be provided with adequate handrails at the top bench with 2 m wide pathway for approach/inspection/maintenance safety purpose. The Power House service water waste shall be collected in a RCC underground oily waste retention pit, which is also under the scope of this package. Necessary pumps and supporting floor/maintenance area shall be provided. This effluent will finally be treated in corrugated plate interceptor. Foundation for CPI shall be designed as per IS: 456. Oil storage and handling area run-off shall be collected to a conventional baffled oil water separator of API design (battery limit shall be as shown in tender drawings). This oil water separator shall be an underground RCC structure having RCC baffle wall and overflow sump for collecting water at outlet end. An oil collection pit shall be provided on sidewall of oil water separator. This structure shall be designed as uncracked section as per IS: 3370. The structure shall project at least 300mm above finished grade level. Handrail shall also be provided around the pit. The overflow sump shall be covered at top over which pumps shall be installed. RCC sump for collecting boiler blow down shall also be under the scope of this package. Civil work for outlet of this effluent shall also be under the Scope of this Package. NDCT blow down, sludge drain from NDCT, C.W.floor wash, effluent from water treatment plant (pre & post) shall also be take into ETP. As far as possible, the effluent from all the sources shall be brought to ETP by gravity. Wherever the flow by gravity is not possible, the pumping arrangement with necessary piping shall be provided.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 146 of 639

There will be a central monitoring basin sized for holding wastewater for 8 hours (minimum) before entering into ETP. The earthen pond shall have adequate capacity as per design requirement & with 750 mm free board. Top of earthen dyke shall be 500mm above finished grade level. 2 m wide pathway shall be provided all around the pond for inspection/maintenance etc. The pond shall be of such construction as to prevent pollution of ground water by seepage of any wastewater having side slopes and bottom lined with minimum **1.0mm HDPE for minimizing seepage loss**. Over the HDPE lining, PCC blocks of minimum 75mm thickness having interstices filled with cement-sand mortar shall be provided. Filter media shall be suitably designed & provided below HDPE liner.

From Central Monitoring Basin, wastewater shall be pumped to R.C.C watertight stilling chamber partly underground & partly overground. From stilling chamber, water would be directed to High rate solid contact type clarifiers (HRSCC).

HRSCC shall be of RCC construction including inlet, outlet channels & distribution chamber. The treated water from HRSCC shall be stored in a RCC clear water storage tank. Water from storage tank shall be utilized in Ash handling plant, CHP/AHP dust suppression etc. Generated sludge shall be collected in RCC sludge sump & then pumped to ash slurry sump.

Waste water chemical house shall be a two storied concrete frame building having lifting arrangement by monorail hoist, storage area at ground floor & chemical solution tank in 1st floor. The building shall have toilets, overhead water tank. The building shall be complete with brickwork, plaster, painting, doors & windows, rolling shutter, roof etc and all other items necessary for satisfactory performance of the building. The solution tank & parts of floor slabs shall be lined with Acid/Alkali proof tile lining.

All other civil works including drains/MS pipe with fitting/RCC pipes/pipe racks including foundations etc. for successful completion and operation of waste water treatment plant shall also be done

4.11 <u>CW AND ACW PUMP HOUSE</u> Dimensions, sizes depth of CW/ACW pump house, control building etc. if indicated in bid specification are indicative and bear minimum only. The bidder should note that the cost implication, if any, due to change in the dimension, sizing etc. as per the equipment supplier's requirement is deemed to be included in the offer. Covered R.C.C. channel from Cooling Tower basin to CW Pump House shall be minimum 500 mm above F.G.L. and road-crossing portion shall be designed for Class 'AA' traffic. 4.11.1 CW and ACW Pump House Cooling water (CW) pump house for housing cooling water pumps and auxiliary cooling water pumps shall be provided. Separate bays shall be provided for each pump by providing intermediate dividing piers /walls of RCC between the pumps. (a) (i) CW and ACW Pump Houses shall be provided with two sets of stop logs for the respective pump bay dimensions along with electrically operated hoisting arrangements. Steel embedment required for stop logs shall be provided for all bays. (ii) CW/ACW bays of pump houses shall be provided with a removable trash rack/screen including electrically operated hoisting arrangements and cleaning arrangements. Moreover, one spare trash rack of respective pump bay dimension shall also be supplied for pump house. (iii) Stop logs, trash racks/screens (typ) and hoists shall be supplied in accordance with the specifications covered elsewhere, in this specification. (b) The sub-structure of CW/ACW pump houses including their fore bays shall be RCC with M-30 grade concrete conforming to IS: 456. The superstructure of all pump houses shall consist of structural steel

frames or RCC portals with minimum M 25 grade of concrete. The base slab and side walls of CW channel, fore bay and sump for CW/ ACW pump house shall be designed as non-cracked section. (c) CW and ACW Pump Houses shall be provided with a separate maintenance bay for maintenance of various equipment and an electrical switchgear room. Length of maintenance bay shall be adequate for one pump maintenance. However, minimum length of maintenance bay for CW pump house shall be 10 m. (i) The dimensions of the cell for CW and ACW pumps shall be governed by the guidelines of the Hydraulic institute Standards recommendations, The Contractor shall have to carry out sump model studies to ascertain smooth and laminar flow through the bell mouth thereby avoiding entry of eddies or vortices entering the pump column. The contractor shall accordingly provide special features (baffle walls, swirl prevention device, etc, based on sump model studies. The sump model studies shall be witnessed by representative of the owner and his consultant. (d) For all other structures other than the CW and ACW pump house where flow regulation is required, suitable steel flap/slucice gates shall be provided. Stop logs gates shall be provided for CW and ACW pump house. The steel flap/slucice gates/stop log gates shall be provided with self engaging and disengaging lift beams and electrically operated hoisting arrangements, as required. The steel flap /slucice gates/stop log gates shall be provided with proper rubber seal so as to avoid any leakage of water. Rubber seal provided shall be tested in accordance with the relevant Indian Standards. The stop log gates shall be checked for water tightness and smooth operation in dry and wet conditions. The leakages, if any, shall be measured and it shall not be more that 5 liters per minute per meter length of the seal under maximum head. (e) All stop logs gates and trash racks shall be of structural steel, which shall be treated for anti corrosive treatment as specified elsewhere in the tender document. The guide rails meant to facilitate raising and lowering of stop log gate/channel that are welded to guide channel

embedded in concrete groove or attached to the sides of stop log shall be of stainless steel grade SS-316 L conditions. All mild steel parts other than the stop logs and trash racks used in the water retaining structures shall be hot double dip galvanised and epoxy coated. The minimum coating of zinc shall be 610 gm/sq.m for galvanised structures and shall comply with IS: 4759 and other relevant codes. Galvanising shall be checked and tested in accordance with IS: 2629. The galvanising shall be followed by the application of an etching primer and dipping in black bitumen in accordance with BS: 3416. 4.11.2 Stop Logs and Screens/Trash Racks (a) Technical specification of zinc spray painting for stop log gates, screen and corresponding guides for CW pump house/raw water pump houses/other pump houses (i) Cleaning before zinc spray painting Surface of the fabricated items shall be thoroughly blast cleaned to near white metal surface as per Swedish Standard (SA 2 ½) from oil/grease. Mill scale and other loose metal deposition due to weld droppings shall to be cleaned by grinding wheels. (ii) Zinc spray painting Zinc spraying shall only be done by zinc rich paint (normally minimum 90 % m/m metallic zinc content of dry film) or by a low melting point zinc alloy within 4 hours of blasting. (iii) Minimum coating of zinc The minimum coating of zinc in zinc spraying shall be 610 gm/sq.m. Zinc shall be conforming to any grade specified in IS: 209 or IS: 13229.

(iv) Minimum dry film thickness a. Spray painting with zinc rich primer (DFT-50 microns) to be applied within 4 hours of blast cleaning. b. 1st coat of finishing zinc rich spray painting (DFT-75 microns) of CORECOAT ZRC 3- component system. c. 2nd coat of finishing zinc rich spray painting (DFT-75 microns) of CORECOAT ZRC 3- component system. d. Final coat of High Build Epoxy finish paint (DFT-100 to 150 microns) of CORECOAT FC 150. e. Minimum DFT shall not be less than 300 microns. (v) Application of primer and finish coats The time interval between each coat and application procedure and other details shall be as per manufacturers specification. (vi) Freedom from defects The zinc coating shall be uniform, adherent, reasonably smooth and free from such imperfections as flux, ash patches, black spots, pimples, lumpiness, runs, rust stains, bulky white deposits etc. (vii) Applicability of agreed technical specification This Technical Specification covers for zinc spray painting of Stop Log Gates, screens & corresponding guides only, other technical parameters described in Technical Specification for Civil, structural and Architectural works specified elsewhere, shall remain unaltered. (b) The stop log units shall be operated under balanced head and they shall be designed for maximum water head to which they shall be subjected to. The stop log shall be used only for the maintenance/

	inspection of pumps. These are not to be designed for lowering under flowing water. The stop log shall be operated by means of monorail trolley with electric rope hoist and a lifting beam, which shall engage and disengage automatically with stop log in required position. Lifting beams shall be designed and fabricated by the Bidder in coordination with the manufacturer of monorail with electric hoist. The structural design of stop log shall conform to IS: 5620. (c) Trash racks shall be installed in vertical position. Trash racks shall be designed for differential head of 1 m of water column. Each unit of trash rack shall consist of vertical square bar and horizontal square bar of minimum size 10 mm square from durability point of view. The grating shall be pressure locked. Size of the openings for the trash racks shall be 100 mm x 100 mm (clear). All trash racks should be capable of being lowered in the associated stop log grooves to enable drawal of clean water while a particular trash rack is raised for cleaning purposes. Details of block-outs to be provided in structural concrete for stop logs and trash racks shall also be shown on the drawings. (d) All the design computations and drawings for the structural and mechanical parts including hoist supporting structure and connections of various components for stop logs and trash racks shall be submitted by the Bidder for approval of the Owner before the manufacture is taken up. Detailed drawings of mechanical parts such as wheels, wheel parts, hoists and various component parts of the hoists shall also be supplied along with calculations. (e) Bidder shall prepare all necessary shop drawings for the fabrication of stop log/trash rack and shall be responsible for the correct fitting of all parts. Any fabrication done before the shop drawings are approved, shall be at the Bidder's risk. The Owner shall have the right to instruct the Bidder to make any change in the Bidder's fabrication details, which may be necessary in the opinion of the Owner to make the finished construction conforming to the requirements and intent of these specifications without additional charges to the Owner. Fabrication shall conform to the requirements of the relevant Indian Standards.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1

(f) Approval of the Bidder's drawings by the Owner shall not relieve the Bidder of any part of the Bidder's responsibility to meet the requirement of these specifications, or of the responsibility for the correctness of the drawings. The Bidder shall furnish the Owner for record purposes complete sets of the final shop drawings from which the stop logs/trash racks etc. have actually been fabricated. Dimensions, tolerances, types and grades of materials and various component parts shall be shown in sufficient detail to enable the Owner to make a complete review and thoroughly check the drawings. (g) All components of stop logs and trash racks covered under this specification shall be subjected to inspection tests by Owner during manufacture at works. Shop tests shall include all tests to be carried out at Bidder's works of his sub-bidder and at works where raw materials are supplied for manufacture. The tests to be carried out shall be included but not be limited to the tests described herein. (h) Bidder shall conduct all tests according to relevant I.S. or according to relevant British/American Code of Practice in the absence of suitable I.S. Code to ensure that all the components and accessories of stop logs, trash racks, bulk heads, hoists etc. to be supplied as per the contract are confirmed to the requirements of this specification. The accessories e.g. bearings, couplings, etc. shall be subjected to tests as per Manufacture's Standard. The applicable test reports/ certificates shall be submitted to Owner. (i) Tests on motors shall be conducted as per latest revision of IS: 325 and IS: 4029. Tolerance in dimensions shall be within the limits as prescribed in the relevant I.S. Codes and Standards. Surface defects shall be removed as required by the relevant Standards. All local repairs, grinding or machining shall be smoothly blended into the surrounding surface. (j) Complete stop logs, trash racks including exposed surfaces of hoists, gear housing, shafting bearing pedestals, base plates and other machinery shall be fully galvanised. (k) After the equipment has been installed in the field, it shall be operated and tested by the Owner and when so operated and tested, it shall

	meet all the requirements of specifications and drawings. The gates shall be raised and lowered several times for their full length of travel. The primary requirements for acceptance shall be that each stop log operates smoothly and guarantees satisfactory water tightness. Any equipment required for inspection and testing shall be provided by the Bidder and no such equipment shall be supplied by the Owner. All defects detected during testing shall be repaired to the satisfaction of the Owner. After completion of all installations, the frames and guides etc. shall be thoroughly cleaned of dirt, dust, rust and concrete spoils or other foreign materials. (l) The stop logs shall be thoroughly cleaned with particular attention being paid to bearing and seating surfaces. The mechanical hoist equipment shall be properly lubricated. Each set of stop logs, Bulkheads and Trash Racks shall be tested under dry conditions and under full water load conditions, by traversing the item concerned from its extreme raised position to full seating position and return at least thrice. (m) Upon successful completion of such tests, final acceptance shall be made by the Owner. But before a completion certificate is issued by Owner, the Bidder shall have to remove from the area of operation, on which the work has been executed, all scaffoldings, surplus materials, rubbish and other materials. If the Bidder fails to comply with this requirement, the Engineer shall get it done by other agencies at Bidder's Cost. (n) The Bidder shall strictly follow at all stages of fabrication, transportation and erection of steel structures, raw materials and other tools and tackles, the stipulations contained in the Indian Standard Safety Code for erection of structural steel work IS : 7205. Local Statutory labour safety regulations are also applicable. (o) The Bidder shall furnish to the Owner a complete and unused set of all special tools and tackles, which are necessary or convenient for erection, commissioning, maintenance and overhauling of any of the equipment provided under the specification. The tools shall be shipped or transported in separate containers clearly marked with the name of equipment for which they are intended.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 155 of 639
4.12.1 Transferring/Pressuring Pump House The super structure of the pressuring & transfer pump house shall be of RCC framed structure with brick cladding around these pump houses. A separate maintenance bay and MCC/Control room shall also be provided in these pump houses. 4.12.2 Pipe/Cable Trestles and Foundations Four legged trestles and foundations are to be provided for supporting the pipelines/cables at suitable intervals. Cross overs, operating platforms and necessary thrust resisting arrangement at pipe bends shall be provided as required. 750 mm wide platform shall be provided as a walkway along the length of the trestles. 4.12.3 RCC dyke wall of minimum 1.25m clear height above finished ground level shall be constructed around HFO & LDO day tanks as per system requirement specified in mechanical specifications for fuel handling system. All civil, structural & architectural works not specifically mentioned but required for satisfactory completion & commissioning of fuel oil handling system are included in the scope. HFO, LDO tank shall be supported on sand bitumen pad with ring wall. 4.13 <u>AUXILIARY PLANT/NON PLANT BUILDINGS</u> List of Auxiliary plant/Non plant buildings is given in clause No.3.0 of this section. In Auxiliary plant, miscellaneous building will be of RCC construction, excepting CW and ACW pump house superstructure. In Non plant, all buildings will be R.C.C construction excepting workshop, watch tower etc. Roof of all building shall be cast-in-situ R.C.C slab with removable shuttering. Workshop, watch tower will be of structural steel construction.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

4.14 <u>PIPE/CABLE TRESTLES AND FOUNDATIONS</u> All cables & pipes in outdoor area shall run above ground over steel trestles or other supporting structures for easy inspection & maintenance except in Transformer Yard area, Switchyard area and some other localized area where the same can run in R.C.C. trenches. In case over ground routing is not feasible due to site constraints, the pipe/cable to be routed through duct-banks subject to the Approval of the owner. A minimum clearance (clear head room) of 8.0m shall be kept for all over ground pipe/cable trestles for all road/rail crossings. In other areas the clear height shall be 4.0m (minimum) from ground/grade or crest of the road whichever is higher. All trestles shall be provided with continuous walkway of minimum 750 mm clear width with handrail and toe-guards all along the length of the trestle along with approach ladder near roads, passageways etc. Before and after the rail/road crossing, a barrier of suitable height shall be constructed so as to prevent the approach of cranes (having height more than 8.0m) etc. up to the pipe/cable rack trestles. Trestles & foundations are to be provided for supporting the pipe/cables at suitable intervals. Four legged trestles are to be provided mainly at intercepting location of branch pipe rack (max. distance 100m). Crossover, operating platform & necessary thrust resisting arrangement at pipe bend shall be provided as required. 4.15 <u>ROADS</u> Main access roads to the power plant shall be from National Highway NH-6. All plant service roads of this package will be partly RCC road on sub grade and partly Bituminous concrete road laid over water bound Macadam on sub grade providing access to all truck sized building doors and all structures requiring maintenance by vehicles. Extent of different types of road shall be as shown in drawing. RCC pavement will be provided at areas requiring parking facilities. Bituminous topping of all bituminous plant road shall be done after completion of plant construction and maintenance of such road till such time shall be in scope of contractor.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 157 of 639
	(a) All Roads shall be designed in accordance with the provision of the latest edition of the relevant I.R.C. codes of practice. (b) For concrete road, the sub-grade shall be prepared with well-compacted selected soil/earth to achieve 95% of the standard density at optimum moisture content. Sub-base shall be 300mm thick rubble soling for filled/loose soil and 150 mm thick for cutting area (consolidated thickness). Over that 150mm thick WBM laid in two equal layers shall be applied and then dry lean concrete M-15 of 100 mm thick shall be applied. Top concrete slab shall be M-35 as per design thickness with bottom 125 micron polythene sheet. All above shall be as per 'MORTH' specification. (c) For bituminous road, the sub grade shall be prepared with well-compacted selected soil/earth to achieve 95% of the standard density at optimum moisture content. Sub base shall be 300 mm thick (consolidated thickness) with murrum/selected soil/crushed stone (grading-1), 300mm thick rubble soling for filled / loose soil and 150 mm thick for cutting area (consolidated thickness) and 100 mm thick well compacted cushion of murrum/selected soil. The wearing course shall be 75 mm thick bituminous macadam binder course with 10-12 mm seal coat laid on 150 mm thick (compacted thickness) water bound macadam course in two equal layers. (d) All roads as shown in shall have to be constructed as per the technical specification. However, additional roads and access to individual buildings/structures/facilities within scope of this specification which are not specifically shown in layout but required from functional requirement shall be provided by the Bidder. Minimum carriageway and shoulder width shall be as per the drawing enclosed with bid documents. Shoulders width shall be added to the carriageway widths to obtain minimum roadway widths.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 159 of 639
collection and further reclamation of oil through oil water separators, if necessary. Drains shall be adequate to remove full discharge from deluge system used for fire control. Transformer Yard shall be paved with reinforced cement concrete of minimum 150 mm thickness (requirement of reinforcement shall be same as given for Boiler area pavement). Rail track embedded in concrete pavement and/or roads in transformer yard for movement of transformer and in front of A row for movement of generator stator shall be in the scope of Bidder. 4.17 DRAINAGE SYSTEM Yard Drainage System Scope of drainage shall include following (a) Drains surrounding the buildings and systems and work area within the scope of this specification. (b) Interconnection of drains with the existing/plant water drainage system/main outfall location Drain shall be of RCC construction. Necessary structures shall be provided for crossing of roads/water ways on the way. Storm water from drainage system in Sl. No. (a) and (b) above, shall be led into Rain water harvesting pond . Drains shall be designed as a network covering the plant area as per specification. This plant area drainage shall be led into rain water harvesting pond. Attempts will be made to convert construction drains into main drain as far as practicable. Auxiliary/Branch drains shall cover individual grades to terrains; collect storm water and other non-contaminated discharge from plant buildings and then be connected to Main drain /main out fall at suitable locations. The

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 160 of 639
invert of the in-plant peripheral drains shall be kept such that water can be discharged by gravity to the main/trunk drain under all condition. RCC pipe culverts/box culverts will carry drainage under intercepting roads and railway tracks. Effluent drains shall completely be separated from storm water drain. Suitably designed underground storm water RCC piping on the basis of design loads specified elsewhere in this specification shall be limited to required areas where surface drainage ways are not desirable or practicable from other functional point of view. Class of RCC pipes shall be decided by Bidder as per design requirement. For pipe drains, concrete pipes of minimum grade – Class NP2 will be used. However, for road concrete pipes of Class NP3 will be used and for rail crossing, railway norms shall be followed. R.C.C. Manholes will be provided at maximum 30m intervals along the length, at connection points and every change of alignment, gradient or diameter of pipeline. The drains shall generally be of open type RCC rectangular construction. R.C.C. drains shall be covered with perforated R.C.C. pre-cast slab (M-25) of minimum 75mm thickness with provision of openable galvanized steel grating covers at every 4.0m intervals. Similarly, all drains along the periphery of buildings shall also have perforated R.C.C. pre-cast slab (M-25) of minimum 75mm thickness with provision of openable galvanized steel grating covers at every 4.0m intervals. Design of such drain covers shall be done considering loading as per Cl. No. 3.1.2.1 (d) Vol. VI-A/S-II of Specification. In areas where vehicular loads would be coming, pre-cast RCC covers of suitable thickness without perforations and designed for the vehicular loads shall be provided. In Boiler and ESP area, drains shall be provided with galvanized steel grating. For areas covering vehicular movement, pre-cast covers shall be provided. The width of the pre-cast planks shall be so designed that it can be easily handled during maintenance period. Grating shall be as per Cl. No. 5.0 of Vol. VI/A / S-III. The storm water drainage shall also cater for discharge of treated waste water.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 161 of 639
The drainage system shall be designed taking into account runoff resulting from 1 hr rainfall intensity with a return period of 100 years. These values are based on the recommendations of the Indian meteorological department. Run-off coefficient for open ground area (unpaved) shall be minimum 0.80 and for paved area and other covered surface including roads the same shall be considered as 1.0. Surface drains will normally have a slope of 1 IN 1000 along longitudinal direction and RCC pipes to have such slopes such as to have effective discharge. RCC or masonry structures will be provided at drops/falls to prevent scouring. Drops/falls shall be provided on both sides of box/pipe culverts. Minimum self-cleansing velocity should be adopted as 0.7m/sec but the velocity of flow should not be more than 2.4 m/sec for concrete drain, however, it is recommended to maintain the maximum velocity within 1.2 m/sec. Open RCC rectangular drains shall be provided for storm water. The thickness of sides & bottom shall be minimum 100 mm or as per design considerations whichever is higher. RCC culverts shall be provided for road and rail crossing. Drains shall be provided on both sides of the roads Inside surface of the drain will have smooth neat cement finish over screed concrete. Invert of the drain shall be decided in such a way that the water can easily be discharged to the recommended nearest main plant drainage system. The minimum slope of the drain shall be 1:1000 longitudinally to take care of the silting problems. 4.18 <u>SANITARY SEWERAGE SYSTEM</u> Sewers shall be designed for a minimum self-cleansing velocity of 0.75 m/sec and the maximum velocity shall not exceed 2.4 m/sec and shall be connected to sewerage treatment plant. Manual on Sewerage and Sewage treatment (published by Central Public Health Environment Engineering Organization, Government of India) shall be followed for design purpose. Plant effluents shall be handled in separate drains/ pipes. The plant effluent		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 162 of 639
drain shall not be mixed with storm water drain or sewer lines. Two types of system shall be adopted for this purpose: 1) Centralized sewage treatment plant along with pipe networking system for transfer of sanitary sewage from different plant & non-plant buildings to sewage plant inside plant boundary 2) Septic tank, up flow filter, chlorination, soak pit arrangement for the buildings (mainly at ash dyke area) required for plant operation outside plant boundary 4.18.1 Sewerage Transfer/Treatment System: Extra heavy Cast Iron pipes shall be used for sanitary work below ground as per IS: 1536. Heavy duty Cast iron pipes shall be used for sanitary work above ground level. Inspection chambers and gully trap chambers shall be in solid fly ash brick construction and manhole spacing shall not exceed 20 m. (a) System The system shall be designed on the principle of "TWO PIPE SYSTEM" having two separate vertical pipes namely Main Soil Pipe (MSP) and Main Waste Pipe (MWP) receiving waste from number of Branch Soil Pipe (BSP) and Branch Waste Pipes (BWP). A BSP either shall have only one W.C. to be connected to MSP or it shall receive discharge from number of urinals to be connected to MSP. A BWP shall receive waste from washbasins, baths, sinks, cooler areas, etc. Floor traps shall be provided to receive waste from waste pipes of various fixtures (except from W.C. which shall be directly connected to MSP) and at locations where wastewater is to be drained out.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 163 of 639
A MSP shall be directly connected to first manhole of an outside sewer. A MWP shall be discharged into first manhole through a gully trap. All vertical stacks and ventilating pipes shall be carried to a height of at least 1.5 meters above parapet and shall be provided with cowl to top. (b) Sizing Minimum size of BSP receiving discharge from W.C. shall be 100 mm up to MSP/first manhole. Minimum size of BWP shall be 80 mm. Minimum size after gully trap up to first manhole shall be 100 mm. (c) Gradients: The gradient of a horizontal branch shall normally be 1 in 40 but in no case it shall be flatter than 1 in 50 and steeper than 1 in 10. Non-silting and non-scouring velocity shall be maintained. 4.18.2 Sewage Treatment Plant Centralized Sewage treatment plant is to be provided by the contractor. Anticipated number of users may be considered as 650 for design purpose. The contractor shall have to provide complete arrangement for sewage disposal up to sewage treatment plant as far as possible by gravity. Wherever, the flow by gravity is not possible, the effluent shall be transferred by pumping. All this arrangement is included in the scope. Centralized sewage treatment plant shall be with extended aeration method followed by disinfection by chlorine and necessary filtration before reuse. The contractor shall make arrangement for utilizing the treated water for gardening and plantation, along with necessary pumping and piping of required size/ capacity for recycling the treated effluent. The water generated from canteen shall also be taken in to centralized sewage treatment plant. Before canteen sludge enters the sewage treatment network pipe tank, suitable screen and oil trap shall be provided.

4.19 <u>AREA GRADING</u> The levelling/dressing of plant area as necessary shall be within scope of this contract. Work shall have to be carried out as per grading layout plan approved by the Owner/Owner's Consultant. 4.20 <u>FENCING</u> Fencing with gates shall be provided around transformer yard, fuel oil area and other areas wherever necessary due to security, safety, and statutory requirements as per following specifications. The fencing, with gate (unless specified otherwise) shall comprise of PVC coated G.I. welded wire mesh fencing of minimum 4 mm diameter (including PVC coating) of mesh size 75 mm X 75 mm of height 2.4 m above the toe wall with a 600 mm high galvanised concertina at the top, such that total fence height of 3.0 m above the toe wall is achieved. The diameter of the steel wire for chain link fence (excluding PVC coating) shall not be less than 2.5 mm. The PVC coated chain link shall be stretched by the clips at 0.5m intervals to three strands of galvanised high tensile spring steel wire (HTSSW) of 2.5 mm diameter interwoven with chain link wire mesh and kept under tension which in turn are attached to the fence post with security nuts and bolts. On every fourth post a clamping strip shall be threaded through the links of chain link and bolted to the fence post with the help of security nuts and bolts. Above the chain link a 600 mm high tensile serrated galvanized wire (HTSW) concertina made with wire diameter of 2.5mm shall be stretched to 6m and attached to two strands of galvanized HTSSW of 2.5 mm diameter by means of clips at 1m intervals. These two HTSSW strands shall be attached to the fence posts with 12 mm security fasteners. All nuts, bolts, fasteners, clamping strips, clamps, clips, etc., shall be galvanized. All fence posts shall be of 75 x 75 x 6 MS angles spaced at 2.5m c/c distance. All corner posts shall have two stay posts and every tenth post shall have transverse stay post. Suitable R.C.C. foundations for the post and stays shall

be provided based on the prevailing soil conditions. All posts of fencing shall be painted with chlorinated rubber paint over a suitable primer. Toe walls either of brick masonry with bricks of minimum 50 kg/sq.cm. Crushing strength or of hollow concrete block masonry shall be provided between the fence posts all along the run of the fence with suitable foundation. Toe wall shall be minimum 200 mm above the format on level with 50 mm thick P.C.C. coping (1:2:4) and shall extend minimum 300 mm below the formation level. Toe wall shall be plastered with cement sand mortar (1:6) on both sides and shall be painted with two coats of textured cement paint (Sand tax Matt or equivalent) of approved color and shade. Toe wall shall be provided with weep holes at appropriate spacing. 4.21 GATES All gates shall be of structural steel of minimum 3.75 metres clear width for single lane access road and 7.75 m clear width for double lane access roads. The height of gate shall be same as that of the fence. Each gate shall have provision for wicket gate of size 1.0 m x 2.1 m. The gate frame and post shall be fabricated from medium class MS pipe of nominal diameter not less than 75 mm. The panel plate shall be of minimum thickness 2.5 mm conforming to IS: 513. The gate shall be complete with fabricated hinges, MS aldrops with locking arrangement, tempered steel pivot, guide track of MS tee, bronze aluminium ball bearing arrangement, castor wheel etc. 5.0 DOCUMENT SUBMISSION The bidder shall submit detailed design basis report for the civil structures on which designs shall be prepared and submitted for scrutiny and approval. Design and Construction documents pertaining to all Civil, Structural and Architectural works that will be required to be submitted to Owner/Owner's Consultant/Review Consultant for their approval have been brought out under following clauses. Approval of these documents by the Owner/Consultant shall not relieve the Contractor of his responsibility for any errors and fulfilment of Contract requirements. The actual design of individual structure shall commence only after approval of the related mechanical G. A.

drawing. 5.1 <u>DESIGN DOCUMENT</u> Design Document shall comprise Mechanical/Electrical assignment Drawings, design data, design basis report & references, detailed structural analysis (including computer out put, if any) & design calculations and design drawings. Design calculations and drawings shall be submitted and reviewed only after approval of corresponding Mechanical/Electrical/System general arrangement drawings. The contractor shall submit approved GA drawings along with three (3) copies of design documents (except design drawings) and eight (8) copies of design drawings for comments/approval of the Owner /Consultants. Soft/electronic copy of 2D and 3D analysis file and drawing shall be submitted with first submission. Procedure of approval will be as stated in Volume:II. On final approval of the drawing and design, Contractor shall submit three (3) copies of design calculation and twelve (12) copies of the drawing with one soft copy in CD each to the Owner and consultant for distribution. Soft copies of input data/STAAD file shall invariably be forwarded to the owner for scrutiny of the design calculations. The contractor shall submit related extracts of the code/standard to the owner/his consultant for ready reference in case he uses any foreign code / standard 5.2 <u>CONSTRUCTION DOCUMENT</u> Based on approved design drawing, detailed drawings for construction will be prepared by the Contractor. For reinforced concrete structures and foundations detailed bar bending schedules in approved format shall accompany each detailed drawing. For structural steel work the Contractor will prepare detailed fabrication drawing along with bill of materials. Six (6) copies each of selected or all detailed drawings/ fabrication drawings as decided by Engineer for all structures along with bar bending schedule/

bill of materials need be furnished to Owner/Consultants for their review and approval. Procedure of approval shall be as stated in Volume: II. Upon approval, eight (8) copies of each drawing along with one soft copy in CD shall be submitted to the Owner and Consultant for their distribution. Procedures for submission and approval of Construction Documents other than stated above have been mentioned in Volume: II and elsewhere in this specification. 5.2.1 As Built Drawings "As-built" drawings shall be prepared by the Contractor after completion of construction/erection incorporating all the changes, if any, done on Engineer's instruction/approval. After completion of construction, Contractor shall submit eight (8) copies of all the drawings, irrespective of any changes during construction, marked "As Built" with one soft copy in CD each to the Owner. 5.3 Guidelines for preparation and submission of drawings: (a) paper size : A0/A1 (b) Fonts : Appropriate to suit the size of the drawing 6.0 <u>LAYOUT</u> Before starting the work, the Contractor shall carry out the setting out of foundation and structures and provide levels, with reference to general existing grid and benchmark. If the Contractor uses the grid, benchmark and reference pillar made by other Contractors, he shall co-ordinate with the Contractor and shall satisfy himself of the accuracy of the reference marks. If he is required to set out the foundation afresh, he shall do so independently with reference to the one existing grid and benchmark, which has been followed by other agency at the instruction of the Engineer. In case any discrepancy is found, it shall be immediately brought to the notice of the Engineer for any rectification/modification necessary. No complaint shall be entertained at a later stage. The Contractor shall accurately set out the position for holding down bolts and inserts.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 168 of 639
If required, in the option of the Engineer, he shall construct and maintain pillars for grid, references and benchmarks and maintain them till the completion of the construction. He shall also help the Engineer with instruments, materials and labours for checking the detailed layouts and levels. The Contractor shall be solely responsible for the correctness of the layout and levels, and Engineer's approval shall not be deemed to imply any warranty in carrying out the works correctly. The Bidders shall take into account the cost of these in quoting their price. 7.0 <u>WORKMANSHIP</u> Workmanship shall be of the best possible quality and all work shall be carried out by skilled workmen except for those which normally require unskilled persons. Welding shall be done by experienced and certified welders in proper sequence using necessary jigs and fixtures. Fabrication shall be done in shops having proper equipment for accurate edge lanning and milling of column shaft ends, base plate surfaces etc., and shaping and dimensioning of anchor bolt assembly, inserts and other misc. items. In addition to the requirement specified above, if the bye- laws of the local Govt., Municipal or other authorities require the employment of licensed or registered workmen for various trades, the Contractor shall arrange to have the work done by such registered or licensed personnel. In case of manufactured materials, the Contractor shall have, with no additional cost to the Owner, the services of the supervisors of the manufacturers to ensure that the work is being done according to the manufacturer's specifications. 8.0 <u>TEMPORARY WORK</u> All scaffoldings, staging, temporary bracing and other necessary temporary work required for proper execution of the Contract shall be provided by the Contractor at his own cost and inclusive of all materials, labour, supervision and other facilities. The layout and details of such Temporary work shall have the prior approval of the Engineer, but the Contractor shall be responsible for proper strength and safety of the same. All Temporary work shall be so constructed as not to interfere with any permanent work or with the work by other agencies. If it is necessary to remove any of the temporary work at any time to facilitate execution of the work or with the work of other agencies, such removal and

re-erection, if required, shall be carried out by the Contractor at the direction of the Engineer without any delay and any extra cost on this account shall be borne by the Contractor. 9.0 <u>INTERFACE WITH STRUCTURES UNDER OTHER'S SCOPE</u> Modification in layout of foundation/structure during detail engineering stage may be necessary to avoid fouling with those under other's scope. Necessary changes on this account will be made without any extra cost to Owner. 10.0 <u>SEQUENCE OF WORK AND PROGRESS REPORT</u> The sequence in which the works are to be carried out shall be as approved by the Engineer in accordance with the construction method accepted by the Engineer and to be followed by the Contractor. A programme of work is to be submitted for the Engineer's review and approval and this has to be periodically updated and modified as per actual progress to enable timely completion. The Contractor shall regularly submit to the Engineer progress reports for periods of working as specified by the Engineer showing up to date progress on all-important items of work. The contractor shall prepare and submit the sequence of works and submit the same to the Engineer-in-charge for approval. Any changes / suggestions by the Engineer-in-charge shall be accommodated in the works scheduled and a fortnightly review shall be taken to ensure desired progress of work. The contractor on such review shall submit beforehand the programme of works he intends to take within the next fortnight for consideration and approval of the Engineer-in-charge. It shall be the responsibility of the contractor to make sure that the raw material/ingredients/equipments are available well in advance before the works are taken up. Delay on accounts of non-availability of raw material/ingredients/equipments shall be to the contractor's account and no relief / compensation such as extension of time limit etc. shall be granted on such grounds.

1.0 <u>INTRODUCTION</u> This section outlines following: 1.1 Soil Characteristics. 1.2 Design considerations for Reinforced Concrete Structures. 1.3 Design considerations for Foundations. 1.4 Roads. 1.5 Quality assurance and quality control 2.0 <u>SOIL CHARACTERISTICS</u> Preliminary geotechnical investigation work is carried out at site by the Owner. However soil characteristics and parameters to be adopted in final design, the contractor is required to do detail geotechnical investigation work as part of the contract to verify/generate data so required. The cost of such work shall be deemed to have been included in the contractor's quoted price. It should be noted that nothing extra whatsoever on account of variation between soil data annexed in this specification and that found by detailed geotechnical investigation to be carried out by bidder shall be payable. 3.0 <u>DESIGN LOADS</u> All structures and portions thereof shall conform to the latest revision of relevant Indian Standard specifications and also to the various other technical requirements. Any structure, which carries Indian Railway Loading or is situated in the vicinity of Railway Lines, the design has to conform to the Indian Railway Standard Specifications and approval must be obtained from Railway Authority including the clearance etc. All structures shall be designed to sustain within the stress limitation as specified in the Code, all dead loads plus assigned live, equipment, wind, seismic or other design

loads.

3.1 LOADS

3.1.1 Dead Loads

Dead load shall include the weight of all structural components and architectural appurtenances incorporated in the structures plus hung loads and any other permanent, externally applied load. This should also include equipment dead load. The content of tanks, silo, bins and hoppers shall be measured at full capacity for this purpose. Hung loads and the contents of tanks, silo, bins, and hoppers shall be listed separately so that they can be excluded from dead load when dead loads are acting as stabilizing loads for uplift. For Chimney all permanent loads due to the weight of chimney shell internal platform & lining supported on them. flue duct, staircase other accessories etc.

The following unit weight of material shall be considered for computation of loads. Loads given in IS:875 (part-I) shall be made use of for material not listed below:

Materials	Unit weight
(a) Reinforced Cement Concrete :	25.0 kN/cum
(b) Plain cement concrete :	24.0 kN/cum
(c) Structural steel :	78.5 kN /cum
(d) Brick work :	19.0 kN /cum
(e) Cement plaster :	21.0 kN /cum
(f) Floor Finish :	24.0 kN /cum
(g) Coal :	12.0 kN /cum
(h) Fly Ash :	16.0 kN /cum
(i) Bottom Ash :	16.0 kN /cum

3.1.2

Live Loads

Live loads in different areas shall include dust loads, minor equipment loads, cable trays, small pipe racks/hangers, operation/maintenance loads etc. The loads considered shall not be less than those specified in IS: 875 (Part II).

The loads listed hereunder are minimum loads for the areas involved. Special use areas shall be investigated and loading revised upward as necessary.

Hung loads shall be based on minimum loading equivalents of 1.0 kN/ Sq.m for piping and 0.5 kN/Sq.m for electrical, ventilation and air conditioning. Loadings resulting from concentrations of facilities in specific areas shall be substituted where listed base loading is excluded.

3.1.2.1

All Buildings

(a)

Roofs:

(i)

Inaccessible roof (Flat):

1.5 kN/Sq.m + hung loads, if any + 0.5 kN/Sq.m (dust load).

(ii)

Accessible roof where equipments are placed

5 kN/Sq.m + hung loads, if any + 0.5 kN/Sq.m (dust load)

(iii)

Accessible roof without equipments

1.5 kN/Sq.m + hung loads if any + 0.5 kN/Sq.m (dust load).

(iv)

Inclined roof

As per IS : 875 (Part 2)

(b)

Stairs & Platforms

5.0 KN/Sq.m

(c)

Corridors

5.0 KN/Sq.m

(d)

Removable gratings, chequered plates walkways etc.

5.0 KN/Sq.m

(e)

Office, Laboratory Conference rooms and

5.0 kN/Sq.m

3.1.2.6 Non Plant Buildings (a) Floors with equipment 10 kN/Sq.m (b) All other floors 5 kN/Sq.m 3.1.2.7 Underground Structures/Trenches/pits Minimum surcharge shall be 20 kN / Sq.m. For structures in vicinity of roads and heavy vehicular movement, surcharge shall be considered as applicable as per loading specified elsewhere in this specification. Trenches/pits inside building shall be designed for a surcharge equal to Live Load intensity of Ground Floor or 15 kN/Sq.m whichever is greater. In Boiler area and other outdoor areas within Power Block, the minimum surcharge shall be 20 kN/Sqm. 3.1.2.8 Covers for Trenches/Channels Self-weight of top slab and a uniformly distributed load of 4.0 kN/Sqm on each panel or one 0.75 kN central point load, whichever is critical, shall be considered. At road crossings, the covers shall be designed for vehicular movements as per IRC standards. 3.1.2.9 Roads Design of roads shall be in accordance with Indian Road Congress standard, IRC 37. 3.1.2.10 Road Culverts and its allied structures including R.C.C. Pipe Crossings & Road Crossing of Trenches shall be designed for Class `AA` loading (wheeled and tracked both) and to be checked for Class `A` loading as per IRC standards. 3.1.2.11 Railway Supporting Structures, Rail Culverts (a) Railway supporting structures and rail culverts shall be designed as per Railway Bridge Rules.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 183 of 639
Reduction in Live load as per provision of IS: 875 shall not be permitted. (b) The areas covered with equipment shall be designed on the basis of weight of equipment (flooded/operating) in addition to an uniform live load of 5.0 kN/Sqm or specifically defined live load whichever is greater. Foundations and fixing arrangements for items of equipment, which generates vibration, shall be designed to prevent transfer of such vibrations to the adjoining structures. For loads caused by moving equipment over the floor for installation, consideration shall be given to the shoring of beams and floor, from floors below. 3.1.3 Equipment Loads (a) Loadings (both static and dynamic) of major equipments, including boiler, turbine-generator, boiler feed pumps, feed water heaters, de-aerator, PA, FD & ID fans, Coal Mill ,Chimney, Ash handling Plant, Coal handling Plant, Cooling Tower obtained from the manufacturer's certified drawings of the specified equipment to be furnished. Where design of structures supporting minor equipment other than those included above has to proceed, the loadings shall be estimated from similar jobs or catalogue data. (b) All equipment, tank and piping design loadings shall include Hydraulic Testing loads. (c) Air and gas duct loadings shall include weight of insulation, duct attachments, dust accumulation loads, seismic, wind and other loads as applicable. (d) Crane girders and supporting columns shall be designed for vertical and horizontal forces (including impact forces) as developed from the crane weights and wheel loads. Unless otherwise specified, the vertical and horizontal loadings shall conform to the applicable sections of the IS specifications.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 184 of 639
	(e) Weight of equipments, ducts, tanks, pipes, conduits etc. supported by structure shall include maximum possible loading conditions i.e. flooded material contents and associated impacts, test loadings, anchorage and constraint effects. (f) All structural components shall be designed to accommodate anticipated concentrated loads which will or may be applied during the life of the plant. Where both concentrated and uniform loads cannot act simultaneously, the structure or component shall be analyzed for both conditions of loading and shall be designed for most critical condition. (g) Jet forces resulting from guillotine type pipe ruptures shall be considered in the design, if it is of high magnitude. Jet force to be considered shall be equal to the product of the pipe cross section and the internal design pressure applied on an area equal to the pipe cross section. (h) Lay down areas in the Turbine Hall shall be investigated for concentrated loads resulting from equipment components to be stored during erection and maintenance operation. Where live load allowance is inadequate to permit storing of such equipment components, the design live load shall be increased to permit such use or the area shall be restricted by identifying lay down areas for specific components, each area to be identified by permanent marking.	
3.1.4	Wind Loading Wind loading shall be in accordance with Indian Standard Code IS: 875 (Part 3) for a basic wind speed of 39m/sec. Terrain Category-2 shall be considered for all structures. Risk coefficient (k1) shall be considered as 1.07 for all structures.	
3.1.5	Seismic Loading The lateral forces shall be established in accordance with the recommendations of IS-1893. The site falls in Zone-III as identified in the map	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 185 of 639
of IS 1893:2002. Importance factor (I) shall be taken as 1.75 (Table 2 of IS 1893 (PART IV): 2005). Under earthquake condition, the whole frame except roof shall be assumed loaded with 50% design live load. No further reduction in column live loads shall be considered. In view of the asymmetrical nature of main powerhouse, response spectrum method will be used for analysis. 3.1.6 Temperature Loads The structures shall be designed to withstand stresses due to fifty (50) percent of the total temperature variation. The total temperature variation for temperature loading should be taken as two-thirds (2/3) of the average annual variation in temperature. The average maximum annual variation for this purpose shall be taken as the difference between the mean daily minimum temperature during the coldest month of the year and mean daily maximum temperature during the hottest month of the year. Expansion and contraction due to changes of temperature of materials of a structure shall be considered and adequate provision shall be made for the effects produced as per provision in the relevant IS codes. 3.1.7 Steam Piping Load Minimum intensity of steam piping load shall be 6.0 kN/Sqm for the areas at different levels through which steam piping is routed. However, the bidder shall check the loading as per static/dynamic analysis for steam piping or load data supplied by piping vendor and the worst loading shall be considered in design. Horizontal anchor loads, if any, shall also have to be considered in design. 3.1.8 Earth Pressure Load Earth pressure for all underground structures shall be calculated using coefficients of earth pressure at rest, coefficient of active or passive earth pressure (whichever is applicable). However, for design of substructure of pump house, cold-water basin of cooling water and under ground liquid storage tanks, earth pressure at rest shall be considered. In addition to earth pressure and ground water pressure, surcharge load shall also be considered for the design of all underground structures including		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 186 of 639
channels, sumps, cable & pipe trenches, etc., to take into account the vehicular traffic in the vicinity of the structure. Intensity of Surcharge Load shall be as described elsewhere in this specification. 3.1.9 Crane, Monorail & Elevator Loads Crane girders and supporting columns shall be designed for vertical and horizontal forces (including impact forces) as per crane vender's data. All lifting beams and monorails shall have their design loads increased for impact factor as mentioned hereinafter. (a) Impact Factor: Loads for cranes, hoists and elevators shall be taken as per IS: 875. The minimum impact factor to be used in design shall be as follows: (i) Crane loads : - For vertical force, an impact factor of 25% of the maximum crane wheel load - A lateral crane surge of 10% of the weight of the trolley plus lifted load applied at the top of each rail - A horizontal surge of 5% of the maximum static wheel loads of the crane applied at the top of the rail in longitudinal direction. (ii) Monorail loads - Impact factor of 10% of lifted load of hoist for monorail and support design - Impact factor of 25% of the lifted load for electrical pulley and support design		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 187 of 639
(iii) Elevator: A 100% of the lifted load including elevator live load plus the cab weight for the elevator support beams. 3.1.10 Construction Loads The integrity of the structures shall be maintained without use of temporary framing struts or ties and bracing so far as possible. However, construction or crane access considerations may dictate the use of temporary structural systems. Special studies shall be made and documented by bidder to ensure stability and integrity of the structures during any periods involving use of temporary bracing systems. 3.1.11 Other Loads Stresses imparted to structures due to differential settlements, variation of water table, erection and maintenance load, creep and shrinkage shall also be considered in design of all structures. All Power House columns adjacent to first row of Boiler columns shall be designed for an additional load of 500 kN to account for piping/cable rack loads. All structures situated in the vicinity of railway lines shall be designed conforming to the Indian Railway Standard Specification. 3.1.12 Thrust Load Thrust blocks will be designed against the thrust load from pipelines considering the test pressure in the pipelines 3.2 <u>STABILITY OF STRUCTURES</u> Design shall be checked against buoyancy due to the ground water during construction and maintenance stages for structures like under ground tanks, pits trenches, basements, etc. Minimum factor of safety shall be considered as per latest revision of IS: 3370 considering empty condition inside and ignoring the super imposed loads. For purpose of calculating downward load		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 188 of 639
	due to any overburden, only the mass located vertically above the projected area shall be taken into consideration. All building sub-structures including pump houses shall be checked for sliding and overturning stability during both construction and operating conditions for various combination of loads. Factor of safety for these cases shall be taken as mentioned in IS:456 and other relevant IS codes, subject to the following minimum values. 3.2.1 Factor of safety against overturning due to wind, seismic or other lateral load shall be 1.5 minimum. 3.2.2 Factor of safety against sliding shall be 1.5 minimum. 3.2.3 Factor of safety against uplift due to hydrostatic forces shall be 1.2 and due to any other loads shall be 1.5. Stability of the structure shall also be investigated for loading conditions during construction, repair or other temporary measures. Lower factor of safety may be used for such loading conditions as per relevant IS codes. In case where dead load provides the restoring force, only 0.90 times characteristic dead load shall be considered. Imposed loads shall not be considered as restoring force. Ground water table shall be considered at 1.0 M below ground level in that area for design of foundations and all underground structures. 3.3 <u>LOAD COMBINATIONS</u> While designing consideration shall be given to the following load combinations: (a) DL + LL (b) DL + LL + PL + Equip ± TL (c) DL + LL + PL + Equip + Cb + CtLA ± CS ± TL	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 189 of 639
(d) $DL + LL + PL + Equip + Cb + CtLB \pm CS \pm TL$ (e) $0.9*DL \pm EL \text{ (for DL only)} \pm TL$ (f) $0.9*DL \pm WL1 \pm TL$ (g) $0.9*DL \pm WL2 \pm TL$ (h) $DL + LL + PL + Equip + Cb + Ct \pm EL \pm TL$ (i) (* Appropriate portion of LL which is considered for working out EL shall only be taken) (j) $DL + LL + PL + Equip + Cb + CtL1 \pm (CS1+WL1) \pm TL$ (k) $DL + LL + PL + Equip + Cb + CtL1 \pm (CS1+WL2) \pm TL$ Where the above loads are: PL = Pipe Load DL = Dead loads of structures, floors, walls etc. Equip = Equipment loads LL = General live loads on floors. Cb =Crane Bridge Ct =Crane trolley positioned at middle of bridge CtLA = Crane trolley + Load near one row CtLB = Crane trolley + Load near other row CtL1 = Crane trolley + Half load lifted at centre of bridge CS = Crane surge for full load		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 190 of 639
CS1 = Crane surge for half load lifted WL1 = Wind load from left to right WL 2 = Wind load from right to left EL = Earthquake load TL = Temperature load Appropriate impact factor shall be considered as per IS: 875 (Part 2) - 1987 while calculating crane loads. In calculating wind loads, appropriate internal thrust/suction shall be considered along with external pressures as per IS: 875 (Part 3) - 1987. All possible load conditions considering external and internal pressures shall be considered in analysis and design for each combination number (f), (g), (j) & (k) above to assess worst effect on whole structure as well as its components. Appropriate allowable increase in permissible stresses as per IS codes, may be taken only under normal loads along with wind and seismic conditions. However, members which are designed primarily to resist wind, no increase in permissible stresses will be permitted. Applicable load factors to be used for design of RCC structures by Limit State Method as per IS: 456. <u>Load Combinations for Underground Structures:</u> Following loading conditions shall be considered in addition to the loading from super structure for the design of sub-structure of pump house, channels, sumps, tanks, reservoirs, trenches and other under ground structures. Only liquid pressure from inside and no earth pressure and ground water pressure, and surcharge pressure from outside (applicable only to the structures which are liable to be filled with water or any other liquid). Earth pressure, surcharge pressure and ground water pressure from outside and no water pressure from inside.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 191 of 639
Base slab of the pump house shall be designed for the condition of different combination of pump sumps being empty during maintenance stages with maximum ground water table. Intermediate dividing piers of pump sumps and partition walls in channel shall be designed considering water on one side only and the other side being empty for maintenance. Design shall also be checked against buoyancy due to ground water during construction and operation stage. Minimum factor of safety as per IS: 3370 against buoyancy shall be ensured considering empty condition ignoring superimposed loads. 3.4 <u>DESIGN CONCEPTS</u> Wind and seismic forces shall not be considered to act simultaneously. For the design of main plant structures during seismic condition, the Deaerator Feed Water Tank shall be considered full up to operating level. However, for other load combinations, Deaerator Feed Water Tank in flooded condition shall be considered. ‘Lifted Load’ of crane shall not be considered during seismic condition. For design of all underground structures/foundations, ground water table shall be considered at 1.0 M below the Finished Ground Level. If R.C.C. floors and roofs except those cast over metal decking are assumed to act as diaphragm transmitting lateral loads to braced bays then main beams/ girders shall be provided with shear connectors. However, whenever large/ more number of cut outs is provided in the floor slab, horizontal floor bracings shall be provided below slab to transfer horizontal force to columns without considering diaphragm action from slab. Shear connectors shall also be provided over beams having R.C.C. slab on one side and opening/ chequered plate/grating on other side. For R.C.C. roofs cast over metal decking, horizontal bracings must be provided below slab to transfer horizontal force to columns. In Turbine Bay, horizontal wind girders between A-row and B-row columns must be provided below Mezzanine and Operating floor at gable ends to		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 192 of 639
transmit wind load from gable columns. PTFE bearing shall be provided where horizontal loads not to be transferred. For calculation of seismic load, equipment load shall be considered as Dead Load. Ultrasonic pulse velocity tests shall be carried out for the top decks of all machine foundations including. T.G deck slab, TG foundation and TG super structure/substructures to ascertain the homogeneity of concrete. In addition, additional cubes (at the rate of one cube per 150 Cu.m of concrete subject to a minimum of six cubes) shall be taken to carry out Ultrasonic Pulse velocity (UPV) testing on the cubes, to serve as reference UPV values. Testing shall be done as per 18:13311 (Part-1). In case of any defect, the EPC Contractor shall rectify the defects suitable using cement/epoxy grout, etc. Whenever any structure under this contract will carry or receive additional load from the work of any other contract, the structures under this contract shall be provided with sufficient margin to carry the above load (like Mill Bay structure, Trestles etc.) details of which shall be finalized during detail engineering. Gratings/chequered plates shall not be considered as restraining members for compression flange of beams/girders. Diaphragm action shall also be not considered in design. Adequate horizontal bracings to be provided. 4.0 <u>DESIGN OF REINFORCED CONCRETE STRUCTURES</u> 4.1 Reinforced Concrete Structures shall be designed in accordance with the requirements of IS-456 & IS-875 subject to the minimum Grades as specified in this specification for all possible combination of loads, e.g. dead load, live load, crane loads, wind or seismic loads, soil loads and surcharge loads. The following minimum grades of concrete as per IS-456 shall generally be considered

3812. Percentage of fly ash to be mixed in concrete shall be based on trial mix and subject to maximum of 25% replacement of cement. Such a concrete (OPC + Fly ash) can be used for all areas other than for the critical structures identified below. Higher grade of Portland ordinary cement namely Grade 43 and Grade 53 conforming to IS: 8112 and IS: 12269 respectively can also be used for specific application. However, the ordinary Portland cement (Grade 43) shall necessarily be used for following structures. (a) TG foundation top deck and sub-structure (b) Spring supported decks of all machine foundations. (c) Other structures subjected to dynamic loading. (d) Crusher top deck and sub-structure 4.4 The design of R.C. Structures shall be carried out by limit state or working stress method as per the provisions of IS-456. 4.5 Concrete tanks/water retaining structures will be designed in accordance with the recommendation of IS-3370. 4.6 <u>GROUTING MATERIAL</u> Grouting shall be done with Conbextra GPX-2 of 'Fosroc' or 'SIKA' for Equipment foundations and Conbextra GP-1 for all structural column bases. For pipe-supports, grouting shall be done with 1:1:2 cement-sand - 6mm down stone chips. 4.7 For reinforcement detailing IS: 5525 and SP: 34 shall be followed. 4.8 The walls shall be provided with reinforcement on both faces for sections 150 mm or more, even if not required from design consideration. 4.9 <u>LIQUID RETAINING/STORAGE AND UNDERGROUND STRUCTURES REQUIRING DRY CONDITIONS</u> All raw/sewage/treated water storage/retaining structures and all underground structures where dry working conditions is required shall be		

CONSULTANT : PROCON ENGINEERS

designed in accordance with IS 3370 limiting the concrete and steel stresses within the permissible limits. The crack width of these structures shall be limited to 0.1 mm. Roof beams and slabs of Pump houses shall be designed as per IS 456. The following structures shall be considered as liquid retaining/storage and underground structures requiring dry working conditions. (a) All RCC raw/sewage water/filter water storage reservoir/sumps. (b) RCC sub structure of Raw water pump house/CW pump house, CW channel and forebay, NDCT basin and outlet channel, clarifloculators, CW pit, CEP pit, underground sub structure of wagon tippler, underground coal conveyor tunnel, underground structures of ETP/STP/WTP. All water retaining/storage structures and all underground structure requiring dry working condition shall be designed assuming liquid up to the height of wall irrespective of provision of any over flow arrangement. Use of PRV to counter uplift shall not be allowed. In all liquid retaining structures leak-tightness shall be ensured and guaranteed. To achieve the same, methodology in design and construction in the way of providing PVC water bars at construction/expansion joints and/or injection grouting, usage of admixture in concrete or any such method should be adopted. All underground water retaining/conveying system structures shall have plasticiser cum waterproofing cement additives conforming to IS: 9103 of 'SIKA', 'FOSROC' make. In addition, limits on permeability as given in contact with soil shall be provided with minimum two coats of bituminous painting of grade 85/25 conforming to IS:702 @ 1.7 kg/sqm (minimum) for water/damp proofing. Storm water drains shall not be provided with bituminous paint and weep holes also shall not be provided in storm water drains. 4.10 <u>EXPANSION/CONTRACTION JOINTS:</u> All expansion joints shall be made of engineering grade polystyrene foam backer rod (circular cross section) at 12 mm depth with minimum density of 22 kg/cum and compressive strength of 0.40 kg/sqm having dia. 25% more		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 196 of 639
than the expansion joint width and filling flexible polyurethane sealant having minimum 25% movement accommodation capacity, to a depth equal to half the joint width. 5.0 FOUNDATION DESIGN The design of foundation shall be carried out by Limit State or working stress method as per the provisions of IS-456: 2000 and on the basis of the soil investigation Report done by the Bidder. Structural concrete for foundation work shall be M-25, unless a higher grade is specified elsewhere in this specification. 5.1 FOUNDATIONS (FOR MAIN PLANT STRUCTURES) Foundations for the main plant structures are those for Power House building columns, Boiler House columns, Mill and Bunker bay columns, ESP columns, etc. Top of RCC foundation for the steel columns shall generally be kept at a lower level so that the column base plates together with gussets and stiffeners remain below the finished floor level. Foundation levels of some columns shall have to be suitably lowered to accommodate underground services, pits, trenches, etc. Common foundation should be provided for columns on both side of the expansion joint and shall be designed for loading on both columns. Foundations for Buildings and structures shall be designed to resist forces and moments, caused by vertical loads and by wind or seismic loads, based on static and dynamic analysis done for those structures. The foundation sections shall be sized and reinforced adequately for moments and shear stresses. 5.2 HEAVY EQUIPMENT FOUNDATIONS Loadings (both static and dynamic) of major equipments such as turbine-generator, boiler feed pumps, PA, FD & ID fans, Coal Mill, crusher foundation etc. shall be obtained from the manufacturer's certified drawings of the specified equipment. Where design of structures supporting minor equipment other than those included above must proceed but the exact

load data is not available, the loadings shall be estimated from similar jobs or catalogue data. The foundations for Turbo generator, Boiler Feed Pumps, PA fans, FD fans and ID fans and Mill shall rest on suitable vibration isolation system consisting of springs and damper (M/s. GERB). However, Coal Pulverisers shall be supported on conventional block foundations. Technical Specification for Vibration Isolation System is attached in Annexure-I of this Section. For static and dynamic analysis of machine foundation following data shall be furnished by the equipment manufacturer. 5.2.1 Loading diagram showing static and dynamic loads and points of application of loads. 5.2.2 Operating speed of m/c, Critical speed of m/c. 5.2.3 Weight of rotating parts, maximum eccentricity of rotating mass from the geometric axis of rotation. 5.2.4 Location of C.G. of machines in all three axes. 5.2.5 Mass Moment of Inertia. 5.2.6 Allowable amplitude/velocity of vibration at machine bearing points. 5.2.7 Temperatures in various areas during operation. Design of foundations for major equipments shall be done in accordance with relevant parts of IS-2974. Unbalanced loads for normal operating condition as given by machine manufacturer and/or VDI 2060 whichever is more shall be used for calculating dynamic response. The dynamic analysis shall consist of free vibration analysis and forced vibration analysis. While designing following aspects shall also be taken care of: (a) The turbine generator, pulverizer and large fan foundations shall be isolated from adjacent structures for vibration control.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 198 of 639
(b) The turbine generator pedestals shall be designed to meet the manufacturer's deflection criteria and other recommendations. (c) Natural frequencies of structures and components shall be away from the running speed of equipment by at least 20% generally but for important ones it shall be away by at least 30%. However, frequency separation criteria and amplitude criteria as laid down in IS: 2974 and /or DIN 4024 and/or VDI 2056 and/or as required by the machine manufacturer, whichever is more stringent shall also be satisfied. A fatigue factor of 2.0 shall be considered for dynamic forces/due to normal unbalance. For design of foundation of large fans etc. provision shall be kept in the foundation for addition of mass/area for retuning of the foundations, if required at a later date. All block foundations resting on soil shall be designed using the elastic half space theory or Barkan's theory. The mass of the RCC block shall not be less than three times mass of the machine and the CG of the combined mass of foundation and equipment should pass through the CG of the base area with tolerance not more than 5%. For the foundations supporting minor equipment weighing less than one ton or if the mass of the rotating parts is less than one hundredth of the mass of the foundation, no dynamic analysis is necessary. However, if such minor equipment is to be supported on building structures, floors, etc., suitable vibration isolation shall be provided by means of springs, neoprene pads, etc. and such vibration isolation system (VIS) shall be designed suitably. Analysis and design of the Steam Turbine-Generator (STG) foundation shall be carried out in accordance with relevant codes IS: 2974 Part-3 and IS: 456 and/or manufacturer's requirements. The loads to be considered for static analysis and design shall consist of dead weight of the machine and foundation, machine power torque, condenser loads under normal operating condition, equivalent static load due to machine unbalance, thermal elongation forces, forces due to one sided operation of the condenser, forces due to condensate pump failure, vacuum loads, forces due to piping, frictional forces at machine sole plate level for turbine, generator and condenser, temperature distribution under operating condition, failure loads of turbine (blade

unbalance/loss of blade/bowed rotor), failure loads of generator (short circuit loads), seismic loads due to generator, turbine and condenser and erection loads. In case of machines supported on VIS with springs and viscous dampers, it shall be ensured that not more than 5% of the dynamic loads are transmitted to the substructure. Necessary provisions of DIN 4024 shall be adhered to while designing the substructure. Substructure shall be designed for static loads. The vibration isolation system shall consist of helical spring units and viscous dampers supporting the RCC inertia block which support the machine. The spring units shall conform to DIN 2089 and DIN 2096. For all equipment foundations supported on VIS system, the stiffness of the supporting substructure shall be at least ten (10) times that of spring elements as per DIN 4024. Tension in piles shall not be allowed for any combination of loads. 5.3 <u>OPEN FOUNDATIONS</u> In case open foundations are adopted, the following shall be adhered to: 5.3.1 Minimum width of foundation shall be 1.0 m. 5.3.2 Minimum depth of foundation shall be 1.0 m below NGL. 5.3.3 It shall be ensured that all foundations of a particular structure/ buildings/ facility shall rest on one bearing stratum, i.e. either overburden or rock. 5.3.4 Wherever the intended bearing structure is weathered rock but the actual stratum encountered during foundation excavation consists of both overburden soil and weathered rock at founding level, under such cases either the foundation shall be lowered completely into the weathered rock or the overburden soil upto the weathered rock level shall be removed and built up through PCC up to designed foundation level. 5.3.5 The net allowable bearing pressure values to be adopted for design upon Owner's approval shall correspond to total permissible settlement as		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 200 of 639
mentioned under para “permissible settlement of foundations” or the permissible settlement from functional requirement, which ever is more stringent. 5.3.6 Permissible settlement of foundations: The total permissible settlement and differential settlement shall be governed by IS: 1904 and IS: 13063 and from functional requirements, whichever is more stringent. However, total settlement shall be restricted to the following : (a) All facilities in Main Plant area, ducts, Equipment - 25 mm foundation (b) All foundations in switchyard, control room - 40 mm Building including, isolated/strip continuous/ Raft foundation (c) Other footings of width upto 6m - 40 mm (d) Other footings of width greater than 6.0 m (raft) - 75 mm (e) Footings on rock - 12 mm In case the total permissible settlement is to be restricted to less than as above specified from functional requirements, then the net allowable bearing pressure shall be reduced/reviewed accordingly in consultation with Owner. 5.4 <u>PILE FOUNDATIONS</u> In case piles are adopted, following shall be adhered to: 5.4.1 The pile foundation shall be of RCC, Cast-in-situ bored, precast/cast-in- situ driven pile as per IS: 2911. Bored piles shall be installed by using rotary hydraulic rig. Three-stage flushing of pile bore shall be ensured, by airlift technique or any other internationally accepted method duly approved by the Owner. 5.4.2 The minimum diameter of pile shall be 450mm for cast-in-situ and 300mm for precast piles. The uplift and lateral load capacity shall be established by field test.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 201 of 639
5.4.3 Only straight shaft piles shall be used. Minimum cast length of pile above cut-off level shall be 1.0 m. 5.4.4 The bidder shall furnish design of piles (in terms of rated capacity, length, diameter, termination criteria to locate the founding level for construction of pile in terms of measurable parameter like (SPT & SCPT value, set criteria etc.), reinforcement for job as well as test piles, etc.) for Owner's approval. 5.4.5 The piling work shall be carried out in accordance with IS: 2911 (Relevant part) and accepted construction methodology. The construction methodology shall be submitted by the Bidder for Owner's approval. 5.4.6 Number of initial load tests to be performed for each diameter and rated capacity of pile shall be as under: Vertical Lateral Uplift } Minimum of 3 Nos. in each mode. The initial pile load test shall be conducted with test load upto three times the estimated pile capacity. In case of compression test the method of loading shall be cyclic as per IS: 2911 (relevant part). 5.4.7 Number of routine pile load tests to be performed for each diameter/ allowable capacity of pile shall be as under: (a) Vertical-1.0 % of the total number of piles provided. (b) Lateral -1.0 % of the total number of piles provided. The routine tests on piles shall be conducted upto test load of one and half times the allowable pile capacity. The Owner shall approve piles for routine load tests. Routine load tests may be done by conventional method as per IS: 2911 (Part-4). In case, routine pile load test shows that the pile has not achieved the desired capacity or pile(s) have been rejected due to any other reason, then the Bidder shall install additional pile(s) as required and the pile cap design shall accordingly be reviewed and modified, if required,

without additional cost to the Owner. 5.4.8 Testing of piles and interpretation of pile load test results shall be carried out as per IS: 2911 (Part-4). Bidder shall ensure that all the measuring equipment and instruments are properly calibrated at a reputed laboratory/ institute prior to their use. Additional measurement for pile movement shall also be done. 5.4.9 Low Strain Pile Integrity test shall be conducted on all test piles and job piles. This test shall be used to identify the piles for routine load test and not intended to replace the use of static load testing. 5.5 <u>OTHER REQUIREMENTS</u> 5.5.1 In case of high ground water table, for excavations comprehensive dewatering arrangement shall be required. Scheme for dewatering and design with all computations and back-up data of dewatering and sheet piling shall be submitted for Owner's information. 5.5.2 The founding level for trenches/channels shall be decided as per functional requirement. The bottom of excavation shall be properly compacted prior to casting of bottom slab of trenches/channels. 5.5.3 Excavation for open foundations shall be covered with PCC immediately after reaching the founding level. In case of any local loosening of soil at founding level during excavation, the same shall be removed and compensated by PCC of Grade M15. The foundation pits shall be maintained dry during the complete construction period by means of suitable dewatering systems. 5.5.4 Backfilling, around foundations and bottom of pipes, thrust blocks, etc. shall be carried out with approved material in layers not exceeding 30 cm thickness and each layer shall be compacted to 90% standard proctor density for cohesive soil and to 75% of relative density for non-cohesive soils. 5.5.5 Excess/surplus excavated material shall be disposed off by the Bidder as per the instructions of the Owner upto a lead of about 5 km.		

