be covered up in the shortest possible time. But, in no case the excavation shall be covered up or worked on before approval and measurement by the Engineer. Excavated material shall be placed beyond 1.5 metres from the edge of the pit or trench or half the depth of the pit or trench whichever is more or further away if directed by the Engineer. Excavation shall not be carried out below the foundation level of structure close by until required precautions have been taken. Adequate fencing is to be made enclosing the excavation. The Contractor shall protect all under-ground services exposed by excavation. The Contractor shall also divert all surface drains, etc. affected by the excavation to maintain the working area neat and clean. 3.5.8 Dealing with Surface Water All working areas shall be kept free of surface water as far as reasonably practicable. Works in the vicinity of cut areas shall be controlled to prevent the ingress of surface water. No works shall commence until surface water streams have been properly intercepted, redirected or otherwise dealt with. Where works are undertaken in the monsoon period, the Contractor may need to construct temporary drainage systems to drain surface water from working areas. 3.5.9 Dewatering All excavations shall be kept free of water and slush. Grading in the vicinity of excavations shall be controlled to prevent surface water running into excavated areas. The Contractor shall remove by pumping or other means approved by the Engineer any water inclusive of rain water and subsoil water accumulated in excavation and keep the trench dewatered until the construction of foundation structure and backfilling are complete in all respects. (Except where such dewatering would need installation of well points or deep wells for which separate payment will be made) Sumps made for dewatering must be kept clear of the foundations. Method of pumping

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 58 of 549
shall be approved by the Engineer but in any case, the pumping arrangement shall be such that there shall be no movement of subsoil or blowing in due to differential head of water during pumping. 3.5.10 Timber Shoring Timber Shoring made out of approved quality of timber shall be 'close' or 'open' type, depending on the nature of soil and the depth of pit or trench and the type of timbering shall be determined by the Engineer. It shall be the responsibility of the Contractor to take all necessary steps to prevent the sides of trenches and pits from collapsing. 3.5.10.1 Close Timbering Close timbering shall be done by completely covering the sides of the trenches and pits generally with short, upright members called 'polling boards'. These shall be of minimum 250 x 40 mm sections as directed by the Engineer. The boards shall generally be placed in position vertically in pairs, one board on each side of cutting, and shall be kept apart by horizontal walers of strong wood at maximum 1.2 metres spacing, cross strutted with ballies or as directed by the Engineer. The length of the bally struts shall depend on the width of the trench or pit. In case where the soil is very soft and loose, the boards shall be placed horizontally against the sides of the excavation and supported by vertical walers, which shall be strutted to similar timber pieces on the opposite face of the trench or pit. The lowest board supporting the sides shall be taken into the ground. No portion of the vertical side of the trench or pit shall remain exposed, so that the earth is not liable to slip out. The withdrawal of the timber shall be done very carefully to prevent the collapse of the pit or trench. It shall be started at one end and preceded systematically to the other end. Concrete or masonry shall not be damaged during the removal of the timber. No claim shall be entertained for any timber which cannot be withdrawn and is lost or buried. 3.5.10.2 Open Timbering In the case of open timbering, the entire surface of the side of trench pit is		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 59 of 549
not required to be covered. The vertical board of minimum 250 mm width and minimum 40 mm depth shall be spaced sufficiently apart to leave unsupported strips of maximum 500 mm average width. The detailed arrangement, sizes of the timber and the distances apart shall be subject to the approval of the Engineer. In all other respects, specification for close timbering shall apply to open timbering. 3.6 <u>TREATMENT OF SLIPS</u> The Contractor will take all precaution to avoid high surcharges and provide proper surface drainage to prevent flow of water over the sides. These precautions along with proper slopes, berms, shoring and control of ground water should cause no slips to occur. If however slips do occur due to causes beyond the control of the Contractor, the same shall be removed by him and payment shall be made to him on appropriate item rate of earthwork. Slips caused due to negligence of the Contractor will be cleared and back- filled later by him. 3.7 <u>BACK-FILLING</u> 3.7.1 General The material used for backfilling shall consist of material, approved by the Engineer obtained directly from nearby areas where excavation work by the same agency is in progress, from temporary stacks of excavated spoils or from borrow pits from selected areas designated by the Engineer. The material shall be free from lumps and clods, roots and vegetations, harmful salts and chemicals, organic materials, etc. In certain locations, the Engineer may direct sand fillings. The sand should be clean, well graded and be of quality normally acceptable for use in concrete. 3.7.2 Filling and Compaction in Pits and Trenches around Structures As soon as the work in foundations has been accepted and measured, the spaces around the foundation structures in pits and trenches shall be cleared of all debris, brick bats, mortar droppings, etc., and filled with earth in layers not exceeding 250 mm in loose thickness each layer being watered,

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 60 of 549
rammed and properly compacted to achieve a dry density of not less than 95% of proctor's dry density at optimum moisture content as per IS-2720 (Part-VII) where backfilling with cohesive soil and sandy silt containing high percentage of silt. For back filling with sand having little or no silt, each layer shall be compacted to a relative density of 75% as per IS 2720 part XIV. Earth shall be rammed with approved mechanised compaction machine. Usually, no manual compaction shall be allowed unless specifically permitted by the Engineer. The final surface shall be trimmed and levelled to proper profile as shown in the drawing and as desired by the Engineer. Since the degree of compaction depends on the moisture content of the soil, a close watch should be kept on it and corrections done to optimise the moisture content. 3.7.3 Plinth Filling The plinth shall be filled with earth in layers not exceeding 250 mm in loose thickness, watered and compacted as stated under clause no. 3.7.2 with approved compaction machine or manually, if specifically permitted by the Engineer. When the filling reaches the finished level, the surface shall be flooded with water for at least 24 hours, allowed to dry and then rammed and compacted, in order to avoid any settlement at a later stage. The finished level of the filling shall be trimmed to the slope intended to be given to the floor. 3.7.4 Filling in Trenches for Water Pipes and Drains Earth used for filling shall be free from salts, organic or other foreign matter. All clods of earth shall be broken or removed. Where excavated material is mostly rock, the boulders shall be broken into pieces not bigger than 150 mm size in any direction, mixed with fine material consisting of disintegrated rock, moorum or earth as available, so as to fill up the voids as far as possible and then the mixture used for filling. The types of bedding & pipe surround material shall be as specified in the drawings. Filling in trenches for pipes and drains shall be commenced as soon as the joints of