CONSULTANT : PROCON ENGINEERS

- 5.5.6 CBR tests for flexible pavement design shall be carried out by Bidder after earth filling has been completed, if applicable.
- 5.5.7 The storage tanks shall rest on flexible tank pad resting on an open/shallow foundation or pile foundation. The tank pad shall be made of two layers. The first layer shall be thoroughly compacted fill of gravel, coarse sand or other suitable material topped with minimum 75mm thick compacted crushed stone, screenings, fine gravel, clean sand or similar material mixed in hot asphalt (80/100 bitumen or equivalent 8 to 10% by volume), rolled and compacted. The second layer shall be with minimum 25 thick premix carpet with 12 mm and down broken stone chips and 80/100 grade hot bitumen. The tank pad shall be laid by an expert agency having wide experience in execution of similar works. The tank pad shall be made up from founding level to the required level by controlled compaction in layers of 200 mm to achieve a relative density of 85% using suitable compaction equipment approved by the Owner. In addition to the above, in case of an open/shallow foundation, a ring wall shall be provided adjacent to the tank wall for retaining the fill below tank. The foundation system shall be designed as per the provisions of IS: 803. The tank shall have a flexible bottom plate, which shall establish complete bearing with the foundation fill.

6.0 GENERAL REQUIREMENTS

The following minimum thickness shall be followed:

Pedestals to Steel Columns for Equipment structure (a) Equipment in open area : as required (300 mm min) (b) Equipment in covered area : as required (150 mm min) (c) Structures and equipment : as per vendor's data subject to supplied by vendor minimum as specified above 6.3 <u>GROUND FLOOR SLAB-ON-GRADE</u> Ground floor slab-on-grade shall be minimum M-25 grade RCC construction laid over minimum 100mm thick lean concrete. Minimum 250 mm thick graded stone (63mm down size) soling with interstices filled with sand and compacted mechanically, shall be provided as sub-base below lean concrete. The sub- base shall be laid over rammed and well-compacted earth fill or hydraulically compacted sand fill as specified elsewhere in this specification. 6.4 <u>STAIRS, PLATFORMS, HANDRAILS</u> All internal stairs, platforms and walkways shall either be of RCC or minimum 6mm thick chequered plate construction. All outdoor stairs, platforms and walkways shall either be of RCC or minimum 40mm thick grating. All handrails and posts shall be of 32NB medium duty Galvanised M.S. pipes as per IS: 1239 (Part I). 7.0 <u>ROADS</u> Geometric design of road shall be done in accordance with Indian Road Congress Standard IRC-37. The ruling gradient for roads in longitudinal direction shall be 1 in 30. Normally roads shall have much flatter gradient. Transverse camber of 1 in 40 shall be provided. A detailed CBR test, shall be carried out as per the procedure outlined in IS-2720 (Part-XVI). CBR test shall be carried out in remoulded soil samples under soaked condition. All roads shall have minimum shoulder width on either side of carriageway		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 206 of 639
as stated elsewhere in bid specification. Shoulders shall have sufficient load bearing capacity to support loaded trucks. A flatter slope of 1 in 80 shall be provided on shoulders. Pipe, slab culverts, or RCC box culverts, as suitable, shall be provided at road crossings for drainage, LP pipes, Ash pipes, cable trenches etc. Level crossings shall be provided where a Railway siding line crosses the road. All culverts shall be designed for IRC class "AA" loading and checked for class A loading. Design of concrete road shall be made as per IRC 58-2002, considering single axle load of 10.2 ton with a load safety factor of 1.1. As surface soils show low to moderate swelling potential, so provision of clause no.- 6.2.3 of IRC – 15 - 2002 to be adhered to or as per recommendations of detailed soil investigation to be conducted by bidder regarding road construction. Construction of road shall be in accordance with IRC 15-2002 and other relevant IS/IRC/ MORT&H Codes of practice. Design of Asphalt concrete road (Bituminous road) shall be made as per IRC 37- 2001. As surface soils show low to moderate swelling potential, so Annexure-4 of IRC: 37 -2001 to be followed for design of pavement on expansive soils. Construction of Asphalt road shall be in accordance with SPECIFICATIONS FOR ROAD AND BRIDGE WORKS by Ministry of Surface Transport –Roads Wing (MORT&H) and other relevant IS/IRC Codes of practice. 8.0 DRAINAGE Open RCC rectangular drains shall be provided for storm water. The thickness of sides & bottom shall be minimum 100 mm or as per design considerations whichever is higher. RCC culverts shall be provided for road and rail crossing. Drains shall be provided on both sides of the roads. Inside surface of the drain will have smooth neat cement finish over with screed concrete. Invert of the drain shall be decided in such a way that the water can easily be discharged to the recommended nearest outfall outside the plant boundary. The minimum slope of the drain shall be 1:1000 longitudinally to take care of the silting problems. It is recommended to maintain the maximum velocity within 1.2 m/sec

9.0 TRANSFORMER TRACK & JACKING PAD

Lay out of transformer track and jacking pads shall be as shown in appropriate drawing. Transformer track shall be designed as beam on elastic foundation. For this, appropriate soil investigation/test shall be carried out to establish design parameters. Grade of concrete, reinforcement etc shall be as specified earlier.

ANNEXURE – I

VIBRATION ISOLATION SPRING FOUNDATIONS

1.0 GENERAL REQUIREMENT

Steel helical springs and viscous dampers shall be provided for equipments requiring foundations with vibration isolation system by the supplier with requisite experience and proven track record of similar installation in power plants of Unit capacity not less than 500 MW.

Complete Vibration Isolation System with Steel Helical Springs and Viscous Dampers shall be provided for the foundations of Turbo-generator, Boiler Feed Pump, ID, Fan, FD Fan and PA Fan and other areas as per requirement.

2.0 MATERIAL (DESIGN & SUPPLY)

2.1 STEEL HELICAL SPRINGS AND VISCOUS DAMPERS SHALL CONSIST OF

- (a) Steel helical spring units and viscous dampers along with viscous liquid including associated auxiliaries for installation of the spring units and dampers like steel shims, adhesive pads etc.
- (b) Frames for pre-stressing of spring elements.
- (c) Suitable hydraulic jack system including electric pumps, high-pressure tubes etc. required for the erection, alignment etc. of the spring units. One set of extra hydraulic jacks and hand-operated pumps shall also be provided.
- (d) Any other items which may be required for the pre-stressing, erection, release of pre-stress, alignment and commissioning of the steel helical springs.

2.2 The objective of designing the supporting arrangement for any rotating equipment shall be so that the vibration level is maintained as minimum as possible under all operating conditions. Accordingly, respective rotating equipment shall be supported on RCC deck slab which in turn shall rest on

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

	vibration isolation unit consisting of steel helical springs and viscous dampers, which in turn shall be supported on RCC supporting structure. The above design shall form part of this specification 2.3 The spring units shall have definite stiffness in both vertical and horizontal directions with the horizontal stiffness not less than 30% of vertical stiffness. The stiffness shall be such that the vertical natural frequency of any spring unit at its rated load carrying capacity is not more than 3 to 5 Hz. 2.4 The damper units or spring-cum-damper units shall be of viscous type offering velocity proportional damping. The damper units shall be suitable for temperatures ranging from 0 to 50 deg. C. The damping resistance of individual damper units shall be such that the designed damping is provided using reasonable number of units. Damper shall have damping resistance ranging from 40 kN sec/m to 750 kN sec/m. 2.5 The sizes of the spring units, damper units and spring-cum-damper units shall be such that groups of such units can be accommodated on column heads in case of elevated foundations and on pedestals/walls in case of foundations at ground level. 2.6 The steel helical springs and viscous dampers shall be designed for ensuring “fit and forget” guarantee. 3.0 <u>MANUFACTURING & TESTING</u> 3.1 Complete manufacturing and testing of the steel helical springs and viscous dampers shall be done at the manufacturing shop of the approved sub-vendor/supplier. For this purpose, the contractor/sub vendor shall submit the detail program for approval of engineer and take up the manufacturing/testing after approval of such program. The program shall include : (a) Manufacturing schedule and quality check exercised during manufacturing. (b) Detail of test to be carried out at the manufacturing shop with their schedule. (c) Special requirements, if any, regarding concreting of top deck.	

CONSULTANT : PROCON ENGINEERS

	(d) Complete step-by-step procedure covering the installation and commissioning of the spring system. (e) Manuals for erection, commissioning, testing and maintenance of the steel helical springs and viscous dampers. (f) A checklist for confirming the readiness of the civil fronts for erection of steel helical springs and viscous dampers (g) Checklist for equipment required at each stage of erection (h) Bill of materials (data sheet) of various elements such as spring units, viscous dampers, with their rating, stiffness etc. included in the supply. (i) Bill of materials (data sheet) for frames for pre stressing, hydraulic jack including electric pump, high pressure tubes, hand operated pump etc. with their rating and numbers. (j) Any other details, which may be necessary to facilitate design and construction of the foundations/structures.	
3.2	The springs shall conform to codes DIN 2089 and DIN 2096. The quality assurance and inspection procedures shall be finalized on the basis of the above codes and the quality plans be drawn accordingly.	
4.0	<u>ERECTION, COMMISSIONING AND SUPERVISION</u>	
4.1	Complete erection and commissioning of the steel helical springs and viscous dampers including pre-stressing of elements, placing of elements in position, checking clearances on the shuttering of the RCC top deck, releasing of pre stress in spring elements, making final adjustments and alignments etc. all shall be done under a specialist supervisor of supplier/sub vendor trained for this purpose.	
4.2	The scope of work shall be deemed to include all activities, which may not have been explicitly mentioned but are reasonably implied for the successful commissioning of steel helical springs and viscous dampers.	

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2

4.3	The contractor shall guarantee the performance of the steel helical springs and viscous dampers for 24 months from the date of commissioning of each machine which shall be termed as "Guarantee Period".	
5.0	<u>REALIGNMENT OF SPRING SYSTEM</u>	
	If any realignment of the steel helical springs and viscous dampers is required to be done for aligning the shaft or for any other reasons during the first one year of operation from the date of Commercial Operation of the machine, the same shall be done by the contractor as and when asked for at no extra cost of the Owner.	
6.0	<u>ACCEPTANCE CRITERIA</u>	
	Stiffness values shall be checked. The permissible deviations shall be as per DIN 2096. Following acceptance criteria shall be followed:	
6.1	General workmanship is being good and as recommended by the manufacturer are approved by the Engineer.	
6.2	Tolerances are within the specified limit	
6.3	Material test certificate (MTC) complies with the applicable codes/standards.	
6.4	Bought out material is from the approved manufacturer/vendor	
6.5	Bought out material is matching with the approved sample	
7.0	<u>CODES AND STANDARDS</u>	
	Latest revision of following codes shall be used for the design of the spring supported foundations:	
	(a) IS: 456 : Code of practice for plain and reinforced concrete	
	(b) IS: 2974 : Code of practice for design and construction of machine foundations.

ANNEXURE – II

SAMPLING, TESTING AND QUALITY ASSURANCE FOR CIVIL WORKS

1.0 INTRODUCTION

- 1.1 This part of the specification covers the sampling, testing and quality assurance requirement (including construction tolerances and acceptance criteria) for all works and structures covered in this specification i.e. excavation and filling, cast in situ concrete and allied works, fabrication and erection of structural steel works, masonry/sheeting and allied works, finishing items, water supply and sanitation, modular aerated concrete panel, pre-engineered building, special items of works, and piling.
- 1.2 This part of the technical specification shall be read in conjunction with other Parts of the technical specifications, general technical requirements & erection conditions of the contract. Wherever IS code or standards have been referred they shall be the latest revisions.
- 1.3 All tests required for all materials (procured by Bidder) and workmanship shall be done/got done by the Bidder at his own cost. The rate for respective items of work or price shall include the cost for all works, activities, equipment, instrument, personnel, material etc. whatsoever associated to comply with sampling, testing and quality assurance requirement including construction tolerances and acceptance criteria and as specified in subsequent clauses of this part.
- 1.4 The Bidder shall organize weekly QA/QC meeting with its subcontractor's QA/QC representative. All the ongoing activities shall be discussed and recommendations shall be reviewed for effectiveness.
- 1.5 Regular audits for the works of all its Vendors and testing Laboratories shall be arranged. Engineer shall be informed in advance about the Audit programs. All the Audit Reports and the follow-up Reports shall be submitted to the OWNER. OWNER may also perform Audits on the functioning of the BIDDER and its Vendors/Laboratories.

CONSULTANT : PROCON ENGINEERS

- 1.6 The Bidder shall provide the facilities whatsoever required and also bear all cost for all sampling, testing and quality assurance in the field and in the laboratory. The Bidder shall carry out all sampling and testing in accordance with the relevant Indian standards and/or international standards and this technical specification. Where no specific testing procedure is mentioned, the tests shall be carried out as per the best prevalent engineering practices and to the directions of the Engineer. All sampling shall be done in the presence of the Engineer or his authorised representative. The Bidder shall establish the Field Quality Assurance (FQA) laboratory and field tests shall be done in the presence of the Engineer and/or his authorised representative. The tests which cannot be carried out in the field laboratory shall be done at a laboratory of repute as agreed by the Engineer, If the Engineer desires to witness such tests at laboratory, Bidder shall arrange to conduct the test in his presence.
- 1.7 The recommendations and suitability of material for concreting and other building materials like brick, cement, aggregates etc., shall be ascertained by Bidder prior to start of work.
- Preliminary evaluation of aggregate and its evaluation for potential alkali-aggregate reactivity as per following scope of work shall be done:-
- (a) Evaluation of Aggregates
- (i) To carry out different tests on coarse aggregate sample i.e. specific gravity, water absorption, sieve analysis, deleterious material; soundness, crushing value, impact value, abrasion value, elongation index and flakiness index, as per IS: 2386.
 - (ii) To carry out different tests on fine aggregate sample i.e. specific gravity, water absorption, sieve analysis soundness, deleterious material, silt content, clay content and organic impurities as per IS: 2386.
 - (iii) To prepare evaluation report based on test results of I) and ii) above and to advise regarding suitability of fine and coarse aggregates.

(b) Evaluation of Aggregates for Potential Alkali-Aggregate Reactivity: Evaluation for Potential Alkali-Aggregate reactivity as per following scope of work: (i) To carry out petrographic analysis and accelerated Mortar bar Test on aggregate samples (1N NaOH at 80 deg. Centigrade for 14 days as per ASTM 1260, or the method established/ developed by CSMRS for 22days test. (ii) To prepare a report based on test results of I) above and to advise regarding suitability of aggregates and further testing required if any. (c) To carry out repeated temperature cycle test on aggregates for aggregates to be used in RCC of dynamic foundations from a reputed rock mechanics laboratory like National Institute of Rock Mechanics, Kolar etc. and to advise regarding suitability of fine and coarse aggregates. Moreover Bidder prior to start of work shall ascertain the recommendations and suitability for fill material. A full-scale test shall be conducted including Grain Size Analysis, Specific Gravity, Moisture Content and Standard Proctor Density of fill material. The Bidder shall submit the test results to the Owner in triplicate, within three (03) days after completion of any test. All records shall be submitted, unless specified otherwise, as per the format developed by the Bidder and approved by the Engineer. The Bidder shall identify the main purchase orders & that of sub-contracts as per owner's specification and shall forward the list of manufacturers/ vendors for each bought out items envisaged in the contract. The bought out item (BOI) list shall include all the materials brought out in technical specifications and finalised drawings. The BOI's shall conform to the relevant IS/technical referred specifications for the highest quality grade of material unless otherwise specified. All bought out items shall be procured from the manufacturer's approved by OWNER and tested as per relevant IS Codes/ Owner's Specification. To facilitate advance planning (well before the start of activity as per L-2 network) of material testing/approval of bought out items, representative samples shall be procured by the Bidder (from approved

1.8	vendors) and submitted to the Engineer for his approval before bulk procurement at least two months prior to start of works. In case of manufacturers test certificate submitted for acceptance, it shall be clearly traceable and correlated with the consignment received at site. Approval of material/sample by the Engineer shall not relieve the Bidder of his responsibility, for their conformance to the specification, as well as the requisite quality and performance of material. Structural Steel and reinforcement steel shall be procured from main steel producers like SAIL, TISCO, RINL, Jindal Steels etc. No rerolled structural steel is permitted. Field Quality Plans shall detail out all the equipment, the quality practices and procedures etc. to be followed by the Bidder's "Site Quality Control Organisation", during various stages of site activities starting from receipt of materials/equipment at site. The Bidder shall furnish complete QA & QC programme for the work envisaged which may include the following:- (a) The organization structure for the management and implementation of the proposed Quality Assurance Programme (b) Documentation Control System (c) The procedure for procurement of materials and source inspection. (d) System for site controls including process controls. (e) Control of non-conforming items and systems for corrective action (f) Inspection and test procedures for site activities (g) System for indication and appraisal of inspection status (h) System for maintenance of records (i) System for handling, storage and delivery.

(j) Quality Plan detailing out quality practices and procedures, relevant standards and acceptance levels for all types of work under the scope of this contract. The EPC Bidder shall appoint a dedicated, experienced and competent quality management representative on site, preferably directly reporting to the Project Manager, supported as necessary by experienced personnel, to ensure the effective implementation of the Approved quality assurance programme. The onsite quality management representative shall have the organisational freedom and authority to implement the requirements of these quality assurance arrangements, free from commercial and programme restraints. The QA setup of the Bidder shall consist of qualified and experienced Engineers, with their supporting staff for approval of the owner. Field Quality Assurance (FQA) organisational set up in addition to requisite mechanical & electrical engineers shall consist sufficient graduate civil engineers & supervisors to take care of quality assurance activities of both site & laboratory. The deployment of man power for FQA set up shall be scheduled on the basis of L-2 network so that necessary manpower shall be available to take care of relevant areas of works in progress during currency of works or as and when directed by the Engineer to cope with the work demand. Based on the schedule of work and the approved FQP, the Bidder shall prepare a schedule of FQA tests and shall submit to the owner and shall organize the tests as scheduled. 1.9 The Field Quality Assurance (FQA) laboratory shall have all necessary equipment and instruments and shall be managed by a qualified / experienced person. An indicative list of test equipment is attached at Exhibit-I. All these testing equipment shall be provided by the Bidder at his own cost. The Bidder shall maintain the equipment in good working condition along with valid calibration certificates, for the duration of the contract. Any other equipment though required for testing but not listed in the equipment list shall be provided/arranged by the Bidder at his own cost. FQA laboratory building shall be constructed by the Bidder at his own cost. The laboratory building shall be constructed and installed with the

appropriate facilities. Temperature and humidity controls shall be available wherever necessary during testing of samples. 1.10 All the construction activities shall be taken up according to the approved work procedure/method statement. All the work procedure/method statement shall be prepared by the bidder and submitted to the owner at least 30 days prior to the intended start of the actual work. Work procedure/method statement shall be submitted in the format approved by the Engineer. Bidder shall ensure that work procedure/method statement shall include, among the others, the following: (a) Purpose (b) Scope (c) Reference document/Standards (d) Methodology of work (e) Field quality plan (f) Job safety analysis The Bidder shall obtain the approval of the Owner of the work procedure/method statement including Field Quality Plan (FQP) before the award of the work. These shall cover for all the items/activities covered in the schedule of items and required for the completion of the work. 1.11 All materials components and equipment covered under this specification which shall be manufactured at shop/factory of the vendor/sub vendor shall be covered under a comprehensive quality assurance program. The detailed quality plan for manufacturing shall be drawn up by the Bidder and will be submitted for owner for approval in the prescribed format for manufacturing quality plan. Manufacturing Quality Plan (MQP) will detail out for all the components and equipment, various test/inspection, to be carried out as per the requirements of this specification and standards mentioned therein and quality practices and procedures followed by Bidder's/Sub-Bidder's/ sub-supplier's quality

	Control Organisation, the relevant reference documents and standards, acceptance norms, inspection documents raised etc., during all stages of materials procurement, manufacture, assembly and final testing/ performance testing. The quality plan shall be submitted on electronic media e.g. floppy or E-mail in addition to hard copy, for review and approval. After approval the same shall be submitted in compiled form on CD-ROM. 1.12 The Bidder shall store and handle the materials as per the requirements of the relevant standards/procedures at his own cost. 1.13 All T&P/equipment brought at site for the use shall be in a good working condition and shall preferably be not more than two years old. The Bidder shall submit to the engineer the weekly status of performance of tools & plants deployed at site for mechanised working. These shall include availability of batching plant with printer for recording batch wise details, transit mixers, concrete pumps, vibrators, winches, cranes, welding machines, hoists etc. as per format enclosed at Exhibit-II. In case of outage of any T&P/ equipment for more than 40% of requirement, the Bidder shall ensure the deployment of additional T&P/equipment to augment the mechanised work at no extra cost to owner. 1.14 All major bought out items shall be included in the quality plan. The Quality plan shall include following works/Bought out items wherever relevant to the Technical specifications, BOQ & drawings. (a) Earthworks including selection of fill material, compaction, proctor density tests etc. (b) Preparation of subgrades & sub-base for paving/ road works (c) Roads & Pavements. (d) Bituminous paints for water proofing & Bituminous concrete's (e) Cement, reinforcement steel & structural steel procurements (f) Coarse/ Fine aggregates, ash, water for concrete (g) Cast-in-situ concrete & allied works

(e) Different consignment of different types of cement shall be stored separately with clear identification mark. Not more than 10 layers of Cement bags shall be permitted. (f) Cement stored for more than 60 days in Bidder's godown shall be retested for compliance. (g) Cement shall be consumed on first in first out basis. At every stage of storage and usage, the week of production of Cement shall be displayed in a manner satisfactory to the owner. (h) Steel shall be stacked and stored consignment wise, size wise and grade wise with identification mark. Identification mark shall be traceable to the lot no of manufacturing. (i) For properties, storage and handling of all materials used shall comply with the requirements of Owner's Technical Specification. 2.2 QA REQUIREMENTS FOR ACID/ ALKALI RESISTANT LINING (a) Acid Resistant Bricks/Tiles shall be tested for Water Absorption, Compressive Strength, Resistance to Acid, Flexural Strength, Dimensions and all other tests as per IS-4860 and IS-4457. (b) Acid and Alkali Resistant Bitumastic ready mixed paint shall be tested for all tests as per IS-158. (c) Bitumastic shall be tested as per IS-9510. (d) Potassium Silicate, Resin type and Sulphur type Mortars shall be tested as per IS-4832, Part I, II and III/ Technical Specifications. (e) Surface preparation shall be checked as per IS-2395. (f) Application of Primer, laying of Acid Proof Bitumastic layer, Acid/ Alkali Resistant Tiles/Bricks, Chemical Resistant Epoxy Lining and Epoxy Paint shall be as per Owner's Technical Specification. (g) Thickness of Acid and Alkali Lining shall be checked.

(h) Epoxy painting shall be carried for required coating thickness and dry film thickness. 2.3 <u>QA REQUIREMENTS FOR PRE CAST CONCRETE WORKS</u> (a) All the materials used in Pre cast Concrete work shall be tested and conform to the requirements of IS codes and Owner's Tech. Specification. (b) Concrete mix for Pre cast members shall be M25 grade conforms to IS-456-2000. (c) All relevant QA requirements pertaining to cast in-situ concrete shall be applicable. (d) Load test on Pre cast members shall be carried out for the type of members as decided by Owner's Engineer as per IS-456-2000. (e) Pre Cast Concrete member shall be checked for dimensions (length, cross sectional dimensions, straightness, squareness, and flatness) and tolerances shall be as per Owner's Technical Specification. 2.4 <u>QA REQUIREMENTS FOR RCC PILES (PART I) - BORED CAST-IN-SITU PILES</u> (a) Standard Penetration Test (SPT) as per IS-2131 and Owner's Technical Specification for determining the founding level of piles. (b) Uniaxial Compressive Strength (UCS) test shall also be performed on Rock Cores. In case it is not possible to test the cores so obtained for Uniaxial Compressive Strength, core shall be tested for point load strength Index and correlated to obtain Uniaxial Compressive Strength. (c) Founding level of the piles shall be decided based on the criteria given in Owner's Technical Specification. (d) Check for control of position and alignment of piles as per IS-2911 Part I/Sec-2

	(e) Boring & Drilling : Drilling mud shall be tested for the following (i) Liquid limit of drilling mud (Bentonite Slurry) as per IS-2720 Part V. Acceptance criteria shall be as specified in Owner's Technical Specification. (ii) Sand content of Bentonite powder. (iii) Density of freshly prepared Bentonite suspension shall be checked in each pile bore before concreting. (iv) Marsh viscosity (v) Differential free swell index (vi) pH value of Bentonite suspension Properties of drilling mud shall be checked prior to commencement of the piling work and thereafter, min. once per week or as found necessary by Owner's engineer. One sample consisting of 3 specimens shall be tested for above. (f) Check cleaning of pile bore (g) Concreting: All the checks/tests on concrete and concrete materials shall be carried out as per FQP and IS-2911 Part I/Sec.2 (i) Before starting concreting the contaminated drilled mud at the (slurry collected in sampler tube) bottom of pile bore shall be tested for density and sand content. Density should not be more than 1.25T/Cum. (ii) For Working Piles: Minimum one sample consisting of 6 test cubes shall be made for first ten piles. Out of these 3 shall be tested for 7 days cube strength and 3 for 28 days cube strength. Minimum one sample of 6 test cubes for every 25 nos. of piles shall be tested, out of these 3 shall be tested for 7 days cube strength and 3 for 28 days cube strength

	(h) Reinforcement bars used for piles shall be of tested for quality and conform to the requirements of relevant IS codes. (i) Check distances between two adjacent main reinforcement bars and should be as specified in Owner's Technical Specification. (ii) Check proper cover and central placement of reinforcement cage in the pile bore by suitable concrete spacers/rollers. Check minimum clear cover to reinforcement should be as specified in technical specification. (i) Check cut off level of piles as per drawing. (j) Check recording of all data during installation of piles in prescribed pile data sheet. (k) Check that vibrators are used for preparation of test cubes/ specimens. (l) Slumps of concrete shall be tested at every one-hour interval. (m) Checking position and Alignment: Each pile shall be checked for its position w.r.t. specified location. Each pile shall be checked for its alignment. Permissible limits for deviation shall be as specified elsewhere in the Owner's Technical Specification. (n) Check for Pile Bore: On completion of boring and cleaning, the bottom of each pile bore shall be checked from the samples collected from near the bottom of pile bore or any other method approved by Owner's Engineer, to ensure that it is free from pile bore spoil/debris and any other loose material before concreting. (o) Low strain pile integrity test on all job piles and test piles shall be conducted as specified in the Owner's Technical Specification. This test shall be used to identify the piles for routine tests.	
2.5	<u>QA REQUIREMENTS FOR RCC PILES (PART V) LOAD TEST ON PILES</u> (a) Pile load testing shall conform to IS-2911 (Part IV) and Owner's Technical Specification.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

(b) Check all the equipments and instruments used are properly calibrated. (c) Initial load test and routine load test shall be carried out. (d) Initial load test to assess the safe load carrying capacity of pile before start of work. (i) Cyclic vertical (compression) load test to assess safe vertical load capacity. (ii) Lateral load test to assess safe horizontal load capacity. (iii) Pull out (Tension) load test to assess safe pull out load capacity. (e) Routine Load Test on Working Piles (i) Direct Vertical (Compression) load test for vertical load capacity. (ii) Lateral load test for horizontal load capacity (f) All other tests on piles shall be carried out as specified in Owner's Technical Specification. (g) Pile load-testing procedure to be got approved from Owner.		
2.6	<u>QA REQUIREMENTS FOR PLASTERING & ALLIED WORKS</u>	
(a) Materials like sand, lime for preparation of putty, coarse aggregate, gypsum etc. shall confirm to the relevant IS codes specified in Owner's Technical Specification. (b) Check proper mixing of mortar. (c) Plaster surface shall be checked for following defects and the remedial measures for the same shall be adopted as per IS-1661.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2

(i) Blistering (ii) Bond filer or loss of adhesion. (iii) Cracking and crazing (iv) Efflorescence (v) Grinning (vi) Irregularity of Surface Texture (vii) Popping or blowing (viii) Recurrent surface dampers (ix) Softness or chalkiness (d) Trueness of Plastering System: Finished plaster surface shall not show any deviation more than 4mm when checked with straight edge of 2 m length. (e) Check thickness of plaster. 2.7 <u>QA REQUIREMENTS FOR CONCRETING INCLUDING CONCRETING OF MAJOR EQUIPMENTS FOUNDATIONS</u> All records of concreting, reinforcement, testing of materials, as-built dimensions, the details of the rectification, etc, shall be maintained as given below. Four copies of such record in a bound form shall be submitted to owner for their record and future reference. Cement consumption at batching plant shall also be obtained through computer output. Provision of an on line printer is mandatory. Calibration of batching plant shall be carried out at the starting and once in three months, and shall conform to IS: 4925. (a) Testing data of aggregates (b) Mix design details.

(c) Testing records of admixture including dosage, workability and setting time. (d) Approved scheme for concreting. (e) Quantity of ice used if any for temperature control of concrete for top decks of machine foundations. (f) Hourly records of concreting including pour card. (g) Protocol indicating the dimensional tolerance and details of inserts. (h) Records giving the details of rectification giving the location of grouting, the quantity of grout used at each location, type of grout used. (i) Bar bending schedule. (j) Location and details of mechanical anchoring used for reinforcement. (k) Protocol giving the details of checking of reinforcements before concreting and conformance to the reinforcement details as shown in the construction drawings. (l) Photographs showing the areas where rectification works have been carried out. Photographs should be taken before and after rectification. (m) Report on petrographic examination & potential reactivity of aggregate and the repeated temperature cycle tests. (n) All tests/checks shall be carried out as per FQP. (o) Check temperature control of fresh concrete temperature of fresh concrete should not exceed 25 degree C at the time of placement. (p) Plasticiser/super plasticiser cum Retarder type mixture to be added in the concrete shall be tested as per IS-9103. Once any concrete mix design is approved by the engineer, the IR spectro analysis test result

of the admixture shall be submitted along with test results as per IS 9103 for reference. (q) REINFORCEMENT: Check conformity of material to relevant IS codes. (i) Check lapping/spacing of Reinforcement staggered, as under no circumstances more than 50% of bars at cross section shall be lapped. (ii) Sample test for mechanical bars grips shall be carried out upto the yield strength of reinforcement of bars. The no. of tests to be carried out shall be 3% of the number of bar grips used subject to a minimum of three. (r) Batching shall be calibrated regularly at least once in a 3 months. (s) Ultrasonic Pulse Velocity Test as per IS-1331 Part I for Top Deck and column of T.G. Foundation to ascertain the homogeneity and integrity of concrete. In addition additional cubes (@ of 150/m³ of concrete subject to minimum of 6 cubes) shall be taken to carrying out UPV test on cubes. UPV test shall be carried out by a specialized agency. (t) All precautions and control as specified in Owner's Technical Specification shall be taken care of during concreting. IS 456-2000 shall be applicable for acceptance of execution of concrete works & test results. 2.7.1 Staging and Form Work Automatic climb form scaffolding systems shall be used. Slip form with proven record for similar towers may be used subject to conformance to relevant IS and specific approval of the owner. The design and detailed construction of the form work and the scaffolding system shall be based on the relevant IS code. In absence of the same DIN 4420/ACT 347 shall be followed. Concrete shall have sufficient strength to with stand the anchoring loads of scaffolding system. The concrete strength shall be continuously checked and documented during the climbing process of the scaffolding.

(a) Design and execution of the form work, staging, shuttering and scaffolding shall conform to National Safety Council and all relevant IS Code provisions, i.e. IS: 2750, IS: 4014, IS: 4923, IS: 800 etc. In case the IS Codes do not cover the specific type of shuttering system, then any international Code of Practice, as approved by the engineer, may be followed. (b) Deployment of vertical laser ray equipment for measuring the dimensions and controlling the shape of the tower at all elevations and plan angles shall be carried out. 2.8 QA REQUIREMENTS FOR STRUCTURAL STEEL WORK (a) Physical and chemical properties of material as per relevant codes. Review of correlated Mill Test Certificates or check testing in absence of MTC. (b) Ultrasonic test on plates above 40mm as per ASTM A435. (c) Welding Procedure Specifications, Procedure Qualification Record & Welders Qualification Test shall be as per ASME Section IX/AWS D1.1 (d) Fillet Welds: (i) Check for size and visual examination. (ii) Macroetch examination on production test coupons for main fillet welds with minimum one joint per built up beams, columns and crane girder etc. (iii) 25% weld length of tension member of crane girder shall be subjected to Dye Penetration Test. (iv) On all other fillet welds, DPT on 5% of weld length with minimum 300mm at each location shall be carried out. (e) Butt Welds: (i) 100% visual examination		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

	(ii) DPT on all butt welds after back gouging (iii) Mechanical testing of production test coupons with minimum one joint per built up beam, column and crane girder. (iv) 100% radiography test on butt welds of tension flange (bottom flange) of crane girder. All other butt welds shall be subjected to Radiography test on 10% weld length of each welder. Wherever RT is not feasible, UT shall be carried out. (v) Full penetration welds (other than butt welds) shall be subjected to Ultrasonic Testing in following quantum: (vi) 100% UT on web to flange joint of crane girder. (vii) 10% UT on other full penetration joints. (f) Every 1st and further every 10th set of identical structure shall be checked for control assembly in shop before erection. (g) All structure components/members shall be checked for dimensional tolerances during fabrication and erection as per IS-7215 and IS-12843 respectively. (h) Check for Surface Preparation and Paint thickness. (i) In case of failure of any welds in SPOT RT/UT, the % age for retesting shall be doubled at that particular location. Acceptance criteria of NDT on welds shall be as per AWS D1.1. (j) Low hydrogen electrode (AWS E-7018) for welding of High/Medium tensile steel, for M.S (IS 2062 Gr. A/Gr. B, IS 8500) sections thickness above 20mm shall be used. Preheating and Post weld heat treatment requirements shall be complied as specified in the technical specs. /approved WPS. (k) For CW liners Inspection of welds for shop and field erection shall be as follows:-

	(i) 100% DPT after back gauging/grinding of butt welds by DPT kit shall be carried out as per IS-3658. No line/round and no crack should be observed. (ii) 100% DPT shall be carried out on fillet welds by DPT kit as per IS: 3658. (iii) 10% radiography shall be carried out on shop butt welds, the acceptance criteria shall be as per ASME Sec.V and ASME Sec. VIII Div.1. (iv) 100% Radiography/ Ultrasonic test on field Butt welds shall be carried out, the acceptance criteria shall be as per ASME Sec.V and ASME Sec. VIII Div.1. (v) Hydro testing shall be done as per the method detailed out in Technical specifications.	
2.9	<u>QA REQUIREMENTS FOR SHEETING WORKS.</u> (a) Colour coated sheet (i) Chemical & physical properties of raw material sheet as per relevant codes. (ii) Base Metal Thickness (iii) Thickness of coatings (iv) Type of coating/paint (v) Hardness of painted surface (2H pencil Hardness) (ASTM-D-3363) (vi) Flexibility Test Bend test as per ASTM-D-328 at 180 degree bends (twice the thickness of sheet). There should not be any crack.

Dimensional check after profiling of sheets (vii) Weathering Resistance Test Salt spray test as per ASTM B-117 for minimum 1000 hrs. one sample per batch at random. (b) Bonded Mineral Wool Insulation (i) Thickness (ii) Density (iii) Thermal Conductivity (iv) All other tests as per IS-8183. (c) Sheeting Installation (i) Workmanship including alignment (ii) Level, Slope (iii) Side and End Laps (iv) Proper Installation of Flashing (v) Fixing including opening, (vi) Location, Installation of Lining & Installation. (d) All bought out items shall be procured from the manufacturer's approved by Owner's Engineer and tested as per relevant IS Codes/ Owner's Specification.

2.10 <u>ARCHITECTURAL & MISC. WORKS</u> (a) Material used for floor finishes and allied work shall conform and tested as per the requirements of relevant IS Codes specified in Owner's Technical Specification. (b) Finish shall be checked for : (i) Level, Slope, Plumb (ii) Pattern & Symmetry (iii) Alignment of joints, dividing strips etc. (iv) Colour, Texture (v) Surface Finish (vi) Thickness of Paint (vii) Details of edges, junction etc. (viii) Performance (ix) Precautions specified for durability. (c) For fabricated item like metal doors, windows, ventilators, louvers, rolling shutters and grills etc. Following checks shall be carried out. (i) Overall Dimensions (ii) Mullions Transoms (iii) Doors & Windows shall operate without jamming (iv) Doors, windows & frames etc. shall be on a true plane, free from warp or buckle.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

	(v) All welds shall be dressed flush on exposed and contact surfaces. (vi) Correctness of locations and smoothness of operation of all shop installed hardware and fixtures. (vii) Provision of hardware & fixtures to be installed at site. (viii) Glazing beads shall be cut with mitered corners. (ix) Glazing clips, fixing devices etc. shall be supplied in adequate nos. (x) Shop coats shall be properly applied. (xi) Exposed aluminium surface shall be free from scratches, stains and discoloration.	
2.11	<u>ROLLING SHUTTERS/GRILLS</u> After installing the shutters, the Bidder shall test the performance of the shutter in the presence of the engineer. The shutter shall be smoothly operable under all ambient conditions. All controls and locking devices shall give fault free performance.	
2.12	<u>FIRE PROOF DOORS</u> (a) Fire Proof doors shall be tested for the requirements mentioned in IS-3614 Part-II and Owner's Technical Specification. The doors shall be approved by TAC & shall have minimum 2 hours fuse rating. (b) DFT of paint of Fire Proof Doors shall be checked.	
2.13	<u>GLASS AND GLAZING</u> (a) Materials used in glass and glazing shall conform to the requirements of Owner's Technical Specification and IS Codes specified in Owner's Technical Specification.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

(b) All installation shall be free from cracked, broken or damaged glass, edges of large panes of thicker glass and heat insulating glass be inspected carefully for chipped, cracked or underground edges. (c) Glazing shall be carefully done to avoid direct contact with metal frames. (d) All glasses shall be embedded in mastic for steel works and fixed by neoprene gasket for aluminium works to give a leak proof installation. (e) On completion, the panes shall be free from dirt, stains, excess putty etc. to the complete satisfaction of the engineer.		
2.14	<u>ROOF WATER PROOFING & ALLIED WORKS</u>	
(a) Material used shall be tested and conforms to the requirements of IS Codes/International Codes specified in Owner’s Technical Specification. (b) All elastomeric membrane is fully dried to perform testing with water ponds created on minimum 5% of area of nominal size 6m x 6m for height of 25 mm to 30 mm at critical locations for a period of 48 Hrs. No dampness shall be visible on the underneath side of roof (i.e. ceiling, parapet and well junction etc.). The above testing shall be carried out prior to application of wearing course.		
2.15	<u>PAINTING & ALLIED WORKS.</u>	
(a) Various materials used shall conform and tested for the requirements of Indian/International Codes specified in the Technical Specification. (b) Surface to receive paint shall be made smooth. (c) Painting shall be checked for thickness of different coats as specified in schedule of items and Owner’s Technical Specification/Drawing.

2.19 <u>RESERVOIR LINING</u> (a) Requirement of HDPE Material – The high density Polyethylene Liner shall be manufactured of polyethylene resin. The resin composition and production shall meet its intended purpose as detailed in the technical specifications. The natural polyethylene resin without the carbon black shall meet density requirement of 0.935 to 0.940 g/cc and melt index less than 0.4g/10min. The test methods shall confirm to ASTM D 1505 or ASTM D792 or equivalent for density test and ASTM D1238, condition E or equivalent for Melt Index test. (b) Carbon Black shall be included in the resin to make it UV resistant and its content shall not be less than 2 % as per ASTM D 1603 (c) The lining shall confirm to ASTM D1004, ASTM D4833 ASTM D1693, ASTM D 4437, ASTM D 3895 and as per criteria mentioned in the Tech specification. Thickness shall be as per ASTM D 5199, Tensile properties shall be as per ASTM D 6693, Tear resistance shall be as per ASTM D 1004. (d) Vacuum box Testing (VBT) and Air Pressure Testing (APT) shall be carried out as per the procedure in Technical Specifications (e) Installation and laying shall be as per the procedure laid down in the tech specifications The Bidder shall submit a field quality plan for the reservoir lining in the Owner's format incorporating all the requirement and acceptance criteria as per the technical specification. 2.20 <u>STOP LOGS AND TRASH RACKS</u> (i) Structural design shall be as per IS 5620 and IS: 4622 and as per details given in tech specifications. (ii) Filling valves shall be provided in the stop logs to balance the water pressure before lifting the stop log		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

	(iii) The trash rack to be provided shall Type-1 trash rack (removable section rack), conforming to IS: 11388 (latest). (iv) Center to center spacing , clear opening and center to center spacing of trash bars to be provided in the rack shall be as per technical specifications (v) Leakage test shall be carried out in the stop logs as per the methodology specified in the technical specifications. The leakage shall then be measured and it should not be more than 5 liters/minute/ meter of length of seal under maximum head or as specified. (vi) All material used for trash rack and stop logs shall be of high grade and free from defects and conforming to all the relevant standards mentioned for the various component material in the technical specification. Radiographic examination or magnetic particle testing or other comparable tests shall be carried out for determining the soundness of steel castings and shall be conducted by the Bidder if asked by the employer. (vii) The Bidder shall submit a Field quality Plan in Owner's format incorporating all the quality aspects mentioned in the technical specifications. (viii) The lifting beam is to be tested for twice the weight of the heaviest component to be lifted by the beam. IS: 13591 shall be referred for measurement of the deflection and acceptance criteria.	
2.21	<u>GEOMEMBRANE/GEOTEXTILE FILTER</u> (a) Geotextile filter shall be woven type and shall satisfy the following criteria: (b) Material for Geotextile filter shall be 100% polypropylene. (c) Equivalent opening size shall be as required	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2

(d) Specific gravity shall be 091, Weight in gms/sqm shall be min. 200. Thickness shall be at least 0.55 mm and width to be supplied shall not be less than 1.75 meter. (e) Other physical properties like Breaking strength, percentage elongation at break, grab strength, percentage Elongation(Grab Test), tear strength (single rip) Water permeability shall be as per the details given in technical specification and as per ASTM-D-5035, ASTM-D-5034, ASTM-D-2261 and IS:169 (Latest edition). (f) Geotextile filter shall be with U-V (Ultraviolet) treatment suitable for a temperature range from 0 °C to 50 °C so that the strength and life of the same is not affected due to exposure to ultraviolet rays. In addition to the above, geotextile filter shall have good resistance to chemicals and to biological degradation.		
3.0	<u>CONSTRUCTION TOLERANCE AND ACCEPTANCE CRITERIA</u>	
3.1	<u>EXCAVATION AND FILLING</u>	
3.1.1	Tolerance	
	Finished surface level shall be within 20mm of the level shown in the drawing.	
3.1.2	Acceptance Criteria	
	Following acceptance criteria shall be followed.	
	(a) When only one set of sample is tested, then all individual samples collected and tested should pass without any deviation	
	(b) For retest of any sample two additional samples shall be collected and tested, and both should pass without any deviation.	
	(c) Where a large number of samples are tested for a particular test than 9 samples out of every 10 consecutive samples tested shall meet the specification requirement.

3.2.1.2 Reinforcement

Tolerance on placing of reinforcement and for cover shall be as per clause 12.3 of IS: 456.

Reinforcement shall be placed within the following tolerances:

- (a) For effective depth 200 mm or less : $\pm 10\text{mm}$
- (b) For effective depth more than 200 mm : $\pm 15\text{mm}$

Tolerance for cover

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 246 of 639
Actual concrete cover should not deviate from the required nominal cover by + 10 mm 3.2.1.3 Pre cast concrete Tolerance on dimensions of pre-cast units shall be as follows: (a) Length: +/- 0.1 percent subject to minimum of +/- 5 mm and maximum of + 10 mm. (b) Cross-sectional dimensions: +/- 3 mm or +/- 0.1 percent whichever is greater. (c) Straightness or Bow: 1/750 of the length subject to minimum of +/- 5 mm and maximum of +/- 10 mm. (d) Squareness: When considering the squareness of the corner the length of the two adjacent sides being checked shall be taken as the base line. The shorter side shall not vary in length from the perpendicular by more than 5 mm. (e) Flatness: The maximum deviation from a 1.5m straight edge placed in any position on a nominal plant surface shall not exceed 5 mm. 3.2.1.4 Formwork and staging (a) Staging shall be checked for its soundness as a whole and for adequacy of the joints and its foundations. Formwork joints shall be inspected for soundness of connections. All joints shall be either vertical or horizontal and shall be such as to avoid loss of liquid through the formwork. (b) Dimensional tolerance for formwork shall be as per Clause 9.6 of IS : 14687 and 11.1 of IS : 456, which is reproduced as given below: (i) Deviation from specified : +12mm dimensions of cross section of columns and beams		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 247 of 639
(ii) Deviation from dimensions of : - 6 mm footings a. Dimensions in plan : + 5 -12 mm b. Eccentricity : 0.02 times the width of the footing in the direction of deviation but not more than 50 mm c. Thickness : $\pm$ 0.05 times the specified thickness The above tolerances apply to concrete dimensions only, and not to positioning of vertical reinforcing steel or dowels. (c) Checklist for formwork shall be as per Clause 9.9 of IS: 14687. Format as per Annexure-C of IS: 14687 shall necessarily be made for all important structures including all machine foundations. (i) Acceptance Criteria a. The acceptance criteria of concrete shall be in accordance with clause no.16 of IS: 456. However in exceptional circumstances, and that too in non-critical areas, the Engineer may accept concrete work which is marginally unacceptable as per the criteria laid down in IS: 456. For such accepted work, payment shall be made at a reduced rate pro rate to the concrete cube strength obtained, against that stipulated. b. Unacceptable concrete work shall be dismantled by the Bidder and replaced by fresh work, meeting the specification requirements. In the course of dismantling, if any damage is done to the embedded items or adjacent structures, the same shall be made good, by the Bidder, to the satisfaction of the Engineer, at no extra cost to the Owner.

3.3.2 Acceptance Criteria

- (a) The acceptance criteria of Non Destructive Testing (NDTs) on welds shall be as per AWS D1.1 (Dynamically Loaded Structures - tension welds). In case of failure of any of the tests, the Bidder at his own cost shall also carry out rectification of such defective welds. Retesting of the rectified joint, shall also be carried out by the Bidder at his own cost.
- (b) Every 1st and further every 10th set of identical structure shall be checked for control assembly in shop before erection.

3.3.3 Embedded part

Tolerances shall be as specified under concrete works.

3.4 MASONRY & ALLIED WORKS

3.4.1 Tolerances

- (a) All masonry shall be built true and plumb within the tolerances prescribed as below. Care shall be taken to keep the perpends properly aligned. Unless specified otherwise the tolerances in construction of masonry shall be as below:
 - (i) Deviation in verticality in total height of any wall of a building more than one storey in height shall not exceed $\pm 12.5\text{mm}$.
 - (ii) Deviation from vertical within a storey shall not exceed $\pm 6\text{mm}$ per 3m height.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 251 of 639
	(iii) Deviation from the position shown on the plan of any brickwork more than one storey in height shall not exceed 12.5mm. (iv) Relative displacement between load bearing walls in adjacent storeys intended to be in vertical alignment shall not exceed 6mm. (v) Deviation of bed joint from horizontal in any length upto 12m shall not exceed 6mm, and in any length over 1m it shall not exceed 12.5mm total. (vi) Deviation from the specified thickness of bed-joints, cross-joints or perpends shall not exceed ± 3mm. (b) The plastered surface shall be checked for (i) Blistering, bond failure or loss of adhesion, cracking, crazing, efflorescence, grinning, irregularity of surface texture, popping or blowing, recurrent surface dampness, softness or chalkiness defects and the remedial measures for the same shall be adopted as per IS: 1661. (ii) The finished plastered surface shall not show any deviation more than 4 mm when checked with a straight edge of 2 metre length placed against the surface. (iii) The thickness of the plaster shall be measured exclusive of the thickness of key i.e., grooves or open joints in brickwork. The average thickness of plaster shall not be less than the specified thickness. The minimum thickness over any portion of the surface shall not be less than the specified thickness by more than 3 mm for plaster thickness above 12mm and 1 mm for ceiling plaster. Extra thickness required in dubbing behind rounding of the corners at junctions of wall or in plastering of masonry cornices etc. shall be ignored.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 252 of 639
3.4.2 Acceptance Criteria Following acceptance criteria shall be followed: (a) General workmanship is being good and as recommended by the manufacturer and approved by the Engineer. (b) Tolerances are within the specified limit. (c) Material test certificate is in compliance with the applicable codes/ standards. (d) Bought out material is from the approved manufacturer / vendor. (e) Bought out material is matching with the approved sample.		
3.5	<u>FINISHING & ALLIED WORKS</u>	
3.5.1 Tolerances (a) The floor finish shall be checked specially for the following: (i) Level, slope, plumb as the case may be (ii) Pattern and symmetry (iii) Alignment of joints, dividing strips etc. (iv) Colour, texture (v) Surface finish (vi) Thickness of joints (vii) Details of edges, junction etc. (viii) Performance (ix) Precautions specified for durability		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 253 of 639
Local depressions on account of faulty workmanship shall not be acceptable. Tiles/natural stones with cracked or broken/chipped edges shall not be acceptable. (b) The door, window, ventilator, partition during and after fitting and fixing etc shall be checked for the following: - (i) Installation shall be at correct locations, elevations and in general on a true vertical plane. (ii) Fixing details shall be strictly as shown on drawings. (iii) Assembly of composite units shall be strictly as per drawing, with mastic caulking at transoms and mullions, gaskets, weather strips etc. complete. (iv) All frames on external wall shall be mastic caulked to prevent leakage through joint between frames and masonry. (v) All openable sections shall operate smoothly without jamming. Lock, fasteners, etc, shall engage positively. Keys shall be non-interchangeable. (vi) Cutting to concrete or masonry shall be made good and all abrasions to shop paint shall be touched up with paint or same quality as shop paint. (vii) Aluminium doors, windows, ventilators, partitions etc., shall be free from scratches, stains or discolouration. (viii) Door and window shutters shall operate without jamming. The clearance at head and jamb for door shutters shall not exceed 1.5 mm. For double leaf doors, the gap at the meeting stiles shall not be more than 2.5 mm. 3.6 (a) <u>FOR FALSE CEILING SYSTEM FOLLOWING SHALL BE CHECKED FOR</u> (i) As installed shall be true to shape, level.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 254 of 639
(ii) Correctness for the opening for the fixtures, colour and shade. (iii) All joints shall be in the same line and cross-joints shall be securely fixed to walls. (iv) There shall not be any sagging and/ or unevenness in the surface Acceptance criteria Ceiling panels shall be best quality material in thickness and properties called for in the schedule of items. Material Test Certificate to be submitted before bulk supply. Finished ceiling shall be at the correct plane and prevent an aesthetically pleasing and uniform appearance, free from sags and warps. Joints and exposed grids shall be in true lines and symmetrically placed in manner as shown in drawings. Cut outs for light fixtures, diffusers and other relevant services shall be of exact dimensions and in exact locations. (b) <u>WATER PROOFING</u> Water proofing shall be tested for water tightness by creating a pond of water minimum 25 mm height on area of 6 m x 6 m, for the period of 48 hrs on fully dried elastomeric membrane surfaces. Minimum 5% area of the roof shall be subjected to water tightness test. Such test necessarily be conducted on vulnerable areas like drain channel/drain head. No dampness shall be visible on the underneath side of roof (i.e. ceiling), parapet and well junctions etc. which have been subjected for testing. The above testing shall be carried out prior to application of wearing course. 3.7 <u>WATER SUPPLY, DRAINAGE & SANITATION</u> 3.7.1 Tolerances		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

(a) All soil pipes, waste pipes, ventilating pipes and all other pipes, when above ground, shall be gas tight. all sewers and drain laid below ground shall be watertight. (b) Obstruction/straightness test The obstructions shall be checked by inserting a smooth ball, of diameter 13 mm less than the pipe bore at the high end of the sewer or drain. If absence of any obstructions, such as yarn or mortar projecting through the joints, ball shall roll down the invert of the pipe and emerge at the lower end. The straightness shall be checked by means of a mirror at one end of the line and lamp at the other. If the pipeline is straight, the full circle of the light may be observed. The mirror will also indicate obstruction in the barrel, if the pipeline is not straight. (c) Service pipes testing with water The service pipes shall be slowly and carefully charged with water, allowing all air to escape avoiding all shock or water hammer. The service pipe shall then be inspected under working condition of pressure and flow, when all draw off taps are closed. The service pipes shall be checked for satisfactorily support and protection from damage corrosion and frost. (d) Fixtures etc. All fixtures and fittings shall be connected by watertight joints. No dripping of water shall be acceptable. (i) Acceptance criteria Following acceptance criteria shall be followed: - General workmanship is being good and is recommend by the manufacturer and approved by the engineer - Tolerances are within the specified limit.

ANNEXURE-III**QUALITY ASSURANCE PLANS FOR BOUGHT-OUT ITEMS OF NDCT**

The format of Q.A. plans for various bought out items are enclosed in this specification. Bidder has to procure the information from vendors in these formats of Q.A. plans only, no other format will accepted by M.S.P.G.C.L. Also it is to note here that to ensure smooth progress and timely completion of supply and erection of works, Bidder shall obtain all the vendors' approval within 5 months from the date of work order and start the procurement activity.

1.0 <u>STRUCTURAL STEEL DESIGN</u>		
1.1	Structural steel design will be carried out as per the National Building Code with specific consultation to IS-800 unless noted otherwise. Design of structures in electrical substation will be as per IS-802.	
1.2	Lateral forces along the length of the building will be resisted by bracings in horizontal and vertical frames. The transverse lateral load will be resisted by stiff jointed frame action. Additional bracing or moment connection will be used to assure stability of the structures.	
1.3	Structural steel shall conform to Grade A of IS:2062 for rolled steel members or plates up to 20 mm thickness. For plates above 20 mm thickness and welded construction, steel conforming to Grade B (Killed and normalized) of IS: 2062 shall be used except for crane girders where Grade C (Killed and normalized) (IS: 2062) steel shall be used. All structural steel plates and sections shall be of main producer of such as "SAIL" or "TATA STEEL" or "RINL" or "JINDAL" make or vendor approved by MAHAGENCO.	
1.4	Shop connections will be all welded and field connections will generally be bolted unless specified otherwise. Field bolts, wherever provided shall be high tensile of 20 mm dia. or of higher diameter and of property class 8.8 as per IS-1367 for all major connections. The bolted joints shall be designed for friction type connection and the H.T. bolts shall be tightened to develop the required pretension during their installation. However, the nominal connections in the field like purlins, stairs, wall beams etc. will be done by 16 mm dia. M.S. black bolts (minimum 4.6 grade) conforming to IS-1363 unless specified otherwise.	
1.5	Welding shall be in accordance with the recommendations of IS-816 - Code of Practice for use of metal arc welding for general construction in mild steel and IS-9595 – Recommendation for Metal Arc Welding of Carbon and Carbon Manganese Steels. Built-up members will be fabricated using submerged arc welding procedure unless manual arc welding is specifically required. All butt welds in plate girders and columns will be full penetration. All butt welds will be radio graphically or ultrasonically tested as per relevant IS codes and standard practice. The bare wire electrodes for submerged arc welding shall be as follows:	

CONSULTANT : PROCON ENGINEERS

Filler wire: AWS-A-5.17-EH14 Flux will be agglomerated type of classification AWS-A-5.17-F7A2EH14 1.6 All structural steel members for GIS substation shall be hot dip galvanised in accordance with IS-4759. The fasteners shall also be galvanised in terms of IS-5358. Galvanizing of steel structure shall be done after all fabrication work is completed. Zinc coating over galvanized surface of structural members and threaded fasteners shall not be less than 610 gm/sqm and 375 gm/sqm of surface area respectively. However, fasteners may be tapped or re-run after galvanizing. Threads of bolts and nuts shall be capable of developing the full strength of the bolt. The spring washers shall be electro-galvanized as per IS-1573. All galvanizing shall be uniform and of standard quality and shall withstand tests in accordance with IS-2633. 1.7 Shop primer paint will be single coat of red oxide zinc- chromate primer conforms to IS-2074. The surface preparation will be done in accordance with IS: 1477 (Part I & II) – Code of Practice for Finishing of Ferrous Metals in Buildings. Second coat of primer shall be applied after erection and final alignment of the erected structures. Two or more coats of synthetic enamel paint conforming to IS: 2932 of approved shade and quality shall also be applied after erection. Total Dry film thickness of the finished paint shall not be less than 110 microns. 1.8 All welding electrodes shall be of Low Hydrogen type conforming to IS: 814 and shall be EB5426H3JX type. All electrodes, flux, wire etc. shall be of ADOR Welding Ltd., or ESAB India Ltd., or D & H Secheron Electrodes Pvt. Ltd. or Modi electrodes or equivalent as approved by MAHAGENCO. Alternatively, flux coated arc welding (FCAW) conforming to AWS- E70T-5 which is a modified procedure of MIG/CO₂ (solid wire) can be used. If submerged arc welding is used, the bare wire electrodes shall be as follows: (a) Filler wire : AWS-A-5.17-EH14 (b) Flux : agglomerated type of classification AWS-A-5.17-F7A2EH14

1.9 Minimum preheat & inter pass temperatures for welding over 40mm to 63mm (thickness of the thicker part at the point of welding) will be 66⁰C and for over 63mm, it will be 110⁰C. However, higher preheat & inter pass temperatures may be required due to joint restraint etc. and will be followed as per approved welding procedure. 1.10 Minimum tests to be carried out during fabrication and erection of structural steel shall be as follows: (a) Steel Ultrasonic Test: Plates above 25mm thick will be subjected to ultrasonic test as per ASTM-A435 or equivalent to check the presence of lamination. (b) Fillet weld Dye Penetration Test: 10% of the total length, Dye penetration will be carried out to the root run. (c) Butt weld Dye Penetration Test: 10% of the total length, Dye penetration will be carried out to the root run after back gouging. Radiographic Test: Splicing should not be provided in tension flange of Bunker Girders and crane girders. Spot radiography shall be carried out on 100% joints in tension zone and 10% joints in compression zone. Minimum 300mm length will be spot radiographed. When radiograph is not possible, ultrasonic test will be carried out after grinding the surface. Ultrasonic Test: 10% of all other Butt welds except crane girder and bunker girder shall be subject to spot radiographic test and the entire balance butt weld for ultrasonic test.

1.11	<u>CONNECTIONS</u> Connection of vertical bracings with connecting members and diagonal truss members shall be designed for full tensile capacity of the bracings. Size of fillet weld for flange to web connection for built up column section will be as follows: Full shear capacity for box section. 80% of full shear capacity or actual shear (if indicated in drawings) or 0.5 times of the web thickness which ever is more for I section. Weld will be double fillet. All welds will be continuous. The minimum size of fillet weld will be as per relevant IS code. Shear connections shall be designed for 75% of section strength for rolled sections and 80% of section strength for built up section or rolled section with cover plates. Design shear force should be more than actual shear. Moment connections between beam and column will be designed for 100% of moment capacity of the beam section. All butt welds shall be full penetration butt welds. Connection of base plate & gusset members with the columns will be done considering that total load gets transferred through weld. All splicing work shall be of full strength. Shop splicing for all sections other than rolled sections shall be carried out by full penetration butt welds. Shop splicing of all rolled sections shall be carried out using web and flange cover plate. Following connections will be provided during erection: 1.11.1 Welded Connection (a) Connection of secondary beam to main beam

(i) DL = Dead load of structures, floors, walls etc (ii) LL = General live load on floors (iii) PL = Pipe load (iv) Equip = Equipment loads (v) Cb = Crane Bridge (vi) Ct = Crane trolley positioned at middle of bridge (vii) CtLA = Crane trolley + Load near one row (viii) CtLB = Crane trolley + Load near other row (ix) CtL1 = Crane trolley + Half load lifted at centre of bridge. (x) CS = Crane surge for full load (xi) CS1 = Crane surge for half load lifted (xii) WL1 = Wind load with internal suction of 0.2P, left to right (xiii) WL2 = Wind load with internal suction of 0.2P, right to left (xiv) EL = Earthquake load (xv) TL = Temperature load Appropriate allowable increase in permissible stresses as per IS codes, may be taken except where as per above load combinations load factors are used in combinations (vii) to (ix) above. Appropriate impact factor shall be considered as per IS: 875 (Part 2) - 1987 while calculating crane loads.		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 374 of 639

In calculating wind loads, appropriate internal thrust/suction shall be considered along with external pressures as per IS: 875 (Part 3) - 1987. All possible load conditions considering external and internal pressures shall be considered in analysis and design for each combination number (vi), (vii), (ix) & (x) above to assess worst effect on whole structure as well as its components.

4.0 PIPE AND CABLE RACK STRUCTURES

The pipe and cable rack structures shall accommodate the pipes/cables with proper access and adequate working space for erection and maintenance. These shall be designed to carry safely all the loads acting on them (DL, LL, WL, EQL, forces from pipe lines etc.). The structures shall be adequately rigid to carry the forces from the pipelines at anchor points without undue deflection so that the pipe lines are really anchored at the anchor points.

It is envisaged that pipe/cable rack under this Package will have to accommodate some additional pipes and cables (such as Plant Water System etc.), which are not in the scope of this Package. The Contractor shall in his offer keep reasonable margin for accommodating such additional pipes/cables in the rack structure, details of which will be furnished to him during the detailed engineering stage.

5.0 OTHER SPECIFIC REQUIREMENTS

All steel framed structures shall be either "rigid frame" or "simple space frames" or combination of two.

Lateral forces shall be resisted by stiff jointed moment connections in rigid frame design. The column bases shall generally be fixed to concrete foundation pedestal by providing moment resistant base detail.

Simple space frame design utilizes single-span beam systems, vertical diagonal bracing at main column lines and horizontal bracing at the roof and major floor levels.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 375 of 639

Interaction ratio shall be restricted to 0.9

The most of plant steel buildings such as Main Power House, Mill Building, CW and ACW Pump House etc. shall be designed as space frame structures. The turbine building design shall be a combination of rigid frame in transverse direction and simple frame in longitudinal direction.

Concrete floors shall be considered to provide continuous lateral support to the top (compression) flange of the support beams. **However, wherever large cut outs (area more than 1.0 m²) are provided in the floor slabs, horizontal floor bracing shall be provided.** Grating/chequered plate floor shall neither be considered to provide lateral support to the top flange of supporting beams nor to provide a shear diaphragm. Adequate lateral support in the form of shear connector and horizontal bracing shall be provided as required.

Floors for vibrating machines of all kind together with supporting framework shall be adequately braced in both horizontal and vertical planes. Floors or structure supporting mechanical equipment shall be designed to minimise vibration, avoid resonance and maintain alignment and level.

Chequered plates shall conform to IS 3502.

All indoor gratings shall be electro forged type and outdoor gratings shall be welded type. Minimum thickness of grating shall be 40mm for indoor installation and 32 mm for outdoor installation. The opening size shall not be more than 30mm x 100 mm. The minimum thickness of the main bearing bar shall be 4mm. All gratings shall be hot dip galvanized @ 610 gm/sqm.

Where a steel beam or member is to be connected on RCC structure, it shall be connected using an insert plate and through shear connection.

For crane girders, welding between web and flange plates shall be carried out by submerged arc welding process. Full penetration of weld between web plate and top flange shall be ensured. Intermediate stiffeners shall be connected with top flange plate by full penetration butt weld. Welding across tension flange will not be permitted. Bearing edges of crane girders shall be machined.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 376 of 639
The working point of the bracing connection shall be the centre of column and girder to which it connects, where practical. The connections of gusset plates to column and girders shall be made to include provisions for eccentricity in connection. The double angle back-to-back with gusset plate in between shall not be used in dust-laden areas. Where double angles are not adequate, beam sections with web in the plane of bracing are used. Permissible stresses for different members shall be allowed to exceed up to 33.33% only under normal loads along with wind and seismic conditions. However, members which are designed primarily to resist wind such as bracing members, no increase in permissible stresses will be permitted. However, permissible stresses in bolts and welds shall be allowed to exceed up to 25% only under wind and seismic conditions 5.1 <u>PERMISSIBLE DEFLECTIONS</u> The permissible deflections of various steel members under normal loading conditions shall be as specified below. For calculation of deflections in structures and individual members, dynamic effects shall not be considered, unless specified otherwise. Also, no increase in deflection limits shall be allowed when wind or seismic load are acting concurrent with normal loading conditions. 5.2 <u>VERTICAL DEFLECTION</u> (a) For beams supporting dynamic equipment : Span / 500 (b) For beams supporting floors / masonry : Span / 325 (c) For beams supporting pipes (pipe racks) : Span / 400 (d) For roofing and cladding components : Span / 250 (e) For gratings and chequered plates : Span 250 subject to a maximum of 6 mm

Provisions of IS: 800 and relevant IS Code shall be followed for limiting deflections of structural elements not listed above.

5.4 MINIMUM THICKNESS OF STEEL ELEMENTS

The minimum thickness of various components of a structure and hot rolled sections shall be as follows. The minimum thickness of rolled shapes shall mean flange thickness regardless of web thickness. Structural steel members exposed to significantly corrosive environment (Exposed to open air i.e., to Rain; Contact with Soil, Coal, ash, Contact with drained liquid or contaminated water, acid/alkali etc.) shall be increased suitably in thickness or suitably protected otherwise as per good practice and sound engineering judgment in each instance.

(a)	Trusses, purlins, girts and bracing	: 6 mm
(b)	Columns and beams	: 8 mm
(c)	Gussets	: 8 mm
(d)	Stiffeners	: 8 mm
(e)	Base plates	: 10 mm & above
(f)	Chequered plates	: 6 mm o/p & above
(g)	Grating flats	: 5 mm
(h)	Minimum thickness of structural members other than gratings and chequered plate directly exposed to weather and inaccessible for painting and maintenance shall be 8 mm.	

5.5 MINIMUM SIZES OF STEEL ELEMENTS

The flange width of purlins supporting light weight concrete slab shall not be less than 65 mm and for those supporting roof sheeting and wall cladding it shall not be less than 50 mm. Width of steel rolled section connected to other member shall be at least 50 mm. The depth of beams for platform of all structures shall not be less than 125 mm.

1.0	<u>SCOPE</u>	
The architectural services shall cover finishing work of all main and auxiliary buildings included under the specification starting from brick work, partition walls, roof protection, finishing of walls, floors and ceilings, false ceiling as required, potable water system, sanitation etc.		
2.0	<u>DESIGN REQUIREMENTS</u>	
2.1	<u>ARCHITECTURAL CONCEPTS</u>	
(a) Layout of the plant area shall have definite hierarchy of road network depending upon its usage, aesthetic, visual sensibilities for creating road vistas, focal points, building back drops, building frames. General layout shall be evolved taking over the basis of landform & local climate & due consideration shall be given to orientation and wind direction. The resulting built mass shall present a definite image width in distinct vocabulary in the form of landmarks, nodes & skyline. (b) All plant building shall be architecturally treated in such a way that it retains a monumental scale, yet presents a pleasing composition of mass and void with suitable and functionally designed projections and recesses. The overall impact of the building shall be one of aesthetically unified architectural composition having a comprehensible scale, blending tonal values with the surroundings and taking full consideration of the climatic conditions, the building orientation and the existing structures nearby. (c) Overall colour scheme of the plant and other buildings shall be designed judiciously and in a comprehensive manner taking into account the mass and void of buildings, its facade, equipments, exposed structural elements, piping, trestles, bus ducts and other service elements. (d) Overall emphasis shall be on developing eco-friendly architecture, merging with the nature with its own sustainable energy management systems.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 386 of 639
The scheme shall be conceptually finalized in totality including that of equipments so that the proper co-ordination with other agencies can be taken up at appropriate time. 2.1.1 Architectural Design (a) Natural light shall be used to the maximum extent especially in the form of north light/skylight. For adequate light and ventilation, National Building Code recommendation shall be followed. (b) Entrance canopies, chajjas (projections, recesses) over openable windows and door openings on exterior facades shall be provided. (c) All the buildings shall be architecturally designed to meet the National Building Code (SP: 7) norms and local building bye laws, wherever applicable. (d) Architectural design and detailing aspects of all the buildings shall be rendered through professional services of an Architect Statutory requirement and any clearances from local authority may be required to be met with, wherever essential. The Architect Consultant shall be of national/international repute having experience in similar kind of works. The consultant shall evolve the design philosophy and shall present it in the form of presentation drawings, prospective views, 3-D Models & detail drawings. (e) A comprehensive interior design scheme shall be conceived with the intention of projecting a definite theme and aesthetic appearance to inside working environment. It shall take into account the multidisciplinary engineering activities involving power plant technology and architectural & civil engineering for a smooth control hierarchy and man machine interface. The Bidder shall develop the architectural layout of all the buildings listed in this document as per the final approved equipment disposition and other layout considerations indicated elsewhere in this specification. These drawings shall need the approval of the owner before construction. The contractor shall also have to submit

perspective views if so desired by the owner at no expenditure to the owner. Approval from statutory authorities, e.g. Factories Inspector, Explosives Inspector, Loss Prevention Association of India/Tariff Advisory Committee etc. shall be the responsibility of the contractor without any obligation of the owner. The entire complex shall have an architectural character and style of its own and shall be visually and functionally integrated with the existing landscape. The bidders must visit the site and have a feel of the overall environment, so that a harmonious as well as integrated architectural concept of the proposed phase of development is achieved. Special care must be taken to enhance the visual and technological quality of development by adopting updated technology, materials, finish etc. Special attention should be given in developing Architectural design of the Powerhouse, Service building & Gate complex. Architectural design must take care of its visual quality as landmark, aesthetic balance in its composition particularly in façade design, appropriate physical and functional integration. Entrance shall be suitably designed along with a lobby, which shall also be aesthetically pleasing. 2.1.2 Architectural Work: Architectural design of the buildings shall be in conformity with the following: (a) Architectural design basis. (b) National Building Code of India. (c) Local Municipal or other authority by-laws. (d) Relevant State Government Factory Acts. (e) Tariff Advisory Committee (TAC) regulations/Loss Prevention Association of India(LPA) regulations (f) Any other relevant information included elsewhere in this Specification.

2.2 GENERAL ARCHITECTURAL SPECIFICATIONS

2.2.1 Powerhouse Building

Powerhouse shall be of structural steel framed with RCC floor and Brick Wall & insulated metal cladding construction. Operating floor being the heart centre of Powerhouse shall be designed as a very impressive floor having high quality finish, material and appropriate ambience.

External facade shall be with full brick thick wall up to approximately 3.0m high, plastered and painted. From 3.0m-up to roof, external façade shall be clad with insulated metal cladding on A Row & Gable ends, on C Row and any other external exposed surfaces, single skin metal sheet cladding over brick work shall be installed where brick work is technically required. Fire Wall facing towards Transformer yard, shall be minimum 6.0M high and 1½ brick thick wall or 250mm thick RCC wall as per Fire Prevention regulation.

Single skin metal cladding similar to the Top sheet of Insulated Metal Cladding used for other part of the facia shall be applied over the Fire wall to match the overall elevation treatment.

Sufficient natural light and ventilation has to be ensured for every part of the building unless prevented due to technical reasons. Operating floor may have large glazed area made with Structural glazing system. At Crane girder level, windows on A Row, B Row and gable ends shall be provided.

Rain-water pipes or sanitary pipes shall not be visible from outside. Provision of pipe ducts shall be made to ensure pipe routing.

Steel columns within fire hazardous areas like electrical room, switch gear room shall be encased with brick work or concrete. All steel columns shall have 150mm high concrete base to ensure proper floor finishing work and to protect the column base.

Minimum 2.1m high headroom clearance has to be maintained at every part of the building.

Where false ceiling is to be provided, provision of human access has to be made to maintain the HVAC, Electrical and other service lines above false

CONSULTANT : PROCON ENGINEERS

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 389 of 639
ceiling. If the height between false ceiling and bottom of beam is more than 2.1M then steel grid system (1.2M X 1.2M span) with catwalk to be provided to support the false ceiling system and human access respectively. Minimum 1.5M wide passage is to be marked on the floor as safety exit route. Such passages shall lead to Fire-escape staircases or fire-safe zones. Doors of fire-hazardous rooms or areas shall open towards safety exit passage. All external doors shall open towards outside. Fire escape staircases shall be located as per fire-code. 2.2.2 Mill & Bunker Building This shall be of steel framed structure having single skin metal cladding to clad Tripper floor only. The colour and pattern of the sheeting should match the overall ambience of Power Island. Sufficient natural light and ventilation should be provided for tripper floor. Provision of roof access through stair should be made. 2.3 ROOF INSULATION AND VENTILATION The roof of all buildings shall be insulated with foam concrete. Extractor fans will be provided over roof of turbine hall for ventilation. For ventilation requirements, relevant section of the specification shall be referred. 2.3.1 Other Plant Buildings Structures of Other plant buildings shall be as per description stated elsewhere in this Civil/Structural Specification. Architectural concepts of structures shall offer its own identity and will be aesthetically blended to give pleasing appearance maintaining harmony of the plant complex. Functional needs of each building shall be maintained. 2.4 <u>GENERAL</u> (a) Minimum 1000 mm high (from floor/ roof level) hand railing shall be provided around all floor/roof openings, projections/balconies, walkways, platforms, steel stairs, etc., Hand railings at higher elevations (more than 6.0m from ground level or nearest floor level) shall be 1200mm high. All handrails and ladder pipes (except at

	operating floors) shall be 50 mm nominal bore MS pipes (medium class) conforming to IS: 1161 and shall be galvanized as per IS: 4736 treated with etch primer and finished with suitable paint. All rungs and ladders shall also be galvanized. Minimum weight of galvanizing shall be 610 g/sqm. For stairs and around all floor openings at operating floors, 1000 mm high hand railing with 32 NB (polished) stainless steel pipe shall be provided. (b) All stairs shall have a maximum riser height of 180 mm and a minimum tread width of 250 mm. Minimum clear width of stair shall be 1200 mm unless specified otherwise. (c) All buildings having metal cladding shall be provided with a 150 mm high RCC toe curb at the edge of the floor along the metal cladding. 1000 mm high hand railing shall be provided on this RCC curb, wherever required from the safety point of view. (d) In all buildings, structures, suitable arrangement for draining out water collected from equipment blow downs, leakages, floor washings, fire fighting, etc., shall be provided for each floor. All the drains shall be suitably covered with grating or pre-cast RCC panels. (e) RCC staircase shall be provided for all RCC construction buildings and structural steel staircase for all structural steel buildings. (f) Parapet, Chajjas over window and door heads, architectural facia, projections, etc., shall be provided with drip course in cement sand mortar 1:3. (g) All fire exits shall be painted with P.O red/signal red colour shade which shall not be used anywhere except to indicate emergency or safety measure. Fire safety norms shall be followed as per National Building Codes and fire safety requirements for providing fire exits, escape stairs and fire fighting equipment. In detailing of all buildings, fire safety requirements conforming to IS: 1641 and IS: 1642 shall be followed.

(h) All roofs shall be accessible by means of staircase or by ladder for maintenance purpose. If there are any mechanical equipment on roof top then for roof access staircase shall be provided. 2.5 <u>WALLS</u> All walls shall be non-load bearing infill panel walls. For initial height up to 3000 mm from ground level, minimum one brick thick masonry wall shall be provided where ever metal cladding is specified. TAC requirements shall also be complied with for all other buildings while deciding cladding type & thickness. However, TAC requirements shall also be followed wherever applicable. RCC vertical posts and horizontal lintels shall be provided wherever necessary to reinforce masonry work. For half brick thick wall 2 nos. 8 mm diameter bars shall be used at every third layer. Bricks used shall be solid fly ash lime bricks conforming to IS: 12894 – 1990 in cement sand mortar. Generally 230 mm thick bricks shall be used. 2.6 <u>EXTERNAL WALLS</u> All external walls shall be one brick thick masonry work with 1:6 cement sand mortar, and/or pre-coated metal cladding as per requirement. For walls requiring periodic temporary removal, necessary arrangements shall be made. Masonry work facing any transformer yard up to a required height shall be fire resistant as per code/LPA requirement. Minimum thickness of firewalls shall be 345 mm for brick walls and 200 mm for concrete walls. For external face of the building, where, permanent external finish is to be provided with fire clay bricks, half brick thick fire clay brick cladding (conforming to IS: 6) in cement mortar shall be provided and shall be finished with recessed pointing. 2.7 <u>INTERNAL WALLS</u> In plant buildings, all internal walls shall be one brick thick masonry in cement mortar 1:6. Internal toilet walls and office walls shall be half brick thick masonry with 1:4 cement sand mortar. In non-plant buildings, all internal

walls shall be half brick thick masonry with 1:4 cement sand mortar unless otherwise noted. In control rooms and other specified areas, Glazed partitions with anodized aluminium frame box sections shall be used. External face of Toilets, Air-conditioned and pressurized areas shall be provided with internal masonry wall as per functional/aesthetic requirements inside the metal cladding wherever provided. 2.8 <u>METAL CLADDING</u> (a) Permanent colour coated (non-insulated) metal cladding system Troughed galvanized M.S. sheets having 0.6 mm minimum Base Metal thickness with minimum rate of galvanization of 275 gms./sq.m. (or High tensile steel sheet coated with zinc aluminium alloy @ 150 gms./sq.m. of 0.5 mm minimum Base Metal thickness and having minimum yield strength of 350 MPa) shall be used for the cladding system. The outer side (exposed face) shall be permanently colour coated with Silicon modified polyester paint of minimum DFT 20 microns over primer, of approved colour/shade and the inner side (internal face) shall be coated with same paint of minimum DFT 20 microns over primer of off-white shade. These shall be fixed with concealed fixing system or any other compatible method approved by the Engineer. The sheets shall meet the general requirement of IS: 14246 and shall conform to class 3 for the durability. (b) Flashings, caps, trim closures etc. for jambs, lintels, softies, and cornices All flashings, trim closures, caps etc. required for the metal cladding system shall be made out of plain sheets having same material and any weather/moisture sealants with appropriate material and coating specification as mentioned above for the outer face of the sandwiched metal cladding. Overlap shall be min. 100 mm or as specified by manufacturer. 2.9 <u>ANTI - TERMITE TREATMENT</u> Anti - termite treatment shall be done with insecticide emulsion at the rate of 5 liters/m² as per IS: 6313 (Part – II) 1981 for all structures.		

CONSULTANT : PROCON ENGINEERS

2.10 DAMP PROOF COURSE

Exposed surfaces of cement concrete, lime concrete or brickwork to be treated for waterproofing by the resin based application shall be thoroughly cleaned and the epoxy resin based material to be applied as directed by the manufacturer.

2.11 PLASTERING

(b) External : 20 mm thick 1:4 Sand faced cement plaster to be laid in two courses to all external surfaces.

(c) Plaster of Paris : 2 mm thick plaster of Paris punning (Gypsum anhydrous) conforming to IS: 2547 shall be provided over internal plaster to all air-conditioned areas and control rooms. White cement putty of 2mm thickness may be used instead of POP.

(d) Ceiling : 6 mm thick 1:3 Cement: Sand Plaster below all RCC slabs (except areas provided with false ceiling, cable vault ceiling and metal decking)

(e) RCC walls : 12 mm thick 1:6 Cement: Sand Plaster

Groove of uniform size 12 x 12 mm up to 20 x 15 mm in plastered surface as per approved pattern shall be provided as per approved drawing.

All plastering work shall conform to IS: 1661.

2.12 <u>FLOOR FINISH AND SKIRTING</u> (a) The nominal total thickness of floor finish shall be 40 mm i.e. under bed and topping. The floor shall be laid on an already laid and matured concrete base. The under bed for floors and similar horizontal surfaces shall consist of cement concrete (1 part cement, 2 part sand and 4 part stone chips by volume). Stone chips shall be 12.5 mm down well graded. (b) Sunken RCC slab shall be provided in false flooring area and all toilet areas so as to keep the finished floor level of these areas 12 mm below as that of the surrounding area. For toilet area, sunken slabs shall be made watertight by suitable water proofing treatment. (c) Polished heavy duty white cement concrete tiles (carborundum) of size 300 x 300 x 25 mm thick (minimum) as per IS: 1237, using colour pigments and hard chips like carborandum shall be used. Laying of tiles shall be as per IS: 1443. (d) For battery room, battery charger room, chemical laboratories, chlorination room etc. handling corrosive liquids, fumes/vapors, 25 mm thick acid and alkali proof tiles as per IS: 4457 will be set with acid and alkali proof epoxy mortar under bed as per IS: 4832. Silica based epoxy mortar which is chemical resistant shall be used for dado up to 1500 mm above floor level. (e) All wet areas e.g. pantry, kitchen, locker, laboratory, toilet including W.C, urinal and shower shall have matt finish ceramic tile floor and dado shall be glazed ceramic tiles of minimum 6 mm thickness up to 2200 mm height from floor level as per approved colour pattern. The total thickness of flooring shall be 40mm. Dust pressed ceramic tiles (heavy duty) Group-V conforming to IS: 13755 of size 300 x 300 x 7 mm thick (minimum) of reputed manufacturer and of approved finish shade and colour to be used. (f) Control room shall have 2mm thick heavy duty antistatic vinyl tile flooring over 40 mm thick IPS flooring. PVC flooring, wherever used, shall be minimum 2 mm thick (virgin) as per IS: 3462. The laying of

	flooring shall be as per IS: 5318. 2 mm thick 150 mm high PVC tile skirting shall be provided. Penetrations for cables and pipes shall be arranged. (g) Wherever required, fully vitrified ceramic tiles shall be provided in conference room of main control room complex. (h) Floor/Staircase in areas prone to slippage due to oil spillage etc. shall be provided with anti-skid floor finish like brush-wash and chequered finish. Edge angle shall be provided to steps. (i) Risers and treads of concrete staircase shall be provided with cast-in-situ terrazzo in white cement in general. Staircase up to Control room shall have polished Granite stone of approved colour and design. (j) Office and circulation areas in plant and non-plant buildings shall have terrazzo tiles in white cement laid as per IS: 2114/fully vitrified tiles. Vitrified ceramic tiles of size 400mm x 400mm or 600mm x 600mm (Matte or Mirror Polished) and of specified thickness (8mm minimum) from reputed manufacturer shall be used. The finish, shade and colour and pattern shall be as approved. Total thickness of flooring shall be 40 mm. (k) The main entrance of powerhouse, technical/service building, control room and other important areas shall have high quality finish to floors, walls, ceilings etc. (l) Main stairs and landing shall be equally treated. (m) Inter locking concrete blocks used for paving shall be of minimum M 30 grade of concrete, and of thickness 80 mm, of approved colour and pattern. It shall be laid on the sub base and bedding as per recommendation of manufacturer of inter locking concrete blocks. (n) Acid/Alkali Resistant Lining The material shall conform to the following:

(i) Bitumen primer shall conform to IS: 158. (ii) Bitumastic compound shall conform to IS: 9510. Where the height of bitumastic layer on vertical surface is more than 2.0 m, the bitumastic layer shall be reinforced with diamond pattern expanded metal steel sheets conforming to IS: 412. (iii) A.R. Bricks/Tiles shall conform to class II of IS: 4860 & IS: 4457 respectively. (iv) Mortar: Potassium silicate & resin type mortars shall conform to IS: 4832 Part- I&II respectively. 2.13 <u>DOORS, WINDOWS, VENTILATORS & LOUVERS</u> (a) Maximum size of single shutter door shall be 1200 mm x 2100 mm. For higher widths double shutters shall be restricted to 2000 mm x 2500 mm beyond which Rolling shutters shall be used. Doors to showers and W.C. shall be 800 mm wide and office areas minimum width shall be 1000 mm. The bottom of lintel for all doors shall be generally 2100 mm unless otherwise mentioned. (b) Personnel Doors In plant buildings, personnel doors shall be 45 mm (min.) thick insulated 16 gauge double plated hollow metal steel flush door shutter with 18 gauge pressed steel frame, factory galvanized, primed and field painted. The two outer sheets shall be rigidly connected with continuous vertical 1.0 mm stiffeners at the rate of 150 mm center to center. Side, top and bottom edges of shutters shall be reinforced by continuous pressed steel channel of minimum 1.2 mm thickness. All steel doors and frames shall conform to IS: 1038 and IS: 4351. The cavity shall be filled with mineral wool/glass wool insulation. Doors shall be complete with all hardware and fixtures like door closer, tower bolts, handles, stoppers, aldrops, locks etc. In non-plant buildings, solid core commercial flush doors shall be used unless otherwise mentioned.

(c) Main entrance doors of control room, control equipment room, computer room, etc. shall be provided with air-locked lobby with provision of double doors of aluminium framework with glazing. Doors shall be of double action floor springs mounted. For control room, control equipment room, etc. glazed partitions with aluminium frame shall be provided between air-conditioned and non-air-conditioned areas and on the side of control room facing the operating floor to have a clear view. Glazed panel with aluminium framework shall also be provided as partition between two air-conditioned areas where clear view is necessary. All aluminium sections used shall be heavy gauge of minimum 3 mm thickness and of approved make HINDALCO or equivalent and black powder coated. All aluminium doors shall have heavy gauge box sections with weather seals. (d) Doors of wet areas like W.C., showers shall be hinged type single leaf shuttered FRP (fiber reinforced polyester) doors with heavy-duty aluminium box section frame black powder coated. (e) Fire Doors Fire proof doors shall be provided on division walls of cable spreader rooms and at all fire exit points as per recommendation of Tariff Advisory Committee. These shall be as per IS: 3614. Fire resistance grade of the doors shall be as per TAC requirements. However, minimum fire resistance grade shall be for 2 (two) hours. Fire Doors shall be hollow metal steel flush door with appropriate filler to meet fire rating. All such doors shall have panic bars. (f) Exterior Doors All outside doors shall have door closer as per IS: 3564. All exterior doors located in ground floor shall swing out. Hardware of all doors shall be heavy duty. All exterior doors exposed to weather at all elevations shall also swing out.

(g) Interior Doors Wooden doors in finished office areas shall be 45 mm thick full flush, solid core, veneer faced. All wooden doors shall be mortised and reinforced at the factory. All interior doors in general shall swing in unless otherwise required for functional and egress requirements. Doors shall have glazed vision panels where required. Heavy-duty locks shall be provided to both exterior and interior doors as required by the Owner. (h) Weather stripping shall be provided to all outside doors as well as air-conditioned areas and all other doors where dust-free environment is required (i) All windows and ventilators in general shall be heavy duty extruded aluminium sections with fixed, sliding or swing shutters conforming to IS: 1948 and IS: 1949. All aluminium sections used shall be black powder coated. All aluminium windows shall have heavy gauge box sections with weather seals. Windows at ground floor level shall be lockable and furnished with security grills. All window hardware shall be substantially made, smooth finished, accurately fitted, and smooth in operation. Aluminium windows with double glass filled with vacuum shall be provided in all air-conditioning rooms. (j) Hollow extruded section of minimum 3 mm wall thickness as per IS: 1285 shall be used for all aluminium doors, windows and ventilators. Steel windows and ventilators shall be as per IS: 1361 and IS: 1038. (k) All toilet windows shall be adjustable glazed louvers with powder coated aluminium box frames/ventilators. (l) Louvers shall be aluminium Z or S section type, storm proof, complete with bird screen, MS frame, and mullions where long louver is required. Operating damper shall be provided behind boxed louver where closing of louver openings is required. (m) In Powerhouse building, full glazed windows and ventilators in minimum 15 micron anodized aluminium window frame shall be

provided with 4 to 6 mm thick (depending on the size of panel) clear float glass and 6 mm thick clear wired/laminated glass where required from safety point of view. For operating floor of Power House, structural glazing may be considered as an important façade element. In other areas aluminum windows with 4 mm thick clear float glass shall be provided. The window area shall be so decided as to allow adequate natural ventilation and light. Note: Glass thickness and member sizes of Aluminium Glazed doors and windows shall be designed by the manufacturer and to be submitted for approval by the Contractor before execution 2.14 <u>ROLLING SHUTTERS</u> Rolling shutters as per IS: 6248 with suitable operating arrangement (manual, mechanical and/or electric) according to sizes shall be provided in buildings to facilitate handling and transportation of equipment. M.S. rolling shutters shall be made of interlocking lath section formed from bright cold rolled, annealed M.S. strips not less than 0.90mm thick for shutters up to 3.5m width & not less than 1.20mm thick for shutters above 3.50m width, with weather seals and wind lock and shall have grills for ventilation where necessary. Its components shall be factory galvanized, primed and field painted. They shall be manually or motor operated as required to meet functional requirement and operating convenience. Rolling shutter with area up to 9 sq.m shall be push and pull type manually operated while for area above 9 sq.m. Rolling shutter will be mechanically/ electrically operated, as per IS specifications. 2.15 <u>GLAZING</u> (a) 6 mm thick float clear glass shall be provided for accessible level operable windows and 6 mm thick wired glass for fixed portion of high level windows and ventilators where frequent replacement is not feasible as per IS: 5437.

	the top rail 1065 mm above the walkway surface and the intermediate rail of 32 mm NB shall be 535 mm below the top rail. Spacing of handrail post shall be limited to 1200 mm as far as possible but can be adjusted to suit the length of railing. In non-plant areas, total height of handrail shall be 1000 mm from finished floor level. (c) Removable type hand railing shall be provided in areas like loading/unloading bay, equipment handling platforms etc. (d) For RCC stairs and around all floor openings at operating floors, 1000 mm high hand railing with 32 NB (polished) stainless steel pipe shall be provided. (e) For powerhouse building upto operating floor + half landing, main stair & lobby shall have 40mm diameter stainless steel railing with minimum 3mm thick SS posts & decorative minimum 3mm thick seamlessly joined SS handrails. Stainless steel pipe handrail in shall be of approved design to meet the functional requirement as well as very good aesthetic appearance. (f) For Technical Service building, stainless steel railing with SS posts & decorative SS handrails or CP teak wood rails shall be provided. (g) For any other RCC stairs of non-plant buildings 20mm square MS bar post with suitable MS flat and CP teakwood handrails are to be provided. (h) For any other floor of powerhouse building, plant & non-plant buildings, unless otherwise indicated in the specification the post and handrails of stairs, railings, etc. shall be of 32 mm dia G.I. pipes as per IS-1239-part (I).	
2.17	<u>STAIRS</u> (a) Stairs/Cage Ladders shall be provided from grade level to highest operating level. All buildings with flat roof shall be made accessible. (b) All stairs shall have not more than twelve (12) risers in one flight. Height of risers and width of treads shall be 180 mm (maximum) and

	250 mm (minimum) respectively. Minimum width of stairs shall be 1200 mm. Minimum headroom of 2500 mm to be maintained in all staircases. (c) M. S. Angle/aluminium nosing shall be provided for edge protection in RCC stairs. (d) All staircases shall be in structural steel unless otherwise noted. (e) Escape staircase shall be provided in plant and non-plant buildings as per Fire Regulation Rules in suitable locations. Fire escape stairs shall be provided of width 1000mm. (f) Minimum 900 mm wide Platform in front of doors shall be provided with Door Steps at Ground floor for easy operation of door.	
2.18	<u>OPERATING PLATFORMS, MAINTENANCE WALKWAYS ETC.</u>	
	Maintenance walkways and stairs shall not be less than 920 mm wide. Headroom shall be min of 2500 mm. Space for piping, conduits, lighting fixtures shall be above the headroom. Access platforms shall have min width of 750 mm and min area of 1.1 sqm. No ladders shall be permitted, except for large field erected tanks and secondary means of egress from isolated areas where placement of stair is not practical, ladder may be used. Platforms shall be connected with walkways where necessary. All platforms shall have kick plates at edge of platform. Operating platforms shall not be less than 1000 mm wide. Emergency escape ladders shall be provided for platforms with dead ends. All Platforms from the elevator lobby shall extend to main staircases. Headroom shall be minimum of 2500 mm. Space for piping, conduits, lighting fixtures shall be above the headroom.	
2.19	<u>RAMPS</u>	
	(a) Ramps shall be provided in front of all ground floor rolling shutters. (b) Generally 1:8 slope shall be given to ramp, 1:6 slope being maximum allowable. (c) Ramps shall have neat cement finish with chequered pattern for anti-

skid. 2.20 <u>LIFTS AND ELEVATORS</u> Lifts shall be provided in (a) Service Buildings up to roof level. (b) Power house in de-aerator bay up to de-aerator floor level. Lifts shall not be considered as fire exits. 2.21 <u>FALSE CEILING</u> Aluminium false ceiling shall be provided in all air-conditioned areas and other areas where false ceiling is required, gypsum board false ceiling shall be provided. (a) Aluminium panel/lineal false ceiling system Aluminium panel (coil coated) lineal/panel ceiling system shall consist of rolled formed, coil coated aluminium pre-coated magnesium alloy (Al-Mg AA 5050) carrier and panels of minimum 0.9 mm and 0.5 mm thickness respectively. The ceiling system shall be of approved pattern. The system shall be complete with edge cover profile, special panels, carrier splice, etc. The carrier shall be suspended from roof by MS flats, angles or 4g or heavier galvanized tie wire hangers having special height adjustment clips made from spring steel at maximum spacing of 1.2 m c/c both ways as per manufacturer's specification. False ceiling with Mineral Fiber Tiles False ceiling shall consist of regular or tapered edge lightweight mineral fiber tiles of size of 600 x 600 or 600 x 1200 or as per architecture design with minimum tile thickness of 15 mm. Exposed surface shall be semi perforated (fine fissured) with nominal depth of perforation as 4 mm. The material shall be humid resistance up to 95% RH with fire performance of class 0/class 1 (as per BS 476) and shall not sag for 10 years under 95% RH.

	Metal suspension system shall conform to ASTM C-635 and shall be hot dipped M.S. galvanized (grade 180 as per IS: 277). Nominal size of T-section shall be 24 x 38 mm for main runners and 24 x 30 mm or 24 x 25 mm cross runners. 24 mm wide exposed flange surfaces shall be permanently colour coated. Suspension system shall be as per manufacturer's specification. Gypsum plasterboard, used for false ceiling, shall be minimum 12mm thick conforming to IS: 2095. (b) Suitable cutouts shall be provided in false ceiling to facilitate fixing of lighting fixtures, AC grills, smoke detectors, etc. Additional hangers and height adjustment clips shall be provided for return air grills, light fixtures, A.C. ducts etc. Illumination and A.C. ventilation grills in these areas shall match with the overall aesthetics. (c) Toilets, Pantry, Rest Rooms shall have false ceiling to reduce the high ceiling heights. (d) False ceiling used shall have good impact resistance, durability, high humidity resistance, fire performance shall be in accordance to British Standards BS: 476 as well as aesthetic. (e) Glass wool insulation shall be laid on top of false ceiling panels in Main Control room, Administrative areas where good acoustic is required. (f) Suitable M.S. channel (Minimum MC75 with maximum spacing of 1.2 m C/C both ways) grid shall be provided above the false ceiling level for movement of personnel and to facilitate maintenance of lighting fixtures, AC ducts etc.	
2.22	<u>UNDER DECK INSULATION</u> 50 mm thick under deck insulation with best quality mineral wool insulation of density 40 – 45 kg/cum and conforming to IS: 8183 with aluminium foil facing shall be provided in all air-conditioning rooms, AHU room and at locations where system requirement is there (slab and beam bottom and beam

sides). 2.23 <u>ROOF</u> (a) Roof of pump houses and other buildings shall be cast-in-situ RCC slab. (b) For efficient disposal of rainwater, the run off gradient for the roof shall not be less than 1:100 and the roof shall be provided with RCC/MS plate water gutter, wherever required. Gutter shall be made water tight using suitable watertight treatment. This gradient can be provided either in structure or subsequently by screed concrete 1:2:4 (using 12.5 mm coarse aggregate) and/or cement mortar (1:4). However, minimum 25 mm thick cement mortar (1:4) shall be provided on top to achieve smooth surface. (c) Fillets at junction of roof and vertical walls shall be provided with cast-in-situ cement concrete (1:1.5:3) nominal mix followed by 12mm thick 1:4 cement sand plaster. (d) Roof of all buildings shall be provided with access/approach through staircase or cage ladder. Roof where equipment is mounted shall be provided with access through staircase. (e) Pathways for handling of materials and movement of personnel's shall be provided with 22mm thick chequered cement concrete tiles as per IS: 13801 for a width of 1000mm.		
2.24 <u>ROOF WATER PROOFING</u> The RCC roof shall be provided with pre-fabricated APP (atactic polypropylene) modified waterproofing membrane with non woven polyester reinforcement treatment of 4 mm thickness consisting 160 gsm polyester core coated on both sides with APP modified bitumen and finally finished with thermo fusible film. The treatment shall be laid over a coat of bituminous primer @ 0.27 L/Sqm (IS: 3384). 18 mm thick cement sand mortar (1:4) with chicken wire mesh interposed shall be laid over waterproofing treatment. The roof shall be finished with 22 mm thick cement concrete tiles. Water proofing treatment shall be laid over 75 mm thick foam concrete. 12 mm thick uniform

or varying 1:4 cement sand plaster shall be laid on top of foam concrete cast-in-situ after it is fully cured and dried for providing smooth surface for laying of water proofing treatment.

The finishing course shall be fully secured and shall have an even density. There shall not be any bubble formation or crushed or squeezed insulation on under bed. The contractor shall give guarantee in writing for all works executed under this specification supplemented by a separate and unilateral guarantee from the specified agency for the roof water proofing treatment work. The guarantee shall be for materials and workmanship for ten (10) years. The mode of execution of the guarantee shall have to be acceptable to the Owner.

2.25 ROOF DRAINAGE

The system shall be provided for removal of rainwater from roof surface without over flow to avoid damage to the roof structure of all buildings and shall consist of the following:

- (a) Roof Drain Heads.
- (b) Rain Water Down comers.
- (c) Fixture

Multiple drains (min.2 nos.) shall be provided for all roof areas. The roof drains shall be sized for the roof area run-off for a maximum rainfall per hour at site. Minimum 100 mm diameter pipe shall be provided to drain out 40 Sq.m of roof surface area and minimum 150 mm diameter to drain out 80 Sq.m of roof surface area.

For Building where metal cladding is envisaged medium class galvanized mild steel pipes conforming to IS: 1239/IS: 3589 with welded joints shall be provided to drain off rainwater from the roof. For rest of the buildings cast-iron pipes with lead caulked joints conforming to IS: 1230 shall be used. These shall be suitably concealed with masonry work, cement concrete / or sheeting work to match with the exterior finish. The number and size of down comers shall be governed by IS: 1742 and IS: 2527. Roof drain level of all RCC framed buildings having cast-in-situ RCC roof shall be provided with Rain water

gutter and/or 45 x 45 cm size Khurras having minimum thickness of 30 mm with 1:2:4 concrete over PVC sheet of 1 m x 1 m x 400 micron and finished with 12 mm thick cement sand plaster 1:3. All the pipes shall be provided with suitable fittings and fixtures. Gratings shall be of stainless steel. Any roof more than 8.0 meters above grade shall have access from within the building for cleaning of roof drains. Roof drains will conduct water to storm sewers. Rainwater down comers will generally run outside buildings and conducted away from the building to a watercourse through surface drains. 2.26 <u>PARAPETS</u> Parapets shall be provided to all RCC roofs. Parapet wall shall be 600 mm high for inaccessible roofs and 1000 mm high for accessible roofs. Minimum 110mm thick R.C. concrete parapet will be provided unless otherwise mentioned. Polished Kota stone coping 150mm wide shall be provided to all parapets. In case of parapet wall with brick work, minimum 230mm wall thickness shall be provided. 2.27 <u>PAINTING</u> (a) Exterior Masonry Surface : Buildings shall be finished with water proof cement paint over plaster. Granular textured paint/Synthetic plaster composed of synthetic fibre and petroleum based chemical may also be combined along with cement paint to form suitable pattern on building façade Aluminium composite panels (ACP) may be used to accentuate certain portion of the façade or certain element of the façade as the case may be. (b) Exterior Steel Work : Anti-corrosive synthetic enamel paint over anti corrosive primer. (c) All Woodwork : Synthetic paint over a coat of primer.

	(d) All Internal Steel Work : Synthetic enamel over a coat of primer (e) Interior Office Spaces, Control Rooms, All A.C. Areas : Acrylic emulsion paint over 2 mm thick plaster of paris punning or white cement putty punning. (f) Other Areas : Acrylic distemper over plastered surface as indicated in finish schedule in this document. (g) Fire Door : Post Office red shade shall be provided.	
2.28	<u>MISCELLANEOUS WORK</u>	
	(a) Counter tops in kitchen Washbasin, pantry & similar areas : Polished granite	
	(b) Pavements, walkways, etc : 50 mm thick anti-skid interlocking concrete pavers	
	(c) M.S. grill : Generally anodized aluminium grill shall be provided. But in specific cases, M.S. grills shall be used as per approved design for security purpose made of 25 mm X 6mm M.S. flats/12mm – 20mm M.S. square bar of approved design shall be provided to suit security requirements.	
	(d) R.C.C. stair railing : For R.C.C stair, hand railing with 20 mm square M.S. bar balustrades with suitable M.S. flats & anodized aluminium/CP Teakwood handrails shall be provided. Stainless steel pipe railing in specific areas shall be used.

(e) For RCC main stair and landing of powerhouse building, RCC stair of Technical/service building shall be of white marble with all edges and nosing moulded. (f) Anti - termite treatment shall be done with insecticide emulsion at the rate of 5 liters/m² as per IS: 6313 (Part – II) 1981 for all structures. (g) Suitable arrangement of floor drain with trap shall be provided in floor where spillage of water may occur. (h) RCC staircase shall be provided in main entrance of Turbine building, Facility building and other important buildings. (i) Covered car parking shed with minimum 25mm thick colored interlocking cement concrete tile flooring over reinforced concrete hard standing and . two- wheelers & cycle parking shed shall be provided as per requirement at the desired location of the owner. Structure shall be RCC framed structure with RCC roofing The structure shall be aesthetically harmonious. (j) Access floor where required shall be provided with removable flooring system consisting of fire resistant particle board 600x600x35 mm thick with .05mm thick aluminium foil lining at bottom and with 2 mm thick anti-static PVC topping. The system shall be supported on proprietary removable metal supporting system. Depth of access floor shall be minimum 600 mm. (k) Doors, windows and rolling shutter in all buildings shall have sun-shed either recessed in the wall or projected out. Projection of sun-shed shall be 750 mm for door and 450 mm for windows. Where doors and windows are side by side, 750 wide continuous sun-shed shall be provided. For recessed type shed minimum 450mm offset shall be provided. (l) North Light provisions on the powerhouse shall be made of Polycarbonate sheet of M/s GE fixed to structural framework as per approved design. Arrangement shall have to be provided to prevent ingress of rainwater, if any.

(m) Lifts shall be provided in (i) Service Buildings up to roof level. (ii) Power house in de-aerator bay up to de-aerator floor level. Lifts shall not be considered as fire exits. (n) Ramps (i) Ramps shall be provided in front of all ground floor rolling shutters. (ii) Generally 1:8 slope shall be given to ramp, 1:6 slope being maximum allowable. (iii) Ramps shall have neat cement finish with checkered pattern for anti-skid. (o) Parapets shall be provided to all RCC roofs. Parapet wall shall be 600 mm high for inaccessible roofs and 1000 mm high for accessible roofs. 100 mm thick concrete parapet will be provided unless otherwise mentioned. Polished Kota stone coping 150mm wide shall be provided to all parapets. (p) All painting on masonry or concrete surface shall preferably be applied by roller. If applied by brush then it shall be finished off with roller. Minimum two finishing coats of paint shall be applied over a coat of primer. All paints shall be of approved make including chemical resistant paint. (q) External masonry surfaces of all buildings shall have decorative water proof cement paint over a coat of primer as per IS: 5410. (r) Acrylic plastic emulsion paint shall be provided over plaster of Paris finish for control room, control equipment room, computer room, UPS room and air-conditioned areas including entrance lobby.

All other areas shall be painted with Oil Bound Distemper (available for internal use) and white wash. Internal surface of walls of rooms for pumps, machineries and maintenance shall be painted with washable painting of dark shade up to a height of 1.5 m above floor level. (s) Acrylic emulsion paint shall be as per IS: 5411 (Part-I), Acrylic washable distemper shall be as per IS: 428, white wash/colour wash shall conform to IS: 627. (t) Battery room and all other areas subject to chemical corrosion shall be painted with acid/alkali resistant epoxy paint over a suitable primer from top of dado. (u) All ceiling shall be painted with oil bound distemper over ceiling plaster. (v) All internal steel doors, ventilators, louvers, rolling shutters shall have two coats of synthetic enamel paint over a coat of red oxide/zinc chromate primer conforming to IS: 2074. (w) Fire resistant transparent paint as per IS: 162 shall be provided on all woodwork over French polish or flat oil paint. French polish shall conform to IS: 348. Flat oil paint shall conform to IS: 137. (x) All fire exits shall be painted in post office red/signal red colour shade, which shall not be used anywhere else except to indicate emergency or safety measures. (y) Oil resistant paint shall be provided in oil equipment room, oil canal and fuel oil pump house etc. (z) Fire-proof putty in cable penetration on walls of cable spreader rooms shall be provided. (aa) Steel work, which is encased in concrete or galvanized, will not be painted. All other steel work will be given a coat of shop paint, applied thoroughly and evenly to dry surfaces which have been cleaned, as per

IS: 1477 (Part I & II). After completion of the pre-cleaning, steel work will be given a coat of inorganic zinc primer composed of 85% zinc in dry film, 60 – 75 micron DFT. The final topcoat for interior metal surfaces shall be of polyamide epoxy composed of 77% solids by volume and of 125 – 140 DFT. The final topcoat for exterior metal surfaces shall be Aliphatic Polyurethane composed of 56% solids by volume and of 40 – 50 DFT. (bb) For painting on concrete, masonry and plastered surface IS: 2395 shall be followed. For painting on woodwork IS: 2338 shall be followed. For painting on steel work and ferrous metals, BS: 5493 and IS: 1477 shall be followed. The type of surface preparation, thickness and type of primer, intermediate and finishing paint shall be according to the painting system adopted. Bitumen primer used in acid/alkali resistant treatment shall conform to IS: 158. (cc) All plastered areas above false ceiling shall be provided with two or more coats of white wash. (dd) Resin bonded granular textured finish, for external applications shall consist of crushed stone/quartz chips of 2.5 mm size and of approved colour/shade and bonded with synthetic resins, Adhesives and additives, all together in a single pack mix. It shall be applied externally, on cured and dried plastered surfaces, with a dry film thickness of min. 2.0 mm. The final finish shall have UV-Resistant, fungus/bacterial resistant properties. Grooves shall be provided as per drawing and the same shall be filled with polysulphide sealant of matching colour/shade. 2.29 <u>WATER SUPPLY</u> Two numbers of roof water tanks (one for storing service water and another for potable water) of adequate capacities depending on the number of users and 8 hours storage capacity shall be provided for each building and pump		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

house. Polyethylene water storage tanks conforming to IS: 12701 shall be used. The tanks shall be complete with all fittings including lid, float valve, stop cock, vent pipe, etc.

Potable Water System for various buildings shall be connected to the drinking water and service water systems. System will satisfy state and local plumbing codes.

Galvanized MS pipe of medium class conforming to IS: 1239 shall be used for internal piping works for service water and potable water supply. The pipes shall be concealed, and painted with anti-corrosive bituminous paint (as per IS: 158) wherever required.

2.30 TOILETS

Toilets shall be provided near work areas, but isolated from main areas. Unless otherwise shown in drawings or specified, the dimension of the toilet blocks shall be decided by the number of sanitary fixtures, which shall be based on number of users in accordance with IS: 1172. Attached toilets shall be provided for all senior executive rooms and conference rooms. All other buildings shall have minimum one toilet block each.

Toilets shall be provided with all necessary approved Indian Standard fittings. The finished floor of toilet shall have a drop of 12 mm from general finished floor level and shall have sufficient slope towards trap. Sufficient natural light and ventilation shall be provided as per requirement. Toilet down pipes and vent pipes shall be enclosed with minimum 900 wide ventilation duct upto roof level, considering aesthetics of the building.

Unless specified each toilet shall be provided with minimum one W.C. (water closet), two urinal, one washbasin, towel rail, mirror and liquid soap dispenser, glass shelves etc. Western/Indian closets shall be provided as specified in the drawing. Bathroom also will be provided in DM plant toilet. **Sunken slab to be provided in toilet area** in above floors and suitable waterproofing will be done before and after laying sanitary piping.

Sewage disposal shall be through centralized STP. Janitor's closet shall be provided for toilets in all major buildings.

2.31

SANITARY FITTINGS

Sanitary fittings shall be of “Parryware” make or approved equivalent of the following sizes and specification.

(a)

Indian Water Closet (IWC)

:

Orissa pan of size 600 mm x 400 mm conforming to IS: 2556 with high level UPVC cistern of 10 liters capacity.

(b)

European Water Closet (EWC)

:

Conforming to IS: 2556 with bakelite seats and syphonic low level UPVC Cistern of 10 liters capacity.

(c)

Urinals

:

Flat back of size 610 mm x 410 mm x 380 mm urinal with flushing cistern and bottle trap.

(d)

Wash Basin

:

550 mm x 400 mm conforming to IS: 2556 with chromium plated bottle trap.

(e)

Mirror

:

450 mm x 550 mm x 6 mm bevelled edge bathroom mirror with towel rail.

(f)

Glass shelve

:

600 mm x 125 mm x 4 mm with chromium plated brackets and periphery railing.

(g)

Towel Rail

:

16 mm diameter x 750 mm long chromium plated.

(h)

Liquid Soap Dispenser

:

Chromium plated dispenser.

The exact number of fittings shall however be finalized during detail engineering stage. For all manned structures toilet and drinking water facility shall be provided.

Each toilet shall contain following minimum fittings:

Fittings	Auxiliary Buildings

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 416 of 639
System: The system shall be designed on the principle of “TWO PIPE SYSTEM” having two separate vertical pipes namely Main Soil Pipe (MSP) and Main waste Pipe (MWP) receiving waste from number of Branch Soil Pipe (BSP) and Branch Waste Pipes (BWP). A BSP either shall have only one W.C. to be connected to MSP or it shall receive discharge from number of urinals to be connected to MSP. A BWP shall receive waste from washbasins, baths, sinks, cooler areas, etc. Floor traps shall be provided to receive waste from waste pipes of various fixtures (except from W.C. which shall be directly connected to MSP) and at locations where wastewater is to be drained out. A MSP shall be directly connected to first manhole of an outside sewer. A MWP shall be discharged into first manhole through a gully trap. All vertical stacks and ventilating pipes shall be carried to a height of at least 1.5 meters above parapet and shall be provided with cowl to top. Sizing: Minimum size of BSP receiving discharge from W.C. shall be 100 mm up to MSP/first manhole. Minimum size of BWP shall be 80 mm. Minimum size after gully trap up to first manhole shall be 100 mm. Gradients: The gradient of a horizontal branch shall normally be 1 in 40 but in no case it shall be flatter than 1 in 50 and steeper than 1 in 10. Non-silting and non-scouring velocity shall be maintained. Disposal:

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 417 of 639
2.33	Treated sewage can be used for horticulture. Treated solid wastes can be used as manure. The enclosed annexure of this section gives specific details of finish items required for various buildings. For detailed specification of such items, Volume VI/B may be referred.	
2.34	During execution of the contract, the contractor shall take approval from the owner of all building materials and finish items (e.g. floor tiles, doors, and windows, paints etc.) to be used for the contract by submitting samples and/or product literature as appropriate	
2.35	<u>DRAINING OUT WATER FROM FLOORS</u> For all buildings, suitable arrangement for draining out water collected from equipment, blow downs, leakages, floor washings, fire fighting etc. shall be provided for each floor, complete up to sewers.	
2.36	<u>PLINTH PROTECTION</u> All buildings shall be provided with 1000 mm wide and 100 mm thick PCC of grade M-20 for plinth protection all-round. The plinth protection shall be laid over well-compacted soil and base formed with stone/gravel of rubble for a thickness of 150 mm.	
2.37	<u>PAVING</u> (a) RCC paving minimum 150 mm thick of M20, over an under bed as specified herein shall be provided for areas mentioned below. RCC paving shall be designed, as rigid reinforced concrete pavement for the crane/vehicular/ equipment movement loads which the paving has to bear. The under bed for paving shall consist of preparation and consolidation of sub grade to the required level, laying of stone soling of 230 mm compacted thickness with 63 mm and down aggregate with interstices filled with selected sand followed by 75 mm thick 1:4:8 PCC (1 part cement, 4 parts sand and 8 parts stone aggregate) with 40 mm nominal size aggregate. Paving areas shall be provided with the metallic hardener floor finish as specified elsewhere in the specification. However vehicular passage shall be provided with non-metallic hard granular finish in place of metallic hardener topping. Non-metallic hard granules shall be spread over the green concrete

paving slab at the rate of not less than 5 kg/ sq.m. Paving shall be provided for ground floor of all buildings. (b) PCC paving of grade M-20, 100 mm thick laid over 75 mm thick bed of dry brick aggregate shall be provided for following areas: (i) 2.0 m wide pathway all along pipe/ cable corridor and (ii) 2.0 m wide pathway all around each cooling tower and 2.0 m wide ways inter connecting all cooling towers with each other. 2.38 <u>CAR/TWO -WHEELER SHED</u> (a) Covered car parking shed with minimum 25mm thick colored interlocking cement concrete tile flooring over reinforced concrete hard standing and two- wheelers & cycle parking shed shall be provided as per requirement at the desired location of the owner. Structure shall be RCC framed structure with RCC roofing—The structure shall be aesthetically harmonious. 2.39 <u>STATUTORY RULES</u> (b) Bidder/Contractor shall comply with all applicable statutory rules pertaining to Factories Act as applicable for the State, Rules of Tariff Advisory Committee (TAC) & Water Act for pollution control etc. (c) Provision of safety, health and welfare according to Factories Act shall be complied with. These shall include provision of continuous walkway, minimum 500 mm wide, along the crane girder at crane girder level on both sides, comfortable approach to EOT crane cabin, fire escape, locker room for workmen, pantry, toilets, rest rooms etc. (d) Provision for fire proof doors, number of staircases, fire separation walls, encasing of structural members (in fire prone areas) etc. shall be made according to the recommendation of Tariff Advisory Committee. (e) Statutory clearance and norms of State Pollution Control Board shall be followed as per Water Act for effluent quality from plant.

2.40	<u>LANDSCAPING</u> Refer Annexure – I for Landscaping design criteria.	
2.41	<u>POTABLE WATER SYSTEM AND PLUMBING</u>	
2.41.1	This system for various buildings shall be connected to the drinking water and service water systems, the schemes for which are indicated elsewhere in this specification.	
2.41.2	Water outlets shall be provided for an instantaneous flow rate of approximately 7 Cu.M/Hr. (25 GPM)	
2.41.3	System will satisfy state and local plumbing codes.	
2.42	<u>SEALANT</u> Silicon sealant or polyurethane sealant shall be used in all expansion joints exposed to weather. All joints around exterior doors, windows, and expansion joints, etc. shall be sealed for proper water-tightness	
2.43	<u>CHAIN LINK FENCING</u> 3.0 M high fencing over 250 thick 200 high toe wall with M.S. angle post embedded in cement concrete block and 2.4 M high PVC coated G.I. chain link fencing of minimum 8 gauge (including PVC coating) with barbed wire for remaining height shall be provided for areas as per safety requirement.	
2.44	<u>BOUNDARY WALL</u> Boundary wall shall conform to the requirements for vital industrial undertakings. It will be 3.0-meter high masonry wall over which 600 mm high barbed wire fitted and fixed to embedded bifurcated steel angles shall be provided. Layers of G.I. barbed wire will be four nos. for each bifurcation along with double concertina spiral fencing as per bid drawing 300/ 350 mm thick laterite stone block wall laid in 1: 4 cement sand mortar shall be used in boundary wall. The masonry wall shall be painted with cement- based paint over external plaster and steel angles shall be painted

4.0 ARCHITECTURAL SPECIFICATION OF CONTROL ROOM & ANNEXURE ROOM

The control room is located at Operating Floor level of power house building. It is the nerve centre of the plant having state of the art facilities and requires a highly sophisticated hi-tech expression and ambience.

The room will be fully air-conditioned and have access from T G hall side through Air locks to reduce the noise level as well as heat load. Each Air-lock space shall have two numbers of double leaf glazed aluminium doors. The wall facing the turbine hall shall be fully glazed aluminium partition wall with hermetically sealed insulating glass panels. **Control room shall have an internal acoustic partition wall** and shall be integrated with 2 nos. of digital display boards at two different locations and have monolithic fabric finishes with high acoustical properties. It will have fully vitrified tiled floor, linear metal ceiling with A.C and lighting fixtures and wall with acrylic emulsion paint or Aluminium Composite Panel interior cladding. The control room shall have very high quality furniture of approved make similar to Godrej /Feather light. The control desk of laminated and moulded finish of approved colour and texture, appropriate to accommodate/ house control panels, monitors shall be equipped with all functional requirements. Operator's chairs shall be swivel type on casters and have cushioned seat and back of approved material and colour. Necessary arrangement for sealing expansion joints on floor, wall and ceiling has to be ensured. Brief technical specifications of different items to be used for the control room are as follows.

(a) Flooring

Non-skid, fully vitrified, 10 mm thick non-porous, homogenous, abrasion resistant, floor tiles of minimum size 600 mm x 600 mm x 10 mm of approved colour and shall be laid over concrete floor with laying compound strictly as per manufacturer's specification. Total thickness of the flooring shall be 40mm thick including the thickness of the tiles, under bed.

(b) Skirting

Minimum 150 mm high fully vitrified, 10 mm thick non-porous,

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 430 of 639
homogenous, abrasion resistant cover base of matching colour, internal and external corner strip and fixed to the wall strictly as per manufacturer's specification. (c) Wall finish Brick masonry walls, columns, or any other element within the room as the case may be shall be clad with polyester coated 3mm thick Aluminium Composite Panels (Aluminium thickness minimum 0.2mm) of approved make upto the false ceiling level. The colour and design composition of ACP cladding to be submitted for approval of the authority before erection. (d) False ceiling Lineal precoated aluminum alloy ceiling stove enameled on both sides with suspension system as per manufacturer's details. The false ceiling work shall take care of all illumination, fire detection & fighting, HVAC and all other service requirement. False ceiling shall be provided with 25 mm thick insulation of resin bonded mineral wool conforming to IS: 8183. Wherever under-deck insulation is required the insulation shall be 50 mm thick resin bonded rigid mineral wool/ polystyrene block with protective aluminium foil lining. (e) Air lock doors Double acting glazed aluminium door with minimum 15 micron colour anodized finish shall be used having glazing thickness 6mm of clear float glass of approved brand. The doors shall be complete with weather seal, gaskets, floor spring, doorstopper, door locks, push/pull bars of similar finish and all necessary hardware. (f) Glazed partition wall The glazed partition wall shall be made of aluminium sections having same finish that of aluminium doors with double-glazed insulating glass panels. This partition height shall be from top of floor finish to the bottom of the false ceiling. Insulating glass shall consist of 2 nos. 6 mm thick clear float glass separated by an air gap of 12mm thick,

hermetically sealed, moisture resistant and of approved manufacturer. The partitions shall be weather proof complete with gaskets, clips, hardware, etc (g) Internal partition wall of control room The internal partition wall facing operating desk shall consist of two numbers of digital display boards at two different locations, integrated with wall panels of Anutone Acoustic Ltd. or similar approved, laid flush with the display board and two nos. of matching doors on either sides for access to the rear side for maintenance. This special purpose partition shall be as manufactured by Anutone Acoustic Ltd. or similar and shall have rigid frame work consisting of G.I. Studs of adequate size@ 600mm c/c and floor, ceiling and intermediate channels to provide a strong wall system capable of supporting wall hung C.C.T.V. at designated locations. The framing system shall be integrated with independent floor supported structural framework of digital display board so as to cover the entire exposed surface around the board with partition panels. The front side of the frame shall have Excelsior Acoustical Panels – Elega finish – 2400/1200 x 600 x 19 mm thick FABRICO SoundSoak – Plane Texture of approved colour. The rear side of partition shall have Excelsior Acoustical Panels – Elega finish – specially Sound Smart – Burl of size 2400/1200 x 600 x19 mm thick smooth finished with gypsum plaster and finished with acrylic emulsion paint. The entire wall shall have Class I fire rating as per BS code. The partition shall not transmit any load to false ceiling. The entire partition wall shall have concealed framing system and have monolithic fabric finish of approved colour or composition of two different colours as per approved design to entire exposed surfaces including door panels on control room side. 4.1 <u>BRIEF DESCRIPTION OF TECHNICAL/SERVICE BUILDING</u> The Technical Building is a 5-storied building (size 48M x 15M) including ground floor Building is located adjacent to the Power House Building as		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4

shown in the Plot Plan. An all weather covered access corridor to be provided with powerhouse building at operating floor level, if the Technical Building is detached one from power house building. The building size shall be suitably decided during detail engineering stage. It will house the facilities as listed below. Building should have 2 (two) nos. of passenger elevator (13 passenger) and 2 (two) staircases, with provision of future extension of floors, to be placed suitably. **Overhead water RCC tank of 10,000-litre capacity should be provided at roof of the building.**

It is an important part of operation and maintenance of the plant having state of the art facilities and requires a highly sophisticated hi-tech expression and ambience.

Facilities in different floors shall be as under:

Sr. No.	Level	Area Description
(a)	Ground floor	Entrance lobby, Reception Lounge (double height), First Aid room, Telephone exchange, Civil Maintenance office & Store, Boiler Maintenance Store and staff room, Turbine Maintenance Store and staff room, Lift, Staircases, Toilet etc.
(b)	First floor.	Boiler Maintenance J.E./A.E. room, Boiler Maintenance Dy. E.E. cabins room and E.E. room, Turbine Maintenance Dy.E.E. cabins room and E.E. room, Boiler Maintenance library/record room, Turbine Maintenance library/record room, safety office, pantry.
(c)	Second floor	Electrical Maintenance store and staff room, Electrical Maintenance lab room, Electrical Maintenance J.E./A.E. room, Electrical Maintenance Dy.E.E. cabins room and E.E. room, Electrical Maintenance library/record room, POG store room, POG E.E. cabin, E.E. Efficiency cabin, Computer and Planning section, pantry.

(d) Third floor I & C store and staff room, I & C lab room, I & C J.E./A.E room, I & C Dy.E.E. cabins room and E.E. room, Testing store and staff room, Testing J.E./A.E room, Testing Dy.E.E. cabins room and E.E. room, I & C library/record room, Simulator Room, Training Hall, pantry, testing library/Record room etc. (e) Fourth floor S.E. three cabins, Dy.C.E. two rooms, C.E. one room with attached toilet, Technical Section, VIP lounge, Conference room, Video Conference room, Pantry etc. (f) Roof Lift M/C room, Water tanks, Cooling towers for HVAC, etc The Building shall be centrally air-conditioned. Drinking Water Cooler, Water filter shall be provided on all floors. Wash room shall be provided on all floors. Separate ladies toilet shall be provided on all floors. All finishing items, Layout, and other requirements should be of owner's choice. However modern design approach of an office building like- open & flexible (workstation based) layout, usage of natural light, solar control, energy efficient, etc shall be considered by the bidder. Since this is one of the most prestigious buildings, aesthetically this should achieve landmark quality. Specially designed long and spacious RCC porch shall be given in front of the main entrance for receiving cars of VIP's. Special attention to be given in front of service building in landscaping the area and developing garden with flowering plants and fountains etc Shaded car parking facility shall be provided as per requirement of the owner. Bidder shall have to furnish all relevant drawings and details including finishing in their offer. Brief technical specifications of different items to be used for the area as follows:

(a) Flooring Generally floor finish shall be Non-skid, fully vitrified, 10 mm thick non- porous, homogenous, abrasion resistant, floor tiles, of minimum size minimum 600 mm x 600 mm of approved colour & design, and shall be laid over concrete floor with laying compound strictly as per manufacturer's specification. Total thickness of the flooring shall be 40 mm thick including the thickness of the tiles, under bed. (i) For Entry cum reception lounge, VIP lounge, Main meeting/ conference room:- Suitable and approved combination shed of marble slab and strips shall be used. Floor pattern shall be approved by the owner before erection. (ii) For staircase and Corridors: Steps – risers & tread, stair skirting, corridor floor should be combination of Aranga white marble and Abu green marble. Wall cladding of Elevator Lobby shall be of polished granite slab of light grey shed. (iii) For Toilet Minimum 10 mm thick non-skid vitrified tile, of minimum size 400 mm x 400 mm (overall 40 mm thick) with glazed ceramic tile of same make dado topped with 50 mm wide matching moulded ceramic trims. Dado shall be 100 mm higher than lintel level starting from finish floor level. For other areas like AHU room, Generator room, Electrical room, Etc: 40 mm thick heavy duty cement concrete floor with metallic hardener and matching skirting. (b) Wall finish Two coats of Acrylic Emulsion paint of approved colour shall be applied over a coat of approved primer on the masonry surface

	prepared with POP (Plaster of Paris)/White Putty (Birla White) for all area except areas like AHU room, Generator room, Electrical room, Etc which shall be of plastered surface with Acrylic Distemper paint. Front wall for elevator shaft shall have polished granite slab wall cladding (min 12 mm thick). Painting to exterior surfaces of wall shall be of cement bound paint like weather coat (Asian Paints). To accentuate the building façade a suitable combination of Aluminium composite panel (ACP)/textured paint like RENOVO may be used. (c) False ceiling It will be applicable for all areas excluding non A/C areas like AHU room, Generator room, Electrical room, Etc, pantry and toilet. It shall be of aluminium linear acoustic false ceiling with glass wool insulation on top having approved colour with stove enamel finish, integrated with light fixtures, HVAC grills and other ceiling mounted accessories, complete in all respect with metal suspension system, trims, profiles etc. For pantry and toilet false ceiling shall be perforated aluminium stove enamel finished panels of size 600x600mm. (d) Doors Double acting glazed aluminium door with minimum 15 micron colour anodized finish shall be used having glazing thickness 8mm of clear/tinted float glass of approved brand. The doors shall be complete with weather seal, gaskets, floor spring, doorstopper, door locks, push/pull bars of similar finish and all necessary hardware. Glazed partition may be etched with suitable and approved designed. Wooden doors shall be of factory made solid core wooden flush door with C.P. teak veneered surfaces in wooden frame with wooden architrave. Toilet & pantry doors shall be wooden panel door. Doors for areas like AHU room, Generator room, Electrical room, Etc shall be hollow metal flush door.

(e) Glazed Panels The glazed panels shall be made of aluminium sections having same finish that of aluminum doors with double-glazed insulating glass panels. This partition height shall be from top of floor finish to the bottom of the false ceiling and maximum available width. Insulating glass shall consist of 2 nos. 6 mm thick clear float glass separated by an air gap of 12mm thick, hermetically sealed, moisture resistant and of approved manufacturer. The partitions shall be weather proof complete with gaskets, clips, hardware, etc. Glazed partition may be etched with suitable and approved designed. (f) Windows, Glazed Curtain wall All windows of A/C areas shall be s with heat reflecting glass/double insulated glass. Other windows shall be 15micron thick color anodized aluminium glazed window with minimum 4mm thick clear float glass. Glazed curtain wall shall be Unitised structural glazing system comprising of 30 micron colour anodized aluminium extrusions with double insulated heat reflecting glass. The system shall be able to withstand wind pressure as per relevant data given elsewhere in this specification at all heights. (g) Utilities All utility lines like water supply line, Electrical wiring, telephone line etc. shall be concealed type. Fittings and fixtures for toilets should be of best quality and to be got approved by Owner prior to installation. Roof treatment, sanitary & sewerage system, roof drainage etc. shall be as per detail spec given in V-VI/A and VI/B. (h) Any other items of work not specifically mentioned here shall be as per the guidelines indicated in Volume- VI/ A and VI/B.

Permanent colour coated Insulated metal cladding system Permanent colour coated sandwiched (insulated) M.S./High tensile steel metal cladding of approved colour combination shall be provided for main plant building and any other building with metal cladding where thermal insulation is required. Permanent colour coated (non-insulated) M.S./High tensile steel metal cladding of approved colour combination shall be provided for boiler roof/canopy, CHP areas and cladding over parapet walls of buildings where metal cladding is specified. Troughed galvanized M.S. sheet having 0.6 mm minimum thickness with minimum rate of galvanization of 275 gm./sq.m. Or high tensile steel sheet having minimum yield strength of 350 MPa of 0.5 mm minimum thickness and coated with zinc aluminium alloy (zincalume) at the rate of 150 gms./ sq.m shall be used on external face (outer face) of cladding system. The outer side (exposed face) of the sheet shall be permanently colour coated with silicon modified polyester coating of Dry Film Thickness (DFT) 20 microns (minimum) over primer of approved colour shade. Inner face of the sheet shall be provided with suitable pre-coating of minimum 7 microns, of off-white colour. Galvanized M.S. Sheets of minimum 0.6 mm thickness with minimum rate of galvanization of 275 gms/sq.m. or high tensile steel, having minimum yield strength of 350 MPa of 0.5mm minimum thickness, coated with zinc aluminium alloy at the rate of 150 gm/sq.m shall be used as inner liner (internal face) of cladding system. The exposed face shall be permanently colour coated with silicon modified polyester paint of DFT 20 microns (minimum) over primer. Inner face of sheet shall be provided with suitable pre-coating of minimum 7 microns. Z spacers if required shall be made out of at least 2 mm thick galvanized steel sheet of grade 275 as per IS: 277. The sheets shall be fixed by means of concealed fixing system or any other compatible method approved by the Engineer. The fasteners

	shall be of high quality corrosion resistant grade of self-tapping / self-drilling type provided with suitable cap. The insulation shall be of Glass wool, having a density of 32 kg/cu.m. for glass wool, 48 kg/cu.m. for rock wool or 40-45 kg/cu.m (b) Permanent colour coated (non-insulated) metal cladding system Troughed galvanized M.S. sheets having 0.6 mm minimum thickness with minimum rate of galvanization of 275 gms./sq.m. (or High tensile steel sheet coated with zinc aluminium alloy @ 150 gms./sq.m. of 0.5 mm minimum thickness and having minimum yield strength of 350MPa) shall be used for the cladding system. The outer side (exposed face) shall be permanently colour coated with Silicon modified polyester paint of minimum DFT 20 microns over primer, of approved colour/shade and the inner side (internal face) shall be coated with same paint of minimum DFT 20 microns over primer of off-white shade. These shall be fixed with concealed fixing system or any other compatible method approved by the Engineer. The sheets shall meet the general requirement of IS: 14246 and shall conform to class 3 for the durability. (c) Flashings, caps, trim closures etc. for jambs, lintels, softies, and cornices All flashings, trim closures, caps etc. required for the metal cladding system shall be made out of plain sheets having same material and any weather/moisture sealants with appropriate material and coating specification as mentioned above for the outer face of the sandwiched metal cladding. Overlap shall be min. 100 mm or as specified by manufacturer. (d) Factory assembled double skin insulated metal cladding system Factory assembled double skin insulated metal cladding made up of 0.50mm TCT colour coated profiled galvalume steel sheets shall be provided for cladding. The outer skin profile depth is 28 mm and the inner skin shall be slightly ribbed steel sheet. The core in between the outer profiled sheet and the inner profiled sheet shall be

polyurethane foam in 30 mm thickness having a density of 40 – 45 kg/cum. The foam shall be filled in between the outer and inner sheet at factory using highly dedicated foaming machine. The fasteners to be used for these factory made panels shall be of adequate sizes and shall be of self-drilling and self-tapping type, compatible to be used with galvalume steel sheets. 5.1.8 False Ceiling Aluminium pre-painted false ceiling, either lineal panel system or aluminium tile/plank system. In other air-conditioned areas, 12.5 mm Gypsum board/ Mineral fiberboard ceiling with aluminum grid will be used. This shall be in line with Cl. 2.7 above. 5.1.9 Floor finish (a) Generally, finish to utility areas shall be 40 mm thick heavy-duty patent stone with metallic hardener on concrete slab. (b) For T.G. Hall (operating floor), MCC room, offices etc. self leveling epoxy flooring finish will be as follows The epoxy systems On the prepared substrate, one coat of a solvent free, resin based dispersion, Primer shall be applied. Density of the primer is around 1kg/lit and the mixing ratio of two components, Comp. A and B: 1:2.5 by weight. Over the primed surface, epoxy modified cementations self leveling floor topping shall be laid maintaining the thickness of 2mm. the mixing ratio of three component Comp. A: Comp. B: Comp. C: 1:2.5:17 by weight, compressive strength at 30°C approx. 45N/mm² after 28days, the mortar density is around 2.2 kg/lit. Priming would be repeated again (same as No. 1). Finally, after drying of the primer, a multi component self smoothening decorative floor topping based on special epoxy system

shall be laid maintaining the thickness of 2mm. The compressive strength of shall be greater than 60N/mm² at 30°C after 14 days, tensile bond strength greater than 2.5N/mm² at 30°C after 14 days. The mixed density is 1.7kg/lit at 30°C. The system shall be allowed for curing for 3 days. Application Applicator shall apply each product in the specified system strictly as per the written method statement by the manufacturer at the following minimum consumption rates Primer @ 200gm/sq m depending on the substrate. First layer of epoxy flooring @ 4.4kg/ sq m depending on the substrate for approx. 2mm thickness. Primer @ 100gm/sq m for the second coat. Final decorative epoxy topping @ 3.6Kg/ sq m depending on the substrate for approx. 2mm thickness. (c) For battery room, battery charger room, chemical laboratories, chlorination room etc., the areas handling corrosive liquids, overall 40 mm thick Acid and Alkali resistant tiles flooring with 20mm thick tiles with silica based epoxy mortar shall be used. Acid and Alkali resistant tiles of 20 mm thickness with silica based epoxy mortar up to 2.1M height from finished floor level shall be used as dado. Acid and Alkali resistant paint shall be applied up to the ceiling level above Acid and Alkali resistant tiles dado. Ceiling shall also be painted with Acid & Alkali resistant paint. (d) All areas of toilet, including W.C and urinal shall have vitrified ceramic tiles floor. Dado shall be of glazed tiles of minimum 5/6 mm thickness up to 100 mm higher than lintel level starting from finish floor level.

(e) Wherever access flooring is required this shall consisting of fire resistant phenyl formaldehyde bonded particle board panels (600 x 600 x 35 mm) with 2 mm thick flexible antistatic PVC topping and 0.5mm thick aluminium foil lining at bottom and PVC strip edging on sides of each panel mounted on steel pedestals of adjustable height and supporting steel grid system provided under space, or overall 40 mm thick antistatic PVC flooring having 3mm thick antistatic PVC tiles laid over adhesive as per recommendation of the manufacturer. (f) Floor/staircase and the areas prone to slippage due to oil spillage etc. shall be provided with non-skid floor finish. (g) 750 mm wide, minimum, R.C. paving as plinth protection, shall be provided around all buildings with surface drain of required size. (h) Risers and treads of concrete staircase of powerhouse shall be of white marble slab and in all other stairs, same shall be of Kotah stone finish. 20/25 mm thick, Kotah stone finish excepting main stair riser and treads shall be of marble. All areas shall have 150mm high skirting unless indicated otherwise in the specification.		
5.1.10 Doors and Windows (a) Doors in plant and utility areas shall be double plated (18G) hollow flush door with pressed steel frame as per IS: 4351. The door shutters shall be 45mm thick with two outer sheets of 18G rigidly connected with continuous vertical 20G stiffeners @ 150mm c/c. Side, Top & Bottom edge of shutter shall be reinforced by continuous pressed steel. The doors shall be sound deadened by filling the inside void with mineral wool. (b) Fire rated doors shall be double cover plated type with mineral wool insulations and with panic device shall be provided on division walls of cable spreader rooms and at all fire exit points as per recommendation of Loss Prevention Association of India/Tariff Advisory Committee. These shall be as per IS: 3614. Fire resistance grade of the doors shall be as per LPA/TAC requirements. However, minimum fire resistance grade shall be for two (2) 2 hours.

(c) Main Entrance of Control Room, Control Equipment Room shall be provided with air-locked lobby with provision of double doors of aluminium framework with glazing with double swing type. Doors of control room, control equipment room, computer room, etc. shall be full glazed pre-coated minimum 3mm thick aluminium i.e. colored anodized aluminium. Full glazed aluminium partition with airlock shall be provided along (B) row of Turbine hall operating floor where clear view is desired. Glazing between air-conditioned areas shall be single glass whereas that between air-conditioned and non- air-conditioned area shall be with hermetically sealed insulating glass. (d) Doors of W.C. and shower shall be wooden panel door. (e) All windows and ventilators shall be glazed aluminum windows conforming to IS: 1949. & IS: 1948 (f) Alternatively pre-coated (polyester painted) steel windows and ventilators may be used for auxiliary plant buildings. (g) Alternatively, steel reinforced UPVC windows may be used for Service building if agreed by the owner. 5.1.11 Rolling Shutters Rolling shutters as per IS: 6248 with suitable operating arrangement (manual, mechanical and/or electric) according to size shall be provided in buildings to facilitate handling and transportation of equipment. The curtains of rolling shutter will be of interlocking scrolls made of hot rolled double dipped galvanized steel lath section of 18swg tested mild steel strips at 75mm rolling centres, locked with galvanized malleable iron clips. The bottom lath will be coupled to a locked plated fabricated from 3mm thick galvanized steel plate and security riveted with stiffening angles. 5.1.12 Glazing: (a) Glazing for windows in general shall be minimum 4 mm clear float glass and as mentioned elsewhere in this document.

(b) Glazing in Control room between A/C & non-A/C area shall be with double glazed insulating glass consisting of 2 nos. 6 mm clear toughened float glass with 12 mm air gap in between, hermetically sealed. (c) Minimum 6.0 mm thick toughened float glass shall be provided in doors, partitions, etc. (d) 24mm thick insulated double glazing having 6 mm thick tinted heat-reflecting type outer float glass and 6 mm thick plain inner float glass with 12 mm air gap & hermetically sealed shall be mounted on 15 micron coloured anodized aluminium frame suitable for structural glazing system 5.1.13 Painting (a) External masonry surfaces of Power House buildings shall have combination of cement paint with granular textured finish/synthetic plaster, 'Renovo' and for other buildings, cement paint over plastered surface. (b) Acrylic plastic emulsion paint shall be provided in control room, control equipment room, computer room, UPS room, all office areas and all air-conditioned areas including entrance lobby. (c) All other areas shall be provided with acrylic distemper. (d) Internal surface of walls in rooms for pumps, machineries and maintenance shall be painted with washable synthetic enamel paint of dark shade up to a height of 1.5 m above floor level. (e) Battery room and all other areas coming in contact with acid/alkali or other corrosive liquid shall be painted with acid/alkali resistant paint. Acid and Alkali resistant paint shall be applied up to the ceiling level above Acid and Alkali resistant tiles dado as specified elsewhere in this section. Ceiling shall also be painted with Acid& Alkali resistant paint.

(f) All structural steel members including doors, windows, ventilators, louvers, rolling shutters and all other exposed steel work shall have two or more coats of synthetic enamel paint over zinc chromate primer conforming to IS-2074 and shall have minimum 110 micron DFT. (g) All woodwork shall be painted with two coats of synthetic enamel paint over a coat of approved primer. DFT shall conform to IS specification. (h) All fire exits shall be painted in Post Office red. (i) Epoxy paint shall be provided in oil equipment room, oil canal, fuel oil pump house, etc. (j) Fire-proof putty in cable penetration on walls of cable spreader rooms shall be provided 5.1.14 Aluminium Composite Panels: (a) Material: Total thickness of the panel – 4mm Thickness of the aluminium skin – 0.5mm Tensile strength of aluminium skin – 120N/mm² minimum Density of PE core – 920 – 980 Kg/m³ (Non toxic grade Polyethylene) Coating – PVDF Adhesive film – DUPONT, USA Adhesive film – DUPONT, USA 24μ - 30μ in PVDF including primer. 15μ - 18μ in polyester coating.

Coating thickness (back foil) – 4μ - 7μ polyester coating. Coating thickness (front foil) (b) Color – as indicated in the drawing. (c) Fixing arrangement – aluminium composite sheets shall be folded inwardly on four edges (without cutting the outer skin) to form Aluminium Composite Panels (ACP) and shall be riveted to the aluminium extruded section like angle or channel. There shall be at least one rivet at the both ends of the folded edge and other rivets shall be 200mm c/c per panel edge/ fold. Aluminium angles shall form a frame around the panel and shall be fixed to the steel sub-frame by self tapping screws with EPDM shim to prevent by- metallic reaction. The gap/groove between two adjacent panels shall be filled with Silicon sealant of approved make (GE or similar make) to prevent water seepage. (d) The supply fabrication and erection of ACP is inclusive of steel sub-base framework if necessary as per site condition. The contractor shall take site measurement and produce working drawings for approval of engineer before erection of ACP. 5.1.15 Poly Carbonate Sheet: (a) 4mm thick Compact Polycarbonate sheet, transparent or smoke tinted, of Lexan Polycarbonate or similar approved. (b) Framing shall be specially designed aluminium sections, colour anodized, with EPDM Gasket as per system provider's details. Framing shall be fixed to the steel structure as per site measurement, drawings and instruction of Engineer- in -charge. (c) Sealing of joints shall be done with Silicon sealant. Shape of the roofing shall be as per drawing and approved by the owner.

System provider shall prepare and submit the detailed working drawing for approval of engineer before erection. 5.1.16 Stairs: (a) All stairs shall have not more than 13 risers in one flight but in case of fire escape stairs, 15 risers may be allowed instead of 13 risers. Height of risers and width of treads shall be 180 mm (maximum) and 250 mm (minimum) respectively for fire escape stairs and 166mm (maximum) & 250mm (minimum) for general staircases. Minimum width of stairs shall be 1000mm for fire escape stairs and 1200 mm for general stairs. In general, rises shall be 150 mm. (b) Aluminium angle nosing shall be provided for edge protection of RCC stairs. Moulded marble nosing shall be provided for the main stairs finished with marble slab/Kota slab finishes. (c) 40ø NB stainless steel pipe handrail for Stair in T.G. Hall area and 32ø NB medium class G.I pipe Handrail for stairs in other areas, minimum 1.0 metre high, shall be provided around all floor/roof openings, projections/balconies, walkways platforms, concrete and steel stairs. 1200mm high railing may be provided for external fire escape stairs. Handrail shall be two rail systems with the top rail 1000mm/1200mm above the walkway/platform/floor surface and the intermediate rail 500mm below the top rail. Guardrail post spacing will be proportional to the length of the protected horizontal opening but will not exceed 1500mm c/c to posts. 5.1.17 Draining out water from floors In all buildings, suitable floor drainage system to drain out water collected from equipment, blow downs, leakages, floor washings, fire fighting etc. shall be provided in each floor. 5.1.18 Minimum 3.0 meter high fencing above toe wall shall be provided around switch yard, trans-former yard, building transformer area, fuel oil area, Dry ash storage silo area & other areas where fencing is necessary due to statutory requirements. Fencing shall comprise 2.4 meter high PVC coated galvanized chain link fencing of minimum 8 gauge (including PVC coating)

of mesh size 75 mm and galvanized concertina for switchyard /transformer yard. Galvanized barbed height of 0.6 meters shall be provided above the chain link fence. The diameter of steel wire for chain link fencing excluding PVC coating shall not be less than 12 gauge. Steel entry gate matching construction shall be provided for all fenced areas. Top of toe wall shall be minimum 200 mm above the formation level. 5.1.19 Water Supply and sanitation : (a) RCC roof water tank of adequate capacity depending on the number of users for 8 hours storage shall be provided for each building. (b) Galvanized MS Pipe of medium class shall be used for internal piping work for potable water supply. (c) Extra heavy cast iron pipes with lead joints shall be used for sanitary work below ground. (d) Heavy cast iron pipes with lead joints shall be used for sanitary work above ground level. (e) Each toilet shall contain following best quality fittings /porcelain fixtures in adequate numbers as per National Building Code. In toilets primarily meant for workers an additional squatting type WC shall be provided. Minimum one exclusive toilet facilities for handicapped shall be provided in each floor. Water closet – Indian & European type. Large flat back urinal with porcelain divider. Shower set. Wash basin – Counter-top wash basin to be provided in office areas selectively as per Owner's desire. Sink–Stainless steel sink with integrated drain-board to be provided in janitor's closets, kitchen, pantry areas of "FRANKE" or similar approved make.

Metal storage cabinets, under- counter as well as overhead, shall be provided in janitor's room, kitchen, pantry and similar areas as per requirement of Owner. Minimum 600 mm long porcelain tray. Minimum 500 mm long stainless steel towel rail. Stainless steel liquid soap holder. Recessed porcelain soap tray in shower area. Stainless steel toilet paper roll holder. Robe hooks 450 x 750 mm high square edge 6 mm thick float glass mirror of adequate width to match toilet layout and interior décor. Septic tanks with up-flow filter including all accessories and extra heavy cast iron soil lines shall be provided. Effluent from septic tank shall pass through chlorination chamber to bring down BOD level to acceptable limit before discharging to nearest drain. Drinking fountains in adequate numbers. The exact number of fittings and fixtures, brand, colour etc. shall, however be finalized during detail engineering stage and same shall be of Owner's choice and Approval. Note: Toilets in Power House Operating Floor shall have coloured fixtures including counter-top washbasins with wide mirror, European type water closet with flush valve, sensor operated urinal, exclusive shower set etc. Other toilets in general shall have white porcelain fixtures, low down cisterns, sensor operated urinals etc. Toilets for handicapped

persons shall have adequate grab bars, barrier-free access and appropriate fittings and fixtures.				
5.1.20	Statutory rules			
(a)	Vendor shall comply with all applicable statutory rules pertaining to Factories Act as applicable for the State, Rules of Tariff Advisory Committee (TAC), and Water Act for pollution control etc.			
(b)	Provision of safety, health and welfare according to Factories Act shall be complied with. These shall include provision of continuous walkway, minimum 500 mm wide, along the crane girder at crane girder level on both sides, comfortable approach to EOT crane cabin, fire escape, locker room for workmen, pantry, toilets, rest rooms etc.			
(c)	Provision for fireproof doors, number of staircases, fire separation walls, encasing of structural members (in fire prone areas) etc. shall be made according to the recommendation of Loss Prevention Association of India/Tariff Advisory Committee.			
6.0	<u>INTERIOR FINISH SCHEDULE FOR BUILDINGS</u>			
	BUILDING / AREA	FLOORING/ SKIRTING/ DADO	WALL	CEILING
(a)	Operating Floor			
	T.G. Hall Area, Switchgear Room, MCC Room, Control Equipment Room.	Flooring shall be finished with Self leveling Epoxy flooring. Passages shall have 10 mm thick non-skid fully vitrified tiles of minimum size 600 mm x 600 mm (overall 40 mm thick) laid in pattern	Acrylic emulsion paint over POP on masonry surfaces, polished granite slab minimum 12mm thick wall cladding on (B) row wall (outer) upto false ceiling level. There shall be minimum joints between	T.G. Hall - synthetic enamel paint over zinc chromate primer to metal deck and all metal walls Acrylic emulsion paint on exposed

ANNEXURE-I

TECHNICAL SPECIFICATION FOR LANDSCAPE DESIGN

1.0 INTRODUCTION

Industries located on any site, by virtue of the nature of their operation, changes the existing pattern and circumstances of the site and the areas surrounding it. The impact ranges from general pollution i.e. air, water and noise pollution, alteration and destruction of views, traffic congestion etc.

Landscape planning for this project attempts to identify the various environmental and aesthetic issues related to this and proposes corrective and preventive measures that may be adopted to reduce the negative impacts.

This document sets out the framework and lines of action by which the landscape has to be adjusted in accordance with ecological principles to meet the needs of changed circumstances.

2.0 OBJECTIVES

One of the most common problems in the landscape treatment of industrial sites is the protection of the public from undesirable views and from noise, dust and similar nuisances. The movement of dust will depend on the season of the year and time of the day, wind speed and direction, turbulence of air, soil moisture and soil temperature, air temperature and humidity.

(a) Environmental amelioration

Thus the main challenge of landscape design lies in negating the adverse environmental effects – both off-site as well as on-site i.e.

(i) Control pollution and filter dust

(ii) Provide shade and improve microclimate

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 470 of 639
(b) Site conservation is another major issue associated with landscape design for an industry: soil and water conservation, infrastructure stabilization, pollution control, and wastewater treatment. (c) The other but not lesser objectives are: (i) To create an aesthetically pleasing environment through careful use of hard and soft landscape elements (ii) To enhance the natural and existing characteristics of the land. (iii) To design a functionally appropriate landscape that do not disturb the industrial operations 3.0 <u>LANDSCAPE DESIGN VISION</u> The site has been divided into a few typical zones on the basis of their situational similarities, for the purpose of achieving similar design responses, which are further classified into separate functional zones of specific requirements. These are: (a) Intensive Landscaping Zones (i) Administrative zone (ii) Gate Complex Area (iii) Canteen, Service Building & Similar Building Areas. (b) General Landscaping Zones (i) Open Store yard (ii) Cooling Tower Area (iii) Other incidental areas		

CONSULTANT : PROCON ENGINEERS

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 471 of 639
(c) Linear Landscaping Zones (i) Water Reservoir Embankment (ii) Railway Track Embankment (iii) Green Belt along Boundary (iv) Internal vegetative screen (d) At Micro Level (i) Along Boundary wall (ii) Along internal roads (iii) Along external Approach road 3.1 <u>PROPOSED GUIDELINES</u> The following guidelines have been formulated after close study and analysis of the site plan vis-à-vis it's technical, aesthetic, environmental and security requirements. 3.1.1 Administrative zone This area is to be intensively landscaped with lawn, grass mounds, fountains, flowerbeds, pathways and stone paved areas with appropriate landscape illumination. 3.1.2 Gate Complex Area For security reasons, the design shall be such that trees or other vegetations do not block the eyelevel and obstruct visibility. Also, as per technical requirements, 17.5 M space on both sides of Switchyard area is to be kept free from tall plantations. Therefore, maximum height of plants should be kept within 1.0 m.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 472 of 639
It is preferable to limit landscaping to grass and groundcovers of both foliage and flowering type. Palms may be added to scale down the large expanse of the space. Suitable paving material and pattern may be adopted for smooth flow of movement. 3.1.3 Canteen, Service building & similar building areas: This area is likely to receive a number of visitors, and hence, demands to have aesthetically pleasing surroundings. However, since these two buildings form part of the Plant core area, planting need to be limited to grass, ground cover and small shrubs, which can be maintained as hedges and soft edgings. Appropriate hardscape shall also be a part of landscaping. 3.1.4 Open store yard: This zone should be so treated that alteration and modification do not involve too much resource and is not difficult to reclaim the land when required. Simplified landscaping with grass and ground covers, hedges and plant edgings along roadside should be appropriate. Part of the stretch may also be developed as Plant Nursery to meet the site requirements in long-term. 3.1.5 Cooling Tower Area Air and ground in the adjoining area of the cooling towers is likely to have high humidity. Accordingly, appropriate plants are to be selected for plantation in this area. 3.1.6 Other incidental areas : The rest of the open spaces with no special aesthetic requirements shall be put under grass cover with vegetative borders, edgings and hedges of flowering/ foliage shrubs. Much of the problems associated with industries result from these large un-built ground spaces, which are required as “elbow-rooms”. Proper		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 473 of 639
3.1.7 maintenance of these areas is central to check deterioration of the Plant's overall ambience. Railway Track Embankment: Technical requirements and environmental factors are the main Concern. Evergreen trees with small canopy and dense foliage are to be planted along the railway trackside to arrest coal flying from empty wagons, subject to the space available. The sloped embankment shall be planted with grass. 3.1.8 Water reservoir edge: Similar to above, the embankment shall be covered with grass. 3.1.9 Green Belt along Boundary A 50.0 m wide green belt or dense afforestation along periphery to be created to protect surrounding areas from air pollution, specially coal and fly ash dust particles. 3.1.10 Internal Vegetative Screen A similar buffer is required to screen the core Plant area from air borne coal dust. A vegetative barrier comprising of tall evergreen dense foliage trees would make suitable protection against the dust pollution. 3.1.11 Boundary plantation: Security is the main concern here. Flowering Shrubs and other plants with spikes and thorns may be suitable for this stretch as this would act as natural barriers against trespassing or unauthorized attempts to enter the Plant area. However, these plants are to be maintained below the boundary wall height to allow unobstructed view all around. 3.1.12 Internal Roads The internal roads, wherever possible, may be planted with fast growing and flowering/non-flowering trees of small crown spread. Areas with overhead and underground service lines shall be devoid of trees to prevent

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 474 of 639
root and branching system interfering with these. Those areas shall have planting limited to shrubs and ground covers (in the form of hedges, borders and edgings) only 3.1.13 External Approach Road The approach road of the Plant may also be considered for landscaping with low and dwarf flowering shrubs and grass along the outer periphery of the boundary wall and tall columnar trees on the opposite side. 4.0 DESIRABLE TREE CHARACTERISTICS: (a) Trees shall be so selected that they have the following attributes, apart from being ecologically appropriate: (i) Help in retention of soil (ii) Create less and controlled leaf-litter – evergreen tree species preferred (iii) Large canopy with high crown height to provide shade as well as to allow easy movement of trucks etc. (iv) Trees with high dust-filtering capacity to control air pollution (v) Hardy and resistant to strong gusty winds (vi) Maintenance free and those disliked by cattle (vii) Deep root system, so that chances of surface damage of road due to shallow and surfacial roots are eliminated (viii) Aesthetically pleasing, with attributes like colour and fragrance (ix) Fast growing species are preferred Note: A Detailed out 'Broad Guidelines For Plant Selection' and 'Planting Rationale' leading to selection of plant species are given in the following pages.

4.2 PLANTING RATIONALE FOR SELECTION OF TREE SPECIES

Sr. No.	Zone	Situations/ Activity Areas	Functional Needs	Required Qualities Of Plant Materials
4.2.1	CANTEEN, SERVICE BUILDING AND SIMILAR BUILDING AREAS			
	(a)	Front	Allow visibility to and from building while creating a vista effect, may be interspersed with medium height Canopy trees to provide shade.	Trees with prominent trunk, upright & with minimum leaf litter. Evergreen flowering trees may be added in between to provide shade.
	(b)	Back and sides	Trees providing shade.	Tall spreading winter deciduous flowering trees to allow sun in winter while providing shade in summer. Crown height preferably more to allow easy passage of service/ utility vehicles.
	(c)	Parking areas: (i) Car Parking (ii) Two-wheeler Parking	Trees providing shade	Spreading type winter deciduous trees to allow sun in winter while providing shade in summer.

CONSULTANT : PROCON ENGINEERS

		MAHARASHTRA STATE POWER GENERATION CO. LTD.		Volume: VI-A
		BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1		Section-4
REV: R0		CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS		Page 481 of 630
Sr. No.	Zone	Situations/ Activity Areas	Functional Needs	Required Qualities Of Plant Materials
	(d)	Around the building	Trees providing shade and casting deep shadow. on the building walls specially on the south and western sides to minimise heat gain	Columnar medium height trees with good Aesthetic qualities like colourful and fragrant flower/ foliage.
	(e)	Pedestrian Pathways	Trees and plants providing richness in experiencing the spaces	Mixed variety of trees (both evergreen and deciduous) with good aesthetic qualities like colourful and fragrant flower/foliage to offer seasonal variation and dynamism in landscape.
4.2.2	MASS PLANTATION/ AFFORESTATION & PERIPHERAL GREEN BELT			
	(a)		Fast growing trees to arrest pollution and act as a green belt. Minimum Leaf litter and ability to control pollution are the prerequisites.	Heterogeneous group of trees: A combination of evergreen and deciduous species- Flower and fruit bearing trees may also be considered. Indigenous species preferred. Evergreen trees with fairly large and rough textured foliage to arrest fine air pollutants. Rows of hedges of different heights and with a suitable colour scheme to be used along roadsides.

Sr. No.	Zone	Situations/ Activity Areas	Functional Needs	Required Qualities Of Plant Materials	
4.2.3	SPECIAL LANDSCAPED AREAS				
	(a)		Aesthetics is the main concern here. Environmental factors like shade and Pollution control will follow as secondary requirements.	Evergreen ornamental flowering trees are preferred. Specimen plants and colourful attractive ground covers are must. Accent plants to be used to accentuate the entry points. Exotic species will bring in exciting look.	
4.2.4	OPEN STORE YARD				
	(a)	Entire Area	This area shall be so planted that replacement and transplantation is easy and cost effective.	Grass is the best option. However, a part of this area should be used to develop in-house plant nursery.	
	(b)	Silo-Ash area	Screening	Double row of tall columnar evergreen foliage trees.	
	(c)	Switch Yard Area	Increased greenery along external periphery	Thorny shrubs that form good hedge or edgings are preferred.	
4.2.5	COOLING TOWER AREA				
	(a)	Adjoining areas	This area being slushy, plants that can thrive in soil conditions with high moisture level are preferred.	Plants naturally growing near water margins and which are efficient for wastewater treatment.	

CONSULTANT : PROCON ENGINEERS

Sr. No.	Zone	Situations/ Activity Areas	Functional Needs	Required Qualities Of Plant Materials
	(b)	Pavement sides	May be accentuated with low hedges and ground covers.	
	(c)	All left-over open ground spaces	Required for movement of man and equipment	Plants allowing free movement
4.2.6	WATER RESERVOIR			
	(a)	Sloped Banks	Water body to be kept litter free.	Non-leafy vegetation to be planted that can Stabilize the slope as well as provide a green look.
	(b)	Water body	Water body to be protected from coal dust from sided wagons	Dense foliage small canopy trees with non-Spreading root system that can form a solid vegetative screen.
4.2.7	RAILWAY EMBANKMENT	Sloped Areas	Slope stabilization	Ground covers to prevent soil erosion
4.2.8	BOUNDARY WALL SIDE	Between internal road and boundary	Leave 10.0 m of clear zone for security reasons. However, Smaller plant species that do not block eye level and discourage movement may be considered.	No trees to be provided. Other plant materials shall include shrubs and climbers pruned to boundary wall height. These shall preferably be spiky and thorny. Flowering evergreen species to be given priority. Wall hugging creepers may be used to add more green.

Sr. No.	Zone	Situations/ Activity Areas	Functional Needs	Required Qualities Of Plant Materials
4.2.9	INTERNAL ROADS			
	(a)		Areas with overhead and underground service lines shall be devoid of trees to prevent root and branching system with these	Fast growing and flowering / non-flowering trees of small crown spread. Some areas shall have planting limited to shrubs and ground covers only.
	(b)		The stretch along overhead transmission lines from switchyard shall have to be free from tall trees; rest of the stretch may have taller spreading type trees. However, care has to be taken to avoid the 10.0 m clear zone from tall tree plantation.	Small trees or tall shrubs with large foliage to ensure manageable leaf litter. Evergreen flowering species to be given preference. Indigenous species preferred.
	(c)		Evergreen trees with spreading canopies casting shade on the road may be considered if the stretch is aligned with the sun-path.	Indigenous species preferred.
4.2.10	EXTERNAL ROAD	2.0 M wide strip along Road	Environmental considerations are the main concerns.	Small canopy evergreen trees preferred so that Truck movement along road remains undisturbed. Also hardy maintenance free species are must.

1.0	<u>SCOPE OF WORK</u>	
1.1	The contractor shall execute all the works for and on behalf of MSPGCL.	
1.2	<u>SYSTEM STUDUY:-</u>	
	The contractor shall work out details of the system for Railway Siding works required for successful and timely completion of project. For all necessary information required for establishing the system for providing B.G. Railway siding for 1x660 MW Bhusawal Thermal Power Project, it would be a responsibility of contractor for liaison with railway authority and concerned departments.	
1.3	<u>BASIC & DETAILS ENGINEERING:-</u>	
	Contractor will carry out the final location survey based on the General Arrangement Drawings, pegging out the alignments, soil investigation, preparation of construction programme in consultation & coordination with Railway Department & MSPGCL & executing contract, design & drawing, supply of materials, execution of civil & P-way, construction, erection, commissioning of rail track including construction of bridges, ROB, Foot over bridge, unloading platform, oil handling system, overhead electrification, signalling, TG line, furnishing all the required work in drawing and other connected works required for railway siding for the propose of coal, oil, ash, transportation etc. required for the running of power plant.	
	Scope shall be inclusive of coordination with Railway Department & preparation of design & drawings for construction of all buildings Such as TNC building, Central panel building etc station works such as cabins, relay rack, battery rooms, DG room, signalling and telecommunication room, drain works, cross drainage works goomties etc. along with electrification works and with all materials, equipments machineries etc. The works not elaborated specifically but are essential for supply installation testing and commissioning and BG railway lines are deemed to have been included in the work and the same shall be as per prevailing standard engineering practices of Railways.	

CONSULTANT : PROCON ENGINEERS

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 490 of 639
Rail structures shall generally include Ballast, Prestressed concrete sleepers & 60kg rails normally IU or 1st quality as per railway requirements. The rail structure shall be provided on compacted murum formation. as per RDSO guide lines/Railway norms. The rail top at proposed wagon tipplers and take off point of existing siding should match in such a way that gradient also shall be within permissible limit as per RDSO guide lines/Railway norms. The scope also includes for crossing of tracks, suitable ROB, sub passes for roads wherever required. No where level crossing across the siding shall be allowed. Necessary provision of cross drainage and RCC drains with RCC cover if necessary, in continuation to existing railway siding drains or as per topography of existing land catchments area should be provided to allow the passing of run off across the Railway Siding All along the siding necessary siding protection against scouring cut off toe drain, slope protection as required and approved by railway should be provided. Contractor shall submit design/drawings and obtain necessary various approvals from Railways, other central/state government Departments/agencies/local bodies well in advance. The copy of various approvals/drawings should be submitted to MSPGCL. 1.4 <u>PROJECT AND EXECUTION AND SUPERVISION OF WORKS:-</u> It shall be the responsibility of contractor to ensure the completion of all the activities in proper sequence from the concerned agencies. The contractor shall constantly maintain necessary liaison with concerned Railway Authority. They will attend meeting with Railways for arriving at resolution in issues related to Railway works. The contractor shall check out the activity precisely with time frame to be adhered for completion of work & also obtain timely clearances and approvals from Railways and other out side departments/agencies. The contractor shall exercise proper control on quality of the works and so as to maintain the quality of the works as per relevant IS code/ standards /railway norms as applicable.

1.5

INSPECTION AND CERTIFICATION OF THE SIDINGS:-

On completion of the project, as well as during course of execution of works as and when required contractor shall arrange inspection of Railway authorities with railway equipment if required and obtain fitness certificate before commissioning of part or whole of the siding work. The fees for Railway authorities and charges of railway equipments & manpower for checking the track/OHE line/S&T work shall be borne by the contractor. The contractor shall ensure that the commercial notification for use of the siding are issued by the Railway Department in time so as to achieve mile stone activities.

1.6

POST COMMISSIONING SUPERVISION:-

System shall be maintained after commissioning for the period of 12 months by the contractor. However contractor shall render their services during the guarantee period of 12 months. Further contractor shall be responsible for any deficiency in the supervision as per Railway standard till completion of guarantee period of 12 months after successful completion of the work.

1.7

TENTATIVE LENGTH:-

Tentative length of various rail lines shall be as below.

(a)	Tippler line 1 and 2	-----	4.0 Km)
(b)	Engine line 1 and 2	-----	2.0 Km)
(c)	Stator and Transformer line	-----	2.5 Km)

The above total rail line 8.5 Km are indicative only. The contractor shall finalize the same during detail Engineering as per actual.

2.0

FOUNDATION EXCAVATION & CONCRETING

These specifications supplement the Technical Specifications provided GCC & Specifications of latest Edition

 MAHARASHTRA STATE POWER GENERATION CO. LTD.		Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 492 of 639
2.1	<u>FOUNDATION EXCAVATION</u>	
2.1.1	The excavation in foundation shall include all shoring and other protective work that may be required for ensuring safety during excavation.	
2.1.2	Sand filling in foundation shall be done in the foundation laid on Black Cotton soil or the weak soil, if so desired by the Engineer – in – Charge. If the foundation is laid on good soil, this will not be operated.	
2.2	<u>CONCRETE WORK</u>	
2.2.1	Stone aggregate used for concrete shall be hard stone as per the specification applicable to the Schedule and the same shall have to be got approved by the Engineer-in-Charge. Coarse sand shall also be according to the specification laid down the concerned Schedule for concrete of various type like M15, M20, M25 etc . For these mixes unless otherwise specified stone of 20 mm size shall be used. For fine concrete 1: 2: 4 in RCC or in plain concrete stone aggregate shall be 20 mm size or below.	
2.2.2	Contractor should ensure that quarries selected by him are such, as are approved by State Government for quarry, and that ballast and sand obtained from these are according to the specification followed in concerned Zonal Railway.	
2.2.3	For cement concrete in super-structure, the Contractor should use Steel Shuttering generally suitable to provide batter and offsets. The steel plate should have smooth surface and should be free from bulging during concreting. The entire shuttering should be watertight as far as possible. If however, the contractor wants to use wooden shuttering, he will have to use new planks and scantling etc for fabrication of such shuttering so as to ensure smooth and leak proof surface.	
2.2.4	(a) Concrete in foundation and super-structure shall have to be vibrated. For super- structure, if required by the Engineer-in-Charge, surface vibrator may also have to be used. (b) The concrete shall be mixed properly in mechanical mixer and shall be of plastic consistency. The proper consistency shall be determined by the Engineer-in-Charge by slump test, which shall be carried out	

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 493 of 639
	by the Contractor at his own cost. The concreting shall be commenced only after the Engineer-in-Charge has inspected the shuttering and placement of reinforcement and passed the same. Cost of moulds, labour, tools and plants etc for the slump test and cube test of concrete shall be borne by the Contractor including the cement, which is to be supplied by the Contractor.	
2.2.5	While casting concrete, provision shall be made for providing weep holes with PVC pipes.	
2.2.6	Plain/Reinforced Cement Concrete Works The IS Code of Practice for the structural use of reinforced concrete shall form part of these specifications and this Code and the standard practice in reinforced concrete construction that has been evolved by the adoption of this Code shall be followed. (Refer volume VI-B' section 3)	
2.2.7	Aggregates River sand/coarse sand of approved quality shall be used as fine aggregate for cement concrete, reinforced cement concrete of any other type. Sand shall be clean and absolutely free from dirt and any other objectionable admixture. No deleterious materials shall be permitted. Sample of sand to be used shall be approved by Engineer-in-Charge or his authorised representative. (Refer volume VI-B'section3)	
2.2.8	Coarse Aggregate	
2.2.8.1	The coarse aggregate, which may be either stone ballast as directed, should be well graded and preferably machine broken, and should conform to relevant specification and should be obtained from approved quarries. The Stone should not be soft, thin, elongated, laminated or weathered. The aggregate should be free from dust. Cleaning and washing, if necessary, should be carried out as per direction of the Engineer-in-Charge or his authorised representative.	
2.2.8.2	The mention of sources, as indicated above, does not, however, absolve the Contractor(s) of his/their liability to ensure that the coarse sand, stone chips

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 494 of 639
and ballast as may be required for the work are strictly in accordance with standard specification. In case these materials cannot be had, according to specification, from these sources, the Contractor may bring the materials from any other source by obtaining prior permission of the Engineer – in – Charge provided the materials are according to standard specification. 2.2.8.3 In addition to the routine test, special tests on materials will be carried out whenever required by the Engineer., if the results are as per standard laid down, failing which the cost of these tests will be borne by the Contractor. Necessary facilities in the form of moulds, cones, scales, materials, labour for casting, curing, specimen and such other facilities as prerequisite to any standard concrete tests will in any case be afforded by the Contractor free of cost. (refer volume VI-B' section3) 2.2.9 Form Work And Shuttering 2.2.9.1 The formwork shall be water tight to the best possible and sound material. It shall be sufficiently strong and rigid to resist force caused by vibration and incidental loads associated with it. 2.2.9.2 The shuttering shall be so designed that the shuttering on the sides of beams, columns and the walls may be removed first, leaving the shuttering under the soffits of beams and slabs and their supports to remain the position. If wooden forms are used, they shall be invariably oiled with non-staining material oil. Preferably steel plate; plywood shuttering should be used for exposed concrete surface. 2.2.9.3 If at any stage of the work, during or after placing the concrete in the structure, the work is found defective, such concrete shall be removed and work be done with fresh concrete and adequate rigid forms at the cost of the Contractor. 2.2.9.4 The centering shall be supported by double wedge in order to facilitate casting and removal of the shuttering without jerking. Centering and shuttering shall be carefully eased in order to prevent the load being instantly transferred to concrete. The period that shall lapse after the last pour concrete for easing the removal of centering and shuttering shall be fixed by the Engineer – in – Charge.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 495 of 639
2.2.9.5	Shuttering shall be either of wooden planks of 35 mm minimum thickness with or without steel sheet lining or of steel plates stiffened by steel angles and where wooded planks without steel sheet are used, the edge of the planks and the top surface will be plain to ensure butting of the planks and a water tight surface to prevent leakage of cement slurry. During casting concrete, the shuttering shall be supported on wooden battens and beams and props of vertical ballies properly cross braced together so as to make the form work rigid. In place of ballies props, props of brick pillar of adequate section built in mud mortar may be used.	
2.2.9.6	The formwork shall conform to the shape lines and dimension shown in the plan. It shall be sufficiently rigid and strong to maintain correct shape of the members during disposition of concrete and shall be able to resist forces caused by vibration of concrete and incidental loads associated with the men working over it. The shuttering shall have smooth and even surface and its joints shall not permit leakage of cement slurry.	
2.2.9.7	If at any stage of work during or after placing concrete in the structure, the form work sags or bulges out beyond the required shapes of the structure, the concrete shall be removed and the work redone with the fresh concrete and adequately rigid form work at the cost of the Contractor (details of shuttering centering shall be subject to the approval of Engineer – in – Charge. The complete form work shall be inspected and approved by the Engineer – in –Charge, before the reinforcement bars are placed in position).	
2.2.9.8	Instead of wooden ballies, steel props scolders or in the form of pipes may be used by the contractor with the approval of Engineer-in-Charge. The Contractor will, however, submit the detailed design for these.	
2.2.10	Reinforcement	
2.2.10.1	Reinforcement shall be of the Tor Steel or equivalent (cold twisted deformed bars as per IS: 1786) as directed by the Engineer as per approved drawings. No extra payment shall be made in case other form of steel is used in lieu of mild steel due to non-availability of mild steel.	
2.2.10.2	It shall be the responsibility of the Contractor to clean the reinforcement with dry gunny bag, if they are coated with light rust impurities.	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 496 of 639
2.2.10.3	The rate for reinforced cement concrete includes straightening and uncoiling of rolls of reinforcement. No extra payment for straightening and / or uncoiling of reinforcement rolls shall be payable .	
2.2.10.4	Binding wire of approved quality shall be arranged by the Contractor himself and the rates quoted for respective item should include cost of binding wire and the process of binding etc.	
2.2.10.5	Welding of reinforcement will not be permitted except in special circumstances under the written approval of the Engineer.	
2.2.11	Unless authorised by Engineer-in-Charge, the Contractor shall not dig pits, within or Client's land for extracting shingle or sand or murum, which must be arranged by the Contractor(s) himself/themselves at his/their own cost.	
2.2.12	All works shall be done strictly in accordance with the approved drawings and no departure shall be made by the Contractor without the order of the Engineer (given to him) in writing.	
2.2.13	RCC pipes for culverts/bridges should conform relevant specifications. These should be tested and certified by approved testing agencies/ laboratories and certificate to this effect should be produced by the Contractor if asked for approval of material by Engineer – in – Charge. Nothing extra will be paid for testing and certification by testing agency/ laboratory.	
2.2.14	Paint : Standard brands of paints and primers as per relevant ISI code and as approved by the Engineer-in-Charge shall be used for painting steel work. The rate cover the cost for all labour and materials, cleaning materials, ladder, scaffolding, tools, plants and equipment's including brushes of approved pattern at Contractor's expenses.	
2.2.15	General	
2.2.15.1	The materials to be supplied by the Contractor shall comply with ISI Specifications.	

CONSULTANT : PROCON ENGINEERS

2.2.15.2 2.2.15.3 2.2.15.4 2.2.15.5 2.2.16	Samples of the materials that the Contractor intends to supply shall be got approved in advance from the Engineer before commencing the supply of the same. The land where materials are to be stacked shall be made fit for stacking of materials by the Contractor at his own cost and nothing extra will be paid for this purpose. The Contractor will also himself / themselves arrange and pay towards the cost of land for such working facilities as he / they need (i.e. land for labour camps, Contractor's office, access road to site (s) of work etc.) In case any materials is rejected at the site due to its not conforming to the specifications, the Contractor shall arrange to remove all such materials from site at his own cost within 7 days of the receipt of notice to do so. In case of default, removal from site shall be done by MSPGCL at the risk and cost of the Contractor. If any work (whether temporary or permanent) or other materials, the value of which has been included in any of account bill(s) is destroyed or damaged or has/have for any other reasons be replaced or restored by the Contractor(s), the value of the work or other materials so destroyed may be recovered by MSPGCL from any payment due to the Contractors provided always that no omission to deduct any amount from money due to the Contractor and not payment by the MSPGCL after aforesaid amount become due shall in any way prejudice or effect the right of MSPGCL to make such deductions at any later date.	
3.0	<u>LAYING OF PERMANENT WAY</u>	
3.1	<u>TRACK STRUCTURE</u>	
3.1.1	Components	
	The track shall consist of the following elements:	
3.1.1.1	Main Rails 60 kg/T-12, 90 UTS flat bottom (1 st quality or IU rail as applicable).	

CONSULTANT : PROCON ENGINEERS

3.1.1.2	Secondary rails such as check rails etc shall be of 52 Kg T-12, 90 UTS flat bottom	
3.1.1.3	Rails fastenings – Fish Plates 60/52 kg with bolts and nuts.	
3.1.1.4	Mono block pre-stressed concrete sleepers for plain tracks, level crossings, bridges.	
3.1.1.5	Guard rails on bridge, check rail on level crossings.	
3.1.1.6	Fittings for sleepers – grooved rubber sole plates, elastic rail clips, GFN Liners, metal liners.	
3.1.1.7	Stone Ballast 65mm size.	
3.1.1.8	Fouling mark.	
3.1.1.9	Gradient Posts.	
3.1.2	The track shall be laid with 1540Nos/km monoblock PSC sleepers. The track ballast cushion shall consist of hard stone ballast of 65mm size to a depth minimum 250 mm or as per Railway Standard Specifications.	
3.1.3	Points & crossings – 1 in 8.5 BG turnouts with curved switches and CMS crossings laid on PSC sleepers with built up crossings.	
	1 in 8.5 Diamond crossings with double slip on 60 kg steel sleepers and 60 kg rails.	
	1 in 8.5 Scissor cross over with 4725 mm track center on 60 kg steel sleepers and 60 kg rails.	
3.1.4	Glued Joints.	
3.1.5	Guard Rail on bridges span over 3.00m.	
3.1.6	Check rail at level crossing.

3.2

TRACK LAYOUT STANDARDS

3.2.1

Prescribed Tolerances

The following track standards have been prescribed for track laying.

(a)	Gauge	Sleeper to sleeper variation	± 2 mm
(b)	Expansion gap	Over average gap worked out by recording 20 successive gaps	± 2 mm
(c)	Joints	(i) Low joints not permitted	--
		(ii) High joints not more than	± 2 mm
		(iii) Squareness of joints on straight	± 10 mm
(d)	Spacing of sleepers	With respect to theoretical spacing	± 20 mm
(e)	Cross level	To be recorded on every 4 th sleeper	± 3 mm
(f)	Alignment	(i) On straight on 10 Metre chord and	± 2 mm
		(ii) On curves of radius more than 600 m on 20 m chord.	
		(iii) Variation over theoretical versines on curves of radius less than 600 mm on 20 m chord	± 5 mm
		(iv) Variation over theoretical versines	± 10 mm
(g)	Longitudinal level	Variation in longitudinal level with reference to approved longitudinal sections.	50 mm

CONSULTANT : PROCON ENGINEERS

3.2.2 Service Tolerances

(a)	On straight and on curved track other than transitions.	2mm/m 3.5mm/m
(b)	On transitions	1mm/m 2.1mm/m

(a)	On straight	5mm/m	10mm/m
(b)	On curves	5mm/m	7mm/m

3.3 LINKING

- 3.3.2 The contractor shall lead and spread the rails in pairs along the new alignment on the cess. Kinks from each rail, if any, shall be removed with the help of Jim Crow, etc.

- 3.3.3 The sleepers shall be lead out and laid to the required number for each rail length at the required spacing (65 cm c/c normally) to facilitate linking of track.

3.3.4 Rails shall be placed on sleepers and connected by means of a pair of fish plates at each joints with two bolts initially. 3.3.5 The fishing planes of fish plates and rails shall be lubricated with a paste of workable consistency (plumbago and kerosene oil) in the following proportions and fish bolts be oiled. The material for lubrication of joints shall be arranged by the contractor. (a) Plumbago (Dry Graphite) - 5 kgs. (b) Kerosene Oil (2nd quality) - 3.5 ltrs for 100 joints (c) Black or reclaimed oil - 2.75 ltrs 3.4 <u>PARAMETERS</u> 3.4.1 Gauge – On straight and curves upto 4⁰(440m radius), the gauge shall be maintained exact (1673 mm) and on curves sharper than 4⁰, it shall be kept slack by 6mm (1679 mm). However, the following tolerances are permitted during the course of service. (a) On straight track - 3 mm to +6 mm (b) On curves upto 4⁰ - 3 mm to +13 mm (c) On curves sharper than 4⁰ - 0.0 and upto +19 mm 3.4.2 Unevenness – <table border="1"> <thead> <tr> <th></th><th>Tolerance Generally</th><th>Tolerance on isolated location</th></tr> </thead> <tbody> <tr> <td>(a) On long term basis</td><td>6 mm</td><td>10 mm</td></tr> <tr> <td>(b) As an intermediate measure</td><td>10 mm</td><td>15 mm</td></tr> </tbody> </table>				Tolerance Generally	Tolerance on isolated location	(a) On long term basis	6 mm	10 mm	(b) As an intermediate measure	10 mm	15 mm

3.4.7	Paint marks shall be made on the rails showing the spacing of sleepers as directed by Engineer-in-charge. Necessary paint shall be arranged by the contractor.					
3.4.8	Full quantity of small fittings shall be fitted completely after slewing the track to correct alignment and as directed by Engineer-in-charge. The track so linked shall be aligned to correct position and remaining two bolts shall be fitted and tightened in the fish joints. Cutting, straightening of rails and drilling/chamfering of holes (machine made) in rails wherever required, ensuring correct sleeper spacing, laying of sleepers to correct gauge, alignment, longitudinal and cross levels and fastening of fish bolts, fish plates, fixing of rubber pads, fixing of liners & ERC etc., straightening by Jim Crowing if necessary, paint marking of sleeper spacing on gauge face of the rails, painting and lettering of month and year of laying, greasing/oiling of fish plates and fish bolts shall be in the scope of contractor. (IS-408-1981) Provision of correct expansion gaps according to temperature, etc., including loading, leading and unloading at the site of work with one initial packing shall be done by contractor. The spacing of the sleepers shall be suitably adjusted as directed by Engineer-in-charge at joint. Glued joint & insulated joints, check rail, guard rail etc., shall have to be laid as required according to plan.					
3.5	<u>BALLASTING AND INITIAL PACKING</u> After assembling and laying the track, additional ballast shall be put in and track lifted and packed to make the cushion of 250mm under the sleeper. Lifting and lowering of the track shall be done to the required level.					

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 504 of 639
3.5.1	Defects in cross levels and longitudinal levels shall be rectified and through packing done from one end to the other. Final Adjustment and Packing After the track is tested by Locomotive/Wagon by Engineer-in-charge, lift the track and pack wherever sags are formed. Any sleepers which have shifted from correct spacing or gone out of square, shall be replaced and squared after loosening the fastenings. Thereafter the fastenings shall be tightened again and final packing given. The joint and shoulder sleepers shall be repacked. The ballast section shall be dressed neatly and boxed including light rollers (minimum 2 passes of stone ballast) as per Railway specification for preparation of ballast bed if required thickness 250mm and subsequent supplementation of ballast after linking/packing of track as per approved profile for single line/double line, straight track, curves including ballast in shoulder and cribs as per Railway Specification. 4.0 <u>EARTHWORK, BLANKETING, TURFING, CONCRETE AND OTHER CIVIL WORKS</u> 4.1 <u>SITE CLEARANCE</u> SCOPE This item covers the following operations in the area lying between the toes of banks/tops of cuttings along the alignment and sidings. All necessary labour, materials, equipments, tools and plants, transportation and stacking etc. required are included in the rates. Site clearance Removal of obstructions Stacking and disposal of salvaged materials Preparation of base Cutting of sugarcane and all trees coming in the alignment. (Refer Volume VI-B section 1 and 2)	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 505 of 639
4.2	<u>EARTHWORK IN FILLING</u>	
4.2.1	Bank shall be made to the neat profile. Earthwork in embankment shall be carried out in layers, one layer at a time. No layer shall exceed 30 cm in thickness after compaction. Shrinkage allowance for each layer is to be provided as determined by compaction trials and as approved by the Engineer so as to get the desired thickness of 25 cm.	
4.3	<u>FILL MATERIALS:</u>	
4.3.1	If sufficient material excavated from the adjacent cuttings is available the same shall be used for earthwork in filling in formation. In case the excavated material is not of the required quality the same shall be disposed off as directed. The contractor shall obtain fill material from his own source own cost and the same shall be pre-selected after soil investigations.	
4.4	<u>CONSTRUCTION OF EMBANKMENT</u>	
4.4.1	To achieve a stable formation for embankment, soil investigations and testing are to be done by contractor as per railway norms.	
4.4.2	Determination of maximum dry density in different types of soil to achieve moisture content, density and rolling relationship as per railway specifications.	
4.4.3	The earthwork shall be compacted to the full height by mechanical means at or near the optimum moisture content in layers of 30 cm to achieve the specified density as per latest RDSO/railway specification.	
4.4.4	A "Blanket" of suitable material shall be provided as specified.	
4.4.5	The side slopes shall be as per recommendation in soil investigation report or flatter with or without berms as determined by soil samples and as per profile of embankment approved by railway authority.	
4.4.6	Each layer shall be levelled with motor grader, bulldozer, or similar equipment capable of shifting and forming the layer into a neat and cohesive surface.	

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 506 of 639
4.4.7	Each layer must be approved by the Engineer in charge before the next layer is placed.	
4.4.8	if required slopes shall be protected with stone pitching with or without cement grouting, toe wall, retaining wall etc	
4.5	<u>EARTHWORK ON BRIDGE APPROACHES</u>	
4.5.1	Earthwork on bridge approaches shall be done as directed by the Engineer and the top 100 cm of all banks must be of murum or any suitable blanketing materials as directed by the Engineer.	
4.6	<u>SOIL EXPLORATION / TESTING</u>	
	SOIL EXPLORATION: as per requirement for railway siding work including bore logs wherever required, soil testing as mentioned below	
4.6.1	The Contractor shall arrange for testing of the soil to ascertain the suitability of the soil for formation of embankment, to obtain its proctor density characteristics and to obtain strength of the soil in the compacted/un-compacted conditions in the embankment in order to design slopes. The testing of soil shall be done in accordance with Railway specifications.	
4.6.1.1	The Contractor shall also make arrangements for quality control of compaction of the embankment by establishing and manning adequate Field Laboratory (ies).	
4.6.1.2	The Contractor shall establish Field Laboratory (ies) to cover all the above investigations, triaxial and other tests for ascertaining strength characteristics, for which he may arrange any other centralised laboratory (ies) where he will get the tests done. All the tests and laboratory works shall be in the contractors scope	
4.6.2	The Contractor shall submit samples of earth which he proposes to use for formation of the embankment along with relevant tests results to the Engineer before commencing earthwork and shall get the same approved for use. While approving the sample for use, particular size distribution shall not be the only consideration.	

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 507 of 639
4.6.3	The Contractor shall take undisturbed samples as per IS – 2132:1986 of the parent soil over which the embankment shall rest and shall conduct suitable Laboratory Test to enable analysis of the stability of the base after construction of the embankment to assess its long term settlement, distance of borrow pits etc. Such tests will normally be required when proposed embankment is more than 6 m high or where the parent base soil is exceptionally weak.	
4.7	<u>DETERMINATION OF MAXIMUM DRY DENSITY</u>	
4.7.1	For Clayey Soils	
	The maximum dry density shall be determined by heavy proctor compaction test in accordance with IS: 2720 (Part – VIII) – 1983. The dry density and moisture content relationship shall be obtained for a number of samples and shall cover moisture content ranging from 2 % less than the optimum moisture content to plastic limit.	
4.7.2	Sandy And Silty Soil With Moderate Cohesion	
4.7.2.1	Where the soil is amenable to compaction and satisfactory results are obtained when compacted by heavy proctor test as per IS: 2720 (Pt – VIII) – 1983, the soil, shall be treated like clayey soil in the manner mentioned above.	
4.7.2.2	Where the soil is amenable to tests by heavy proctor, field trials as per IS: 10379-1982 shall be conducted to achieve moisture content density and rolling relationships. Such moisture contents should cover a range upto high moisture contents so that such relationship is available in quality control of compaction at higher moisture contents as mentioned below.	
4.7.3	Gravelly Soil	
	For Gravel fraction upto 30%, moisture content density relationship shall be obtained by heavy proctor test (IS: 2720-Pt-VIII, 1983) on fraction passing 40 mm IS Sieve IS : 10379-1982.	

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 508 of 639
4.7.4	Weathered Soils In certain weathered soils the behaviour to compaction in field differs from Laboratory compaction characteristics and the maximum compaction achievable for such soils in the field shall be determined in accordance with provision of Method 3 of IS: 10379-1982.	
4.7.5	Locally available soil may be selected for use, care being taken to avoid use of organic clays, silts and peat, poorly graded sands and gravel with uniformity coefficient of less than 2 (to safeguard against liquefaction under vibration of moving loads or specially during earth tremors) gravely soils with percentage of gravel size fraction 30 % rock fills and expansive soils. The moisture content of the soil, which the Contractor brings to site for making embankment, should be appropriate for compaction as specified in these specifications.	
4.8	<u>COMPACTION</u>	
4.8.1	Compaction shall be carried out by means of suitable equipment mechanically to achieve the densities prescribed depending upon the type of soil, height of bank etc.	
4.8.2	Compaction equipment shall be specially selected to match the type of soil and got approved in advance by the Engineer for instance, plain rollers should be used for ordinary soil, vibrating rollers for sandy soil, sheep foot rollers for clayey soil, etc.	
4.8.3	Procedure of compaction:	
4.8.3.1	Before work is commenced, the contractor is advised to conduct field compaction trials, for his own guidance so that compaction is efficiently and economically achieved. This trial should also be used to assess the thickness of the loose layer of soil that should be adopted for formation of the bank, as well as to determine the most efficient type of rollers.	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 509 of 639
4.8.3.2 Control Of Moisture Content For Compaction In Field (a) All compaction shall be attempted to be done at moisture content as near as possible to optimum moisture content so as to give maximum dry density under rolling. (b) Where natural moisture content of the earth is less than the optimum moisture content for achieving maximum dry density, water should be sprinkled either in the borrow – pits or over the spread layer in the embankment, as convenient, to obtain the necessary moisture content with a tolerance of 2% and compaction done. (c) Where the natural moisture content is more than the optimum moisture content for maximum dry density, soil should be left for drying for upto 2 days or less so as to reduce the moisture content to the desired level. In case the soil does not lose enough moisture to achieve the optimum moisture content at the end of a period of 2 days, compaction shall be permitted at the available moisture content provided the same is not more than the plastic limit of the soil and also provided that the strength characteristics of compacted soil at available moisture content do not make the slopes of the embankment uneconomical. In such cases, the strength characteristics of compacted soil shall be obtained from appropriate laboratory tests and slope etc. redesigned and adopted. 4.8.4 In filling the approaches of bridges or the spandrels between small arches or culverts, earth filling shall be raised simultaneously with abutments/wing walls and compacted in layers to achieve the standards of compaction specified for the main body of the embankment. The layers in this case shall be 20 cm thick. 4.8.5 The compaction shall be done so as to achieve at least 98 % of the maximum dry density attainable at the corresponding moisture content of the soil, as determined by using heavy proctor test in accordance with IS: 2720 (Pt. VIII) – 1983, followed by field trials as per IS – 10379-1982, depending upon the type of soil. 4.8.6 The moisture content of each layer of soil at the time of compaction should be about 1 percent to 2 percent less than the optimum moisture (OMC)		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 510 of 639
corresponding to IS: 2720 (Part VII). The soil spread in layers shall be thoroughly compacted over the entire width. Each layer shall be tested in the field for density and got accepted by the Engineer before the next layer is laid.		
4.8.7	The moisture content of the soil in the borrow pits and in the embankment after compaction will be determined as laid down in IS: 2720 (Part – II) 1983, except that the soil may also be dried through application of heat from a portable stove on an open pan.	
4.8.8	The optimum moisture content of the soil shall be determined by proctor compaction test as per IS: 2720 (Pt VII). This test shall be conducted for the soil, which is to be taken from borrow pits and whenever any change in the nature of soil is met with.	
4.8.9	The laboratory dry density of the soil being used in the embankment shall be determined as per IS: 2720 (Pt. VIII) – 1983.	
4.8.10	The control of compaction through number of passes of compacting equipment shall not be accepted as a substitute for moisture content and density determination as specified.	
4.8.11	Care should be taken during the compaction operation to slope the surface of the bank to drain water to minimise the absorption of water and to prevent ponding. The quality of compaction shall be determined by taking mean of the results of density of number of samples collected mostly on either side of the centre line at intervals of 10 m or so with a few taken at random near the two sides, in each layer. The mean value so obtained shall be equal to or exceed the minimum specified density mentioned above. However, in no individual test shall the density be less than the minimum values specified by more than 5% otherwise further compaction shall be done at the appropriate location.	
4.8.12	While compacting it should be ensured that there is a minimum overlap of 150 mm between each run of the roller.	
4.8.13	The Contractor shall be allowed to lay a further layer of soil only after the	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 511 of 639
compaction of particular layer has been found satisfactory and approved by the Engineer. 4.8.14 The top of the formation shall be finished to a slope of 1 in 30 away from the centre of the full width of the embankment (old and new in case of doubling). 4.8.15 In all above cases latest RDSO/Railway specification shall be followed. 4.9 <u>BLANKETING</u> 4.9.1 Blanketing materials to be used on the work will have to be approved by the Engineer before being brought to site. The contractor shall bring the bulk supply of blanketing material according to approved sample and stack the same on the finished formation where the quality shall be checked. After approval of the quality, the Contractor shall be allowed to spread the material and start compaction. The top surface of the formation must not be allowed to be damaged by the Contractor in the process of carting the materials for blanketing. Any damage done to the formation shall be made good with necessary compaction by the Contractor. 4.9.2 The blanketing materials shall be sand, quarry dust, gravel, other non – cohesive material/Murum. It should satisfy the following properties. 4.9.2.1 It should be coarse and granular 4.9.2.2 If it contains plastic fines, the percentage of such fines i.e. particles passing 75 micron sieve should be between 2 to 5%. If the fines are non-plastic, the same shall be between 8 to 12%. 4.9.2.3 Uniformity co-efficient i.e. D_{60} / D_{10} must be preferably above 7 but not less than 4. The co-efficient of curvature i.e. $S_{30} / (D_{60} \times D_{10})$ should be within 1 and 3. 4.9.2.4 In all above cases latest Railways/RDSO specification shall be followed. 4.9.3 The blanketing should generally cover the entire width of formation from shoulder to shoulder.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 512 of 639
4.9.4	All the blanketing material should be compacted by mechanical means like appropriate type of rollers or plates vibrator of $\frac{3}{4}$ tonne capacity. Compaction should be at optimum moisture content, as determined by conducting heavy proctor test in accordance with IS: 2720 (Pt VIII) 1983 for maximum dry density at OMC + 2 %. The compaction shall be done to attain 98% of the maximum dry density obtainable at moisture content at which compaction heavy proctor test in accordance with IS: 2720 (Pt VIII) - 1983 followed by field trials as per IS: 10379-1982. Mean density of a number of samples will determine the quality of compaction in each layer. In no individual case shall the density be less than the minimum value specified by more than 5%.	
4.9.5	The top of blanket shall be finished to a slope of 1:30 away from the centre of formation. Each layer shall be compacted to the desired density over the entire width commencing from both sides. There should be a minimum overlap of 150 mm between each run of the roller.	
4.9.6	The Contractor shall establish laboratories at site with such equipment and personnel as adequate for checking the quality of the blanketing material as well as for checking the quality of compaction of the blanket.	
4.10	<u>TURFING</u>	
4.10.1	The turfing of banks shall not be commenced without the written permission of the Engineer. It will consist of soda/sarkanda not less than 100 m thick and 250mm square well beaten into the bank and the Contractor will be responsible for ensuring that the turf grow properly. In the even of its not doing so, he will re-do at his own expense such parts as have not grown. Before turfing is commenced the side slopes are to be dressed to the specified section.	
4.10.2	Before the onset of monsoon suitable measures should be taken for the protection of the bank already formed against erosion of formation deep rain cuts and disturbances to the bank including the side slopes etc.	
4.11	<u>EARTH WORK</u>	
4.11.1	Area grading in railway siding shall be carried out as per relevant Area grading drawing. However necessary excavation and filling shall be carried

out for base formation below rail track, bridges, culverts, toe wall, retaining walls, drains other foundations etc 4.11.2 Clearing the site: 4.11.2.1 The site on which the structure is to be built as shown on the plan and the area required for setting out and other operations shall be cleared of all obstructions, loose stones, materials and rubbish of all kinds, stumps, brush wood, shrubs and other growth, roots being entirely grubbed up, cutting of all trees including sugarcane 4.11.2.2 All holes or hollows, whether originally existing or produced by the removal of loose stones or brush wood, shall be carefully filled up with earth well-rammed and levelled off upto the level of already filled or existing ground as directed. 4.11.3 Excavation: 4.11.3.1 Excavation shall be carried out mechanically or/and manually in accordance with lines, levels, grades, curves as requirement. And Shall include blasting, chiselling shoring, strutting, dewatering, protection and safety measure, disposal of excavated material etc. 4.11.3.2 Bottom of foundations shall be levelled both longitudinally and transversely on stepped, any of the excavation be carried down to a level below the required level, the Contractor shall fill in such extra excavation at his own cost with 1:4:8 ordinary grade concrete well rammed in position until it is brought up to the proper level; filling in with excavated material not being permitted for this purpose. The corners of the excavated pits shall be made true and square and all loose debris shall be removed to the satisfaction of the Engineer. Before any foundation concrete is placed the Engineer shall inspect the foundation trenches. If any, loose patches or pockets come to light on inspection, these shall be dug out as directed and filled and rammed with 1:4:8 ordinary grade concrete. Just before laying the foundation concrete all bottom of trenches shall be lightly watered and thoroughly rammed.

4.11.3.3 Blasting: No blasting shall be permitted for excavation of foundation even in rocky formation, unless permitted by the MSPGCL and subject to proper licenses and permission being obtained from the authorities concerned. 4.11.4 Filling: 4.11.4.1 All filling in and around the foundation, plinth and area levelling in and around the site of work shall be done from selected material from the excavation. in layers of 20cm. (compacted thickness) watered and well compacted as per railway norms. 4.11.4.2 Filling shall be done after the concrete or masonry in the foundation has fully set and it shall be done in such a manner as not to cause undue thrust on any part of the structure 4.12 <u>PLAIN & REINFORCED CONCRETE – ORDINARY GRADE & CONTROLLED GRADE</u> 4.12.1 General: 4.12.1.1 This item relates to the supply, preparation, placing and curing all concrete work in plain and reinforced portions of work referred to under respective item in the Schedule of Quantities. All concrete work shall be carried out in conformity with the latest edition of IS: 456. 4.12.1.2 Concrete for the purpose of these specifications is preferably controlled concrete. 4.12.2 All operations relating to mixing, placing and curing shall be subject to the approval of the MSPGCL and the Contractor shall provide unhindered access for this purpose for inspection and selection of samples. Testing shall be done in close liaison with the MSPGCL and method of testing shall generally follow the standard methods described in the relevant Indian Standard Specification

	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 515 of 639
4.12.3 Materials: 4.12.3.1 All materials used in the work shall be new and of the qualities and standards specified in relevant IS code/RDSO norms/Railway standards 4.12.3.2 Materials falling to comply with these specifications shall be immediately removed from the works 4.12.4 Water: Water used both for mixing and curing shall be clean and free from injurious amounts of oil, acids, alkalis, salts, sugar or organic materials, or other substances that may be deleterious to concrete or steel. The Ph value of water shall not be less than 6. 4.12.5 Cement: 4.12.5.1 Unless otherwise specified, cement shall be ordinary Portland cement conforming to IS: 8112, of approved make and brand. 4.12.5.2 It shall be stored in a dry place in regular piles not exceeding 10 bags high and in such manner that it is adequately protected from moisture and contamination. 4.12.5.3 Different consignments shall be stacked separately, so that they can be used in the order in which they are received. 4.12.6 Sand: Sand shall be coarse, clean river sand. The sand shall be of siliceous material, sharp, hard, strong or durable and free from clay, dust, dirt, alkali, organic material, deleterious matter, lumps etc., in excess of the limits given in Table-I of IS: 383. Sand shall be well graded and conform to either grading Zone-II or grading Zone-III, defined in Table-II, Clause-IV of IS: 383] Sand shall be washed and dried if so required without extra charges.

4.12.7 Coarse aggregate: Coarse aggregate shall be from sources approved by the Architect. It should consist of hard, strong, durable and angular particles and shall generally conform to the requirements of IS: 383. Coarse aggregate shall be well graded and shall be selected from the standard grading given in IS: 383. Maximum size of coarse aggregate for use in reinforced concrete work shall be limited to (20mm or ¾"). For use in massive reinforced concrete members having sufficiently wide spacing of reinforcement use of 40mm (1.1/2") size graded aggregate may be permitted by the MSPGCL Normal aggregate shall have specific gravity (saturated surface-dry basis) not less than 2.6 and shall be determined in accordance with IS: 2386 (Part-III). The coarse aggregate shall be washed if required by MSPGCL and only clean, fresh water shall be used for this purpose. 4.12.8 Admixtures: No admixtures shall be used in the concrete unless approved by the MSPGCL. Approval shall be based on the evidence that with the passage of time neither the compressive strength of concrete is reduced nor are other requisite qualities of concrete and steel impaired by the use of such admixtures. Admixtures containing Calcium Chloride or similar salts shall not be used under any circumstances. 4.12.9 Controlled concrete: 4.12.9.1 All concrete used for structural application shall be controlled grade concrete. The concrete shall be designated by specified characteristic compressive strength of 150mm cube of 28 days in N/sqmm. 4.12.9.2 Mix proportions used for a particular designation of concrete shall be based on the mix design carried out on samples of materials proposed for use in the works. The design mix shall be got approved from MSPGCL well in

advance 4.12.9.3 Preliminary tests will have to be made if the source of the materials change or any changes in mix proportions are to be made in the course of construction. 4.12.9.4 Minimum cement content shall be as specified. 4.12.9.5 All controlled grade concrete shall be compacted by mechanical vibration. 4.12.10 Preliminary test: 4.12.10.1 The cube strengths of concrete as observed during the preliminary tests carried out under laboratory condition shall have a minimum value of as mentioned in IS: 456-2000. 4.12.10.2 Test specimens for works cube tests shall be secured, prepared and tested generally in accordance with IS: 516. 4.12.11 Water-cement-ratio and workability: The quantity of mixing water shall be controlled throughout the works. At least one determination of moisture content shall be made every day, preferably just before commencement of the concreting work. 4.12.12 Batching and mixing: All materials shall be batched by weight, except water, which may be measured by volume in graduated containers. Cement shall be weighted separately. The accuracy of all weighing devices shall be maintained within (one) 1% and the devices shall be checked periodically as directed by the MSPGCL. The weigh-batching machine shall be Healthy Gresham or of other approved make. Cumulative batching of materials may be permitted provided the method of measurement gives the above specified accuracy. All machines and methods used for batching shall be subject to the approval of the MSPGCL.

4.12.13 Compaction: All concrete shall be thoroughly compacted by means of mechanical vibration. The MSPGCL shall remain the final deciding Authority of the type of Vibrators to be used for any particular case. As far as practicable, only internal vibration shall be used for compacting concrete, unless specified otherwise. Internal vibrators of high frequency type shall generally conform to the requirements of IS: 2505 and shall be preferably of electric or pneumatic power driven type. Use of immersion vibrators for compacting concrete shall generally follow recommendation of IS: 3558. 4.12.14 Curing And Protection The concrete shall be initially protected from damage on account of impact, undue pressure, excessive heat, drying winds and rain, etc., by covering with wet sacking, hessian or similar absorbent materials soon after the initial set. After the final set, the concrete shall be kept continuously and preferably by continuous spraying with water or by ponding. 4.12.15 Failure to meet specification requirement and load testing of concrete structures. 4.12.15.1 Concrete structures constructed under this specification shall meet all applicable requirements as regards appearance, dimension, strength and durability (particularly concrete cover to reinforcement). In the event of the failure of these structures to meet the requirements, the Engineer may reject these structures and order their removal and re-building all at contractor's cost or accept the same subject to satisfactory performance under load test conducted generally as per the requirement of IS-456. The cost of conducting such tests as well as provision of suitable electrometers for measurement of deflection shall be borne entirely by the contractor. 4.12.15.2 As and alternative to load tests, the taking out of coarse from concrete in accordance with IS-1139 and testing the same in accordance with IS-516 and using the test result in conjunction with structural analysis of this structure may also be required by the architect. The cost of taking out coarse samples and testing the same shall be borne by the contractor. The contractor must

provide for hammer testing equipment, which shall always be kept at site. 4.13 <u>MASONRY</u> 4.13.1 Stone Masonry 4.13.1.1 Material: Stones used in masonry shall be got approved from Engineer in charges. The stones shall be sound, durable, free from flaws, cracks, injuries, vane sand holes, cavities, patches of soft loose materials and shall be of uniform colour and texture. No stone shall taper to a point. The stone shall be kept free from dirt, oil, grease or any other injuries material, which may attack the stone or mortar or prevent adhesion of mortar. Stones with skins shall not be used. Generally, the stone should not contain crypto crystalline silica, or chert, mica or any other deleterious material like iron oxide, organic impurities etc. and the type shall be as specified. 4.13.1.2 Size Stone Masonry (a) General (i) This specification refers to providing materials and constructing coursed rubble masonry in foundations, plinth and superstructure. Stones (ii) Different categories of stones such as face stone, backing stone, hearting stone, headers, quoins etc. shall be collected in advance to suffice at least for a week's requirements and shall be stacked separately category-wise. (b) Item To Include (i) Un Course rubble masonry laid in cement mortar of specified proportion, built in any position to any height or depth and to lines, levels, curved and batters shown on the plans or as ordered by the MSPGCL including quoins, headers etc., and striking joints and curing.

(ii) Erecting and removing all scaffolding, ladders and use of plant required for execution of the item, safety of the labour and inspection of the work including compensation for any injury, damage etc. De-watering to allow construction in the dry and proper setting of masonry. Clearing the site round the masonry. (iii) All labour, use of tools, materials and other items incidental to satisfactory completion of the item.		
5.0	<u>GENERAL P – WAY WORKS</u>	
5.1	All works – linking of Railway tracks, assembly, laying and linking at points and crossings, ballasting, through packing and connected works shall confirm to the various instructions and specifications stipulated in “Indian Railways Permanent Way Manual – 1985” with up-to-date correction slips, IRS drawings, track manual and other relevant Railway Codes/Manuals.	
5.2	The proposed sidings shall be mostly laid with 60/52 Kg rails on PSC sleepers in single rails / 3 rail panels.	
5.3	While ballasting and track linking, care should be taken to prevent any damage to the formation, including blanketing and to prevent blocking of side drains. The contractor should make good such damages.	
5.4	<u>TURN-OUTS:</u> The Turn-outs 1 in 8 ½ and 1 in 12 assembly i.e. switch assembly, lead portion and crossing assembly shall be laid by 60 Kg rails to the Indian Railway Standard PSC sleepers with a ballast cushion.	
5.5	The operation of dumping ballast lifting and packing should continue till such time the track attains final level and shape of ballast section.	
5.6	Rails shall be connected by means of pair of fishplate in the first instance only with two bolts and nuts, one in each rail. The fishing planes of the fishplates and rail are to be greased. Grease shall be supplied by the Contractor. Cutting of rails where necessary, shall be done to suit squaring	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 521 of 639
of joints. 5.7 Paints mark shall be made on the rails showing the spacing of sleepers 5.8 Full quantity of small fittings is to be fitted completely after linking the track to correct alignment. 5.9 The track so linked shall be aligned correctly to the alignment pegs given or as directed by Engineer till it takes correct position and the remaining two bolts to be fixed in fish plated joints. 5.10 During the above process, alignment, adjustment and squaring of sleepers, gauging shall be done by contractor. Cross-level and longitudinal levels should be checked and rectified. 5.11 Greasing of fishplates, fish bolts and nuts with lubricating oil and graphite grease to be supplied by the contractor includes cleaning fishing planes of rail ends with wire brush. 5.12 The works should be executed in a workman like manner to the satisfaction of the Engineer – in – Charge at site. The contractor will be primarily responsible for Safety of traffic that moves on opened up track, notwithstanding the presence of MSPGCL representative at site. 5.13 Good quality track ballast as per specification and of approved quality shall be supplied and stacked on cess of formation or at the toe of bank or on top of cutting or at suitable places. 5.14 The contractor shall transport the ballast it on top of the blanketing surface /formation and spread it in the standard profile. After spreading, the ballast profile should be consolidated. 5.15 The thickness of the finished ballast spread should be as per railway norms, and the layer should be dressed and boxed to proper profile and dimensions 5.16 While spreading the ballast on the finished formation, care shall be taken that the formation/blanketing surfaces is not damaged. In no circumstances, vehicular carts/trucks shall be permitted to ply on the

finished blanketing/formation. In case some damage to the surface is done, the Contractor shall repair the damages before spreading the ballast. 5.17 Any sleeper which have shifted from correct spacing or gone out of square shall be moved back and square after loosening the fastenings. The fastenings shall be tightened again after squaring. 5.18 The track shall be slewed to correct alignment by sighting along the railhead of the base rail. It should be ensured that track does not get lifted in the process of slewing. 5.19 The track shall then be given a final packing. For this, sighting shall be done along the base rail and any dip or low joint lifted correctly and packed, attending also to the packing of adjacent sleepers. After the base rail is thus packed for two or three rails length, the cross level should be checked and the opposite rail lifted wherever necessary and sleepers under the rail seat packed. 5.20 The joint and shoulder sleepers shall be repacked and cross level adjusted at the time each through packing of sleepers. 5.21 Oiling and greasing hand-operated points will include adjusting the point rodding and fixing hand lever frame, where found necessary by means of spikes with the sleepers for smooth operation of the point and adjusting the opening between tongue rail and stock rail. For any bent tongue rail, if required, Jim-crowing may have to be done and the gap adjusted as required. Oil and Grease shall be supplied by the Contractor 5.22 All the elastic rail clips should be thoroughly cleaned. Grease should then be applied on Central leg of the ERC and eye of MCS Inserts and then the clip should be driven at the time of assembly. 5.23 At some locations work is required to be carried out under running traffic/block. During the work under running traffic/block, contractor should arrange for protection of track and displaying the signals as per rules of Indian Railways.

5.24 <u>CONTRACTOR'S TOOLS AND PLANTS AND CONSUMABLES ETC.</u> All the P. Way tools such as (a) Rail tongs, (b) Crow bars (c) Fishing spanners, (d) Hammers (e) Keying hammers (f) Cotter splitters (g) Shovels (h) Mortar Pans (i) Beaters, (j) Track Lifting Jacks, (k) Gauges, (l) Level Board (m) Spirit levels (n) Cant Board (o) Expansion liners (p) Wooden Squares (q) Steel Tape (r) Wire brushes (s) Cotton Waster (t) Rake Ballast (u) Soap as required for the work shall be arranged by the contractor. 6.0 <u>DEEP SCREENING OF BALLAST</u> 6.1 <u>SCOPE OF WORKS.</u> 6.1.1 Deep screening of ballast shall include the following items of work: - 6.1.1.1 Removing entire stone ballast including muck lying in the track between and under the sleepers and on the shoulders. The depth below the bottom of the sleepers up to which the ballast and the muck should be dug up will be specified by the Engineer-In charge of work. This will normally be 30 cm.		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 524 of 639
6.1.1.2	Screening the ballast with screens of approved design to separate the clean ballast from muck, putting back clean ballast into the track and disposing of the muck as directed by the Engineer-In charge. The muck must be used for cess and slope repairs wherever necessary as directed by the Engineer-In charge but should not be thrown on slopes of cuttings or inside drains and catch water drains. Muck will be defined as particles passing through 30 mm sieve.	
6.1.1.3	Adequate number of wooden blocks of size 45 x 25 x 13 Cm .or as required as per site conditions to support the track for passing trains while the work is in progress shall be provided. These works shall be contemplated on the first day, for the length taken up for screening. No sleepers will be left unsupported at any stage.	
6.1.1.4	Aligning and levelling the track and kutcha packing underneath sleeper with the screened ballast adequately so as to pass trains at 20 Kmph. These works shall be completed on the first day, for the length taken up for screening.	
6.1.2	"Spreading and boxing of ballast" will include the following items of works.	
6.1.2.1	Pulling all the ballast on the formation on to the track and boxing it to approved profiles. Proper template and dog lines should be used. The width at the shoulder should be as directed by the Engineer-In charge which will normally be not less than 3.51m Metres (11'6") not more than 3.81m (12'6") for B.G.	
6.1.2.2	No ballast should be wasted on the slopes of banks or in cuttings. All ballast from the slopes should be picked up & put in the track as directed by the Engineer-In charge.	
6.1.3	Repairs to cess should be carried out with the muck removed after screening. The cess be levelled & dressed to approved profile.	
6.1.4	Speed Restrictions – Speed Restrictions as required for safety of traffic will be arranged by the Engineer-In charge. No work on the track should be commenced until the

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 525 of 639
Permanent Way Inspector of the Railways has imposed the speed restrictions and erected speed indicators. After speed restriction is imposed, the contractor shall progress with the work in a systematic manner, long length of tracks under speed restriction should be avoided. Caution watchman as necessary during day and night should be arranged for by the contractor. 6.1.5 Safety Hazards – 6.1.5.1 The works should be executed in a workman like manner to the satisfaction of the Engineer-Incharge. The Contractor will be primarrily responsible for the safety of traffic that moves on the opened up track, not with standing the presence of Railways supervisory staff at site. 6.1.5.2 In the event of any accident at the work spot, a departmental inquiry will be held by the Railway. If it is established that the accident occurred wholly or partially due to any act amounting to negligence on the part of the contractor shall render himself liable for all damaged and also legal prosecution if loss of life is involved. 6.1.6 Contractors supervisory personnel. 6.1.6.1 The contractor shall employ and post at site a technical supervisor who should adequately qualified and well experienced in execution of permanent way works. The name, particulars of technical qualifications and record of experience of the supervisor employed should be advised to the Engineer-In charge. If in the opinion of the Engineer-In charge the supervisor is not fit to be in charge of the work, he should be forth with replaced. In this matter the opinion of the Engineer-Incharge shall be final and binding on the contractors. 6.1.6.2 No work on the track should be done unless and until the contractor technical supervisor is at site.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 526 of 639

6.1.7 Progress of work.

6.1.7.1 The progress of work shall be achieved by the contractor as directed by Engineer-In charge or his representative with sufficient labour in a systematic way, to keep pace with the relaying and to keep the length of speed restriction to the minimum.

6.1.7.2 If the works are stopped or delayed due to shortage of material or some other reason on owners account, the contractor will have no claim for any compensation whatsoever on account of such delay or stoppage of work.

The Contractor may be required to start the work from any location in the section according to the need of Owner and as directed by the Engineer. The Contractor is bound to execute the work accordingly. The stretch where work is to be done & the direction of progress will be given by the Engineer.

6.1.8 Modus operandi for deep screening.

6.1.8.1 Procedure for deep screening ballast and providing proper cushion without a traffic block.

6.1.8.2 Organise the work of ballast screening party in such a way that at the end of each working day, there is no length of unscreening track left between screened length of track. At the same time, it should be ensured that, when ballast is being excavated from underneath the sleeper (as per procedure detailed below) there are at least four sleeper between it and the next sleeper being simultaneously and similarly worked on.

6.1.8.3 Remove ballast from space 'A' & 'B' on either side of 1st sleeper '1' down to final formation level and provide wooden blocks to support the rail for passing trains.

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 527 of 639

6.1.8.4

Remove ballast, from 1st sleeper down to final formation level.

6.1.8.5

Screen ballast place it back under 1st sleeper and pack it.

6.1.8.6

Remove wooden blocks from space A.

6.1.8.7

Remove ballast from space 'C' down to formation level and after screening, place in space 'A' up to bottom of sleeper the balance may be taken out side the track and screened. Support the rail in space 'E' with wooden blocks.

6.1.8.8

Remove ballast from under 2nd sleeper '2' down to formation level.

6.1.8.9

Remove ballast from pace 'D' down to formation level and after screening place in space 'B' up to bottom of sleeper the balance may be taken outside the track and screening. The wooden blocks should be removed from space 'B' and placed to support the rails in space 'D'.

6.1.8.10

Remove ballast from under sleeper '3' and so on till the whole rail length is provided with screened ballast up to level of bottom of sleepers.

6.1.8.11

Lift track to provide additional cushion where required.

6.1.8.12

Pack the track in the final position and then provide boxing.

7.0

TRACK BALLAST

7.1

SCOPE:

These specifications will be applicable for stone ballast to be used for all types of sleepers on normal track, turnouts, tunnels and deck slabs etc., on all routes.

7.2

DETAILED SPECIFICATIONS

7.2.1

General

(a) Basic Quality:

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 528 of 639
	Ballast should be hard, durable and as far as possible angular along edges/corners, free from weathered portions of parent rock, organic impurities and inorganic residues. (b) Particle Shape: Ballast should be machine crushed and cubical in shape as far as possible. Individual pieces should not be flaky and should have generally flat faces with not more than two rounded / sub-rounded faces. (c) Physical Properties: Ballast sample should satisfy the following physical properties in accordance with IS:2386 Pt.V-1963 when tested as per the procedure given in Annexure – 1&2 for BG Track. Aggregate Abrasion Value - 30% maximum Aggregate Impact Value - 20% maximum * Relaxable up to 35% & 25% respectively on techno-economic grounds by owner. (d) The shape parameter “Flakiness Index” as determined in accordance with IS: 2386 Pt.I-1963 following procedure given in Annexure-3 should not be more than 50%. The “Water Absorption” tested as per IS: 2396 Pt.III-1963, following procedure given in specification should not be more than 1%.	
7.3	<u>SIZE AND GRADATION</u>	
7.3.1	Ballast should satisfy the following size and gradation :	
	(a) Retained on 65mm sq. mesh sieve - 5%	
	(b) Retained on 40mm sq. mesh sieve - 40% to 60%	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 529 of 639
(c) Retained on 20mm sq. mesh sieve - Not less than 98% for for machine crushed. Not less than 95% for hand broken. 7.3.2 Method of Sieve Analysis (a) The screens for sieving of ballast shall be of square mesh and shall not be less than 100 cm in length, 70 cm in breadth and 10 cm in height on sides. (b) While carrying out sieve analysis, the screen shall not be kept inclined, but held horizontally and shaken vigorously. The pieces of ballast retained on the screen shall not be pushed through the screen openings. (c) The percentage passing through or retained on the sieve shall be determined by weight only. 7.4 <u>SAMPLE AND TESTING</u> 7.4.1 On acceptance of tender, three samples in sealed jars submitted by the successful tenderer will be kept in Owners office will provide visual guidance to check uniformity of supply. However, fulfilment of size, gradation, shape and physical properties shall be criteria for acceptance of supply in the field. Rest of the samples submitted at the time of tender can be disposed off after finalization of the tender. 7.4.2 In order to ensure supply of uniform quality of ballast, the following norms shall be followed in respect of sampling, testing and acceptance. 7.4.2.1 On supply of the first 100 cum, the tests for size, Gradation, Abrasion Value, Impact value, Flakiness Index and Water Absorption shall be carried out. Further supply shall be accepted only after his ballast satisfies the specifications for these tests.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.		Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1		Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS		Page 530 of 639
7.4.2.2 Subsequent tests shall be carried out as follows:-			
	Supply in Stacks		Supply in Wagons
	For each stack of volume less than 100 cum.	For each stack of volume less than 100 cum.	
Size and gradation test			
Testing Frequency	One for each stack	One for each stack	One for each wagon
Size of sample	** 0.027 cum.	**0.027 cum for every 100 cum. or part thereof.	** 0.027 cum.
Abrasion Value, impact value, Flakiness Index and Water Absorption Test @	One for every 2000 cum		
Testing Frequency			
Size of Sample	45 Kg.		
** This sample should be collected using a wooden box of internal dimensions 0.3 m x 0.3 m x 0.3 m from different parts of the stack. These tests shall be done for the purpose of maintaining quality during supply. In case of the test results not being as per the prescribed specifications at any stage, further supplies shall be suspended till suitable corrective action is taken and supplies ensured as per specifications. The above tests may be carried out more frequently if warranted at the discretion of owner authority.			
7.4.2.3	If the quality of ballast is noted to have changed during supply, as revealed by visual comparison with the approved sample, the tests shall be redone to confirm that it satisfies the properties as per railway norms. The approved

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 531 of 639
sample of the changed supply should be preserved, for future checks in three sealed transparent jars jointly signed by the contractor and owner Authority.		
7.5	All tests for Abrasion Value, Impact Value, Flakiness Index and Water Absorption conducted subsequent to award of contract shall be carried out by the contractor.	
7.5.1	Aggregate, Abrasion Value	
	The abrasion test for track ballast shall be carried out using Los Angeles machine as per specification based on IS: 2386 part IV - 1963)	
7.5.2	Aggregate Impact Values	
	The Impact value test for track ballast shall be carried out using Impact testing machine as per specification based on IS: 2386 part IV - 1963)	
7.5.3	Flakiness Index	
	(Based on IS"2386 Part I – 1963)	
	The flakiness index of an aggregate is the percentage by weight of particles in it whose least dimension (thickness) is less than three-fifth of their mean dimension.	
8.0	<u>WELDING OF RAILS</u>	
8.1	<u>WORK SPECIFICATIONS</u>	
	The work shall be carried out conforming to IRS Specifications. lay down the steps to be taken for production of a satisfactory joint by AT welding. Two types of AT welding processes are followed for welding of Rails namely conventional welding and SKV welding. As a matter of policy SKV welding (short preheat welding) is adopted now on all Indian Railway for Alumino Thermic Welding and the same shall be followed for this project.	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.		Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1		Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS		Page 532 of 639
8.2	<u>SELECTION OF RAILS TO BE WELDED</u>		
8.2.1	New rails to be welded should conform to Standard Specification. The end bends should have more than plus or minus 0.6 mm of vertical and lateral misalignment when checked with 1 metre straight edge.		
8.2.2	Rails Rails to be welded should have a life of about 50 years. Before welding, the ultrasonic tests shall be carried out on rails as per Indian Railway Standard (T-19-1984/Clause 16.2) and end cropping, battering and hogging, shall also be done before welding if required.		
8.2.2.1	Characteristics of SKV welding for 52 kg rail 90 UTS		
	(a)	Rail gap (mm)	: 25 ± 1 mm
	(b)	Type of mould welding technique	: Prefabricated CO ₂ sand mould SKV process
	(c)	Pre-Heating	
	(i)	Time (Minutes)	: 4.5
	(ii)	Device	: Compressed Air Petrol
	(iii)	Position	: Top preheating
	(d)	Tapping time (sec)	: 20 ± 3 sec
	(e)	Mould waiting time (minutes)	: 4 – 5
	(f)	Post weld treatment	
	(i)	Chipping device	: Double cutter weld trimmer
	(ii)	Weight of Portion	: 11.750 ± 2% Kg
	(g)	Weld Metal Dimension	Web Foot Bottom

8.3	<u>SATISFACTORY PERFORMANCE</u>			
8.3.1	Clause 14 to 16 of IRS/T-19/1984 pertaining to execution, guarantee and acceptance of test shall be strictly followed. However, special attention is invited to Clause 16.2 pertaining to USFD testing of the weld which is read as under :			

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 534 of 639
All the fusion-welded joints shall be got ultrasonically tested by the contractor as per the directions of the Engineer-in-charge before acceptance as per the procedure for ultrasonic testing of thermit welded rail joints. The testing shall be arranged by the contractor as early as possible but before the welding team leaves the welding site. All the joints which are found to be defective on the report submitted shall be cut and re-welded by the contractor free of cost. Such re-welded joints shall also be tested ultrasonically and if found defective, cut and re-welded free of cost. 8.3.2 The contractor will be responsible for the welded joints remaining satisfactory for the guarantee/maintenance period as provided in the specification and the performance guarantee will be kept open for 2 years. For every joint falling during the guarantee period, 4 times of the cost of welding at the accepted rate of the contract will be recovered from contractor's dues, if the joint is not re-welded by the contractor. 8.4 Thermit portions suitable for the welding technique for the type of rail section and its rail chemistry shall be arranged by the contractor. Only such thermit portions shall be used by the contractor which have been inspected, passed and sealed by RDSO. The Engineer-in-charge or any Supervisor authorized by him can check at any time, the place or storage of welding portions, to satisfy himself that only RDSO certified portions are being used. 8.5 The contractor shall provide to each welding party metallic straight edges of 1 metre and 10cms length and 1 set of feeler gauges in units of 0.1mm to 2mm and all other equipment viz Grinding machine along with grinding stones/files/pre-fab moulds etc., required for completion of work in workman-line manner. 8.6 The contractor carrying out the work shall be the approved one by RDSO for the welding technique and type of rails sections. His staff under the category of supervisor duly certified by the RDSO and the welder duly certified by RDSO only shall be permitted to carry out the work. Provisions of Part C of IRS Specifications T-19-1984 shall be strictly followed. 8.7 The welding work shall be carried out by the self contained units at each location so that all type of works concerning each points i.e. lifting, leveling, aligning, packing, moulding, welding, chipping and final finishing shall be done by contractor.		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 535 of 639
8.8	In case of welding on the cess of track, rails spreading, creating gaps, leveling, alignment etc., shall be done by the contractor. The contractor shall be responsible for ensuring that the rails are brought to correct alignment and level before welding.	
8.9	The contractor shall be responsible for proper filling and grinding of the joints and their finish to the specified tolerances after welding as given below :	
8.9.1	Vertical alignment :	
	Variation not more than + 1.0 mm to – 0.0 mm measured with 1.0m straight edge.	
8.9.2	Lateral alignment :	
	Variation not more than plus or minus 0.5 mm measured with 1.0 m straight edge.	
8.9.3	Head finish one side :	
	Plus or minus 0.3 mm on the gauge face side of the rail head measured with 10.0 cm straight edge.	
8.9.4	Head finishing on the top table surface :	
	+ 0.4 mm to – 0.0 mm measured with 10.0 cm straight edge.	
8.9.5	All weld collars are required to be painted in terms of RDSO letter No.M&C W/I dt:12/8 as under :	
8.9.5.1	Apply one coat of Ready Mixed paints, brushing bituminous, black, lead free, acid, alkali, water and chlorine resistant to IS-9862-81 on the welded area and one foot on either side of the joints.	
8.9.5.2	After 8 hours drying, apply a second coat of the same paint to IS-9862-81.	
8.9.5.3	Painting should be carried out by brush.	

CONSULTANT : PROCON ENGINEERS

	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 536 of 639
8.10	The contractor shall ensure to protect the work against wind and weather during the actual execution of the work.	
8.11	The contractor shall arrange the necessary equipments along with qualified staff approved/authorized by RDSO for carrying out requisite tests specified in IRS Specifications.	
8.12	<u>PREPARATION OF RAILS</u>	
8.12.1	Contractor shall remove kinks and twists in the rail particularly within 2 metres of each joint and other works and ensure that necessary defects have been removed before commencing the welding work.	
8.12.2	In case of released serviceable rails, the same shall be free from excessive wear and corrosion. Rails with matching wear shall be welded together. Maximum vertical wear shall not be more than 6 mm and maximum reduction in head with not more than 6 mm in the case of 60/52 kg./m rails. The released rails should have a residual life of about 10 years and ultrasonically tested before welding.	
8.12.3	The rail ends shall be cropped as marked by the Engineer-in-charge to remove any battering or hog effect at the ends before welding.	
8.13	During the course of welding in situ, the contractor shall be responsible for execution of following, but the contractor shall ensure compliance as per Specification before commencing welding work.	
8.13.1	Creation of required amount of gap for welding.	
8.13.2	Shifting of sleeper for inserting wooden blocks/wedges if found necessary for welding.	
8.14	<u>TESTING OF JOINTS</u>	
8.14.1	The USFD testing as per Clause No.16.2 of IRS specification No.T-19/84 is to be arranged by the contractor from the approved/ authorized agency. The testing shall be completed as early as possible and welding team shall not leave the welding site till testing is completed. A test report shall also be submitted for record.	

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 537 of 639
8.14.2	Transverse testing of welding test sample	
	The test weld sample, not less than 1.5m long with thermit weld in the centre shall be placed on cylindrical / semi cylindrical supports having 30-50 diameter on a span of 1.0 m for 60/52 kg/m rail. With a transverse load of 150/75 MT applied gradually at the weld at the centre, a minimum of 20/15 mm deflection must be produced without showing any sign of cracking or failure. This test shall be conducted on 1 out of 1000 welded joints.	
8.14.3	Hardness Test	
	Brinell Hardness Test shall be conducted at the welded joint and at the Heat Affected Zone (HAZ). The average hardness number determined shall be as under:	
	(a) Weld metal	: BHN of Parent Metal + 20
	(b) HAZ	: BHN of Parent Metal + 20
	(c) Rail Metal elsewhere	: = 230 BHN
8.14.4	Test sample shall be taken after every 50 welded joints. The contractor shall arrange for the transport of these joints at his own cost, getting the sample welds tested and shall also bear the testing cost. In case any test joint/joints fails/fail, the guarantee of two years shall be extended for a further period of one year for the particular km/kms representative joints or which fail / fails.	
8.14.5	If during the process of welding certain joints are found defective or do not conform to the required standard and are rejected.	
8.15	<u>STEEL CHANNEL SLEEPERS</u>	
8.15.1	Fabrication of Steel Channel Sleepers	
8.15.1.1	The work includes cutting of steel to size and shape, drilling, assembling, welding, riveting, bolting, milling, grinding, galvanizing and performance of any other activity required in manufacturing of steel channel sleepers	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5

and supply of fittings and fixtures excluding rubber/elastomeric pads. 8.15.1.2 Steel Channel Sleeper and all steel fittings shall be provided as per RDSO drawing references mentioned in table enclosed. 8.15.1.3 M.S. Packing plate of suitable thickness should be welded only at bottom of flange of individual channel of channel sleeper to maintain rail level. 8.15.1.4 The pad plate should have two strips welded, one at either end to avoid lateral movement of channel sleeper. 8.15.1.5 Galvanizing of entire fabricated channel sleeper along with all M.S. Fittings i.e hook bolts, clips, nut bolts etc shall have to be done by dip galvanizing method as per standard specification of railway. 8.15.1.6 No drilling, cutting, punching or exposing the bare metal etc will be permitted after galvanizing. 8.15.1.7 For payment purpose, actual weight of finished sleeper with all steel fittings will be considered. This should however not vary more than +/- 5% of nominal weight of sleeper shown in/calculated from standard/approved drawings. 8.15.1.8 Fittings have to be supplied at site/.depot as directed by engineer in-charge as per Table below. 8.15.1.9 All nuts should have self locking screw threaded insert (Stainless Steel Helisert). No extra payment shall be made for this. 8.15.2 Elastomeric Pads 8.15.2.1 For plate girder/riveted plate girder/through girder bridges requirement of one sleeper will be (i) Elastomeric Neoprene pads of same design as Grooved rubber pads 10 mm thick 2 Nos (ii) Grooved rubber pads 6 mm thick (for guard rails) 4 Nos, (iii) Elastomeric pads as per Drg No.RDSO/B-1636/1/R2 8.15.2.2 Different type of elastomeric pad is required for welded plate Girder /through girder bridges and under slung bridges. It should be supplied as

per type of bridges. 8.15.2.3 The elastomeric neoprene pads of grooved rubber pads design and elastomeric pads shall have to be procured from RDSO approved suppliers with prior approval of Engineer in charge. Contractor shall have to submit copies of challan and bill for such procurement. Elastomeric Neoprene shall have to be used in place of rubber. 8.15.3 Removal of Track for fixing channel sleeper 8.15.3.1 Suitable block will be arranged for execution of these works on running traffic including necessary charges of railway part borne by the contractor. 8.15.3.2 Wooden sleepers/bridge timbers may have different spacing on different bridges. 8.15.3.3 Length of dismantled track will be calculated bridge wise from end of girder on one abutment to end of girder on other abutment. Nothing extra will be paid for closure of the day's work on bridge. 8.15.3.4 Contractor shall be responsible to make suitable arrangement for making up the difference in level of track on wooden sleepers and steel channel sleepers. In case of closure of days work on bridge, suitable ramp shall be provided by contractor to the satisfaction of Engineer in charge. 8.15.3.5 Released material from dismantled track shall have to be transported and neatly stacked as per instruction of Engineer in charge. 8.15.4 Fixing of Steel Channel Sleepers 8.15.4.1 The fixing includes providing channel sleepers with all it's fittings on the flanges of steel girder bridges/rail bearers & linking & fixing running rails and guard rails over steel channel sleepers so fixed with its fittings and fixtures. 8.15.4.2 Suitable block shall be arranged for execution of these works on running traffic including necessary charges of railway part borne by the contractor 8.15.4.3 The running rails and guardrails of any size for the bridges shall be

9.0 <u>OVERHEAD EQUIPMENT (OHE) WORKS</u> 9.1 <u>GENERAL</u> 9.1.1 Introduction This part of specification contains general technical and other specifications for design and erection of complete 25KV AC 50 Cycle single phase traction overhead equipment, switching stations, L.T. transformer stations complete with foundations, structures, return conductors and 25KV feeders, if any. This part also gives reference to technical specifications of materials and components and procedure for submission of designs and drawings of basic arrangements, components and fittings designs and other typical designs relating to overhead equipment switching stations. 9.1.2 Scope Of Work Traction overhead equipment in accordance with this specification are detailed in the particular features of the sections to be electrified and their special requirements are indicated. 9.1.3 Wind Pressure For design of layout of overhead equipment maximum span, wind pressure shall be taken as specified. Structures and foundations of overhead equipment, switching stations and L.T. supply transformer stations, shall be designed for the wind pressure 9.1.4 System Particulars The nominal voltage of the overhead equipment will be 25KV AC 50 Cycle, single phase. The supply voltage may, however, rise upto 27.5 KV. One terminal of the 25KV system shall be solidly earthed at the traction sub-station and also connected to the overhead equipment through switchgear provided at the traction sub- station & at the feedings station.

9.2 <u>OVERHEAD EQUIPMENT</u> 9.2.1 Track 9.2.1.1 Gauge and track Centre: The track gauge is 1676 mm (5ft 6 inch) in multiple track zones the normal distance <u>between track centres varies between 4270 mm and above.</u> 9.2.1.2 Speed The overhead equipment which shall be of the simple polygonal type and pre-sags should be designed for a maximum speed of 160 Km/h (Approx 100 miles/h) if regulated and for a maximum speed of 80km/h 9approx 50 miles/h) if unregulated unless otherwise specified in part-III for any particular section. 9.2.1.3 Curves The minimum radius permissible is 175mm (573 ft) i.e. a 10 degree curve. Inside station limits, the curvature at a 1 in 8/1-2 turnout is 8 degree i.e. of radius 219 mm (716 ft) 9.2.1.4 Super elevation The maximum super elevation is 165 mm (6.5 inch) one curve; the minimum setting of structures shall be decided on the basis of maximum super elevation. For purposes of design and erection of overhead equipment, the actual super elevation as existing at site or as indicated to the Contractor shall be adopted. 9.2.1.5 Low Joints For low or loosely packed rail joints, a difference of 25 mm (1 inch) in the level of opposite rails may be taken as the basis for estimating the displacement of the pantograph with respect to its normal position.

9.2.1.6 Formation Generally sections more than one track have common formation. In certain lengths, however, the formation for different tracks may be separate. 9.2.1.7 Displacement The general design of overhead equipment shall permit a displacement of 100 mm of tracks without difficulty and an adjustment of the overhead equipment on this account shall be of such a nature as could be done conveniently without changing any component of the overhead equipment. 9.2.2 Sectioning 9.2.2.1 Insulated overlap Insulated overlaps are provided for facility of isolation. Some of the overlaps may be provided with manually operated isolator switches. 9.2.2.2 Yard supply The sectioning diagram/s also indicate the tracks in station yards and sidings whose equipment is electrically independent from those of other track. The overhead equipment in yards and sidings may be fed through isolator switch or interrupter. 9.2.2.3 Section Insulators Section insulators shall be provided as indicated in the sectioning diagrams or cross- over between main tracks and to isolate sections of overhead equipment in yards & sidings. Section insulators may also be used to form neutral sections at special locations as indicated in approved drawings. 9.2.3 Overhead Equipment 9.2.3.1 Brief Description

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 547 of 639
Essentially the traction overhead equipment shall consist of a standard catenary wire from which a grooved contact wire is suitably suspended by means of droppers. In order to cater for a speed of 160 km/h, the contact wire is given a pre-sag of about 100 mm for 73 m span and reduced suitably for other spans. 9.2.3.2 Catenary The catenary wire shall be of cadmium copper 19/2.1mm, 65 sq. mm. in size. 9.2.3.3 Contact wire The contact wire shall be grooved and made of hard drawn copper having 107 sq mm cross section. 9.2.3.4 Dropper Droppers shall be made of hard drawn round copper wire, approximately 5 mm dia. Droppers shall be spaced not more than 9 m apart. 9.2.3.5 Encumbrance As a general rule, the nominal “encumbrance” i.e. the centre distance between the catenary and the contact wire at the support shall be 1.40 m. Deviation from this figure will be permitted in special cases (e.g. spans near – bridges, structures with more than one cantilever etc). 9.2.3.6 Jumpers All jumpers connected to OHE conductors shall be used of copper only. The in span jumpers, potential equalizer jumpers at insulated overlaps and neutral section, shall be of 50 Sq. mm. nominal, 19/1.8 mm size. Flexible jumpers shall be used at overlaps, turnouts, crossings etc.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

9.2.3.7 Anti-theft jumper Anti-theft jumper of 50 sq. mm. nominal, 19/1.8 mm in size shall be used in out of turn wire of conventional OHE and copper cadmium anti creep wire as an anti-theft measure. 9.2.4 Type Of Equipment The overhead equipment used shall be of the regulated type. 9.2.4.1 Regulated In the regulated type of overhead equipment, the tension of both the catenary and the contact wires shall be maintained at a constant value at all temperature/temperatures by means of automatic tensioning devices desired to take up the variation in the length of overhead equipment due to temperature variation. An anti creep shall be provided at a point approximately midway between two tensioning devices and not more than 750 metres from any one of them. Alternatively, the arrangement may consist of anchoring the catenary on either side of the boom of a portal with the contact wire running through and providing a jumper connection. 9.2.5 Plane Of Contact 9.2.5.1 Regulated The regulated overhead equipment shall be so erected that the contact wire has the designed sag. 9.2.5.2 Dropper Dropper charts to be used for standard span of regulated and unregulated overhead equipment would be supplied by the Contractor. Droppers for non- standard span, spans with section insulators and special locations shall be calculated by the contractor.

9.2.6 Tensions Regulated In regulated equipment, the tension in the catenary and in the contact wire shall be 1000 kgf in each conductor. 9.2.7 Clearance 9.2.7.1 General The distance between live parts and parts at earth potential (or likely to be earthed) shall be as large as possible. 9.2.7.2 Over bridges and tunnels. The clearance which are to be made available at over bridges, signal, gantries and other over line structures shall be based on the above rules. 9.2.7.3 Platform sheds and structures In the course of checking the overhead equipment pegging plans, the Contractor shall prepare a list of platform sheds and other structures in the vicinity of track to be wired. The clearance to these structures shall be in accordance with Railway norms. If these clearances are not available, the Contractor shall take up necessary modifications. 9.2.8 Height Of Contact Wire 9.2.8.1 Normally, the minimum height of contact wire above rail level shall be 5.50 m at mid span under the worst temperature conditions. This height may be reduced under bridges and in tunnels to the extent permitted by the railway authority. The minimum height shall be 4.80 m. In electric, locomotive sheds and over electric locomotive inspection pits, the minimum height shall be 5.80m. At level crossing, the minimum height shall be 5.50 m. Any infringement restricting minimum height at level crossing shall be removed by contractor.

9.2.8.2 Gradient of Contact wire Any change in the height of the contact wire shall be made gradually and the maximum slope shall not normally exceed 3 mm per meter on main lines and 10 mm per meter on sidings. The end spans of any section with a gradient of contact wire shall have a slope not greater than half the main slope. 9.2.9 Termination General 9.2.9.1 Traction overhead lines shall be terminated using components. The termination may be carried forward by one or two spans if anchoring facilities so require. 9.2.9.2 Terminating wires shall be electrically connected to the conductors with which they are likely to approach closely or come in to contact under normal conditions. Supplementary Insulation 9.2.9.3 If a terminating wire passes over a live conductor to which it should not be connected, i.e. in a different elementary section, the portion of the terminating wire close to the live conductor shall be separated by means of insulators. The insulators shall be located in such manner as to clear the swept zone of the pantograph under the worst conditions and as far away as possible from live conductors. 9.2.10 Type Of Structures 9.2.10.1 Cantilever The overhead equipment of main tracks in case of multiple track sections shall be electrically and mechanically independent of one another by provision of independent cantilever masts to the maximum extent possible.

9.2.10.2 Portals In cases where the tracks in a multiple track section do not permit location of independent masts and where automatic tensioning of overhead equipment is required, rigid portals may be used. Also in the vicinity of points and crossing, portals may be used, provided it is not possible to have prescribed setting with independent cantilever masts. These structure shall be equipped with standard bracket assemblies for supporting individual equipment of different tracks. Portal structures shall also be employed at anti creep central locations and such portals shall have necessary guy arrangement. 9.2.10.3 Foundation Foundation for all structures shall be designed in an economical manner and as per IS/railway standards. 9.2.11 Cantilever Assembly The bracket assembly carrying overhead equipment shall be of the swiveling type. The assembly shall be such that the tubes adopted will permit easy adjustment of the whole equipment after erection to cater for displacement of the track during maintenance up to the extent of 100 mm on either side. In special locations, pull- off arrangement may be used. 9.2.12 Overlaps Overlaps shall be provided at suitable intervals such that neither the tension length exceeds 1500 m nor the fixed anchor to balance weight anchor exceeds 750 meters. 9.2.12.1 General The contact wires at the overlapping zone shall be parallel to each other in a plane to the track and run separated from each other.

9.2.12.2 Insulated In the case of insulated overlaps, the separation between the two contact and the two catenary wires shall be 0.5 m. 9.2.13 Points & Crossing Arrangement of overhead equipment of different type i.e. regulated, unregulated or tramway at points & crossing shall be in accordance with the standard drawings. 9.2.14 Section Insulator 9.2.14.1 Brief Description The section insulators shall provide effective electrical isolation of two elementary electrical sections of overhead equipment and permit smooth passage of the pantograph in either direction at all speeds upto 70 km/h. The section insulators shall be of the single wire type. 9.2.14.2 Size and weight The section insulators assembly shall be such that it should be possible to install the insulator in the overhead equipment. The axial distance between the catenary and the contact wire with section insulator in position is not less than 450 mm. The weight of the complete assembly shall not be more than 45kg (for single wire type excluding the weight to the catenary insulator and that catenary ending lamps). 9.2.15 Bridges & Tunnels 9.2.15.1 Over bridges The complete overhead equipment (i.e. both the catenary and the contact wires) shall normally pass under over-line structures. Additional specified minimum height of contact wire shall be maintained. In special cases, the catenary may be anchored on either side of the over-line structure and the contact wire carried under earth.

9.2.15.2 Safety Screens On over bridges, metallic protective screens shall be provided in order prevent any person from coming into contact with the live wires over the equipment. Such screens shall be properly earthed. 9.2.15.3 Height gauges at level crossing Height gauges shall be provided at all level crossing. 9.2.16 Bonding And Earthing Bonding & earthing shall be done in accordance with the code for binding and earthing. 9.2.16.1 Longitudinal and Transverse bonding Longitudinal and transverse bonding of tracks, bonding of structure including traction structure to rails and associated earth shall be provided in accordance with the above code. 9.2.16.2 Traction Structure Bonding Every traction mast or structure shall be bonded to a non- track circuited rail unless it is provided with a continuous earth wires or it is individually earthed by means an earthing station. 9.3 <u>FOUNDATIONS</u> 9.3.1 Scope This part deals with the design of foundations and anchor blocks for traction structures carrying overhead equipment (including those on bridges), structures at switching stations and booster stations and other concrete work. It also deals with specifications for concrete.

9.3.2

Design Of Foundation

9.3.2.1

Soil pressure

For design of foundations for traction structures carrying overhead equipment, the Contractor shall determine the type and allowable bearing pressure of soil at suitable intervals and adopt the type and size of foundations, suitable for particular locations with the help of the approved employment schedules. In cases of particularly weak soil, the bearing pressure may have to be determined for each location.

9.3.2.2

Structures carrying overhead equipment

Foundation for traction structures carrying overhead equipment shall be either of the side bearing, side- gravity or new pure gravity type according to their location, formation of the sub- grade and the bearing pressure of the soil. In new filled up soil or cinder formation, pure gravity sand filled core foundations or cantilever type foundation with weight or guyed foundations may be adopted.

9.3.3

Bearing Pressure

9.3.3.1

Guiding Information

The following allowable bearing pressures may generally be expected for kinds of soil. The information is given for general guidance only.

Average good soil in banks and cuttings	: 11,000 Kg/Sqm
Moorum soil in cutting	: 22000 Kg/Sq.mm
New banks and bad soils in banks and cuttings	: 5500 Kg/Sq.mm.

Black cotton soil- pure gravity foundation shall normally be adopted. However, under reamed pile foundations may be adopted in limited locations for rails purpose. In the case of dry black cotton soil, the soil should be subjected to a bearing pressure as close as possible but not exceeding 16500 kg/sq m. the foundation block being not less than 2.8 m. In the case of wet black cotton soil, the soil should be subjected to a bearing pressure as close as possible but not exceeding 8000 kg/sq m.

aggregates become finer and the maximum size of coarse aggregate becomes larger. Graded coarse aggregate shall be used for an average grading of fine aggregate(that is zone II of Table 4 of IS: 383-1970*) , the proportions shall be 1:1.5,1:2 and 1:2.5 for maximum size of aggregate 10 mm , 20 mm and 40 mm respectively. Specification for coarse and fine aggregate from natural sources for concrete (second revision) “In case uniformity in the materials used for concrete making has been established over a period of time, the proportioning may be done by volume batching, provided periodic checks are made on mass/volume relationship of the materials. Where weight batching is not practicable, the quantities of fine and coarse aggregate (not cement) may be determined by volume. If the fine aggregate is moist and volume batching is adopted, allowance shall be made for bulking in accordance with IS: 2386 (Part-III) – 1963’*. ----- “Methods of test for aggregates for concrete part III specific gravity, density, voids, absorption and bulking” ----- The crushing strength of concrete shall not be less than the limits given below :- In judging the acceptability of the materials, quantity of concrete and the method of work, the purchaser will generally observe the provisions of the “ Indian Standard Code of practice for plain and Reinforced Concrete, IS : 456-2000”. 9.3.5 Size And Grading Of Aggregates The graded coarse aggregate 40 mm nominal size (table-2 of IS: 383-1970) shall be used for foundation. A coarse aggregate for grouting muffs and embedding shall be of 20 mm graded nominal size as per table –2 of IS : 383-1970(specification for coarse and fine aggregate from natural sources for concrete). Fine aggregate shall be graded from 10 mm downwards. The maximum size of aggregate for under reamed pile foundation shall be 20 mm graded nominal size.

Structure/uprights shall generally be embedded in concrete foundation blocks: in special cases structures may be secured by means of holding down bolts. Limited quality (Appro 700 Nos) of circular span pre stressed concrete mast may also be used as the sole discretion of the purchaser. 9.4.3 Design Steel Structures 9.4.3.1 Designs for steel structures shall, except where otherwise provided, comply with the “Indian standard code of practice for use of structural steel in General Building construction” IS-800-1962. The thickness of smallest steel section used shall be 5 mm for galvanized members 9.4.3.2 All the steel structures and small part steel for carrying overhead equipment are to be fully galvanized after drilling and fabrication as per specification ETI/OHE13(4/84) and no painted structures are to be used. 9.4.4 Cantilever Masts 9.4.4.1 Load For purposes of design the worst possible combination of all loads that may occur shall be considered. The load shall include the following (weight to be assumed for design of structures are shown against important items.) (a) Weight of overhead equipment (1:60 kg/metre for each conventional and 1.32/kg for each composite OHE) (b) Weight of bracket supporting the overhead equipment (60kg/normal bracket) (c) Weight of a man (60 kg) (d) Weight of an earth wire (0.32kg/ metre)

(e) Weight of feeder, return conductor or other special equipment wherever they occur. (f) The effect of eccentricity of vertical and horizontal loads on the bracket due to variation in temperature. (g) Wind loads perpendicular and parallel to the track. The wind pressure adopted shall be taken as that indicated. (h) Radial forces on the mast, due to stagger, curvature, anchorage etc. (i) Weight of the mast itself (j) Any other load or loads that may occur due to the special location of the structure. 9.4.4.2 Deflection Notwithstanding the provision contained in IS: 800-1962 regarding permissible deflection, the following shall apply. (a) The deflection at the top of the mast due to permanent loads shall not exceed 8 cm and mast shall be so erected that it becomes reasonable vertical after application of permanent loads. (b) The additional deflection under maximum wind pressure shall not exceed 8cm at the level of the contract wire. 9.4.4.3 Torsion The torsional rotation of the mast due to permanent loads shall not exceed 0.1 radian 9.4.4.4 Typical Design The typical design of a traction mast is included in the set of standard drawings listed. Employment schedules for standard masts for various locations and types are included in the standard drawings listed, to enable selection of suitable types for different locations and local conditions.

9.4.5 Anchor Masts 9.4.5.1 Masts at which overhead equipment will be anchored shall also normally be of same type as those other locations. Anchor mast shall normally be provided with suitable guys but struts may be permitted in special cases. 9.4.5.2 Dwarf masts At certain locations where due to local conditions it is not feasible to anchor the guy rod on a foundation block in the ground, dwarf mast shall be used in accordance with approved designs. 9.4.6 Portals 9.4.6.1 General Portal shall be of fabricated steel of standard types to purchaser designs. The most important designs are covered by Drawing listed. 9.4.6.2 Load The loads shall be as detailed in Para 9.4.4as applicable. 9.4.7 Structures On Bridges 9.4.7.1 The structures may be either cantilever masts or portals (hinged or fixed at base) depending on the type and condition of bridge piper capping. As far as possible cantilever masts grouted in foundation blocks on piers will be used. Where this is not possible cantilever masts with holding down- bolts or suitable (hinged or fixed at the base) may be adopted. 9.4.7.2 Designs of structures on bridges to suit different locations and local conditions will be furnished to the contractor by the Purchaser 9.4.8 Special Structures In the case of structures at locations not covered by the employment schedules furnished by the purchaser, the Contractor shall furnish

complete design calculation justifying the choice of the type of structures for such locations. 9.4.9 Setting Of Structures 9.4.9.1 The setting of the distance from the central line of the track, on straight or curve to the face of the mast/structure of fitting located on the mast. 9.4.9.2 On straight and outside of curve, the standard setting shall be as per relevant drawing included. Minimum setting of structures shall be 2.5m plus curve allowance as required. Wherever this distance cannot be provided specific approval of purchase shall be obtained before erection, setting of portal upright overlap/ turn-out structures, anchoring structures and other masts carrying more than one OHE will be 3.0 m wherever possible. 9.4.9.3 Extra clearance in curve. The minimum setting of structures on curves shall be determined by adding to the above minimum figures an extra clearance included in the table included in the set of standard listed. Structures with counter weight In cases of structures carrying counter-weights assemblies, the term “setting” shall refer to the minimum distance of the counter-weight from the track centre under the worst conditions of wind. 9.4.9.4 Structures on Platform The setting of structures on platforms shall be not less than 4.75M 9.4.9.5 Structures Near signals In the vicinity of signals, structures shall be located in a manner, which shall ensure good visibility, where necessary, the setting shall be increased as per the relevant drawing included.

9.5.3 Prototype Tests Fittings, Components and materials:- If prototype samples of equipment's components or fittings of any manufacturer have already been approved in connection with the electrification of other section of Indian Railway on the 25KV 50 cycles single phase AC system; prototype samples of such items will be exempted from the tests.		
9.5.4 Inspection and testing These comprise inspection and test conducted at the manufacturer's factory for ensuring quality of manufactured items as part of the <u>Quality Assurance Program</u>.		
9.5.5 Test Certificate These copies of the test certificates for the test carried out at the manufacturer's factory on all equipments shall be furnished within a month after completion of the prototype test. Three copies of the routine test carried out on each equipment shall also be furnished after the equipment is passed for inspection.		
9.5.6 Technical Specification		
9.5.6.1 The following specifications (latest revision) will govern the supply and test of important materials, components and equipment:- (a) Structures steel IS 226-1975 IS 800-1962 IS 808- 1964 and IS 808 (Pt. - 1-1978) IS 1731- 1971 IS 2004- 1978 (b) Tensile testing IS 1607- 1972 for steel products etc (c) Dropper wire IS 282- 1982 (d) Tin bronze casting IS 366- 1968

Traction Equipment 9.5.6.2 Bracket Bracket tubes shall be of seamless cold drawn or electric resistance weld steel with ETI/OHE/11(9/83) with an insulator near the support. The length of the tubes shall be than there will remain a free length of 200mm beyond the catenary suspension bracket to facilitation adjustment during track maintenance. 9.5.6.3 Tubular stay arm Steel tubes adjustable steel rods shall be used for tubular stay arm of all bracket assemblies. 9.5.6.4 Register arm The register arm shall also be electric resistance weld or cold drawn steel tubes of proper dimensions duly formed. This will be suspended by a dropper from the catenary suspension clamp of bracket tube. A hook an eye arrangement shall be used at the bracket end to permit free movement in every direction. 9.5.6.5 Steady arm The steady arm shall normally be fitted in all assemblies or OHE in running and shall be of light alloy BFB sections arranged to work always in tension in accordance with ETI/OHE/2 (9/74). The contact wire shall be fixed by a simple swivel clip without threaded parts. Its length normally of one meter but at tern outs diamond crossing etc, it will be of longer size .Bent steady arm of aluminum alloy tube conforming to spec. ETI/OHE/21(9/74) shall be used for neutral section, over lap and central mast of 4 span overlap. 9.5.7 Dropper General Design 9.5.7.1 The dropper shall generally be designed as shown in standard drawing and made of copper wire about 5mm dia conforming to IS 282 and shall be held by a clip of aluminum bronze as shown in the standard drawings.

The distribution of dropper shall be in accordance with standard designs. 9.5.7.2 Loading The droppers shall be able to withstand a vertical load of 200 kg at the point of attachment to the contact wire and the clip shall not slide under a horizontal load of 120 kg. The permissible tolerance in overall length of a dropper will be + 5 mm. 9.5.8 Insulators All insulators except on return conductors and earth wires are of solid core type. 9.5.8.1 Interchange Ability For free inter changeability only the following types of insulators shall be used. While the shapes of the insulators may vary slightly from those in the drawings, the standard dimension of the galvanized malleable cast iron caps shall be adopted. 9.5.8.2 Stay arm Insulator These insulators shall be used in conjunction with the tubular stay arm of all bracket assemblies. 9.5.8.3 Bracket Insulators These shall be used at the base of each bracket assemblies in conjunction with bracket tubes. 9.5.8.4 Ton insulators These shall be used at all places for cut in and terminal insulation including those in return conductors but excluding those in earth wire.

9.5.8.5 Post Insulators These shall be used at all places for supporting isolator mechanism bus bars, Jumper's etc of 25KV. 11KV post insulators are used at all places for supporting busbars, jumpers etc in conjunction with return conductors/ return feeders. 9.5.9 Ending Fittings And Splices 9.5.9.1 Terminal or end fittings and splices on copper conductors shall be of the cone type clamping on both the inner and outer strands of conductors except for contact wire- ending clamps, which may be of wedge type. The arrangement shall be easy to install and also be such as would apply the clamping pressure gradually without shock (see specification No. RE/OHE /10/ (3/66) 9.5.9.2 Loading All the parts shall be capable of withstanding, without damage, a load greater than the ultimate strength of the wires to which they are fitted. In the case of threads on damage shall occur when they are subjected to a load- equal to the two third of the ultimate strength of the wires. 9.5.9.3 Restricted use of the splices The use of splices shall generally be avoided and their use shall be restricted to the minimum necessary. Over main tracks, there shall be no splice in the contact wire on first erection. Elsewhere not more than one splice be used in any tension length(i.e. anchor to anchor) for which prior approval shall be taken from the Purchaser. Additional splices may, however, be provided to enable retention of conductors which are found defective during and/or after erection. Splices may also be permitted for repair of damage due to thefts or railway accident. 9.5.9.4 Strength of Assembled Fittings. The strength of fittings assembled with appropriate conductors or wires shall be not less than that of the conductor or wire itself.

9.6.5	Measurements All measurements for location of structures and foundations shall be made with the aid of steel tapes. On curves, these measurements shall be taken on the outer rail of the middle track in the case of odd number of numbers of tracks and on the inner rail of the first outer track from the center of the formation in the case of an even number of tracks, structures on curves shall be located in the radial offset of the location as determined.	
9.6.6	Bolts, Nuts Etc All bolts, nuts and locknuts screws, locking plates, split cotter pins etc., shall be properly tightened and secured and the contractor shall carry out systematic inspection of this aspect of work after all adjustments to overhead equipment are completed sections of equipment to the purchaser for inspection and testing.	
9.6.7	Damage To Galvanising Painting In loading, transport and erection, all galvanized painted materials shall be handled with care to avoid damage to galvanizing painting is damage in spite of all care taken. The damage part of component shall be put up for inspection, to obtain permission from the purchaser to carry out repairs.	
9.6.8	Foundations The contractor shall carry out soil pressure tests to determine permissible bearing pressure of various representative types of soils during the pegging out of site inspection. .	
9.6.8.1	Location The location of each foundation or anchor block shall be set out correctly in accordance with approved structure cross – section drawings or foundations layout drawings, as the case may be.

9.6.8.2 Method Of Installation The contractor may adopt either manual or mechanized method for installation of foundations. He may erect traction masts of structures in the same operation as casting of foundations or erect them subsequently in cored holes left in foundation blocks and grout them separately. In any case the method of casting of foundation blocks and erection of masts or structures shall be subject to the approval of the purchaser. 9.6.8.3 Excavation Normally, excavation of soil for foundations or anchor blocks along side the tracks may be done upto length of 1 to 1.2 m and a depth of 0.8 to 1 m without shoring, provided the excavated hole is concreted immediately and not left overnight. Shoring shall otherwise be done unless the holes is re-filled with soil and tamped. In case the length of excavation is 1 to 1.2 m and depth of excavation for foundation and anchor blocks, along side the tracks is more than 0.8 to 1 m, the excavation may be undertaken only after certification by the Engineer incharge to be safe and concrete is cast on the same day. Shoring shall be done to the satisfaction of the Engineer in charge; 9.6.8.4 Concreting All concreting or grouting shall be done in accordance with Para 9.3.4 with ballast graded for the purpose specified in Para 9.3.5. The concrete shall be poured and tamped properly in accordance with the method approved by the purchaser. The contractor shall arrange to provide concrete testing samples for tests once every week or as and when required by the purchaser, to determine crushing strength after 7 days or 28 days curing as required. Testing shall be arranged by the purchaser at his own cost. 9.6.8.5 Muffs All anchor blocks and foundations of structures carrying overhead equipment shall be provided with concrete muffs. The top of these muffs shall be above the level of ground of the track formation and of adequate height of not less than 15 cm to afford reasonable protection during rainy weather. Muffs may be installed at the same time the masts are grouted or

after the mast/structure is loaded with equipment. The foundations of structure of switching stations need not, however be provided with muffs. Such foundations shall be given a slope of 1 in 50 towards the edge to ensure that water not collect at the base of the structure if the frame work of the equipment. Suitable grooves or niches shall be provided in the foundation blocks, wherever required, at the time of casting, to enable embedment of earth strips etc. to avoid the necessity of chipping of concrete. Conduits for cables should be embedded in the foundations blocks, wherever required, to avoid subsequent chipping off and breaking of the foundation blocks. 9.6.9 Masts & Structures 9.6.9.1 Erection In case traction masts or structures are erected in cored foundations, till such time they are grouted, they shall be properly wedged to prevent them leaning towards the track and endanger safety of moving vehicles. In case traction masts or structures are erected simultaneously with the casting of the foundations, the contractor shall provide temporary supports approved by the purchaser. The masts shall be embedded in the foundation blocks for the correct length specified in approved drawings. 9.6.9.2 Reverse Reflection All traction masts and structures shall be erected with the correct reverse deflection so that they become reasonably vertical after they are loaded. The method of erection of mast with the correct reverse deflection shall be submitted to the purchaser for approval. 9.6.9.3 Infringement To Standard Dimensions In erection care shall be taken to ensure that no part of the traction masts, structures or any fittings located on such mast or structure infringement the schedule of dimensions 1676 gauge 1939 printed in metric units in 1973.

9.6.9.4 Alignment Of Masts At Gantries The main masts of gantries shall be carefully aligned to enable easy and good assembly of fabricated steel work. 9.6.10 Overhead Equipment A suggested method for erection of traction overhead equipment which would ensure good speed and quality erection is included in section 2 of this part. The contractor may, however, follow other methods which they consider would speed up and ensure good quality work, subject to the approval. Any wiring method should take into consideration appreciable stretch of the catenary & contact wires in the initial days, after they are strung and put under tension. 9.6.10.1 Bracket Tubes In the erection of bracket assemblies, it shall be ensured that the free length of the bracket tube beyond the catenary suspension bracket is at least 150 mm to facilitate adjustment during maintenance. 9.6.10.2 Stay Arms The choice of stay arms shall be such that their adjuster are capable of adjustments of minimum of 90 mm in either direction except as other wise relaxed. 9.6.11 Insulators Before insulators are used in bracket assemblies or dispatched to work site for erection from the contractor's store depot, they shall be tested as specified for routine mechanical test. No chipped or cracked insulators shall be installed. All insulators shall be cleaned before offering completed sections of equipment for inspection and testing. 9.6.11.1 Stringing Catenary Care shall be taken to avoid kinking or bird-caging of the catenary wire in stringing and subsequent observations. While stringing, the wire shall be

suspended from pulley blocks hung from the suspension clamp eye of bracket assemblies. The pulleys shall be fitted with ball bearing and shall be of the swiveling type of permit free movement in all directions to prevent damage to the strands of the wire. The design shall also be such that it will prevent slipping off of the wire during stringing operations. The designs of the pulley shall be submitted to the purchaser for approval. After initial stringing of the catenary, it shall be maintained at the no load tension (for a minimum duration of 48 hours before the pulley blocks are removed and the catenary is clamped to suspension clamps of bracket assemblies. 9.6.11.2 Stringing Contract Wire Care shall be taken to avoid formation of kinks, twists and damage to contact wire in stringing and subsequent operations. While stringing the contact wire, it shall be suspended from pulleys hung from droppers fitted to the centenary in their final position. In curves, the contact wire shall be bun in pulleys located at traction masts or supports, corresponding to the approximate final position of the wire. 9.6.11.3 Location Of Droppers Droppers shall be correctly positioned in each span to ensure correct level of contract wire as per dropper chart applicable to the span. 9.6.11.4 Clipping Of Droppers The droppers shall be clipped on to the contract wire only after a minimum duration of 48 hours from the time the automatic tensioning device is brought into action. 9.6.11.5 Auto-Tension Device The auto-tensioning device shall be erected with the correct height of the counter-weight above rail level with corresponding distance between the pulleys of the device for a temperature of 35c before it is connected to the overhead equipment and put into action. The installation of the device shall be such as to permit free, easy and unobstructed movement of counter-weight.

9.6.11.6 Cut-In Insulators All insulators in out of run shall best positioning that they are away from the swept zone of the pantographs and will not foul with them. The live parts of these insulators shall also be so located that they are at least 2 m away from structures other than this supporting traction overhead equipment. 9.6.11.7 Section Insulators All sections insulators shall be so located that they are beyond the swept zone of the pantograph running on adjacent tracks and there is no unusual sag due to the same Where section insulators are installed, the contract plane of the runners of the insulators as well as those of overhead equipment connected to it shall be parallel to the track plane. 9.6.11.8 Anti-Wind Clamp Anti-wind clamp shall be provided as per the standard practice. 9.6.11.9 Connections All jumper connections including anti-theft jumpers shall be made properly with parallel clamps and finished neatly without any loose wire or cables. The length of flexible jumpers shall be adequate to avoid any disturbance to overhead equipment or restraint in the relative movement of conductors, but the jumpers should not be excessively long. The ends of jumpers shall be tinned, including the portion inside the first parallel clamp. 9.6.11.10 Separation Between OHE In erection, the physical separation required between overhead equipment's and brackets assemblies on the same structure at insulated overlaps shall be ensured.

9.6.11.11 Gradient Of Contact Wire The gradient of the contract wire on either side of over line structures with restricted clearance maintained between the over line structure and live equipment. 9.6.11.12 Adjustment At Turnouts Etc Careful adjustment of equipment shall be made on equipment's at turn-outs cross overs, diamond crossings, overlaps and special locations, for position of bracket assemblies, stay arms and height of contact wire to ensure that pantographs of electrical rolling stock on the run will not foul with any parts of the bracket assemblies and change over of the contract wire is effected smoothly. For wiring in large yards, the contractor shall, prior to the execution of works, submit to the purchaser's Engineer for his approval the sequence of stringing of centenary and contract wires to arrange for proper crossing of wires. Endeavor will be made to arrange for traffic blocks to suit approved sequence of wiring. Insulator switches shall normally be so mounted that when the switches are operated, the operator faces the directions of the motion of trains. The operating handles and contact blades shall be correctly aligned for easy operation. 9.6.11.13 Isolators Isolators switches shall normally be so mounted that when the switches are operated, the operator faces the direction of the motion of trains. The operating handle and contract blades shall be correctly aligned for easy operation. 9.6.12 Busbars And Connection Bus bars and connections shall be neatly shaped and bend to give a good appearance.

9.6.13 Earthling The copper earth strips or flats used for earthling shall be bent and shaped neatly before connection to the structure or from work of equipment. The connections of MS flats to steel work shall be made at a height not exceeding 15 cm from the datum level of a switching station. Before making earth connections the shall be cleaned thoroughly and tinned for copper strips. All junctions shall be properly secured to avoid loose contact. Portions of copper earth strips which remain visible above the ground level should be painted with suitable paint to make them inconspicuous. 9.6.14 Tolerance The permissible tolerance in dimension for erection from those included in the appropriate drawings or schedules for different items are given below:- 9.6.14.1 Measurements The span length shall not vary more than 50 mm as measured along the appropriate rail. The cumulative error of measurement of all spans in a kilometer shall be not more than 1000 mm. 9.6.14.2 Setting Of Structures The setting of structure shall be not less than that included in the appropriate cross-section drawings, especially those with the minimum setting of 2.50 m. A tolerance of 20 mm will be permitted subject to minimum specified value if the structure is not located in between tracks. 9.6.14.3 Height Of Contact Wire 20 mm will be permitted on the height of wire at points of supports as shown in the relevant structures where no tolerance will be permitted.

9.6.14.4 Stagger Generally 20 mm will be permitted for stagger 9.6.14.5 Dropper Length 5 mm will be permitted for dropper lengths. 9.6.14.6 Dropper Location 100 mm will be permitted for dropper locations. 9.6.15 Wiring Procedure This section deals with the wiring procedure which may be adopted for erection of normal overhead equipment. The following procedure for erection of overhead equipment has been formulated with a view to ensure that: (a) Bracket assemblies (brackets) and regulating equipment are correctly installed in their final position. (b) The conductors are correctly tensioned and (c) The need for final adjustments of overhead equipment immediately before energisation and commissioning is virtually eliminated. 9.6.16 General: In the case of regulated overhead equipment when the regulating equipment's are in action, the tension in the conductors should remain constant, irrespective of variations in the ambient temperature. As the regulating equipment's are brought into action a few days after the stringing of conductors the equipment is unregulated in the intervening period. Any of the following two procedures may followed for tensioning and clamping of conductors of regulated overhead equipment during stringing operations i.e. before regulating equipments are brought into action.

9.6.16.1 The catenary is tensioned to 1000 Kgf, the stipulated tension at the mean temperature of 35c, whatever may be the ambient temperature during the stringing operations. In this case, at the time of clamping the catenary to the bracket, the bracket should be placed at angular positions corresponding to temperature at the time of clamping and proportionate to their distance from the anti-creep. 9.6.16.2 The aluminium alloy catenary is tensioned at the calculated tension to correspond to 800 kgf the stipulated tension at the mean temperature of 35c whatever may be the ambient temperature during the stringing operations. 9.6.16.3 The catenary is strained to a stringing tension corresponding to the ambient temperature for the equivalent span of the tension length. In this case, the brackets are placed in the mean position, i.e. at right angles to the track, when the catenary is clamped or the regulating equipment commissioned. The advantage of the second method is there would be necessity to adjust each bracket separately at the time of clamping the catenary or commissioning the regulating equipment. The erection work is thus considerable simplified and the possibility of errors greatly reduced. This is also applicable to erection of unregulated overhead equipment. 9.6.17 Erection Of Brackets After the brackets are fabricated correctly in the contractor's depot, in accordance with the approved structure erection drawings, and provided with indelible labels or/painted marking indicating the intended locations for each bracket, they are to the site of work and erected on traction masts or supports. The brackets are swiveled to a position at right to the track and secured in that position by means of steel wires tied to similar brackets located on the opposite side of the track or other suitable means. 9.6.18 Anti-Creep The anti-creep of the tension length is then installed in its final position. 9.6.19 Locking The Regulating Equipment In the case of regulated overhead equipment, the regulating equipment's are erected on the terminal masts or structures and their movement locked

by suitable means in the middle position, with the distance between the pulleys of the regulating equipment corresponding to 35° C 9.6.20 Temporary Arrangement A pulley approximately 30 cm. dia is attached to the overhead equipment and of the regulating equipment by means of temporary accommodation fittings at both ends of the tension length to be wired. Over this pulley a flexible stranded wire is passed over. At each end of the wire to ending clamps, one for catenary and one for contact wire, are attached. This wire is also clipped in the middle by 'U' clamps. The length of this temporary arrangement from the regulating equipment to the extremities of the standard wire passing over the temporary pulley shall be a little longer than the distance between the regulating equipment and ends of the catenary and contact wires in their final position, to permit easy clamping of terminal fittings during the final termination of the wires. 9.6.21 Stringing Catenary The catenary is initially terminated in the ending clamp of the temporary arrangement at one end of the tension length. The catenary is then paid out from the reel of the wiring train and run of pulley blocks hung from the suspension clamps eyes of brackets until the terminating point at the other end of the tension length is reached. 9.6.22 Tensioning Of Catenary The catenary is strained upto the 'stringing tension' corresponding to the equivalent span of the tension length and the ambient temperature at the time of stringing with the aid of a dynamometer, and terminated at the tension For this purpose, the ambient temperature shall be deemed to be the temperature registered by a thermometer tied to a length of catenary wire 3 to 4 metres long, laid flat on the top platform, on one of the wagons of the wiring train. Subsequently, the tension in the wire is checked by measurement of sag with the help of leveling lathe attached to suspension points and to the catenary at mid span by a ladder working party. The sag shall be measured in two spans, each preferably greater than 54 metres and situated on either side of anti-creep approximately midway between the anti-creep and the termination points. The value of sag measured by this		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 581 of 639
method should be within $\pm 5\%$ of the theoretical value for the corresponding stringing tension and the temperature at the time of this measurement. In the case of discrepancy is more, the tension should be adjusted again and sag rechecked as above. After the sag is checked the catenary is terminated at the ending fitting of the temporary arrangement at the terminating point. In order to restrict the duration of traffic blocks to the minimum, in the first block, catenary is strained to the stringing tension with the aid of dynamometers and the catenary is terminated. In a subsequent block, the sag is checked and the tension readjusted with ladders, if necessary. 9.6.23 Clamping The Catenary The catenary is clamped on the brackets placed at right angles to the track. 9.6.24 Droppering Droppers are fitted to the catenary at the correct location. At the contact wire ends these droppers may be provided with small pulley or hooks to act as temporary supports when the contact wire is strung. Hooks made of scrap contact wire suspended from the catenary wire, may also be used as temporary supports. 9.6.25 Stringing Contact Wire The contact wire is initially terminated in the contact wire ending clamp of temporary arrangement at one end of the tension length. The wire is then paid out from the reel wagon of the wiring train and supported on the pulleys hung from droppers or on hooks until the terminating point at the other end of the tension length is reached. In curves, the contact wire shall be supported on pulleys located at traction masts or supports corresponding to the approximate final position of the wire. The axes of these pulleys should be more or less vertical.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 582 of 639
9.6.26 Tensioning Of Contact Wire The contact wire is strained to a tension of approximately 1.2 times the tension corresponding to the ambient temperature and terminated in the ending clamp of the temporary arrangement. 9.6.27 Regulating Equipment In Action The regulating equipment is put into action with the counter weight at the correct height above rail level and with distance between pulleys or the regulating equipment corresponding to a temperature of 35° C. The regulating equipment is then released and brought, into action. The 'U' clamp connection the flexible stranded wire passing round the temporary pulley is also removed. 9.6.28 Final Adjustment The entire installation is left in this condition as long as it is possible preferable for a period not less than 15 days. The temporary pulleys are removed and the conductors terminated in the permanent ending fittings, compensating plates, insulators and turnbuckles. The equalizer plate is kept vertical or at a slightly inclined position by 2 or 3 cm the contact wire being shorter than the catenary and the position of the regulating equipment is checked in relation to, the temperature at the time. The contact wire is clipped on to droppers (in the vertical position) and on the steady arms. Contact wire height at the bracket is adjusted as also the stagger and register arm clearance. 9.6.29 Concluding Remarks If the above method is followed with care, no further adjustment may be needed. 9.6.29.1 It should be ensured that sagging is done carefully and accurately. The adjustment of tension in the catenary after checking of sag, if required, would be easy if a temporary turnbuckle is inserted in the temporary terminations. The use of leveling lathes is recommended for the following reasons:		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 583 of 639
(a) The accuracy of adjustment is greater than that with a dynamometer (b) No traffic block is required for this operation (c) It obviates the necessity of initial tensioning of the catenary accurately this permitting a reduction in the period of traffic block required for the wiring train. 9.6.29.2 If feasible, without any hindrance to progress of works, the catenary may be maintained at stringing tension for a period of 48 hours before checking sag and clamping it to the brackets. This would ensure equalization of tension in the different spans. 9.6.29.3 If it is difficult to obtain a separate traffic block for stringing contact wire, the wire may be paid out at the same time, as the catenary, with the following precautions. (a) The contract wire is run and suspended from independent pulleys hooked on to the brackets, separately from the catenary pulleys to avoid twisting together of the two conductors. (b) The contact wire should not be suspended from the catenary until the later is clamped on to the brackets. (c) The tension in the contact wire before termination should be about 1500 Kgf. This will ensure that sag is not excessive. (d) The adjustment of tension and checking of sag of the catenary wire is carried out as if the contact wire had not been strung only after adjustment of tension and checking of sag is completed, the contact wire is transferred to the pulleys attached to the droppers or to hooks suspended from the catenary and the tension is adjusted as indicated elsewhere.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 584 of 639
9.6.29.4 When the contract wire is under tension creep takes place which results in an increase in the length of wire and, consequently, the droppers and the equalizer plates would become oblige. Though creep may continue for along time, about a year, the bulk of it would occur during the days following stringing. If sufficient period of time is allowed the contact wire may be clipped to the droppers and the equalizer plates, all in the vertical position and the necessity for any further adjustments before energisation and commissioning of the OHE may be reduced to a great extent. It this precaution is not taken, at the time of energisation of the OHE, the droppers may not all be vertical and staff would have to be detailed for shifting the dropper clips which is attendant with risk of damage to the contact wire. 9.6.29.5 Before the temporary arrangement is removed a reference mark should be made on each conductor. After final termination of the conductors, it should be ensured that two marks are in the same relative longitudinal position as they were before the removal of the temporary arrangement 9.7 <u>INSPECTION AND TESTING</u> 9.7.1 Scope This part deals with the inspection and testing of completely erected overhead equipment. 9.7.2 Overall Performance The overall performance of the overhead equipment should be such as would permit collection of current by electric rolling stock with full load at speeds, upto and including the maximum specified for the design of overhead equipment, smoothly, without mechanical shocks or prejudicial sparks and without undue heating the case of other equipment. 9.7.3 Responsibility The general tests of overall performance stipulated below are only supplementary to other tests on structures foundations, equipments, components and fittings. Any testing and acceptance by the purchaser of

9.7.4.7 Stagger And Height The stagger and height of contact wire over the entire section of completed overhead equipment and the clearances available shall be measured and the measurement shall be checked against approved drawings. These measurement shall be carried out at low speed with a vehicle or device to be arranged by the contract, the movement of which will follow the track levels as closely as possible. Tolerance that will be permitted on the dimensions indicated in the approved drawings are shown. The actual position of the two contact wires, relative to each other, overlaps and turnouts shall also be checked. Special attention shall be paid to a smooth movement of pantograph over section insulators, particularly those which are likely to be frequently traversed. 9.7.4.8 Mechanical Behaviour The mechanical behavior of the entire equipment shall be tested at various speeds under normal pantographs pressure without energizing the overhead equipment. 9.7.4.9 Energising If the overhead equipment, after being subjected to the above tests in an un-energised condition, is found to be satisfactory, it will be energized with the normal 25 K.V A.C supply. 9.7.4.10 Power Collection Test shall then be conducted to check if the power collection performance of the overhead equipment is satisfactory after ensuring that the contact wire is adequately clean. For this purpose and observation shall be attached next to the electric locomotive. The behavior of the overhead equipment will be watched at various speeds. Power collection shall be considered unsatisfactory if a long blue flash is observed, indicating that the contact between the contact wire and the pantograph is not continuous.

10.0 <u>SIGNALLING & TELECOMMUNICATION FOR RAILWAY SIDING</u> 10.1 <u>SCOPE OF WORK</u> 10.1.1 Scope of work is related to Supply installation testing & commissioning of Signalling & Telecommunication (S&T) System along with its allied works in connection with MSPGCL Railway siding for 1x660 MW project. Bidder to specifically note that the following are only the indicative specification related to the work intended and it shall be bidder's responsibility to consult the ruling codes and standard laid out by Indian Railway and other concerned authorities & carry out design, procurement, construction, testing and commissioning of the work intended in this section. Signal Interlocking plan of in plant Yard (1x660 MW project) shall be finalized with railway authorities and MSPGCL. Scope of work shall also include commissioning of related works i.e. Signals, Track circuits, Magneto Telephone etc. at in plant Yard. The signalling and telecommunication material to be supplied by contractor should be as per the latest RDSO(Research Design and Standard Organisation) specification/drawing. Specification, drawings may be purchased from RDSO Lucknow. The complete work should be carried out according to the Technical specifications and drawings approved by the concerned authorities. The bidder shall bring out comprehensive data support by relevant drawing in his bid for Owner's/Owner's consultant for review. 10.1.2 Signal Lighting All the Signals are provided with LED lamps lit on 110V AC. In case of LED lamp failure, Health Monitoring Unit (HMU) shall generate an audio visual alarm that will be provided on control panel.

10.1.3 Single Section Digital Axle Counter (SSDAC) System 10.1.3.1 The installation of all indoor & outdoor equipments including resetting arrangement (Reset Box) must be carried out as per detailed instructions given in installation procedure issued by RDSO. The installation manual of original equipment manufacturer should be followed strictly. 10.1.3.2 Station master should be able to reset the axle counter with permission from verification box. Wiring of verification box is also included in the scope of work. 10.1.3.3 Installation, testing and commissioning of SSDAC system along with track side equipments, wheel detection points, reset boxes etc. This includes supply and installation of housing for EJB as per IR specifications. 10.1.3.4 Supply of technical documentation, track section plan and drawing shall be done by contractor. Supply of all miscellaneous stores required for completion of work shall be supplied by contractor. 10.1.3.5 Axle counter system should detect presence of railway vehicle with standard wheel size within defined section of track. It should not detect push trolley, which is having smaller size wheel. System should work independent of poor track conditions and wet/ flooded track. 10.1.3.6 The necessary testing of each detection point and track section shall be done as per methodology prescribed by the manufacturer and also in the specification. 10.1.3.7 The necessary register with suitable Proforma shall be opened for recording of test results as well routine maintenance along with measured readings. 10.1.4 Relay Rack 10.1.4.1 Outer frame of Relay rack for fixing point group relays shall be made of MS angle iron of minimum size of 65x65x8mm.

10.1.4.2 Mounting arrangement for 'Q' style/point group relays should be provided by MS angle iron of size 45x45x6. Size of Relay rack should be such that it can accommodate 'Q' style relays in 9 rows with 14 relays in each row. 10.1.4.3 Relay racks should be painted by two coats of good quality enamel paint after installation in EI room/Hut. 10.1.4.4 Arrangement to insulate the relay racks from ground should be provided. 10.1.5 Wiring: 10.1.5.1 The equipments are to be wired in relay room, Station Master's Office, power supply arrangements, as per circuit diagram. The necessary guide lines given have and followed by railway should be strictly followed while preparing the different wiring diagrams. The two copies of each WD should be checked by concerned agencies. 10.1.5.2 Contact numbering for the relays should be made by the contractor as per the approved circuit diagram issued by the railway and type of relay proposed to be used on the installation. 10.1.5.3 Wiring inside one rack for shelf type and plug in type (Metal to Carbon) Contact relays, Relay rack wiring housing plug in type relays conforming to BRS-930 and BRS-931 and shelf type relays conforming to BS-1659 should be done with "PVC" insulated unsheathed flame retarding type single core flexible wire 1100V grade having 0.6/0.2mm annealed copper conductor and nominal cross sectional area of 0.5 Sq.mm of common colour code to the specification IS:694". For wiring these relays the above wires should be terminated in eyelets/lugs of Standard design. 10.1.5.4 Wiring of proven type relays (metal to metal contact) For wiring the above relays the use of single brand tinned copper wire of 0.6mm and 1.0mm/1100V grade PVC insulated flame proof should be used. The use of multi core cable of 100 cores, 60 core, 40 core and 20 core having the above conductor dia and grade is permitted. Size of conductor

should be chosen based on current to be carried through these conductors. The wire and cable used should generally conform to IS: 694. 10.1.5.5 The wiring between the terminal board of the panel and the unwired tag block on the relay rack is to be carried out using multi-core cables (40 core or 60 core) 0.6mm/1.0mm diameter annealed lined copper wire to IS-694. The wiring on the Q series relay rack is to be carried out by 16/0.2mm diameter single core multi strand flexible A.T. copper wire to IS: 694. 10.1.5.6 Soldering at the tag block terminals should made using good quality solder and flux. Care must be taken to prevent dropping of excessive solder from terminal thereby causing failure/unwanted connection or short by fusing of PVC insulation in row below it. It is advisable to raise the wires by mechanical means and temporarily interposing a wooden or plastic sheet between the adjacent rows while soldering, to collect the excessive solder that may be dropping out. 10.1.5.7 After testing, the loose wires on the cable ladder should be neatly bunched and laced with twine black. The contractor should adopt suitable colour code for wiring as required by the Railway's representative. Spare conductors to an extent of 10% are to be provided on the interconnecting wire runs for future developments. 10.1.5.8 Various supplies associated with signalling viz., 110V AC, 110V DC, 60V DC, 24V DC, 12/24V AC and 12/24V DC flashing are to be brought out to the relay/equipment room as per instructions. 10.1.5.9 The incoming cables to the relay room are to be neatly arranged and fixed to the cable supporting and guiding rack. The duct should be filled with sand and plastered neatly to avoid entry of mice or reptiles. 10.1.5.10 After the complete testing and before commissioning the installation, the contractor should arrange necessary sealing leads and wires for sealing the relays. 10.1.5.11 The nomenclature of each relay should be painted both in front and rear side of each relay with contact configuration. The relay index sheet duly painted of details of relay and their position in the relay rack should be manufactured out of Decolum/Novapan sheet and fixed in the relay room.

All the relays to be plugged should be checked visually and defect if any, noticed should be replaced, duly reporting the same to the Railways. As made relay rack wiring and contact chart of all relays should be prepared in linen/polyester sheets, duly signed and handed over for preparation of handing over documents to maintenance organisation. 10.1.5.12 Suitable arrangements should be made in the relay rack for fixing condenser and resistance unit, required for slow to release feature. Letter painting should be made against each unit to identify circuit for which it is used. 10.1.5.13 All circuits should be carefully protected by individual fuses in the relay room and locations grouped preferably to facilitate easy fault location. Fuses should be so arranged that they can be easily be placed without causing interference of fuses and the circuits in which they are used should be prepared and kept in the relay room. Fuses for all Signalling circuits should be of the non-deteriorating type as per RDSO specification. 10.1.6 Power Supply System 10.1.6.1 10 KVA DG set with sound proof enclosures, anti vibration mountings and AMF panel is to be installed at Reception yard. Specifications of DG set are given below: Alternator : The Alternator shall be self excited and self regulated of 10 KVA rating in single phase at 240 Volt, 50 Hz, 1500 RPM and 0.8 power factor (lag) and shall conform to IS:13364 (Part 1):1992(reaffirmed 2003). The alternators shall be of brush less type with VG-1 Grade of voltage regulation. The alternators shall be screen-protected drip proof with Min.IP-21 degree of protection as per IS:4691/85.The class of insulation of the Alternator would be 'H'. The rated voltage of Alternator will be 240V single phase. The alternator shall also have following features: - $\pm 1.0\%$ voltage regulation (max.) in static conditions. - Permissible overload of 10% above rated capacity for one hour in 11 hours of operation.

10.1.6.2 Diesel engine: Diesel Engine shall be liquid cooled, electric start, developing 18 B.H.P at 1500 RPM with Class A-2 Governing or better for alternator to deliver 10 continuous KVA output at 0.8 lagging pf at NTP conditions(all rating shall be tested at 0.8 PF). The Diesel Engine should be capable of providing 10% overload for one hour for every 11 hours continuous running at full load. Naturally aspirated engines shall conform to IS:10000-1/81 series and engines upto and including 19 KW rating shall be ISI marked and IS:10000-2/81 for engines above 19 KW. Pressure charged engine shall conform to IS:13018/1990 (reaffirmed 2000). The Diesel Engine shall be complete with the following accessories: (a) Fuel tank with capacity for minimum 8 hours continuous running at full load. (b) Engine instrument Panel consisting of starting switch with Key, Lube Oil temperature and pressure gauges, (water temperature gauge in case of water cooled engines), RPM indicator and hour meter. (c) Safety controls to shut down the engine in the event of low lube oil pressure or high cylinder head temperature in case of air-cooled engines or high water temperature in case of water-cooled engines. (d) Radiators for liquid-cooled engines. (e) Exhaust silencer of Residential type. (f) 12V starting system complete with starter motor, charging alternator and Cutout. (g) Lead Acid Battery/ies of suitable ratings with connecting cables. battery/ies shall be supplied in uncharged conditions and shall conform to relevant IS Specn.

earth shall be well soldered. 10.1.12 Where two or more block instruments are located in the same room, they shall be fitted with bell units / bell buzzers of distinctive tones. 10.1.13 Painting of indoor gears: All signalling equipments should be painted in accordance with signal engineering manual 10.1.13.1 Painting equipment Rack and wiring all equipment numbering details, painting of hard wood planks provided on the equipment rack and power board racks, details of equipment fixed on power board. 10.1.13.2 Painting numbering on secondary cells, writing circuit details in the battery room as instructed by Section Engineer at site. 10.1.13.3 Painting all termination particulars in the panel, block instruments, EKT's Crank Handle box, axle counter resetting box, resetting plunger box in the SM's Office/Panel room. 10.1.14 Testing and commissioning: The different stages and procedures for testing of indoor and outdoor equipments are given below as guidance: - Testing and commissioning consist of testing of selection circuits, for proper functioning of track circuits, signals and points as per SEM. Energizing and testing of power cables, stabilizers, secondary cells for all circuits, energizing and testing of colours light signals and final commissioning of the entire signalling arrangements for traffic use. All the alterations for improving safety should be carried out before commissioning. The equipments should be first tested by the contractor and then jointly with Site Engineer. The contractor should provide simulation test panel for testing at his own cost. The different stage and procedures for testing of indoor and outdoor equipments are given below as guidance. However detail testing should be done in consultation with Site Engineer.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 598 of 639
<u>STAGE – I</u> TESTING OF THE RELAY INTERLOCKING (INDOOR) <u>STAGE – II</u> TESTING OF THE OUTDOOR GEARS, Viz., POINTS, SIGNALS, TRACK CIRCUITS, LC GATES ETC. 10.1.15 Testing of interlocking: Testing of relay interlocking consist of: 10.1.15.1 Energisation of relays by connecting the simulation panel. 10.1.15.2 Clearing of signals on the simulation panel and carrying out the following tests as per table of control :- (a) Route test (b) Dead/ Approach locking tests (c) Route/Back locking tests (d) Testing of conflicting signals (e) All other circuits viz., SM's key, HLR, LXPR, KLCPR are proved correctly in the respective signalling circuits 10.1.16 Testing Of Outdoor Gears Testing of outdoor gears consists of testing all the outdoor signalling gears for correspondence and proper functioning: - (a) Signals (b) Motor operated points (c) Track circuits

(d) LC gates (Interlocked) (e) Sidings (f) Slots 10.1.17 Commissioning Of Panel Commissioning of panel consists of: - 10.1.17.1 Testing all points & signals from panel 10.1.17.2 Checking the correspondence between the points and their panel indications. 10.1.17.3 Checking the correspondence between the track circuits and its panel indications. 10.1.17.4 Testing of sidings, its electrical transmission of EKT, panel indications. 10.1.17.5 Testing of LC gates, its electrical transmission of EKT, panel indications. 10.1.18 Testing of relay interlocking energisation of relays by connecting simulation panel: 10.1.18.1 For major yards, it is preferable to energise relays, circuitwise and sheetwise, since it involves number of routes and parallel movements. For way station, it is preferable to energise the circuit, route wise. Before taking up the above energisation, the following work should be completed. (a) Wire to wire bell-test of all sheets before soldering and after soldering. (b) Plugging of all relays as per contact configuration. Before plugging of relays, all fingers are to be checked. Any finger found loose or not properly hooked is to be set right. (c) Power supply arrangement with batteries.

(d) Connecting the simulation panel. (i) It should be possible to control all TPRs, NWKR/RWKR, CHLRs, KLCRs, LXCPRs etc., from the simulation panel by energising all the relays. (ii) It is desirable to have the simulation panel adjacent to control panel so that the panel indication can be observed simultaneously while testing. 10.1.19 Simulation Panel Simulation panel consists of two Boards:- 10.1.19.1 Board no. 1:- It depicts the yard (painted) with points, track circuits, LC gates and slots. Switches are fixed on the boards to simulate the conditions of the points, track circuits, interlocked LC gates, slots etc. Track circuit switches are fixed on the track. Point control switches are fixed nearer to the points, for small yards. For major yards the switches are grouped as point switches and track circuit switches. Functions requiring ON and OFF switch (with make and break facility i.e. two wires only) with facility to pick up a relay in one position and drop the same in other position. Example: Switch OFF - Track Down - TPR dropped. Switch ON - Track pick up - TPR picked up. For controlling the following function the above type switches should be used: - (a) Track circuits (b) Siding point (c) Crank handle (d) Slot		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 601 of 639

(e) LC gate

Points require ON and OFF switches with facility to pick up conflicting relays (i.e. NWKR and RWKR) in two positions. (These switches require three wires).

10.1.19.2 Board no. 2:-

To simulate the signals the following bulbs are used as dummy loads for the ECRs to pick up and also to observe the aspect of the signals during testing.

(a) ON aspect	110 V 40 W
(b) OFF aspect	110 V 25 W
(c) Route aspect	110 V 75 W

10.1.19.3 Wiring simulation panel to the relay room side wiring at MDF.

Disconnect all the links on cable termination rack. Wires from the switches are connected to the relay room side termination. Similarly the wires from simulation panel board No.2 consisting of lamps are connected to the relay room sides termination.

Multi core 0.6mm dia. cable is used for wiring the simulation boards. To reduce the voltage drop, more conductors are used for supply taken to the test panel and also to the negative since common return is used.

10.1.20 Testing Of Signals

10.1.20.1 Signals should be initially tested from the LOC box to attend to minor troubles of bulb holders, wiring etc.,

10.1.20.2 All the aspects should be checked by giving 110 V AC feed from Loc. Box and then the test should be repeated by giving feed from Relay room CT rack. This test should be done for each aspect, route and pilot lamp of shunt signals.

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 602 of 639
10.1.20.3 Care should be taken to ensure that no train is approaching during this test to avoid misleading information to drivers. 10.1.20.4 Ensure that signal number plate is provided and unit back door is fastened and locked properly. Door locking is very important to prevent sun rays falling on to lenses to give phantom indications. 10.1.20.5 Focus the signal aspects, record the aspect voltages and ensure that it is within the permissible limit (90% of rated voltage of the bulb). 10.1.21 Testing Of Points 10.1.21.1 Points Should be tested first locally from the location box when point contactor unit kept in location. Before commencing this test, ensure 110 V DC, 24 V DC are available in location box. If it is cross over point, it is preferable test one by one and then test both at a time. 10.1.21.2 Siemens Points Contactor Unit Connect N 24 V to W4, connect B 24 V to W1, then remove so that N/R picks up and holds, then touch B24 V to W3 to operate points from normal to reverse. All the relays in point contactor unit operate as required and relays in point operated from N to R. Check up whether NWKR supply to relay room is available. For reverse to normal operation, keep N 24 V in W4 touch B 24V on W1 and then on W2. Point operates from reverse to normal. Check up the RWKR supply to relay room is available. The following tests should be carried out on Pt. Machines:- (a) Obstruction test (b) Detection contact break test. (c) Out of correspondence test (in case of cross over point). (d) Track locking test (to be done when operated from panel). This test is to be done for both N to R and R to N operations.

(e) Whether point can be hand cranked with interlocked crank handle. (f) Check the correspondence between point position at site, both the ends in case of crossover and NWKR / RWKR in relay room (to be done when tested from panel). 10.1.22 Testing Of Slot Circuits Wherever end panels are available, inter cabin slot circuits should be tested. Slot circuits can be tested similar to that of signal HR circuits. <table border="0"> <thead> <tr> <th></th><th>SLOT CIRCUIT RELAY</th><th>SIMILAR RELAY IN HR CIRCUIT</th></tr> </thead> <tbody> <tr> <td>(a)</td><td>SLRR</td><td>RR</td></tr> <tr> <td>(b)</td><td>SLUCR</td><td>UCR</td></tr> <tr> <td>(c)</td><td>OVSR</td><td>ASR</td></tr> <tr> <td>(d)</td><td>OVYR</td><td>HR</td></tr> </tbody> </table> Negative tests, approach-locking tests, back lock/route holding tests, cancellation of slots should be tested similar to that of any signal in the yard as given in table of control. 10.1.23 Commissioning Of Panel 10.1.23.1 Check up all signal aspects by directly feeding from cable termination rack (110 V AC). Check up operation of points from C.T. rack and check whether NWKR/RWKR incoming feed is available (by connecting 24V DC to W1, W2, W3 & W4 as explained earlier). 10.1.23.2 Check up the incoming feed of TPRs in the C.T. rack. The above checking will confirm the pairing of cable conductors. Remove the wiring connection of simulation board on cable termination rack and make through the links of all TPRs, WKR and signal circuits. First test the points from panel individually and conduct all tests discussed earlier including track locking test, correspondence between point position and NWKR/RWKR in relay room. 10.1.23.3 Check whether all TPRs have picked up and check up the panel indication by individually by dropping each track circuit correspond correctly. 10.1.23.4 Check whether all other required relays viz., CHLR, LXPR, KLCR have picked up. 10.1.23.5 Test all the signals from panel. 10.1.23.6 Check the correspondence between relay from and signal aspects, which is most important. For checking the aspects of home signals, distant signals, staff (not below the rank of Site Engineer) should be deputed to site with walkie-talkie or Magneto telephone and check the correspondence. 10.1.23.7 Remove the signal lamp at site of every aspect and check whether indication disappears on the panel and ECR drops in the relay room. 10.1.23.8 Open all the registers and make entries of counter numbers before handing over to operating staff. 10.1.23.9 Testing and Commissioning of Interlocked Level crossing lifting Barrier THE FOLLOWING REGISTERS SHOULD BE HANDED OVER TO OPERATING STAFF. (a) Relay room key register, (b) Route cancellation register, (c) Crank handle register, (d) Axle counter reset register, Sealing of equipments where required should be done. Entries should be made in the signal history book regarding new S&T assets commissioned.

Testing & Commissioning of Panel at Level Crossing Gate. (i) The Level crossing gate should be operating with 24 V DC from Gate Panel provided at the gate lodge. The movement of barriers must be smooth in opening and closing conditions. There shall not be any jerking movement in the barriers while the gate is being closed or opened (ii) The LC gate shall be at 90 degrees while in fully opened condition. (iii) The height of the gate in closed condition shall not be more than 1 meter from the road level. (iv) When the gate is closed, the complete closing of the LC gate shall be ensured through the electrical connection provided through the Circuit breakers and reed switches provided with the level crossing gate assembly. (v) Once the Level crossing gate is closed and signals are lowered, it shall not be possible for the gateman to open the gate until a. the entire train has passed and the signals are gone to On Position. - Or b. 120 seconds after the signals are put back to ON position by the gateman (vi) It shall not be possible to lower any of the gate Home signal until the complete closing and locking of the LC gate has been ensured. (vii) The Gate Home signals shall be replaced to Danger (ON) automatically after passing of the home signals by train in either direction. (viii) It shall not be possible to lower both the Home Signals at a time.

<u>SPECIFICATINS (POWER SUPPLY FOR 25W VHF SET)</u>		
<u>SR.NO.</u>	<u>ITEMS</u>	
1.0	<u>GENERAL</u>	
1.1.	SCOPE	: This specification defines the performance characteristics of a 13.5V, 15 AMPs Equipment supply cum battery charger operating on single phase AC supply.
2.0	<u>INPUT REQUIREMENTS</u>	:
2.1.	Phase	: Single phase, 2 wire and ground
2.2.	Input Frequency	: 50Hz $\pm$ 3Hz
2.3.	Input Voltage	: 170 to 270 VAC rms.
2.4.	Efficiency	: >75% at 230 VAC input, with Output Full load.
3.0	<u>OUTPUT CHARACTERISTICS</u>	
3.1.	Outputs	: Equipment supply $\rightarrow$ 13.5V at 15,0 Amps. Max. (When battery drawing No. Current) Battery supply $\rightarrow$ 13.5V at 7.0 Amps max. Battery is to be directly floated across the load, however it has separate terminals. Battery is connected to the load through a fuse and reverse polarity protection circuit.
3.2.	Output Voltage Regulation	: Load output (with battery disconnected) will be regulated with in $\pm$ 2% with battery connected will follow the battery voltage.

<u>SR.NO.</u>	<u>ITEMS</u>		
3.3.	Ripple & Noise	:	Ripple on output load terminal (with battery disconnected) will be less than 135mV. Noise will be less than 270mV Pk-Pk.
3.4.	Battery Charging	:	Battery Charging will take place with constant current, Maximum charging current of the battery is limited to 7.0A +20%, Maximum charging voltage is set at 13.5V $\pm 2\%$.
4.0	<u>PROTECTIONS</u>		
4.1.	Output Over Voltage Protection	:	PSU shall trip on over voltage condition (between 15V to 16V) and resume to normal operation on removal of fault condition and AC power recycling with 20Sec. Interval between switch OFF and ON.
4.2.	Output Over Load and Short Circuit Protection	:	Output folds back on over power and resumes normal operation on removal of over power condition. On Short circuit, power supply goes into hick up mode or putput filds back. It resumes normal operation on removal of the Short.
4.3.	Battery Reverse Polarity Protection	:	On reverse polarity, a fuse of 15A rating mounted on the rear panel will below isolating battery from the equipment.
5.0	<u>INDICATIONS</u>		
5.1.	Mains On Indicator	:	Will be ON when AC is available.
5.2.	Battery On Indicator	:	Will be ON when battery is supplying

10.1.27 Cable Laying

10.1.27.1 Cable plan:

Cable plan with distribution chart for each cable should be prepared for each station by the contractor leaving adequate spare conductors in each cable i.e. **20% of working** conductors on each cable should be left spare upto outer most points and 10% beyond outer most points. Provision should also be made for additional cable conductors required for repeater relays as per 25KV AC electrified section – The similar cable layout plans should be prepared for telecommunication cables. The necessary approval of layout plan and cable core distribution chart etc. should be obtained from the site engineer before start of cable laying work. Copy of this plan should also be sent to client. A distance of approximately 10 cm. must be maintained between Telecommunication cable and Signalling cables. The Signalling cables must be separated from power cables by a row of bricks between them.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 615 of 639

10.1.27.2 Cable trench:

Excavation of cable trench should be made in all kinds of soils including clearing roots of trees, rocks etc., to a depth of 1.0 m and to a width of not less than 0.30 m, proper protection as required by Site Engineer should be provided while crossing power cables, pipe lines, gas lines etc. The bottom of the trench should be leveled and got rid of any sharp materials. Trenches should be straight as far as possible and steep angles should be avoided. Alignment of the main cable route as well as track/road crossings will be indicated in the cable layout plan.

- (a) Signalling/Power cables should be laid as close to the track as possible in the station limit but not less than 3 m from the nearest track centre. The cable track separation distance both within station limits and in the block section generally not to exceed 6 metres. However outside the station limits, the cables should generally be laid at not less than 5.5 metres from the centre or the nearest track.
- (b) It is desirable that the excavation of trenches is not done in long lengths and does not remain uncovered overnight. It is preferable that trenches are dug, cable laid and refilling done on the same day.
- (c) Wherever rock formation is encountered and trenching cannot be done to a depth of one metre, the trench should be dug as far as possible and protective measures taken to avoid damages of cable as decided by site engineer. The drawing in this regard shall be given by OWNER/CONSULTANT. Payment of trenching should be made proportionate to the depth of trench and no payment should be made for any extra excavation carried out in the slope and width of the trench. The contractor, who supervises the excavation, should take the shoring materials ready on hand, so that on banks where ashes or loose materials are encountered, shoring can be adopted. However, the minimum depth should not be less than 300 mm for laying DWC pipes in hard morrum. Whenever rocky soil is experienced, concreting has to be done for a depth of 150 mm after laying the cables to protect them.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 616 of 639
(d) During excavation of the trenches, the earth should not be thrown on the ballast. The earth should be thrown by the side of the trenches, away from the track. Complete excavated earth should be back filled in the trench after laying the cable and well rammed. (e) Wherever Power Cables are to be laid alongwith other cables bricks are to be laid lengthwise approximately, five bricks per metre for separating Power Cables from other Signalling Cables. 10.1.27.3 Before the cables are laid, a visual inspection of cable should be made and it should be tested for insulation and continuity of cores. The insulation resistance of new cable should not be below 500 MOhms per KM at 20 degrees centigrade. The cable meggering record should be maintained in a register and should be signed by contractor's representative & Owner's representative. If there is wide disparity between insulation of different conductors, the conditions of the cable should be thoroughly checked before permitting its use. Bedding and armoring should be inspected to see that there has been no damage during transit or in storage. In case where the wheels are not available or the area is not convenient for rolling the wheels along with route, the drum should be mounted on the axle at one end of trench and cable paved out. It should be carried out by adequate number of men ensuring that the insulation of the cable is not damaged and no kink/twist is formed. In no case should the drum be rolled on the road for laying of cables and the cable dragged on the ground for laying purposes. The cables should be laid gently into the trench and not thrown out under any circumstances. Before laying of cable in the trench, a visual inspection should be adequate for any damage or defect through out its length. Normally, cable laying should be commenced only after the relay room and cable termination box on the route at the respective stations are ready, and the cable should be duly terminated at the relay room/Location Boxes, immediately after the cables are laid. However, if for any reasons the cables are to be laid in advance, special care should be taken to ensure that the coiled cable near the relay room/Location Box is fully protected before and during final termination. The coiled cable should be fully covered with a layer of bricks in its entire length and provided with adequate number of cable markers. On no occasion the ends of the cable should be left

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 617 of 639
unprotected. The cable ends should be sealed with cable compound. All the cable terminals should be sign written with point describing the function. 10.1.27.4 Cable laying should commence only after the depth and width of trench, quality of bricks and sand are jointly inspected by the Site Engineer and Contractor's representative and approved. The necessary record of such approvals should be maintained in a register. 10.1.27.5 Cable should not be normally taken over the running tracks at the time of cable laying by the contractor as this is likely to cause accident to trains and damage to cable. If at any time the cable has to be taken across the track either in full drums or in spread out conditions, it should be done only in the presence of site engineer and also after safety precautions have been taken to post flagmen on all the sides as may be required to stop any train approaching the site of the fouled line. The stationmaster should be informed in writing and a acknowledgement obtained for this work. 10.1.27.6 At each end of the main cable/tail cable/power cables an extra coil length of 6 to 8 metres should be kept. 10.1.27.7 At the time of commissioning of cables, the insulation values of the cable should again be checked and the value obtained should not be below 500 M.Ohms per KM at 20 degree C. If there is wide disparity between insulation of different conductors, the conditions of the cable should be thoroughly checked before permitting its use. The readings should be recorded in a register called Cable Insulation Record Register. This should be recorded for all cables. 10.1.27.8 The Contractor thereafter should supply the completion cable layout/termination plan and cable route plan showing the distance of cables from the nearest track centre at every 30 M interval and location of location boxes. The distance of location box from nearest track centre should be indicated. 10.1.27.9 After the signaling cable/power cables are laid, one layer of country bricks of size 225mm x112mm x 75mm (9 bricks per Mtr.) approximately, should be placed closely in breadth wise.

10.1.27.10 Refilling of the cable trenches with the earth and placing and concreting of cable markers at an interval of 30 M throughout the cable route and also on either side of track crossings along the cable route should be done. The cable marker should be concreted to a depth of 0.3 M from the top of the cable marker to avoid theft. 10.1.27.11 As unscreened signalling cables are used, the necessary arrangements are made to comply with the instructions issued at Part 'B' of Special requirements of signalling in AC electrified area (1989) with latest amendments. 10.1.27.12 Contractor should be fully responsible for making necessary preventive arrangements to avoid theft/damage to cables, during construction period and also up to handing over of station after commissioning. 10.1.28 Track/Road Crossings Wherever signalling/power cable has to cross the track/road, it should be ensured that: 10.1.28.1 The cable crosses the track/road at right angles to track as far as feasible. 10.1.28.2 The cable normally does not cross in between or inside points and crossings. 10.1.28.3 The track/road crossings shall be carried out as per standard specification 10.1.28.4 The work includes removal of ballast, cutting of trench across track/road at the places indicated by the Site Engineer and covering the trenches after placing DWC pipe/pipes in position. 10.1.28.5 HDPE DWC pipe/pipes 120/200 mm outer dia. should be provided for track/road crossings. For each road crossing, required number of DWC pipes should be provided depending upon the width of the road and number of cables.

**SIZES OF Double Wall Corrugated Pipes (with IS: 14930 – II Mark)
Recommended for PVC sheathed Cables as per the recommendations of IS-1255***

RATING OF CABLE	SUITABLE DWC PIPE	
	O.D. (mm)	I.D. (mm)
2.5 Sq.mm to 16 Sq.mm cable	50	38
2.5 Sq.mm to 35 Sq.mm cable	77	63
50 Sq.mm cable	90	76
95 Sq.mm to 185 Sq.mm cable	120	102
240 Sq.mm cable	145	126
300 Sq.mm cable	175	148
400 Sq.mm cable	200	175

Clause 6.3.4.3.1(of IS-1255)

The diameter of the cable conduit or pipe or duct should at least 1.5 times the outer diameter of cable. The ducts/pipes should mechanically strong to withstand forces are to heavy traffic when are laid across road/ railway tracks.

10.2 BRIDGE CROSSINGS:

On bridges, the cables are to be laid through GI pipe/trough and taken through GI pipe on either ends suitably buried on both sides of the bridges for a sufficient depth so as to meet the bottom of the cable trench, then fixing the pipe in concrete of size 0.5m x 0.5m in both abutments. Separate pipes/troughs should be used for power/signalling cables. Suitable supporting clamps should be manufactured as required at the rate of 2

clamp/pipe depending upon the type of girder. Before fixing GI pipes, perforated holes of 20mm dia should be drilled at an interval of 0.3 Mts. to avoid theft of GI pipes. In case cables/cable is laid through trough, it should be filled in with cable compound/bitumen compound to prevent theft of cables. In theft prone area a special concreting arrangement should be developed in consultation with site engineer in both sides of the bridge from where cable leaves the pipe. The cable laying on Girder Bridges should be carried out as per relevant document 10.3 <u>CROSSING OF CABLES FROM FOOT OVER BRIDGE</u> Wherever it is possible cables should be taken from the foot over bridge for the purpose of track crossing. Cable should be laid inside DWC pipe of suitable diameter and the DWC pipe should be properly clamped to the FOB structure. It should be ensured the DWC pipe doesn't hang below the FOB structure. 10.4 <u>FOUNDATIONS</u> 10.4.1 The top level of the foundation should be in level with the existing rail level. The proportion of cement, sand and ballast should be in the proportion of 1:3:6 for casting foundations for signals, location boxes, and the proportion will be cured for a period of not less than 7 days. 10.4.2 Fine aggregate must consist of sand, stone ballast not exceeding 40mm x 40mm size and cement. The sand and ballast must be clean and free from soil, clay, shells, soft or flaky materials or any vegetable. Ballast must be washed when necessary to ensure cleanliness. 10.4.3 Sand used must be tidal river sand and must be free from any salts. 10.4.4 Water used for mixing must be clean and free from any oil, alkali, and acid. 10.4.5 Materials for concrete must be carefully and accurately measured for every batch.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 623 of 639
10.4.6 Mixing must be done in a mixing trough or a M.S. Sheet which should not be more than half full at the time of mixing. Two men should use square ended shovels and not phowrahs. Water must be added by pouring, water must be continuous until all materials and water are thoroughly mixed and uniformly combined. 10.4.7 When batch is fully mixed, it must be used without any delay. The aggregate should be deposited in uniform layer not exceeding 15cms. Tamping and spreading of each layer to be done as to cause it to settle thoroughly in the form and produce a dense mass. 10.4.8 Forms must be drenched with water before the concrete is placed against them and must not be removed in less than 36 hours afterwards. 10.4.9 A template for each foundation should be prepared suiting the holes in the base of the location box or signal post (for which foundation is cast) in order to hold the anchor bolts in position till the foundation is cured. The template should be removed before the top of the foundation is given fine finishing. 10.4.10 The exterior surface of the foundation should be finely finished leaving 4 cms of thread portion of the anchor bolt free to enable erection of signal post or location boxes. All foundations should be cast under the direct supervision of the Site Engineer of the work. Curing must be done for all foundation for not less than 7 days. 10.4.11 No payment should be made for any extra excavation carried out in the slope and width of the pit, including for foundations where soil is loose and pit is to be dug for more depth. 10.5 <u>LOCATION BOX/ APPARATUS CASE</u> 10.5.1 The work consists of pit excavation, casting foundations with bolts of adequate size having cement concrete of ratio of 1:3:6 with stone ballast of 40mm size The position of Location Boxes will be finalised by the site engineer. It should be fixed taking care that staff working on location boxes are not in

danger from running train. All the location boxes will be erected perpendicular to the track. 10.5.2 All Location Boxes/battery boxes should be erected on concrete foundation and plumbed. It should be clear of infringement when the doors kept open perpendicular to the track. All foundations should be plastered on all sides and earthwork should be made upto the required level. All the Location Box/battery boxes used should be painted on inner side with white paint before fixing the shelf planks and terminal board after a primary coating with red oxide and with aluminum paint after a primary coating with red oxide on outer side after installation at site. 10.5.3 Teak Wood planks of 20 to 25 mm thick to be used for keeping track chargers & choke. ARA Terminal/fuse block will be fixed on hylam sheet. Wood screws of proper size should be used. Size of terminal boards and shelf planks should be finalised by Site Engineer. Two holes on either side of terminal/fuse block should be made if required for carrying out wiring termination. Shelf plank should be securely fixed in level on suitable M.S. angle brackets. Wood polish/varnish of good quality should be applied before fixing terminal/gadgets. 10.5.4 The underground signalling cable should be taken into the Location Box/ battery boxes and properly secured by wooden clamps. 10.5.5 The cables should be neatly skinned, bunched and terminated. All cores of cable should be terminated on the terminal board at locations and in Relay rack at the required places in the order as approved by Site Engineer. All the power cables (aluminum) should be provided with aluminum lugs using crimping tool. 10.5.6 All Location Boxes should be provided with 'E' type lock arrangements on one or both the doors as per instructions at site. Contractor should procure material and fabricate for fixing of 'E' type lock if such provision did not exist on the Location. 10.5.7 After all the signalling cables are taken inside the Location Box/battery box the side opening should be closed with masonry work and plastered. The inner side is then filled with sand and finally the bottom is sealed with sealing compound.

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-A
	BID SPECIFICATION NO.:DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 625 of 639
10.5.8	All the underground cable should be provided with punched name plates, showing total number of cables, cross section of each core, aluminum or copper and from and to details etc., inside each Location Box.	
10.5.9	The armours of all the cables and Location Box/battery box should be earthed as per RE standards.	
10.5.10	The earth resistance should not be more than 10 Ohms. Earth resistance and date are to be painted on earth pit.	
10.5.11	Track relays, line relays, point contractors, overload relays, transformers, transformer chargers, rectifiers, charged secondary cells, track feed resistance, EKT, telephone plugs etc., should be fixed neatly in the Location Box as required by the Site engineer. The wiring should be carried out in a neat manner with 3/0.75mm PVC copper wires and terminated, bunched and tested. The relays wherever fixed should be fixed in such a manner that they can not be easily removed or tilted. Details of cable terminations and wiring particulars should be painted inside the Location Boxes door in addition to documentation. Contractor should procure and fabricate M.S. flats/angle for relay fixing, inside Location Box. The design of such fabrication will be issued by Site Engineer. Relay fixing arrangements should be firm and rigid to avoid any chance of vibration due to train movements.	
10.5.12	All electrical equipments wherever provided should be earthed to RE Standard. Description of equipments, relay etc., should be neatly painted inside the Location Boxes door. All the internal wiring should be tested from Point to point in full, jointly by contractors authorised Engineer and Site Engineer/ Supervisor.	
10.5.13	Charged secondary cells if installed inside Location Boxes, should be fixed firmly leaving enough working space for taking specific gravity reading and during distilled water topping. Anti corrosive black paint to be coated inside the Location Box. Additional ventilation arrangements should be made. The date of installation, capacity and serial number should be painted on each cell and the inner side of the door. The record should be maintained in a proper format for each battery set as per railways laid down practice.

10.5.14	Battery links (lead) with suitable bolts and nuts should be used for connecting cells. Petroleum jelly is to be applied on terminals immediately after connection. The specific gravity and voltage reading should be recorded in a separate register and handed over to Site Engineer duly signed	
10.6	<u>SIGNALS</u>	
10.6.1	The work includes excavation of pits and casting of Signal foundations. The exact position/location of signals will be indicated/decided by Site Engineer.	
10.6.2	Foundation for Signal post should be of cement concrete in the ratio of 1:3:6 using stone ballast of 40 x 40mm size to be cast at location shown by Site Engineer. The foundations are to be plastered in all sides.	
10.6.3	Signal pole should be securely fixed to surface base and erected on signal foundation and plumbed. The gap between the signal pole and surface base should be filled up with lead wool or any other approved substance to avoid tilting. Multi unit colour light Signal upto 2/3/4 aspect should be properly mounted on Signal post with or without route indicator. Soon after installation, the pole should be painted with aluminum/white enamel after giving a coat of primer and the Signal unit should also be painted as per the Standard practice.	
10.6.4	Wherever route indicator junction type or stencil type is to be erected, it should be mounted on the top of the Signal pole and a large off set bracket should be fixed with 'U' Bolts of 20mm dia 2 Nos. on the Signal pole for mounting multi unit colour light signal. A 21.5mm through hole should be drilled on pole just below the off set bracket and a through bolt provided to prevent the offset bracket from sliding down. The tail cable should be first terminated on the route indicator and separate wiring (PVC 3/0.75 copper) should be run to colour light multi unit signal from route indicator. The LED lamp lit on 110v DC, with inbuilt current regulator should be used for junction type route indicator.	
10.6.5	To take the wires into the Multi unit, a vertical slot of not less than 25mm x 37mm in size should be made on the Signal pole. Suitable protection should be provided on the slotted pole before cable is taken through it and

care should be taken that no damage to insulation of tail cable is caused. 10.6.6 Signal units door should be locked using hand cuff (Universal) locks. 10.6.7 Necessary earthwork should be made for each signal as required by Site Engineer. The cables are to be taken through the pole to the unit without damaging the insulation and armour. Armour should then be skinned and terminated. 10.6.8 All the signal units are to be wired as per approved practice by railway. The wiring is to be tested jointly. The signal should be focused correctly in daytime at bright light at 90% of rated voltage. 10.6.9 The signal post should be properly plumbed and fitted with ladder having a platform and guarding on the top. Necessary ladder supports as required should be provided. All the signal posts and signals should be installed clear of infringements (i.e. 2.36 Mts. from the central line of the nearest track. Extra clearance to be catered for, to commensurate with the degree of curvature, if the, signal to be installed is situated on the curve). Markers and number plates should be fixed wherever necessary as per signalling-plan using suitable clamps. Signal No. has to be painted on the "Number plate" as well as on the door outside. All fittings are to be tightened properly. Signal unit should be looked properly. The back cover of the signal should be crossed by white lines (X). The signals should be preferably LED lit, however in case of non availability of LED lit signals, the commissioning can be done by lamp lit signals temporarily. 10.6.10 Earth work should be made around the ladder foundation to Railway electrification Standard and consolidated and concreted. Protective mesh should be provided for all signal units as per RE Standard. Ladder should be painted with black paint. 10.7 <u>CALLING ON SIGNALS/POST TYPE SHUNT SIGNAL</u> Off set bracket should be fixed with 'U' Bolts of suitable size on Signal pole for mounting Calling on Signal. A 21.5mm through hole should be drilled just below the off set bracket and through bolt of diameter 20mm should be provided to prevent the offset bracket from sliding down. Vertical slotted hole not less than 25x50mm in size should be provided on the Signal pole

to take tail cable. Care should be taken that no damage is caused to insulation. 10.8 <u>POSITION LIGHT SHUNT SIGNAL GROUND TYPE</u> 10.8.1 The work includes excavation of pits casting of shunt signal foundations as per relevant document. 10.8.2 Foundations for shunt signal should be of cement concrete with ratio of 1:3:6 using stone ballast of 20/25mm size to be cast at location shown by the Site Engineer. The foundation to be plastered in all sides. 10.8.3 The position light shunt signal should be properly mounted on post and plumbed. 10.8.4 Necessary earthwork should be made for each Position Light Shunt Signal as required by Site Engineer. The cables are to be taken through the post to the unit, skinned and terminated. 10.8.5 Position light shunt signals are to be wired as per approved practice by Railway. The wiring is to be tested jointly. The shunt signal to be focused correctly in daytime at bright light at rated voltage. The signal unit's back door covers are to be locked using universal locks. Soon after installation, the pole should be painted with a aluminum/white enamel paint after giving a coat of primer and the Signal unit should be painted as per the Standard practice. 10.8.6 The position light Shunt Signals are to be earthed to RE standard. 10.9 <u>POINT MACHINES</u> 10.9.1 Electrically operated point machines of IRS design should be fitted in level to all points as per signalling plan on long sleepers on extended insulated gauge tie plate, clear of infringement as per the latest RDSO Drawing.		

CONSULTANT : PROCON ENGINEERS

10.9.1.1 The point machine should be installed after cleaning both inside and outside the machine, after greasing/oiling to all moving parts. The point machine should be hand operated and detection and motor-controlling contacts should be adjusted before taking to site. All unwanted openings should be covered with MS sheets. 10.9.2 The point machines should be fixed with proper bolts, nuts and flat/spring washers with correct size of holes through the special sleepers to avoid lateral/ longitudinal play, on extended insulated Gauge Tie Plate. 10.9.3 All point connecting rods should be connected to point machines without any strain and with Min. offset. All connecting rods should be in level and correct size of bolts and nuts should be used to avoid longitudinal play. Any changes in the connecting roddings during installation, which necessitates welding and offset should be carried out by the Contractor at site. The welding should be by smithy process. Lengthy roddings should be supported suitably by roller guides assembly. The point roddings should be suitably provided with insulation joints as per track circuit requirements. 10.9.4 All the wooden sleepers on which the point machine is installed should be strapped on both sides with 50mm x 20mm M. S. Strap. Necessary holes 21.5mm dia. should be drilled on the strap and 20mm dia. bolts and nuts should be used for fixing to the sleepers. Point Machine is installed on PSC sleepers at point & crossing PSC sleepers set are laid for 1:8 ½ and 1:12 (LH or RH) arrangements. 10.9.5 Separate track lead junction box/boxes should be installed clear of infringement near the point machine and the respective cables should be terminated. The leading in wires from the boxes should be taken through flexible conduit PVC pipes and securely fixed. The wiring inside the point machine for motor and detector circuit should be carried out neatly. All the electrical wiring should be tested for insulation and earth and all connections tightened. 3/0.75mm. PVC copper wire/cable should be used for wiring point machines as per Standard practice approved by Railways.

10.9.6 Point machines and track lead junction boxes should be painted and point numbers should be painted neatly. Wiring diagram should be painted on the inside of the point machine cover. The point switches web should also be written with point number. 10.9.7 Where IRS type point machines are installed, fixing of additional heavy-duty contactors (2 Nos. per point machine) of 40 amp. Only Siemens/IRS design point machines 110V DC operated should be used. The installation should meet with the requirement of the electrified section. 10.10 <u>ADJUSTMENT AND TESTING</u> 10.10.1 The point machine should be worked by crank handle and the housing of switch rail with the stock rail should be checked. 10.10.2 The point machine should be worked both ways with proper feed without undue friction and working current should be recorded. 10.10.3 The point detector and lock connections are adjusted in such a way that with a 3.25mm thick test piece obstruction placed between the switch and stock rail at 150mm from the toe of the switch The point do not get locked, and The point detection circuit is not completed. The point machine de- clutch arrangement should be properly adjusted is that it works satisfactorily under condition of obstruction. The feed to motor should also be disconnected after a period or 9 to 11 seconds. 10.10.4 Fixing Point/Trap indicator stand and Point/Trap indicator including lenses with required bolts and nuts, washers, connecting the Point Indicator base with connecting rod to the switch rail, adjusting the Point Indicator for correct operation as per SEM and focussing. 3 Nos. of 20mm x 200/250mm bolts are required to fix Point/Trap indicator stands onto the sleepers. If the Point happens to be in the track circuit zone, necessary arrangements for insulating the split lock stretcher, switch extension pieces from switch rail has to be carried out by enlarging holes on split lock

stretchers and switch extension pieces. Painting of fittings etc. The necessary arrangements should be provided to meet with requirement of RE standard. 10.11 <u>TRACK CIRCUITS</u> 10.11.1 Pin brazing technique shall be used for fixing lead wires and jumpers to the rail and for providing continuity bond at rail joints. Figure below shows the components used in pin brazing:  The diagram illustrates the components used in pin brazing. It shows a cross-section of a rail head with a ceramic ferrule inserted into the web. A brazing pin is shown passing through the ferrule and the rail head. A connector is shown attached to the end of the brazing pin. Brazing equipment shall be battery powered, light weight portable unit and no external power at site shall be required. Following are the specifications of typical brazing equipment: Batteries Voltage : 36 V, DC Brazing Current : 250 Amps. Brazing Time : under 2 Sec. Brazing Temp. : 650°C max. Brazing per Charge of battery: 30-40 nos. Contractor will bring his own Pin Brazing Machine and Consumable like Ceramic ferrule and brazing pin for installation of track circuit at site and. 10.11.2 Continuity bonds and lead wires: Rail head continuity bond in track circuit area for installation by Pin Brazing will be of 20mm² galvanized steel wire rope, length 145mm. With copper lugs machine crimped at both ends.

Continuity bond for point zone track circuit area for installation by Pin Brazing will be of 20mm² galvanized steel wire rope PVC insulated, length 1mtr. with copper lugs machine crimped at both ends. Track Lead Wire (Near End) for installation by Pin Brazing will be of 20mm² galvanized steel wire rope PVC insulated, length 2.5m. With copper lugs machine crimped at both ends. Track Lead Wire (Far End) for installation by Pin Brazing will be of 20mm² galvanized steel wire rope PVC insulated, length 4m. With copper lugs machine crimped at both ends. 10.11.3 Insulated Rail Joint (IRJ) Glued joints shall be provided on track circuited area. Where it would not be possible to insert glued joint, thermoplastic poly urethane (TPU) moulded insulated rail joints shall be provided. The glued joints shall be fabricated in situ at site and inserted in the track. In dry conditions, insulation resistance of glued joint shall not be less than 25 Mega ohms when a meggering voltage of 100V DC is applied across the joint. In wet condition resistance shall not be less than 3 kilo ohms when obtained with application of 100V DC and by dividing the voltage reading with that of current. Details of components and assembly of TPU joint is shown in figure below:

The insulation components of the TPU insulated rail joint are:

(a)	End post	1 No
(b)	Left hand Side channels	2 Nos.
(c)	Right hand Side channels	2 Nos.
(d)	Ferrules or Bushes	8 Nos.
(e)	Backing plates with collar	4 Nos.
(f)	Washers	2 Nos.

10.11.3.1 Two TLJ boxes one at track feed end and another at relay end should be fixed clear of infringement and the respective track circuit tail cable 2 x 2.5 Sq.mm PVC copper conductor from the Location Box should be terminated. The connection from the TLJ boxes to the rail should be through the PVC insulated flexible wire rope seven strand of overall dia 8mm. (steel wire dia of 5mm.) which should be fixed to the Rail by channel Bond pin both at feed and relay ends.

10.11.4 All the TLJ boxes shall be fixed on 50X75mm MS channel as per relevant document. TLJ boxes should be painted and track circuits should be neatly numbered as required by Railways. 10.11.5 Jumpers should be provided as per track bonding plan approved by engineer incharge. 10.11.6 Any alteration to existing track circuits should be done by the contractor at his own cost. 10.11.7 After completing the installation of track circuit, it should be energized, tested, adjusted and readings recorded in a register/track circuit history cards. The bonding and jumping plan should be prepared for each track circuit. 10.11.8 The additional work like skimming of fish plates, insulation of fish plate holes etc required in connection with provision of RDSO type insulation Joint for track circuits should be done by contractor. The insulation provision should not be required where glued joints are supplied by Civil Engineers for Track Circuit. 10.12 <u>CABLE TERMINATION RACK:</u> 10.12.1 Cable termination racks should be erected in the relay room at the required location as shown by the Site engineer with suitable foundation bolts and cement concreted. The cable termination racks should be painted soon after installation before cable termination work is taken up. Suitable cable ducts wherever required should be provided to bring all outside cables to the termination rack. All the cables are to be neatly skinned, fixed on the cable bracket and terminate in order. The cable armours and the rack should be earthed. Internal wiring and termination particulars are to be written with paint. 10.12.2 6 way terminal blocks are to be fixed on 10mm. thick hylam sheet which is fitted to the cable termination rack. The number of 6 way terminals is to be painted serially on the C.T Rack and details of termination are painted on

Hylam sheet. All the cables should be identified by punched labels tied on each cable. Painted cable termination index board should be fixed in the relay room showing the terminal numbers circuit wise. As made terminal particulars should be prepared in linen/polyester tracing. 10.13 <u>WIRING of OUTDOOR GEARS:</u> 10.13.1 The equipments and power supply are to be wired in location boxes, battery boxes and in other locations as per circuit diagram and location details. These circuit diagrams should be prepared and submitted by contractor in advance for approval of the railways. The necessary guide lines given by the concern railway should be strictly followed while preparing the different wiring diagrams. The two copies of each WD should be checked by EMPLOYER/CONSULTANT and one approved copy should be returned to contractor to carry out the work. 10.13.2 Contact numbering for the relays should be made by the contractor as per the approved circuit diagram issued by the EMPLOYER/CONSULTANT and type of relay proposed to be used on the installation. 10.13.3 Wiring of shelf type and plug in type (Metal to Carbon) Contact relays : Plug in type relays conforming to BRS-930 and BRS-931 and shelf type relays conforming to BS-1659 should be done with "PVC" insulated unsheathed flame retarding type single core flexible wire 1100V grade having 0.6/0.2mm annealed copper conductor and nominal cross sectional area of 0.5 Sq.mm of common colour code to the specification IS:694". For wiring these relays the above wires should be terminated in eyelets/lugs of Standard design. 10.13.4 Soldering at the relay contact pin should made using good quality solder and flux. Care must be taken to prevent dropping of excessive solder from relay contact pin thereby causing failure/unwanted connection. It is advisable to raise the wires by mechanical means and temporarily interposing a wooden or plastic sheet below the relay while soldering, to collect the excessive solder that may be dropping out.

10.13.5 After testing, the loose wires should be neatly bunched and laced with twine black. The contractor should adopt suitable colour code for wiring as required by employer's representative. Spare conductors to an extent of 10% are to be provided on the interconnecting wire runs for future developments. 10.13.6 The incoming cables to location boxes are to be neatly arranged and fixed to the cable supporting guides. The cable entry should be filled with sand and plastered neatly to avoid entry of mice or reptiles. 10.13.7 After the complete testing by the EMPLOYER/CONSULTANT representative and before commissioning the installation, the contractor should arrange necessary sealing leads and wires for sealing the relays. 10.13.8 The nomenclature of each relay in location boxes should be painted both in front and rear side of each relay with contact configuration.. All the relays to be plugged should be checked visually and defect if any, noticed should be replaced, duly reporting the same to the owner /Railways. 10.13.9 Wiring of EKT/HKT, telephone using 16/0.2mm wire and testing as per approved circuit diagram and commissioning, the same wiring has to be neatly clipped wherever necessary. 10.14 <u>WARNING/ STOP BOARD / SIGHTING BOARD</u> 10.14.1 Warning/stop boards fitted on the MS angle/channel should be erected and concreted at locations as indicated by Site Engineer and as per approved signalling plan, and should be clear of all infringement. If necessary, existing warning/stop boards should be shifted and re-erected on the place required by Site Engineer. These should be of retro-reflective design or painted with luminous paints. Design of Goods warning board and SLB shown in fig. below:

(ii) WARNING BOARD FOR GOODS

10.14.2 The rail post and other fittings should be painted as required by Site Engineer

10.15 EARTHING:

Earthing should be carried out as per provisions given in the tender schedule. The equipments to be earthed should be connected to the earth pipe by means of GI Wire 8 SWG by neatly soldering at equipment end and earth pipe end. Earth resistance should be measured and painted on the earth pipe with date. The earth resistance should be always less than 10 Ohms.

10.16 PAINTING of OUTDOOR GEARS:

All signalling equipments should be painted in accordance with signal engineering manual.

Approved quality of paint for painting the following equipments in two coats duly scrapping the rust as directed by Site Engineer shall be supplied by the contractor.

INTRODUCTION

The Soil Investigations for Bhusawal Replacement Project – 1 x 660 MW have been recently completed under the directives of **Executive Engineer (Civil)**, Civil Construction Division under Superintending Engineer Construction Circle , Maharashtra State Power Generation Co. Ltd. Bhusawal . The object of the investigations was to study the subsoil characteristics for proposed Bhusawal Replacement Project .

The works of the subsoil explorations covering field and Laboratory tests were awarded to M/s Renuka Engineers , Thane , vide their work Order No. CGMC/Gen.I/Bhusawal Replacement/Soil Investigation/T-484/3184 dated 15/12/2008. The work was executed as per specified specifications and under the directives of Project Engineer , Mumbai .

The specified scope of the total project work consists of :

- 1) Boring and drilling of 32 nos. bore holes in the proposed planned lay out for Bhusawal Replacement Project in Bhusawal including collection of undisturbed and disturbed soil samples .
- 2) Conducting field tests such as i) Standard Penetration Tests , ii) Plate load test and iii) Cross Bore hole tests .
- 3) Various Laboratory tests to be conducted on the undisturbed as well as disturbed soil and rock samples . Electrical Resistivity tests have been conducted as directed .
- 4) Submission of expert's report based on the above studies including foundations.

WORKS FEATURES :-

The field work consists of drilling of bore holes , standard penetration tests , and collection of disturbed and undisturbed soil and water samples and carrying out the various field tests . The samples collected from the site are transported and tested at “**Renuka Engineering Research Laboratories**”, Thane .

This report has been prepared after careful study of the data collected from the site and Laboratory test results on different soil and rock samples . The report deals with subsoil conditions which were encountered up to a depth of maximum about 11.50 m or Rock level below ground level and indicates the strength and other related parameters of at specified layer of subsoil profile deposit . It also includes the important field test parameters related to the present objectives .

Based on the analysis of different field and laboratory test results , this report is prepared and presented in the following different sections and related annexes .

Section – 1 : General Site Conditions , Nature and Procedure of Investigations
Geology.

Section – 2 : Discussions on field and Laboratory tests including soil profile .

Section – 3 : Discussion on foundations.

Section – 4 : Recommendations.

Annexure – 1 : Location Sketch of Site and bore logs data Sheets, Soil profile .

SECTION - I

SECTION - I

GENERAL SITE CONDITIONS, TOPOGRAPHY AND NATURE OF INVESTIGATIONS

1. LOCATION AND TOPOGRAPHY:

The site for the proposed Bhusawal Replacement Project is situated adjacent to the existing power plants and office premises along the Road Bhusaval Dhule of Maharashtra State Power Generation Company Limited, Bhusawal on outskirts of Jalgaon Dist.. The proposed plot portion is a basically an agricultural land and has a gentle slope with level difference varying from 0.300 m to 1.00 m. The location plan of the proposed layout is attached (Figure nos. 1.1). Major bore holes are planned in Main Plant building area of the proposed 1 x 660 MW project and ancillary facilities like CHP and Chimney. Surface soils are generally agricultural black cotton soils followed by residual soils. The investigations were carried out on the given layout of proposed power plant infrastructure as per the directives of the authorities through Superintending Engineer (C) and Executive Engineer (Civil), Bhusaval. The location sketch plan highlights the details of site locations and bore holes as proposed by the authorities.

2. DETAILS OF EXPLORATIONS:

The exploratory works at site were carried out using 100.0 mm and 76.0 mm core cutters with Rotary drilling system. The rock / hard stratum drilling is achieved and terminated as per the directives of the Engineer-In-Charge. The field tests, sampling and specifications have been exclusively followed as per the directives and schedule of the tender. The details of bore hole locations are given in Table - 1.1 of this Report. The bore logs details have been provided in Annexure - 1.

2.1. DISTURBED REPRESENTATIVE SAMPLES :

The disturbed representative samples were collected from shell, cutting shoes of the undisturbed soil sampler and split spoon sampler. The samples collected in such a manner are logged, labeled and depth wise placed in polythene bags. Wash samples were also collected. The S.P.T. samples were also waxed for evaluation of laboratory moisture content and grain size analysis.

In all total 32 nos. undisturbed soil and 21 nos. disturbed soil samples excluding S.P.T. (35) samples have been collected from 32 nos. bore holes of proposed layout site and the details of have been presented in Table no. 1.2.

			32	80	21	

3. WATER SAMPLES:

The water samples were collected from each bore hole. The water samples were collected before the start of the further boring work of the day so as to collect the natural ground water contents.

4. FIELD TESTS CONDUCTED :

4.1 STANDARD PENETRATION TESTS : (IS 2131-1981)

This test was carried out using a Terzaghi spoon sampler driven by a 63.50 k.g. Hammer weight falling freely through a height 750 m.m. The penetrometer was lowered inside the bore hole on a string of drill rods and blow count of the number of blows for every 150 mm of penetration was maintained till total penetration was 450 mm. In some cases 600 mm penetration is also obtained.

The "N" value adopted was the number of blows required to penetrate 300 mm length (i.e. from 150 mm to 450 mm depth of penetration.) inside the soil or the available ground stratification. The soil so recovered in the penetrometer tube was placed in polythene bags and labeled.

The no. of bore holes, S.P. tests and sample collection have been executed with adequate frequency as per the scope of works.

4.2. PLATE LOAD TEST:

A Single Plate Load test has been conducted as per IS: code-1888-1982. A regular steel stanchion reaction load platform is erected at the proposed location of the Bhusawal T.P.S. Replacement project. The depth of the section on which loading is planned is 2.00 m below ground level. The stratification at the proposed site is completely weathered rock formation. Plate load test no. 1 has been conducted in T.G. Block area near B.H. Nos. 25 of main plant area.

4.3 CROSS BORE HOLE TEST :

4.3.1. General :

Two nos. Seismic Cross Hole tests have been performed to determine the various soil and rock parameters at the proposed site. Both the tests have been conducted at B.H. No. 4 and B.H. No. 23 respectively.

4.3.2. Theory and Methodology :

The general principle of the cross bore hole test is to establish the shear wave (S- wave) and compression wave (P- wave) velocity of the soil and rock layer at 2.00 m selected depth . The waves are generated in an "impulse" bore hole and detected by the geophone(s) in "receiver" bore hole drilled at known distance from the impulse bore hole . (Refer Figure no. 1.6)

The wave form detected by the geophone (s) is recorded on a signal enhancement seismograph (Geode) . The travel time of the generated S and P wave is interpreted from the wave front recorded by the seismograph . The travel time and the distance between the "impulse" and the "receiver" bore hole is used to calculate the S and P wave velocities .

The tests have been carried out as per IS 13372 - Part - 2 of 1992 . The preliminary results for the both the Cross Hole tests comprising of P- wave and S- wave are incorporated .

5. GEOLOGY:

Geology in this area is volcanic basaltic rocks as found in Maharashtra in general . Columnar joints , fractured rocks are common. The overburden varies from few meters to 15 m.

6. SOIL PROFILE:

Soil profile description presented below gives relative strata thickness in general .

1) RESIDUAL BROWNISH GRAVELLY SAND CLAY:

(Average thickness 1.15 m) :

Residual brownish to yellowish Gravelly sandy clay is common to all the area of the proposed project . The fine grained soils in this zone vary from 15 % to 40 % generally . The sand contents are generally within 20 % with extreme variation of 30 % to 40 % are also observed . The soils are of very stiff to very hard consistency and with loss of moisture content in ground at lower depth S.P.T. refusals are common . S.P.T. values in the stratum are within 15 to 20 only . The average thickness of the stratum is 1.20 m . However thickness upto 1 m – 2 m are also common .

In upper zone S.P.T. values above 20 are common . Stratum is quite hard as such . This stratum has consolidation characteristics and with 50 % to 65 % finer presence , short and long term settlements both are very important . Soils are of medium compressibility and low plasticity . In general these soils show low swelling potential .

II) COMPLETELY WEATHERED BASALT ROCK : (1.15 m onwards)

S.P.T. values of refusal range i.e. greater than 50 have been observed within a depth of 3.00 m to 10.00 m depth. Even S.P.T. values in shallow depths refusal have been observed. All the bores display completely weathered, fractured, disintegrated basalt rocks. The disintegration is severe to such an extent that R.Q.D. is invariably below 30 % in most of the bores. In hardly few bores good hard R.Q.D. has been observed in patches only. Recoveries vary from nil to 65 % and R.Q.D. values are invariably nil with exceptions at some places up to 40 %.

7. GROUND WATER :

The ground water table variation is of extreme nature. In general ground water average depth is at 4.00 m to 5.40 m. The samples of the same have been collected and are subjected to chemical analysis. Water levels have been recorded for all the bores. In near area 2 nos. well are present and indicate water presence at about 4.0 m to 5.00 m depth.

Plan View

Figure No. 1

SECTION - II

SECTION II**FIELD AND LABORATORY TESTS**

This section deals with the results of field and laboratory tests conducted on various insitu soil and rock samples during the execution process of the proposal.

1. FIELD TESTS :

The field tests conducted cover the standard penetration tests . The details of the same are summarised in following paras . Generally 2 nos. to 4 nos. S.P.T. have been conducted for each bore holes . In rock stratum to ascertain the quality of weathering S.P. Tests have been conducted . The actual values have been entered in bore logs and details have been provided in Field Daily Reports (Refer Annexure - I) . However the final results are summarised in Table no. 2.1 .

1.1. STANDARD PENETRATION TESTS :

This test was carried out using a Terzaghi spoon sampler driven by a 63.50 k.g. Hammer weight falling freely through a height 750 m.m. A comparative study of " N " values (i.e. no. of blows / 30 cm) penetration using Terzaghi's split spoon sampler , are presented in Table no. 2.1.

The actual values of S.P.T. such as (N₂ + N₃) have been reported . The refusal of the test has been considered when the penetration is not possible . Refusals have been indicated by mentioning penetration in centimeters and the no. of blows . The S.P.T. values help in assessing the stratum strength in general .

TABLE 2.1
STANDARD PENETRATION TEST RESULTS

B.H. No.	Sr. No.	Depth of test m	" N " Value blows/30 cms	Remarks
1.	1	0.45 --- 0.90	06-08-09	17 Residual Soils

In general S.P.T. values are invariably refusal in lower stratum area .

1.2. PLATE LOAD TEST:

A single plate load tests has been conducted as per location details provided in Figure no. 1.1. The Plot is presented in Figure No. 2.1 .

The stratification and the ground water table aspects have been given due consideration for arriving the allowable safe bearing capacity . Completely weathered rock stratum stratification is observed at plate load conduction level .

The plate load test has been conducted at the proposed site with ultimate load intensity of 74 t/m^2 . Limitations of plate load test in present stratification context needs to be presented.

- i) Plate load test indicates only the strength of stratum located within a depth of twice the width of plate.
- ii) The test is of short duration.
- iii) Size and water table effects need to be accounted.

Water table in the area varies from 4.00 m to 5.40 m below ground.

Hence in light of above considerations and the plot of plate load test Figure no. 2.1 an allowable safe bearing capacity with factor of safety 2.0 is of 25 t/m^2 . The water table consideration need to be accounted considering the stratum.

Hence we recommend an allowable safe bearing capacity 25 t/m^2 at 2.00 m depth below ground level. This allowable safe bearing capacity is within the allowable settlement of 25 mm.

1.3. CROSS BORE HOLE TEST:

An adjustable device, generating the wave front is lowered in the proposed "impulse" hole. The multi-directional geophone placed in the receiver hole detected both the P- and S-waves. Smartse is Seismograph collected the data and geophones recorded the P- & S-waves. The Seismograph has stacking capabilities and an automatic floating point to determine the first break. The P- and S-wave measurements were made at every 2 m interval below the ground surface.

The necessary cognizance of bore hole data has been taken into account before conduction of the test.

The cables marked with 1 m interval ensured the lowering of geophone and hammer at same depth. The hammer is secured in position by inflating the rubber tubes by air pressure. In similar manner the geophones are also secured in receiving holes. The tests were started by pulling the strike rod up with the help of a string and then allowing it to fall under its own weight. The signals are enhanced by stacking i.e. by repeating the process as described above.

The procedure is repeated a number of times until the first arrival of Seismic waves corresponding to the known stratigraphy is identified. The procedure is repeated at each test depth. Locations of Cross Bore Hole tests are presented in Location Sketch nos. 1.1.

1.3.1. DATA EVALUATION :

The various dynamic soil parameters are determined through the data collected. The recorded first arrivals of P-wave (t_p) and S-wave (t_s) include the time required by the "impulse" wave to travel through the medium.

The following equations were used to determine various parameters.

No.	Parameters	Equation
1.	Primary Wave velocity (V_p)	$V_p = 1,000 X / t_p$
2.	Shear Wave Velocity (V_s)	$V_s = 1,000 X / t_s$
3.	Poisson's Ratio (μ)	$\mu = (m^2 - 2) / 2 * (m^2 - 1)$
4.	Dynamic Shear Modulus (G)	$G = (\gamma_t V_s^2) / g$
5.	Dynamic Young's Modulus (E)	$E = 2(1 + \mu) * G$

where,

X	= Distance between the impulse and the receiver holes
V_p & V_s	= Primary and Shear wave velocities, m/sec.
t_p, t_s	= time of first arrival of primary and Shear waves respectively, milliseconds.
m	= V_p / V_s
G	= Dynamic Shear Modulus, MPa
γ_t	= Total unit weight, KN/m ³
g	= Acceleration due to gravity m/sec/sec/
E	= Dynamic Young's Modulus, Mpa

Parameters calculated from above equations are presented in a tabular in Table Nos. 2.2 & 2.3 for a distance of 3m and 6m respectively.

1.3.2. COMMENTS ON TEST RESULTS :

In general the P- and S-wave velocities indicated an increasing trend with depth and the increasing trend indicates increased densities. The calculated velocities indicate slight increase in completely weathered rock stratum and density with depth.

The values obtained represent a completely weathered basalt rocks in deeper depths (up to depth 10 m).

The calculated velocities from the surface to a 4 m depth indicates the presence of Silty Sands to compact sandy Clayey gravel with depth. Relatively thin zones have not been observed.

Soil "P" wave velocities vary between 590 m/sec to 700 m/sec. and "S" wave velocities vary 270 m/sec to 300 m/sec. The pattern confirms that stratum is quite compact overburden compared to over burden in other corresponding soft media.

As compared to this Completely weathered Basalt Rocks represent "P" wave velocities of 1000 m/sec. to 1400 m/sec.. Such low velocities indicate completely weathered rock stratum. Results of both the tests are presented in Table no. 2.2 and Table no. 2.3 respectively.

2.0. LABORATORY TESTS :

The laboratory tests conducted on undisturbed, disturbed soil samples and rock samples recovered from bore holes are given in Table No. 2.4 and Table No. 2.5 respectively.

PLATE LOAD TEST

PROJECT: Soil Investigation/Exploration work by Bhusawal Replacement Project.

Test No. 1 Client: M.S.P.G.C.L., Bhusawal.
 Location: As per sketch Strata: Weathered rock
 Depth: 2.00 m below G.L.
 Size of plate: 45 x 45 square plate
 Allowable safe bearing capacity = 25 t/m².

SECTION - III

SECTION III

The purpose of this detailed Geotechnical investigation has been to study the subsoil characteristics for founding of the proposed 1 x 250 MW Bhusawal Replacement Project, at Bhusawal. The works involves investigations for various complex units of Thermal power project such as Switch yard bay, control room, Transfer Tower etc.. Detailed evaluation of allowable safe bearing capacity based on exploration studies, various field tests and laboratory tests is presented in this section. Various recommendations related to construction activity are also included.

2. BEARING CAPACITY:

The foundation design must take into account both the bearing capacity and settlement aspect.

A) The bearing stress at the interface of structure foundation system must be less than the bearing capacity of the said strata.

B) The settlement of the structure caused by deformation of the ground material must be less than the allowable settlement for the structure.

Keeping these constraints, the foundations for present structural system are formulated. Obviously we have to consider the foundations for a general structural buildings as well as important heavy structural systems. The following discussions highlight both the aspects and necessary recommendations are proposed accordingly.

3.0 FOUNDATIONS :

Considering the importance of the project and related activities structural units involved presentation covers both the heavy structural load units as well as light structural load units. Exploration studies and related tests convey that for major portion of the area soft strata depths is hardly 2.50 m below the ground level.

Hard stratum is invariably completely weathered rock stratum lying below ground from 1.00 m to 2.00 m depth. The only cautious note is that this stratum of hard strata is invariably completely weathered and fractured and disintegrated. Hence necessary precautions and design parameters will have to take into account the vibrational modes of the heavy loads in relation to weak hard strata.

All exploration Bore holes and related Soil Profiles show that "Soft Stratum with relative stiffness" is predominant for about 3 m depth. Hence open foundations, Isolated spread, Special footings, Combined footings, Floating Foundations, Raft / Mat with various combinations of thickened Plates, pedestals and possible basement combinations foundations are the possible avenues. Hence in light of exploration studies open foundation schemes and related allowable safe bearing capacities have been presented.

4. OPEN FOUNDATIONS :

4.1. BORE HOLE NOS. 1, 6 to 10, 15, 18, 23, 25, 26, 29 :

ALLOWABLE SAFE BEARING CAPACITY AT VARIOUS DEPTHS BELOW GROUND LEVEL :

Considering soft stratum overburden we recommend an allowable safe bearing capacities as below. Allowable Safe bearing capacities at shallow depths 3.00 m, 4.00 m and 5.00 m have been recommended as below. (Table No. 3.1)

TABLE NO. 3.1

Sr. Nos.	Sizes of Footings Length * Width	Depth below ground, m	Allowable Bearing Capacity t/m ²
1.	3*3, 3*5, 3*7, 3*10	3.00	25, 22, 21, 20
2.	5*5, 5*7, 5*10,	4.00	45, 42, 40
3.	5*5 and above	5.00	60

The allowable bearing capacity of the stratum have been recommended on the basis of samples, SPT, and rock tests.

4.2. BORE HOLE NOS. 2 to 5, 11 to 14, 16, 17, 19 to 22, 24, 27, 28, 30 to 32 :

ALLOWABLE SAFE BEARING CAPACITY AT VARIOUS DEPTHS BELOW GROUND LEVEL :

Considering soft stratum overburden we recommend an allowable safe bearing capacities as below. Allowable Safe bearing capacities at shallow depths 3.00 m, 4.00 m and 5.00 m have been recommended as below. (Table No. 3.1)

TABLE NO. 3.1

Sr. Nos.	Sizes of Footings Length * Width	Depth below ground, m	Allowable Bearing Capacity t/m ²
1.	3*3, 3*5, 3*7, 3*10	3.00	30, 25, 23, 20
2.	5*5, 5*7, 5*10,	4.00	47, 45, 43
3.	5*5	5.00	60

5.0. ADDITIONAL CONSIDERATIONS FOR FOUNDATIONS :

5.1. LATERAL SEPARATION OF ADJACENT FOUNDATIONS :

Net allowable bearing pressures and settlement estimates are based on the assumption that foundation soils underlying a footing are not significantly affected by adjacent footings. The minimum lateral distance between adjacent individual spread footings bearing at the same grade on soil should be $B/2$, where B is the footing width or diameter of the larger footing. For strip footings of width B , the minimum lateral separation distance should be not less than B . Where lateral spacing is less than recommended, the stress distribution beneath adjacent footings should be analyzed. Typically, footings spaced between $B/2$ and $B/5$ apart may experience 10 to 20 percent higher settlement.

5.2. OVERTURNING:

Wind loads acting on tall structures, which have dimensions less than their heights, will induce overturning moments and lateral forces. The overturning moment should be balanced by the structure and footing dead weights, and soil overburden pressure. The structure's resistance to overturning should be at least 1.5 times the applied moment.

For individual foundations, the ratio of moment to vertical load (M/v) should not exceed $B/6$ and $R/4$ for square and circular footings, respectively. B and R are footing width and radius, respectively. If necessary, anchor piles can be used to resist large uplift loads due to overturning forces. Alternatively, the foundation width could be increased.

For lightly-loaded structures, the above recommendation may result in conservative foundation sizes. We recommend that the effect of eccentricity be checked using a procedure proposed by Vesic (1975) and illustrated on Plate - 5. In this method, an "Effective area" is calculated from the load-eccentricity. This area is given by standard references. This is particularly important for Chimney structure.

The average bearing pressure on this effective area should be less than the allowable bearing pressure from bearing capacity and settlement considerations.

5.3. SLIDING RESISTANCE

The sliding resistance of shallow foundations can be computed from the following equation :

$$S = 0.42 V$$

where S = allowable horizontal resistance, kN; and

V = minimum vertical load on foundation; kN

The above allowable horizontal resistance includes a factor of safety of 1.5. The equation is based on a 25° friction angle between the concrete and foundation soils. Horizontal loads acting on foundations will be resisted by friction along the base of foundation and by the net passive pressure acting on sides of the foundation. The net passive resistance is negligible for most shallow foundations and has not been considered in the equation given above.

6.0. FOUNDATION CONSTRUCTION CONSIDERATIONS:

6.1. EXCAVATION :

We believe excavation in soil can be done easily. Rock excavations may arise in present case. Slopes of temporary open-cut excavations in surface soil need to be 1-vertical on 2-horizontal.

In completely weathered rock stratum 1V: 1.5 H and permanent side slopes and embankment slopes through soil should not be steeper than 1-vertical on 3-horizontal for stability considerations. Both open-cut and embankment side slopes should be protected from wind and water erosion.

Excavations for below-grade facilities can be made by either sheeted vertical cuts or open-cut procedures. Open-cut methods of completing excavations are considered generally satisfactory for relatively shallow below-grade structures. For deeper-seated facilities, because of increased space requirements to accommodate side slopes and associated difficulties in effectively dewatering such excavations, open-cut methods may not be feasible. Vertically cut excavations retained by using conventional sheeting may, therefore, be the most effective method of completing excavations for deep below-grade structures. Back-filling around completed structures should be carried out with proper compaction. Hence excavated portions to be concreted need to be protected from erosion and weathering effects. Surface portions excavations may be carried out instantaneously.

6.2. DEWATERING

Water level at the site varies from 3.50 m to 4.50 m below the existing ground during field investigation time. However, during monsoon season this water level may rise. Excavations extending deeper than the reported water level will encounter ground water. Seepage of ground water into excavations deeper than the ground water level may be excessive and some positive means of effectively controlling ground water level should be provided to enable construction to be completed in the dry.

Excavations may be carried to about 0.5 m below ground water level by open pumping from carefully constructed gravel-filled sumps. Excavations extending 4 to 5 m below ground water level can probably be effectively dewatered using a vacuum well point system or submersible pumps. Excavations deeper than 5 m below ground water level may require either a staged vacuums well point system or jet ejection wells to satisfactorily control the ground water level.

6.3. FOUNDATIONS BEARING SURFACE:

Foundations soils should be protected against disturbance from construction activities. Soils exposed at the bearing grade, or any backfill place to establish the bearing grade, should be watered and compacted. After compaction the soil should be kept moist until the foundation concrete is poured.

Foundation concrete should be poured the same day that the excavation is made to grade. If this is impractical, a thin seal slab of lean concrete should be poured over the base of the excavation to protect the bearing level.

In addition, positive drainage should be established away from foundation excavations to prevent water from pounding within the excavations or around the completed foundation, prior to, or during backfill placement.

6.4. RETAINING WALLS

Permanent or temporary walls retaining in excess of 0.5 m of backfill should be designed to resist lateral earth pressure. A freestanding retaining wall not restrained from minor rotational movement should be designed for the active earth pressure case. Foundation walls restrained from rotational movement, such as the walls for basements should be designed for the at-rest condition.

Resistance to lateral movement of a retaining wall is provided by net passive earth pressure. The active, passive and at-rest lateral earth pressure may be calculated using the earth pressure diagrams at the location point.

The earth pressure values are based on the assumption that the backfill will be free-draining material and will be compacted in accordance with structural fill recommendations.

If compaction using heavy equipment is performed near retaining walls, or buried structures, soil pressures against these structures can be as much as two times the normal values. It is recommended that large vibratory rollers not be used within 2 m from retaining walls and within 2 m directly above any buried structures. Small hand-guided plate tampers should be used in pipe trenches and next to retaining walls.

7. FOUNDATION PROTECTIONS:

7.1. WIND AND WATER EROSION

Sand fill, if placed outside building areas and not covered by paving, should be protected from wind and water erosion. One method of protection commonly employed is to place and compact a minimum 300 mm thick murrum (gravel) cap.

The rock content plus cementation of the murrum have proven adequate resistance against wind and water erosion. Other alternatives that may be considered for protection against wind and water erosion include asphalt paving, planned landscaping, or sprayed on polymer based erosion inhibitors.

7.2. WATER PROOFING :

Ground floor slabs and other buried structures placed less than 1.0 m above ground water level should be protected from ground water infiltration. Methods that could be used to protect the buried structures include bitumen coatings if the structures are less than 3 m below the ground water level. For deep basements, consideration should be given to permanent drainage systems to control seepage of ground water into the basement.

8.0. SITE PREPARATION :

8.1. GENERAL:

We recommend that all fill placement and compaction, including raising the site grades and back filling of foundation utility trench excavations, be done in accordance with our recommendations given in the following sections of this report. In the present case surface soils are agricultural soils with moderate Swelling potential. Hence these soils need to be removed or stabilized using stabilisation technique.

All vegetation and deleterious material should be removed from areas to receive fill, prior to fill placement. The thickness of vegetation layer is @ 150 mm to 200 mm. The surface of the existing natural soils should then be scarified, watered and compacted and stabilized in accordance with the recommendations. The natural ground surface should be thoroughly stabilised.

8.2. FILL CHARACTERISTICS:

Clean sand, defined as sand with less than 10 percent passing the no. 200 sieve or 75µm sieve is considered the most suitable fill material. Silty sand or sandy silt intermixed with sandstone fragments, locally called marl may also be used as fill material.

However , the use of Marl requires close control of moisture content and lift thickness to achieve compaction .

In general suitable marl should consist of material with less than 30 percent passing the No. 200 sieve . The minus No. 40 fraction should have maximum Liquid Limit of 25 and a Plasticity Index less than 8 . Dune sand , if available , is considered as suitable fill material .

8.3. COMPACTION EQUIPMENT

The procedures used for fill placement and compaction generally depend upon material used and equipment available . A 10 ton vibratory roller is most suitable for conducting granular soils . Large quantities of water may be needed to facilitate compacting . The lift thickness can be effectively compacted will depend on gradation of the fill material .

8.4. STRUCTURAL AND GENERAL FILL

Fill placed for paved areas or below specific facilities should be compacted in accordance with the recommendations given here for structural fill . We recommend that structural fill extends a minimum distance equal to twice the average foundation width beyond the outer perimeters of the structure foundations. Permanent slopes beyond this limit should not exceed 1V: 3H . Clean sand placed for land scraping purposes outside buildings or roadway areas is considered to be general fill .

8.5. CAP LAYER .

We recommend that if clean sand is used as fill material then a cap layer be placed to provide wind erosion protection in exposed areas . A cap layer of gravel or marl placed and compacted in accordance with the above recommendations may be used for this purpose . We recommend that a cap layer be a minimum of 300 mm thick . Consideration may be given to use of soil cement , asphalt paving or spread-on , polymer based erosion inhibitors .

8.6. PLACEMENT CONTROL:

Fill placement and compaction can be monitored by nuclear density or sand cone density test . Dry densities and moisture contents may be determined by any one of these tests . Selection of the appropriate procedures will depend upon the types of fill material and expertise of the personnel performing the test .

8.7. CUT AND FILL SLOPES

Both cut and fill slopes may be required at the site during excavation and for raising the site grades. We recommend that permanent slopes in soil not exceed 3H:1V. Temporary slopes in natural material cut areas may be steeper but should not exceed 1.5H:1V. All permanent slopes should be provided with some form of protection against erosion. The recommendation for the cap layer above is applicable.

9. CEMENT CONTENT :

The water and soil contents have been tested for chloride / sulfate contents. Both the Chloride and Sulphate contents are minimal. The fluctuations of water table are up to 2.0 m to 7.0 m below ground level. Considering IS 456: 2000 the minimum cement content need to be adopted. The durability and the importance of the structure needs to be considered. We recommend that normal Portland cement content should not be less than 380 kg/m^3 . The minimum concrete cover of 75 mm should be ensured. The water cement ratio need to be restricted within 0.45 only.

ANALYSIS OF BEARING CAPACITY

Stratification in shallow depths is completely weathered rock. Completely weathered rock is a combination of rock mass and soil. Disintegrated mass may contain soil mass to extent of 75 % to 80 %. S.P.T. values in this zone are refusal for major extent. The lowest prorated S.P.T. values vary from 56 to 100 and above. Ground water table is at shallow depths.

K.W. Kule and M. A. Stroud (Piles in weak rocks, The Institution of Engineers, London, 1977) provide Scale of Shear strengths and N values for weak rocks and soils. Accordingly shear strengths vary from 38 t/m^2 to 70 t/m^2 .

Considering water table, actual S.P.T. locations, footing areas allowable safe bearing capacities have been recommended.

In first group allowable safe bearing capacity recommended is 25 t/m^2 and in second group same is 30 t/m^2 based on insitu conditions.

Based on various footing sizes slight modifications have been proposed. Present stratifications is not expected to be subjected to long term settlements as the same have no consolidation characteristics. Present recommendations are based on allowable safe minimum bearing capacity.

44 OF 146

SECTION - IV

SECTION IV RECOMMENDATIONS

1. Exploration studies convey the presence of maximum soft stratum thickness hardly 2.50 m. Completely weathered Basalt rocks are observed beyond about average 1.5 m overburden thickness. In few cases completely weathered rock is present at 0.5 m to 1.0 m below ground level. Water table presence varies 4.00 m to 5.40 m depth below ground in general cases. Monsoon water table rises considerably in surface soils. Hence this consideration needs to be taken while designing open foundations.
2. Considering the importance of the project foundation in surface soils are ruled out. Surface soils show low to moderately swelling potential. Surface soils need stabilisation or removal to the extent. Roads and pathways need to be planned in gravelly sandy Soils. Surface soils of upper 0.50 m to 1.00 m should not be used for plinth filling or similar activity. Surface soils cover extends 2.00 m to 2.50 m below ground.
3. Open foundation scheme has been recommended. Allowable safe bearing capacities have been recommended for various levels below ground level. Each bore wise and in combined way allowable safe bearing capacities have been recommended.
4. Before laying concrete, trench bottom surfaces need to be protected from atmospheric conditions either by leaving partial excavation as protection or protecting the excavated surface by thin concrete layers.
5. Soil and water contents display chloride and sulphate contents within limitations. Hence a cement content of minimum 380 kg/m^3 of concrete is recommended with maximum water cement ratio of 0.45 from durability considerations.
6. The slope of excavations should be 1:2 in surface soils. The angle of repose for the excavated material below fill material is 19.50° . Rotationally restrained retaining walls for the basements should be designed for at the rest condition.
7. The basement portions as well as ground floor slabs and other buried structures placed below ground water level should be protected from ground water infiltration. Bitumen coatings and permanent drainage system to control the seepage water need to be considered.
8. The foundations need to be designed for earthquake resistance in general accordance to the criteria given in IS: 1893 - 1984.

ANNEXURE – II
ELECTRICAL RESISTIVITY TEST
(ERT)

BACKGROUND:

Electrical Resistivity Survey was carried out in the premises of **Maharashtra State Power Generation Corporation Limited**, at site **Bhusaval Project 1x660 MW Bhusaval (M.S)** in order to assess the geological strategy. Vertical Electrical Sounding (VES) were carried total 08 location using Wenner array for an electrode spread (AB/2) of 10 mtr deep in order to ascertain sub-surface geology.

PRINCIPLE:

In Wenner array observation are made to obtain information on the variation of the physical field in the vertical section at a given location (sounding). The variation in the physical field is interpreted in terms of subsurface in homogeneities, which include underground nature and structure of rock layer, variation in lithology. Quantity and quality of water, the electrical properties of most rock / soil are primarily dependent on the amount of moisture in the rock / soil. Saturated rock / soil has lower resistivity the unsaturated and dry rock / soil. The higher porosity of the saturated rock, the lower its resistivity. The basis of making an electrical sounding is that the further away from a current source the measurement of the potential the deeper the probing will be.

GEOLOGICAL FEATURE:

The land observed 3 layer cases.

- a) Heavy burden, b) Thick black clay-soil (black cotton soil), c) Hard rock.
- a) Heavy burden upto approximately 1.00mtr to 2.0 mtr below ground level.
- b) Thick black clay-soil (black cotton soil) seems from 2 to 4.5 mtr approx below burden level.

- c) Hard rock (basaltic) seems in between 4.5 mtr approx below thick soil level and further deep.
- d) Static water level from 5to 6 metres below ground level. (By well inventory)

Nature of rock: Basalt rock (Igneous)

Classification: Rocks are aggregates of minerals. Geologists divide rocks into three groups: igneous, metamorphic, and sedimentary. Igneous rocks crystallize from magma also called basalt.

Basalt is an extrusive mafic volcanic rock. It is commonly erupted as passive lava flows due to its low viscosity (resulting from high magmatic temperatures and low silica contents). A dominant component of oceanic crust, basalt is the most abundant volcanic rock.

Rainfall and climate:

The area studied moderate humid climate with the minimum and maximum temperature of the area lies between 21° c (winter) to 45°c (summer). The annual rainfall recorded from 1500 to 2000 mm (source by National Informatics Centre).

1.0	<u>SCOPE</u> This specification shall govern all clearing, grubbing, excavating, area filling, grading and compacting soils for areas designated on the drawings. The work shall include clearing and grubbing, stripping and storage of top soil, excavation, blasting (if required), hauling, dumping and spreading of soil, undercutting to remove unstable soil areas, compacting existing soil surfaces and bottom of excavated areas to receive fills, compacting excavated areas for sub-grade, placing and compacting soils in fills, dealing with surface water, pumping to keep excavated areas and areas to be filled dry, final grading of designated areas, disposing of unsuitable and excess excavated materials and incidentals thereof. <u>2.0 GENERAL</u> <u>2.1 WORK TO BE PROVIDED FOR BY THE CONTRACTOR</u> The work to be provided for by the Contractor, unless specified otherwise, shall include but not be limited to the following: 2.1.1 Furnish all labour, supervision, services, earth-moving machineries and equipment, compaction plant and equipment, tools and plants, survey instruments, transportation etc. required for the work. 2.1.2 Prepare and submit working drawings showing the approaches, slopes, berms, sumps for dewatering, space for temporary stacking of spoils, disposal area, borrow pits, fencing etc. and all other details as may be required by the Engineer. 2.1.3 To carry out and submit to the Engineer, results of soil compaction tests whenever required by the Engineer to assess the degree of compaction. 2.1.4 If blasting is resorted to, necessary licenses to be procured from the proper authorities. <u>2.2 WORK TO BE PROVIDED FOR BY OTHERS</u> No work under this specification will be provided by any agency other

the Engineer's instructions. 2.5 <u>MATERIALS TO BE USED</u> 2.5.1 General All materials required for the work shall be of best commercial variety and as approved by the Engineer. 2.5.2 Borrow Material Borrow material required for area filling shall be excavated from approved locations and levels, and shall consist of selected material, approved by the Engineer, free from roots, vegetations, decayed organic matter, harmful salts and chemicals, free from lumps and clods. Clean graded sand, free from harmful and deleterious materials from approved quarries, shall be used as fill material at places approved during detail engineering stage. Necessary arrangement shall be done by the Contractor at his own cost for locating and using the borrow areas as the source of supply of filling material. The depth of borrow pits should be so regulated that the borrow pits do not cut an imaginary line having a slope of 1 vertical in 4 horizontal projected from the edge of final section of the adjacent embankment of stack of excavated soil. 2.6 <u>QUALITY CONTROL</u> The Contractor shall establish and maintain quality control for the various aspects of the work, method, materials and equipment used. The quality control operation shall include but not be limited to the following items of work: (a) Lines, Levels and Grades (i) Periodic Surveys (ii) Establishment of markers, Boards etc.

(iii) Checking levels and slopes of the graded surface. (b) Area filling (i) Checking the quality of fill material (ii) Checking moisture content of the fill. (iii) Checking the degree of compaction. 2.6.1 Any work which fails to conform to the specifications will be subject to the issue of a Non-conformance Report in line with the Quality Control Procedure to be implemented at site. Corrective or remedial action, design modifications or product rejection will be reviewed in accordance with the site Quality Plan. 2.7 <u>INFORMATION REGARDING SITE CONDITIONS</u> Boring and sub-surface data regarding the nature of soil, rock, sub-soil water etc. shown on drawings or otherwise furnished to the Contractor shall be taken as guidance only and variation there from shall not affect the terms of the Contract. The Contractor must satisfy himself regarding the character and volume of all work under this contract and expected surface, sub-surface and/or sub-soil water to be encountered. He must also satisfy himself about the general conditions of site and ascertain the existing and future construction likely to come up during the execution of the Contract so that he may evolve a realistic programme of execution. 3.0 <u>EXECUTION</u> 3.1 <u>GENERAL</u> The work shall be undertaken in accordance with the lines, levels, grades and details shown on the drawings, specification and the approved method of work. The works shall be carried out in a workman like manner without endangering the safety of nearby structures, roads, railway tracks, cable, pipelines, etc. and without causing hindrance to construction activities.

Suitable approaches, fencing, area lighting and temporary works required for the works shall be provided by the contractor. Sturdy and elegant fencing is to be provided around the top edge of the excavation as well as the bottom of the fill at the surplus disposal area where damping from a high bench is in progress, if directed by the Engineer. Adequate area lighting shall be provided by the contractor, if night work is undertaken. The Contractor shall submit a proposal covering the proposed excavation and placement of fill material for approval of the Engineer. The proposal shall include but not be limited to the following. (a) Mobilisation and demobilisation of plant (b) Proposed plant and equipment, labour resources & supervision. (c) Details of proposed method of clearing and grubbing for each area of cut and fill. (d) Drawings showing the areas for placement of material. (e) Management of excavation and filling works i.e. control of setting out, testing procedures, handling, temporary stockpiles etc. (f) Temporary works proposals (g) Excavation, filling and compaction by mechanical plant (h) Dealing with surface water (i) Dewatering (j) Disposal of materials (k) Safety precautions, fencing and lighting (l) Calculations as appropriate to support work proposal

3.2	<u>SETTING OUT</u> The Contractor will prepare and submit to the Engineer, detailed drawings of the excavation and filling work necessary, as proposed to be executed by him, showing the dimensions as per drawings and specification, adding his proposals for slopes, approaches, dewatering sumps, berms etc. On receiving the approval from the Engineer with modifications and corrections if necessary, the Contractor will set out the work from the control points furnished by the Engineer and fix permanent points and markers for future checking. These permanent points and markers will be checked by the Engineer and certified by him after which the Contractor will proceed with the work. Engineer shall be provided with necessary men, material and instruments for such checking. It should be noted that this checking by the Engineer prior to start of the work will in no way absolve the Contractor of his responsibility of carrying out the work to true lines, levels and grades as per drawing and subsequent corrections, if any. In case any errors are noticed in the Contractor's work at any stage, the same shall be remedied by the Contractor. 3.3 <u>INITIAL LEVELS</u> Initial levels either in a definite grid pattern or as directed by the Engineer will be taken by the Contractor jointly with the Engineer over the original ground prior to starting actual excavation work and after setting out. These initial levels will be used for preparing cross-sections for volume measurement or for cross-checking the depths obtained from tape measurements. These initial levels and cross-sections shall be jointly signed by the Contractor and the Engineer before commencement of work. 3.4 <u>CLEARING AND GRUBBING ETC.</u> The area to be excavated or filled shall be cleared out of fences, trees, logs, stumps, bush, vegetation, rubbish, slush, etc. and levelled up. Trees upto 300 mm girth shall be uprooted. Trees above 300 mm girth which are required to be cut, shall be got identified by the Engineer and then marked. Felling of trees shall include taking out roots upto 600 mm below ground level. After the tree is cut and roots taken out, the pot- holes formed shall be

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 19 of 549
filled with good earth in 250 mm layers and compacted to acceptable degree unless directed by the Engineer otherwise. The trees shall be cut in suitable pieces as instructed by the Engineer and then shall be transported to the Owner's store or any other space as directed by the Engineer. Before earthwork is started, all the spoils and unserviceable materials and rubbish shall be burnt or removed from the site to approved disposal areas as may be specified. Ash shall be spread or removed as directed by the Engineer. Useful materials, saleable timber, firewood, etc. shall be the property of the Owner and shall be stacked properly at the worksite in a manner as directed by the Engineer. 3.5 <u>CLASSIFICATION</u> Materials involved in earthwork shall be classified under the following categories. No distinction will be made whether the material is dry or wet. The Engineer's decision in regard to such classification shall be final and binding on the Contractor: (a) Ordinary and hard soil This shall include clay, silt, sand, moorum, shingle, kankar, gravel, loam, peat, ash and other similar materials in soft, hard or dense state which can generally be excavated with ordinary spade, pick axe, shovel etc. and does not require the use of wedges, pneumatic breaking equipment and/or blasting for removal. It shall also include loose rock boulders present in the soil, with dimensions not exceeding 500 mm in any direction. Breaking of consolidated brick ballast and mud concrete shall be considered equivalent to excavation work under this type of soil. (b) Soft and Decomposed Rock This shall include rocks like chalk, slate, mica schist, laterite and other similar materials which in the opinion of the Engineer is rock, but does not require blasting for removal and could be removed with picks, hammers, crow bars, wedges, pneumatic breaking equipment etc. It shall also include boulders with dimensions greater than 500

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 20 of 549
mm but not exceeding 1000 mm in any direction. The mere fact that the Contractor resorts to blasting for his own convenience shall not mean that the rock will be classified as hard rock. (c) Hard Rock This shall include rocks occurring in large masses which cannot be removed except by blasting. Harder varieties of rock such as trap, with or without veins and secondary mineral which in the opinion of the Engineer require blasting for removal shall also be considered as hard rock. It shall also include boulders bigger than 1000 mm in any direction. Construction in concrete, both reinforced and unreinforced, which is required to be dismantled during earthwork. 3.6 <u>EARTHWORK IN EXCAVATION</u> 3.6.1 General Before commencement of excavation the existing ground surface shall be cleared in accordance with Clause no. 3.4. All excavation shall be done to the minimum dimensions as required for safety and working facility. Prior approval of the Engineer shall be obtained by the Contractor, in each individual case, for the method he proposes to adopt for the excavation including dimension, side slopes, dewatering, disposal, etc. This approval, however, shall not in any way make the Engineer responsible for any consequent loss or damage. The excavation must be carried out in the most expeditious and efficient manner. Prior to starting the excavation, the ground level at the location shall be checked jointly with the Engineer. The rough excavation may be carried upto a maximum depth of 150 mm above the final level. The balance shall be excavated with special care. If directed by the Engineer, soft and undesirable spots shall be removed even below the final level.

3.6.2 Excavation in Ordinary Soil, Hard Soil & Soft and Decomposed Rock

The excavation in ordinary soil, hard soil and soft and decomposed rock shall be carried out as per the approved proposal, modified and corrected where necessary by the Engineer. The work shall be carried out in a workmanlike manner without endangering the safety of nearby structures or roads, railway tracks, cables, pipelines etc. if any, and without causing hindrance to other activities in the area. As the excavation reaches the required dimensions, lines, levels and grades, the work will be checked by the Engineer thoroughly and the balance work will be carried out carefully to avoid any over-excavation.

On completion, the work will be finally checked and approved by the Engineer. In case where excavation in soil, soft and decomposed rock and/or hard rock are involved, the soil or soft and decomposed rock layers, shall be removed by turn and levels of the underlying rock surfaces observed to enable measurements. Further work shall be resumed after getting clearance from the Engineer.

3.6.3 Excavation in Hard Rock

Overburden, if any, consisting of top soil, ordinary and hard soil, soft and decomposed rock as per classification of soil, which do not require blasting shall be completely stripped off and the levels of the hard rock surface shall be taken to enable measurement. Further work in hard rock shall be resumed after clearance from the Engineer.

Personnel deployed for rock excavations shall be protected from all hazards such as loose rock/boulder rolling down and from general slips of excavated surfaces. Where the excavated surface is such that it is not stable against sliding, necessary supports, props, bracings or bulkheads shall be provided and maintained during the period of construction. Where danger exists of loose rock/boulder falling from the excavated surfaces deeper than 2 metres, steel mesh anchored to the lower edge of excavation and extending over and above the rock face, adequate to retain the dislodged material shall be provided and maintained.

In case where blasting, though otherwise required, is prohibited for any reasons, the excavation shall be carried out by chiselling, wedging or any

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 22 of 549
other approved method. All loose or loosened rock in the sides shall be removed by barring, wedging, etc. 3.6.4 Blasting 3.6.4.1 General Excavation shall be continued in hard rock to such widths, lengths, depths and profiles as are shown on the drawings or such other lines and grades as may be specified by the Engineer. As far as possible all blasting shall be completed prior to commencement of construction. At all stages of excavation, precautions shall be taken to preserve the rock below and beyond the lines for the excavation, in the soundest possible condition. The quantity and strength of explosive used, shall be such as will neither damage nor crack the rock outside the limits of excavation. All precautions, as directed by Engineer, shall be taken during the blasting operations and care shall be taken that no damage is caused to adjoining buildings or structure as a result of blasting operations. In case of damage to permanent or temporary structures, Contractor shall repair the same to the satisfaction of Engineer. As excavation approaches its final lines and levels, the depth of the charge holes and amount of explosives used shall be progressively and suitably reduced. Unless otherwise stated herein, I.S. Specification IS: 4081 "Safety Code for Blasting & Related Drilling Operation" shall be followed. Specific permission of Engineer will have to be taken by Contractor for blasting rock and he shall also obtain a valid Blasting licence from the authorities concerned. Contractor shall obtain necessary licence for storage of explosives, fuses and detonators issued to him from owner's stores or from supplier arranged by him, from the authorities dealing with explosives. The fees, if any, required for obtaining such licence, shall be borne by Contractor. Contractor shall have to make necessary storage facilities for the explosives etc. as per rules of local, State and Central Govt. authorities and statutory bodies/ regulations.		

CONSULTANT : PROCON ENGINEERS

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 23 of 549
In no case shall blasting be allowed closer than 30 metres to any structure or to locations where concrete has just been placed. In the latter case the concrete must be at least 7 days old. Contractor shall employ a competent experienced supervisor and licensed blaster in-charge of each set of operation, who shall be held personally responsible to ensure that all safety regulations are carried out. Before any blasting is carried out, Contractor shall intimate Engineer and obtain his approval in writing for resorting to such operations. He shall intimate the hours of firing charges, the nature of explosive to be used and the precautions taken for ensuring safety. The blasting of rock near any existing buildings, equipments or any other property shall be done under cover and Contractor has to make all such necessary muffling arrangements. Covering may preferably be done by M.S. plates with adequate dead weight over them. Blasting shall be done with small charges and where directed by Engineer, a trench shall have to be cut by chiseling prior to the blasting operation separating the area under blasting from the existing structures. When excavation has almost reached the desired level, hand trimming shall have to be done for dressing the surface to the desired level. Any rock excavation beyond an over break limit of 75 mm shall be filled up as instructed by Engineer, with concrete of strength not less than M 10. Stepping in rock excavation shall be done by hand trimming. Contractor shall be responsible for any accident to workmen, public or Owner's property due to blasting operations. Contractor shall also be responsible for strict observance of rules, laid by Inspector of Explosives, or any other authority duly constituted under the State and/or Union Government. Storage, handling and use of explosives shall be governed by the current explosive rules laid down by the Central and the State Governments. The Contractor shall ensure that these rules are strictly adhered to. The following instruction, wherever found in variance with the above rules, shall be considered as superseded by the above rules. No child under the age of 16 and no person who is in a State of intoxication

shall be allowed to enter the premises where explosives are stored nor they shall be allowed to handle the explosives. 3.6.4.2 Material All materials such as explosives, detonators, fuses tamping materials etc. proposed to be used in the blasting operations shall have the prior approval of the Engineer. Only explosives of approved make and strength are to be used. The fuses known as instantaneous fuse must not be used. The issue of fuse with only one protective coat is prohibited. The fuse shall be sufficiently water resistant as to be unaffected when immersed in water for thirty minutes. The rate of burning of the fuse shall be uniform and not less than 4 seconds or inch of length with 10% tolerance on either side. Before use, the fuse shall be inspected and moist damaged or broken ones discarded. The rate of burning of fuses or when they have been in stock for long shall be tested before use. The detonators used shall be capable of giving an effective blasting of the explosives. Moist and damaged detonators shall be discarded. 3.6.4.3 Storage of Explosive Storage of explosives shall be governed by the current Explosive Rules. Explosives shall be stored in a clean, dry, well ventilated magazine to be specially built for the purpose. Under no circumstances should a magazine be erected within 400 m of the actual work site or any source of fire. A space surrounding the magazine shall be fenced in. The ground inside the fence shall be kept clear and free from trees, bushes etc. The admission to this fenced space shall be by one gate only and no person shall be allowed inside this fence without permission of the Officer-in-charge. The clear space between the fence and the magazine shall not be less than 90m. The megazine shall be perfectly well drained. Two lightning conductors shall be provided to the magazine, one at each end. The lightning conductors shall be tested once in every year. Fuses and detonators shall be stored in separate magazines. However,		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 25 of 549
detonators can be kept in an annexe adjoining the magazine provided that their number does not exceed 25,000 and that the annexe is so constructed that not less than 60 cm masonry and 100 cm of air space shall intervene between any detonators in such annexe and the interior of the main magazine. Cases containing explosives are not to be opened in a magazine. Explosive in open cases are not to be received into a magazine. Explosives which appear to be in a damaged or dangerous condition are not to be kept in any magazine, but must be removed without delay to a safe distance and destroyed. Persons entering the magazine, must put on the magazine shoes which shall be provided at the magazine for this purpose and should be careful: - Not to put their feet on the clean floor unless they have the magazine shoes on. - Not to allow the magazine shoes to touch the ground outside the clean floor. - Not to allow any dirty or grit to fall on the clean floor. Persons with bare feet, shall before entering the magazine, dip their feet in water and then step direct from the tub over the barrier (if there be one) on to the clean floor. A brush broom shall be kept in the lobby of the magazine for cleaning out the magazine on each occasion, if it is opened for the receipt, delivery or inspection of explosives. No matches or inflammable materials shall be allowed inside the magazine. Illumination shall be obtained from an electric storage battery lantern. No smoking shall be allowed within 100 m of a magazine. No person having article of steel or iron on him shall be allowed to enter the magazine. Oily cotton, rag waste and articles liable to spontaneous ignition shall not be allowed inside the magazine.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 26 of 549

Workmen shall be examined before they enter the magazine to see that they have none of the prohibited articles on their person.

The mallets, levers, wedges etc. for opening barrels or cases are to be of wood. Inside a magazine the cases of explosives are to be carried by hand and shall not be rolled or dragged. Explosives which have been issued and returned to the magazine are to be issued first; otherwise those which have been longest in store are to be issued first.

Cases of explosives must be kept clear of the walls and floors for free circulation of air on all sides, special care is to be taken to keep the floor free from grains of powder or portions of explosive matter fallen on the floors due to leakage of cases etc.

The magazine shall not be opened during any dust storm or thunderstorm nor any person shall be allowed in the vicinity of the magazine.

All magazines shall be officially inspected at definite intervals and a record of the results of such inspections shall be kept.

3.6.4.4 Carriage of Explosives

Detonators and explosives shall be transported separately to the blast site. Explosives shall be kept dry and away from the direct rays of the sun, naked lights, steam pipes or heated metal and other sources of heat. Before explosives are removed, each cage or package is to be carefully examined to ascertain that it is properly closed and shows no sign of leakage.

No person except the driver shall be allowed to travel on a vehicle conveying explosives. No carriage or vessel shall be used for transporting explosives unless all iron or steel therein with which a package containing any explosive is likely to come in contact is effectually covered with lead, leather, wood, cloth or other suitable material. No lights shall be carried on the vehicle carrying explosives.

No operation connected with the loading, unloading and handling of explosives shall be conducted after sunset.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 27 of 549

3.6.4.5 Use of Explosives

The Contractor shall appoint an agent who shall personally superintend the firing and all operations connected therewith.

The contractor shall satisfy himself that the person so appointed is fully acquainted with the responsibilities imposed on him.

Holes for charging explosives shall be drilled with Pneumatic drills, the drilling pattern being so planned that the rock pieces after blasting will be suitable for handling.

The hole diameter shall be of such a size that cartridges can easily pass down them and undue force is not required during charging. Charging operations shall be carried out by or under the personal supervision of the shotfirer. Wrappings shall never be removed from explosive cartridges. Only wooden rods shall be used for loading and stemming shotholes. Only one cartridge at a time shall be inserted and gently passed home with the wooden tamping rod.

Only such quantities of explosives as are required for the particular amount of work to be done shall be brought to the works. Should any surplus remain when all the holes have been charged, it shall be carefully removed to a point at least 300 m from the firing point.

The explosives shall be fired by means of an electric detonator placed inside the cartridge. For simultaneous firing of a number of charges the electric detonators shall be connected with the exploder through the shotfiring cable in a simple series circuit.

Due precautions shall be taken to keep the firing circuit insulated from the ground, bare wires, rails, pipes or any other path of stray current and to keep the lead wires short circuited until ready to fire. Any Kinks in detonator leading wire shall be avoided.

For simultaneous firing of a large number of shotholes, use of cordtex may be done. Cordtex shall be initiated by an electric detonator attached to its side with adhesive tape, connecting wire or string.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 28 of 549
All connections shall be made by the authorised shotfirer himself. The shotfiring cable shall not be dragged along the ground to avoid possible damage to the insulation. The shotfiring cable shall be tested for continuity and possible short circuiting before it is used each time. The shotfirer shall always carry the exploder handle on his person until he is ready to fire shots. The number of shots fired at a time shall not exceed the permissible limits. Before any blasting is carried out, it shall be ensured that all workmen, vehicles and equipment on the site are cleared from an area of minimum 300 metres radius from the firing point, or as required by statutory regulations, at least ten minutes before the time of firing by sounding a warning siren. The area shall be encircled by red flags. At least five minutes after the blast has been fired in case of electric firing or as stipulated in the regulations, the authorised shotfirer shall return to the blast area and inspect carefully and shall compare the number of blasts planted/fired to the actual number of shots heard and satisfy himself that all blast have exploded. Withdrawal unexploded charges shall not be permitted. The unexploded charges shall be flooded with water and the hole shall be marked in distinguishable manner. Another hole shall be made by drilling a parallel fresh hole not less than 450 mm from misfired hole and fired in the usual way. The process shall be continued till the original blast is exploded. The engineer shall also be informed by the Contractor of all the cases of misfired/unexploded charges, their causes and steps taken. The authorised shotfirer shall be present during removal of the debris liable to contain unexploded explosives near the misfired hole. The workmen shall not return to the site of firing until at least half an hour after firing. Adequate safety precautions as per building bye-laws, safety code, statutory regulations etc. shall be taken during blasting operations. 3.6.5 Disposal The excavated spoils will be disposed off within the specified lead in any or

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 29 of 549
a combination of some of the following manners, as directed by the Engineer: (a) By stacking separately the materials suitable for area filling and materials not suitable. (b) By stacking it temporarily for use in backfilling at a later date. (i) By either spreading, or (ii) Spreading and compacting at designated filling areas and/or disposal areas. 3.6.6 Dewatering All areas shall be kept free of water. Grading in the vicinity of excavations shall be controlled to prevent surface water running into excavated areas. The Contractor shall remove by pumping or other means approved by the Engineer, any water inclusive of rain water and subsoil water accumulated in the area. Method of dewatering shall be got approved by the Engineer. 3.6.7 Dealing with Surface Water All working areas shall be kept free of surface water as far as reasonably practicable. Works in the vicinity of cut areas shall be controlled to prevent the ingress of surface water. Working surfaces shall be formed to such falls to shed water and prevent ponding. No works shall commence until surface water streams have been properly intercepted, redirected or otherwise dealt with. Where works are undertaken in the monsoon period, the Contractor may need to construct temporary drainage systems to drain surface water from working areas.

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 30 of 549

3.7 TREATMENT OF SLIPS

The Contractor will take all precautions to avoid high surcharges and provide proper surface drainage to prevent flow of water over the sides. These precautions along with proper slopes, berms and control of ground water should cause no slips to occur. If however slips do occur due to causes beyond control of the Contractor, the same shall be removed by him.

3.8 EARTHWORK IN FILLING

3.8.1 Area Filling for Grading

The material to be used for area filling shall be selected material capable of being compacted to the requirements stated herein below and approved by the Engineer, obtained directly from excavation for area grading, from nearby areas where excavation work by the same agency is in progress, from temporary stacks of excavated spoils or from borrow pits in selected areas designated/approved by the Engineer. The quality of the material shall conform to that mentioned in clause 2.5.2 of this specification.

Where excavated material is mostly rock, the boulders shall be broken into pieces not more than 150 mm size, mixed with properly graded fine material consisting of murum or earth to fill up the voids and the mixtures used for filling.

If any material is rejected by the Engineer, Contractor shall remove the same forthwith from the site at no extra cost to the Owner. Surplus fill material shall be deposited/disposed of as directed by the Engineer after the fill work is completed.

No earthfill shall commence until surface water discharges and streams have been properly intercepted or otherwise dealt with as directed by the Engineer.

Before commencement of area filling, the existing top soil shall be removed upto a minimum depth of 150 mm or more, as directed by the Engineer in order to clear the surface of undesirable materials. After this, the filling operation shall be performed with earth in layers not exceeding 250 mm,

CONSULTANT : PROCON ENGINEERS

loose thickness. Successive layers shall not be placed until the layer under construction has been thoroughly compacted to the specified requirements as given below and got approved by the Engineer. (a) Each layer of earth of cohesive in nature shall be compacted to 95% of proctors dry density unless otherwise permitted/directed by the Engineer. (b) Each layer of earth of non-cohesive in nature shall be compacted to minimum 75% relative density unless otherwise permitted/directed by the Engineer. Each shall be compacted with approved machine (mechanical plant) and usually manual compaction shall not be allowed unless specifically permitted by the Engineer. The original ground formation and each fill layer shall be compacted by rollers as described below with a maximum of six passes of 8/10 tonne roller. (i) When the optimum moisture content of soil is relatively high, a pneumatic tyred roller (tyre pressure 3.0 - 3.5 kg/sq.cm) shall be considered to give better performance for mechanical compaction. (ii) When the optimum moisture content of soil is relatively low, a vibrating roller shall be considered to give better performance for mechanical compaction. Since the degree of compaction depends on the moisture content of the soil, a close watch shall be kept on this aspect and corrections done to optimise the moisture content. The adequacy of the compaction and moisture content of the soil shall be determined by performing field density tests and other tests as and when directed by the Engineer and shall conform to the stipulations laid down in IS:4701. The cohesionless soil to be used for area filling, should be placed in fully saturated condition to obtain the maximum possible density. The saturation moisture content shall be determined by laboratory tests prior to commencement of work. Field compaction test shall be carried out at different stages of filling and also after the fill to the entire height has been completed.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 32 of 549

When density measurements reveal soft areas in the construction, further compaction shall be undertaken at the contractor's cost as directed by the Engineer. If the required compaction is not achieved, the material in the soft area shall be removed and replaced by approved material and compacted in accordance with this specification, all to the contractor's account.

The fill shall be carried out to such dimensions and levels as indicated on the drawings after the stipulated compaction. The fill will be considered as incomplete if the desired compaction has not been obtained.

If so specified, the rock as obtained from excavation may be used for filling and levelling to indicate grades without further breaking. In such an event, filling shall be done in layers not exceeding 50 cms approximately. After rock filling to the approximate level, indicated above has been carried out, the void in the rocks shall be filled with finer materials such as earth, broken stone etc. and the area flooded so that the finer materials fill up the voids. Care shall be taken to ensure that the finer fill material does not get washed out. Over the layer so filled, a 100 mm thick mixed layer of broken material and earth shall be laid and consolidation carried out by a 12 tonne roller. No less than 12 passes of the roller shall be accepted before subsequent similar operations are taken up.

3.8.2 Filling in Disposal Areas

Excavated materials if not used in area filling, will be disposed of in designated disposal areas as directed or as indicated in the drawings. The earth shall not be dumped haphazardly but shall be spread in horizontal layers not exceeding 500 mm in thickness and nominal compaction done to the satisfaction of the Engineer.

All clods shall be broken before placing the fill. Earthmoving machinery including dumpers, dozers and trucks shall be allowed to ply over the fill to permit compaction to take place.

In wide areas rollers may be employed and nominal compaction done to the satisfaction of the Engineer.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 33 of 549

3.9 COMPACTION CONTROL

The density of each layer of compacted soil shall be ascertained by testing a number of samples. For this purpose the necessary arrangements for soil testing at the site shall be made by the Contractor in accordance with these specifications and as directed by the Engineer.

The Contractor shall arrange the provision of the field laboratory including the testing equipment and a suitable motor vehicle. He shall also supply all consumable materials such as kerosene, spirit, gas and sample bags, as required.

All soil testing is to be carried out by a competent and suitable qualified engineering testing firm. The Contractor is to obtain the Engineer's approval for the firm to be used. The Contractor may undertake this work with the Engineer's approval.

All density testing shall be carried out on a lot by lot basis. A lot shall be considered to be a portion of work which is essentially homogeneous with respect to material type general appearance response during compaction, moisture condition during compaction, compaction process and state of underlying material.

All fill testing shall be carried out in accordance with the recent editions of relevant Indian Standards. The chainage and the off-set from the centre line of the fill of each test sample shall be recorded and presented along with the test results.

Each test lot shall be classified as cohesionless or cohesive. The classification shall be determined by the Engineer based upon particle size distribution. Cohesionless fill shall have 10% or less by mass of particles finer than 0.075 mm. Otherwise fill shall be treated cohesive.

For cohesionless fill material, a representative laboratory sample obtained from three field samples from each test lot shall be tested to determine its maximum and minimum dry density. These reference values of dry density shall be used to compute the density index (relative density) of each of the field density test samples taken from the test lot.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-1
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 34 of 549
For cohesive fill material, a representative laboratory sample obtained from three field samples from each test lot shall be tested to determine its maximum dry density and optimum moisture content (OMC). These reference values of dry density and moisture content shall be used to compute the dry density ratio of each of the field density test samples taken from that test lot. The degree of compaction shall be determined by considering the mean density of the samples in each test lot. The mean dry density shall be equal to or exceed the minimum specified density. In no individual case shall density be less than the minimum value specified by more than 2 percent; otherwise further rolling shall be done at the appropriate locations. The contractor shall lay a further layer or fill only after compaction or a particular layer has been found and approved by the Engineer. 4.0 <u>TESTING AND ACCEPTANCE CRITERIA</u> 4.1 <u>SOIL TESTING</u> The following tests shall be undertaken by the Contractor and results and reports shall be submitted to the Engineer for approval. Test failures are to be immediately notified to the Engineer, otherwise results to be submitted within 24 hours of testing. Each layer of material shall be tested for compaction. Each layer is to be tested in a manner that is representative of its full depth. The Engineer may at his discretion instruct the Contractor to increase or decrease the frequency of testing. (a) Minimum one test per 500 cu.m. of soil coming out of the borrow pits for determination of natural moisture contents in order to evaluate how far the natural moisture content tallies with the optimum value and whether further addition or reduction of water content would be necessary. Test to be done in accordance with IS: 2720 (Part-II). (b) Minimum two sets of laboratory tests per 8000 cu.m. of soil coming out of the borrow pits for determination of dry density at optimum

moisture content. Test to be done in accordance with IS: 2720 (Part-VII, XIV, XXVIII, XXIV) as applicable. (c) Minimum two sets of test per 500 cu.m. of loose fill for determination of moisture content just prior to compaction of area filling. Test to be done in accordance with IS: 2720 (Part-II). (d) For each compacted layer, minimum one test per 2000 sq.m. of compacted area for determination of moisture content and dry density. (e) Minimum two tests per 8000 cu.m. of soil for determination of soil classification. Test to be done in accordance with IS: 2720 (Part-IV). (f) Minimum 10 (ten) density measurements shall be plotted to establish moisture content-dry density relationship. 4.2 <u>ACCEPTANCE CRITERIA</u> 4.2.1 Excavation On completion of excavation, the dimensions of the area will be checked as per the drawings after the area is completely dewatered. The work will be accepted after all undercuts have been set right and all over excavations filled back to required lines, levels and grades by compacted earth. Over excavation of the sides will be made good free of cost by the Contractor. The excavation work will be accepted after the above requirements are fulfilled & all temporary approaches encroaching inside the required dimension of the excavation have been removed. 4.2.2 Area-filling The degree of compaction required will be as per the stipulations laid down in appropriate sections of this specification. The actual method for measuring the compaction achieved will be as decided by the Engineer. The work of area filling will be accepted after the Engineer is satisfied with the degree of compaction achieved.

5.0 <u>INFORMATION TO BE SUBMITTED</u> 5.1 <u>WITH TENDER</u> Following details of Machineries, transport vehicles, equipment proposed to be used for excavation, area-filling and compaction have to be submitted along with the tender: (a) Equipment, machinery & earthmoving vehicles, available with the Contractor and proposed to be used for excavation and haulage giving details regarding make, model, capacity, year of manufacture, numbers available for this contract and general condition. (b) Equipment proposed to be used for area filling and compaction giving similar details as in item 5.1 (a) above. (c) Method of transportation. 5.2 <u>AFTER AWARD</u> After award of contract the successful bidder shall submit the following for approval and adoption: (a) Within 15 days of Award of the contract, the Contractor shall submit a detailed programme of work as proposed to be executed giving completion dates of excavation of the various areas and the time required for area-filling and compaction. The programme should also show how the excavation and area-filling quantities will be balanced, minimising temporary stacking of spoils. It is to be noted that the Engineer even after initial approval of the programme, may instruct to enhance or retard the progress of work during the actual execution, in order to match with overall construction schedule without attracting any claims from the Contractor. The initial programme being submitted by the Contractor should have sufficient flexibility to take care of such reasonable variations.

1.0 <u>SCOPE</u> This specification covers excavation in all types of soil, soft and decomposed rock not requiring blasting and rocks requiring blasting, shoring, dewatering, filling around foundations and to grade, compaction of fills and approaches, protective fencing, lighting, etc. relevant to structures and locations covered under the scope of this contract. 2.0 <u>GENERAL</u> 2.1 <u>WORK TO BE PROVIDED FOR BY THE CONTRACTOR</u> The work to be provided for by the Contractor, unless specified otherwise, shall include but not be limited to the following: (a) Furnish all labour, supervision, services including facilities as required under statutory labour regulations, materials, scaffolds, equipment, tools and plants, transportation, etc. required for the work. (b) Prepare and submit working drawings showing the approaches, slopes, berms, shoring, sumps for dewatering, including drains and outfall for drainage, space for temporary stacking of spoils, disposal area, fencing, etc. and all other details as may be required by the Engineer. (c) To carry out sampling and testing and submit to the Engineer, results of soil compaction tests whenever required by the Engineer to assess the degree of compaction. (d) Construction, maintenance and removal after completion of magazine of proper capacity as well as design for storing of explosives required for blasting work to be carried out under the scope of this Tender including procurement of necessary licenses from proper authorities.

2.2 WORK TO BE PROVIDED FOR BY OTHERS

No work under this specification will be provided by any agency other than the Contractor unless specifically mentioned elsewhere in the Contract.

2.3 CODES AND STANDARDS

All works under this specification, unless specified otherwise, shall conform to the latest revision and/or replacement of the following or any other Indian Standard Specifications and Codes of Practice. In case any particular aspect of work is not covered specifically by Indian Standard Specification, any other standard practice as may be specified by the Engineer shall be followed.

(a) IS:1200 (Part-I) : Method of Measurement of Building and Civil Engineering work; Part - I Earthwork.

(b) IS:2720 (Part-II) : Determination of Moisture Content

(c) IS:2720 (Part-VII) : Determination of Moisture content / Dry Relation using Light Compaction.

(d) IS:2720 (Part-XIV) : Determination of Density Index (Relative Density) of cohesionless soils.

(e) IS:2720 (Part xxix) : Determination of Dry Density, in place, by core cutter method.

(f) IS:2720 (Part-xxviii) : Determination of Dry Density of soils, in place, by sand replacement methods.

(g) IS:3764 : Safety code for Excavation work.

(h) IS:4081 : Blasting and Related Drilling Operations

(i) IS:4701 : Earthwork on canals

2.4 CONFORMITY WITH DESIGNS

The Contractor is to carry out the work as per the drawings issued to him and/or Contractor's drawings which are approved by the Engineer and/or

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

the Engineer's instructions. 2.5 <u>MATERIALS TO BE USED</u> 2.5.1 General All materials required for the work shall be of best commercial variety and approved by the Engineer. 2.5.2 Borrow Material Borrow material required for back-filling shall be excavated from approved locations and levels, and shall consist of material, approved by the Engineer, free from roots, vegetations, decayed organic matter, harmful salts and chemicals, free from lumps and clods. If specified, clean graded sand free from harmful and deleterious material from approved quarries shall be used as fill material. 2.6 <u>QUALITY CONTROL</u> The Contractor shall establish and maintain quality control for the various aspects of the work, method, materials and equipment used. The quality control operation shall include but not be limited to the following items of work: 2.6.1 Lines, Levels and Grades (a) Periodic Surveys (b) Establishment of markers, boards etc. (c) Checking the quality of fill material 2.6.2 Back-filling (a) Checking moisture content of the back fill (b) Checking the degree of compaction		

CONSULTANT : PROCON ENGINEERS

2.7	<u>INFORMATION REGARDING SITE CONDITIONS</u> Surface and Sub-surface data regarding the nature of soil, rock, sub-soil water etc. shown on drawing or otherwise furnished to the Contractor shall be taken as guidance only and variation there from shall not affect the terms of the contract. The Contractor must satisfy himself regarding the character and volume of all work under this contract and expected surface, sub-surface and/or sub-soil water to be encountered. He must also satisfy himself about the general conditions of site and ascertain the existing and future construction likely to come up during the execution of the contract so that he may evolve a realistic programme of execution. <u>3.0 EXECUTION</u> <u>3.1 SETTING OUT</u> The Contractor will prepare and submit to the Engineer, detailed drawings of the excavation work as proposed to be executed by him showing the dimensions as per drawings and specification adding his Proposals of slopes, shorings, approaches, dewatering sumps, berms, etc. On receiving the approval from the Engineer with modifications and corrections, if necessary, the Contractor will set out the work from the control points furnished by the Engineer and fix permanent points and markers for ease of future checking. These permanent points and markers will be fixed at intervals prescribed by the Engineer and checked by the Engineer and certified by him after which the Contractor will proceed with the work. Engineer shall be provided with necessary men, material and instructions for such checking. It should be noted that this checking by the Engineer prior to start of the work will in no way absolve the Contractor of his responsibility of carrying out the work to true lines and levels and grades as per drawing and subsequent corrections, if necessary, in case any errors are noticed in the Contractor's work at any stage. <u>3.2 INITIAL LEVELS</u> Initial levels of the ground either in a definite grid pattern or as directed by	

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 47 of 549
the Engineer will be taken by the Contractor jointly with the Engineer over the original ground prior to starting actual excavation work and after setting out. These initial levels will be used for preparing cross-sections for volume measurement or for cross-checking the depths obtained from tape measurements. All records of levels, measurements etc. and also any drawing, cross section etc. made there from, shall be jointly signed by the authorised representative of the contractor and the Engineer before the commencement of work and they shall form the basis of all payments in future. 3.3 <u>CLEARING AND GRUBBING ETC.</u> The area to be excavated or filled shall be cleared out of fences, trees, logs, stumps, bush, vegetation, rubbish, slush, etc. and levelled up. Trees upto 300mm girth shall be uprooted. Trees above 300 mm girth to be cut, shall be approved by the Engineer and then marked. Felling of trees shall include taking out roots upto 600 mm below ground level or 150 mm below formation level whichever is lower. After the tree is cut and roots taken out, the pot-holes formed shall be filled with good earth in 250 mm layers and consolidated unless directed by the Engineer otherwise. The trees shall be cut in suitable pieces as instructed by the Engineer. Before earthwork is started, all the spoils and unserviceable materials and rubbish shall be burnt or removed from the site to approved disposal areas as may be specified. Ash shall be spread or removed. Useful materials, saleable timber, firewood, etc. shall be the property of the Owner and shall be stacked properly at the worksite in a manner as directed by the Engineer. 3.4 <u>CLASSIFICATION</u> All earthwork shall be classified under the following categories : No distinction will be made whether the material is dry or wet. (a) Ordinary Soil This shall comprise vegetable or organic soil, turf, sand, silt, loam, clay, mud, peat, black cotton soil, soft shale or loose moorum, a mixture of these and similar material which yields to the ordinary		

CONSULTANT : PROCON ENGINEERS

application of pick and shovel, rake or other ordinary digging implement. Removal of gravel or any other nodular material having diameter in any one direction not exceeding 75 mm occurring in such strata shall be deemed to be covered under this category. (b) Hard Soil This shall include: (i) Stiff heavy clay, hard shale, or compact moorum requiring grafting tool or pick or both and shovel, closely applied. (ii) gravel and cobble stone having maximum diameter in any one direction between 75 and 300 mm, soling of roads, paths, etc. and hard core, (iii) macadam surfaces such as water bound and bitumen/tar bound, (iv) lime concrete, stone masonry in lime mortar and brick work in lime/ cement mortar, below ground level, (v) soft conglomerate, where the stones may be detached from the matrix with picks and (vi) generally any material which requires the close application of picks, or scarifiers to loosen and not affording resistance to digging greater than the hardest of any soil mentioned in (i) and (vi) above. (c) Soft and Decomposed Rock This shall include: (i) limestone, sandstone, laterite, hard conglomerate or other soft or disintegrated rock which may be quarried or split with crowbars; (ii) Unreinforced cement concrete which may be broken up with

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 49 of 549
crowbars or picks and stone masonry in cement mortar below ground level ; (iii) Boulders which do not require blasting having maximum diameter in any direction of more than 300 mm, found lying loose on the surface or embedded in river bed, soil, talus, slope wash and terrace material of dissimilar origin ; and (iv) Any rock which in dry state may be hard, requiring blasting, but which when wet becomes soft and manageable by means other than blasting. (d) Hard Rock (requiring blasting) This shall include: (i) Any rock or cement concrete for the excavation of which the use of mechanical plant or blasting is required ; (ii) Reinforced cement concrete (reinforcement cut through but not separated from the concrete) below ground level; and (iii) Boulders requiring blasting. (e) Hard Rock (blasting prohibited) Hard rock requiring blasting as described under (d) but where blasting is prohibited for any reason and excavation has to be carried out by chiselling, wedging or any other agreed method. In case of any dispute regarding classification, the decision of the Engineer shall be final. 3.5 <u>EXCAVATION FOR FOUNDATIONS AND TRENCHES</u> 3.5.1 General All excavations shall be done to the minimum dimensions as required for safety and working facility. Prior approval of the Engineer shall be obtained		

CONSULTANT : PROCON ENGINEERS

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 50 of 549
by the Contractor, in each individual case, for the method he proposes to adopt for the excavations including dimension, side slopes, shoring, dewatering, disposal, etc. This approval, however, shall not in any way make the Engineer responsible for any consequent loss or damage. The excavation must be carried out in the most expeditious and efficient manner. All excavation in open cuts shall be made true to line, slopes and grades shown on the drawing or directed by the Engineer. No material shall project within the dimension of minimum excavation lines marked. Boulders projecting out of the excavated surfaces shall be removed, if in the opinion of the Engineer they are likely to be a hindrance to the workers. Method of excavation shall be in every case subject to the approval of the Engineer and the Contractor shall ensure the stability and safety of the excavation, adjacent structures, services and works. The Contractor shall have full responsibility of the stability of the excavation and safety of the workmen. If any slip occurs, the Contractor shall remove all slipped material from the excavated pit. All loose boulders, semi-detached rocks, not directly in excavation but so close to the area to be excavated as to be liable, in the opinion of the Engineer, to fall or otherwise endanger the workmen, equipment of the work etc., shall be stripped off and removed away from the areas of excavation. The method used shall be such as not to shatter or render unstable or unsafe the portion which was originally sound and safe. Any materials not requiring removal as contemplated in the work, but which, in the opinion of the Engineer, is later to become loose or unstable shall also be promptly and satisfactorily removed as directed by the Engineer. Prior to starting the excavation, the ground level at the location shall be checked jointly with the Engineer. The rough excavation may be carried upto a maximum depth of 150 mm above the final level. The balance shall be excavated with special care. If directed by the Engineer, soft and undesirable spots shall be removed even below the final level. The extra excavation shall be filled up as instructed by the Engineer.

If the excavation is done to a depth greater than that shown on the drawing, or directed by the Engineer, due to the Contractor's fault, the excess depth shall be filled up to the required level (with cement concrete not leaner than 1:4:8 ordinary concrete or richer) as directed by the Engineer in each individual case. In formation of rock requiring blasting, those overcuts which are unavoidable will be made up by ordinary cement concrete 1:2:4. All excavated materials such as hard rock, boulders, bricks, dismantled concrete blocks etc. shall be stacked separately as directed by the Engineer and shall be the property of the Owner. 3.5.2 Excavation in Ordinary Soil, Hard Soil and Soft and Decomposed Rock The excavation in ordinary soil, hard soil, soft and decomposed rock will be carried out as per the approved proposal, modified and corrected where necessary by the Engineer. The work will be carried out in a workmanlike manner without endangering the safety of nearby structures/services or works and without causing hindrance to other activities in the area. As the excavation reaches the required dimensions, lines, levels and grades, the work will be checked by the Engineer thoroughly and the balance work will be carried out carefully to avoid any over-excavation. On completion, the work will be finally checked and approved by the Engineer. In certain cases, where deterioration of the ground, upheaval, slips etc. are expected, the Engineer may order to suspend the work at any stage and instruct the Contractor to carry out the balance work just before the foundation work of the structure can be started. 3.5.3 Excavation in Hard Rock In case where excavation, both in ordinary soil and hard rock, are involved, the ordinary soil comprising of soft, hard and dense soils (including laterite formations) and rock including weathered rocks, lateritic rocks, etc. which can be excavated without blasting, shall be completely stripped off. Further work in hard rock shall be resumed after clearance from the Engineer. Personnel deployed for rock excavations shall be protected from all hazards such as loose rock/boulder rolling down and from general slips of excavated surfaces. Where the excavated surface is such that it is not stable

against sliding, necessary supports, props, bracings or bulkheads shall be provided and maintained during the period of construction. Where danger exists of loose rock/boulder falling from the excavated surfaces deeper than 2 metres, steel mesh anchored to the lower edge of excavation and extending over and above the rock face, adequate to retain the dislodged material shall be provided and maintained. In case where blasting, though otherwise required, is prohibited for any reasons, the excavation shall be carried out by chiselling, wedging or any other approved method. 3.5.4 Blasting 3.5.4.1 General Storage, handling and use of explosives shall be governed by the current explosive rules laid down by the Central and the State Governments. The Contractor shall ensure that these rules are strictly adhered to. The following instruction, wherever found in variance with the above rules, shall be considered as superseded by the above rules. No child under the age of 16 and no person who is in a state of intoxication shall be allowed to enter the premises where explosives are stored nor they shall be allowed to handle the explosives. 3.5.4.2 Storage of Explosive Storage of explosives shall be governed by the current Explosive Rules, Explosives shall be stored in a clean, dry, well ventilated magazine to be specially built for the purpose. Under no circumstances should a magazine be erected within 400 m of the actual work site or any source of fire. A space surrounding the magazine shall be fenced in. The ground inside the fence shall be kept clear and free from trees, bushes etc. The admission to this fenced space shall be by one gate only and no person shall be allowed inside this fence without permission of the Officer-in-charge. The clear space between the fence and the magazine shall not be less than 90m. The mezzanine shall be perfectly well drained.

Two lightning conductors shall be provided to the magazine, one at each end. The lightning conductors shall be tested once in every year. Fuses and detonators shall be stored in separate magazines. However, detonators can be kept in an annexe adjoining the magazine provided that their number does not exceed 25,000 and that the annexe is so constructed that not less than 60 cm masonry and 100 cm of air space shall intervene between any detonators in such annexe and the interior of the main magazine. Cases containing explosives are not to be opened in a magazine. Explosive in open cases are not to be received into a magazine. Explosives which appear to be in a damaged or dangerous condition are not to be kept in any magazine, but must be removed without delay to a safe distance and destroyed. Artificial light is not to be allowed in any magazine. No smoking shall be allowed within 100 m of a magazine. Magazine shoes without nails shall be used while entering the magazine. The mallets, levers, wedges etc. for opening barrels or cases are to be of wood. Inside a magazine the cases of explosives are to be carried by hand and shall not be rolled or dragged. Explosives which have been issued and returned to the magazine are to be issued first; otherwise those which have been longest in store are to be issued first. Cases of explosives must be kept clear of the walls and floors for free circulation of air on all sides. Special care is to be taken to keep the floor free from grains of powder or portions of explosive matter fallen on the floors due to leakage of cases etc. The magazine shall not be opened during any dust storm or thunderstorm nor shall any person be allowed in the vicinity of the magazine. All magazines shall be officially inspected at definite intervals and a record kept of the results of such inspections. 3.5.4.3 Carriage of Explosives Detonators and explosives shall be transported separately to the blast site.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

Explosives shall be kept dry and away from the direct rays of the sun, naked lights, steam pipes or heated metal and other sources of heat. Before explosives are removed, each cage or package is to be carefully examined to ascertain that it is properly closed and shows no sign of leakage. No person except the driver shall be allowed to travel on a vehicle conveying explosives. No carriage or vessel shall be used for transporting explosives unless all iron or steel therein with which a package containing any explosive is likely to come in contact is effectually covered with lead, leather, wood, cloth or other suitable material. No lights shall be carried on the vehicle carrying explosives. No operation connected with the loading, unloading and handling of explosives shall be conducted after sunset. 3.5.4.4 Use of Explosives The Contractor shall appoint an agent who shall personally superintend the firing and all operations connected therewith. The contractor shall satisfy himself that the person so appointed is fully acquainted with the responsibilities imposed on him. Holes for charging explosives shall be drilled with Pneumatic drills, the drilling pattern being so planned that the rock pieces after blasting will be suitable for handling. The hole diameter shall be of such a size that cartridges can easily pass down them and undue force is not required during charging. Charging operations shall be carried out by or under the personal supervision of the shot firer. Wrappings shall never be removed from explosive cartridges. Only wooden rods shall be used for loading and stemming shotholes. Only one cartridge at a time shall be inserted and gently passed home with the wooden tamping rod. Only such quantities of explosives as are required for the particular amount of work to be done shall be brought to the works. Should any surplus remain when all the holes have been charged, it shall be carefully removed to a point at least 300 m from the firing point.

The explosives shall be fired by means of an electric detonator placed inside the cartridge. For simultaneous firing of a number of charges the electric detonators shall be connected with the exploder through the shotfiring cable in a simple series circuit. Due precautions shall be taken to keep the firing circuit insulated from the ground, bare wires, rails, pipes or any other path of stray current and to keep the lead wires short circuited until ready to fire. Any kinks in detonator leading wire shall be avoided. For simultaneous firing of a large number of shotholes, use of cordtex may be done. Cordtex shall be initiated by an electric detonator attached to its side with adhesive tape, connecting wire or string. All connections shall be made by the authorised shotfirer himself. The shotfiring cable shall not be dragged along the ground to avoid possible damage to the insulation. The shotfiring cable shall be tested for continuity and possible short circuiting before it is used each time. The shotfirer shall always carry the exploder handle on his person until he is ready to fire shots. The number of shots fired at a time shall not exceed the permissible limits. Blasting shall only be carried out at certain specified times to be agreed jointly by the contractor and the Engineer. Before any blasting is carried out, it shall be ensured that all workmen, vehicles and equipment on the site are cleared from an area of minimum 300 metres radius from the firing point, or as required by statutory regulations, at least ten minutes before the time of firing by sounding a warning siren. The area shall be encircled by red flags. At least five minutes after the blast has been fired in case of electric firing or as stipulated in the regulations the authorised shotfirer shall return to the blast area and inspect carefully the work and satisfy himself that all charged holes have exploded. Cases of misfired unexploded charges shall be exploded by drilling a parallel fresh hole not less than 600 mm from the misfired hole and by exploding a new charge. The authorised shotfirer shall be present during removal of the debris liable to contain unexploded explosives near the misfired hole. The workmen shall not return to the site of firing until at least half an hour after firing.

When blasting is conducted in the neighbourhood of roads, structures, buildings etc. controlled blasting has to be carried out by drilling shallow shotholes and filling the same with light charge of explosives. Adequate safety precautions as per building bye-laws, safety code, statutory regulations etc. shall be taken during blasting operations. 3.5.5 Disposal The excavated spoils will be disposed of in any or all the following manners: (a) By using it for backfilling straightway. (b) By stacking it temporarily for use in backfilling at a later date during execution of the Contract. (c) (i) By either spreading, Or (ii) Spreading and compacting at designated filling areas and /or disposal areas. (d) By selecting the useful material and stacking it neatly in areas designated by the Engineer for use in backfilling by some other agency. 3.5.6 Disposal of Surplus All surplus material from excavation shall be carried away from the excavation site to designated disposal area selected by the Engineer. All good and sound rock excavated from the pits and all assorted materials of dismantled structures shall be the property of the Owner. 3.5.7 Protection The Engineer shall be notified by the Contractor as soon as the excavation is expected to be completed within a day so that it may be inspected by him at the earliest. Immediately after approval of the Engineer, the excavation must
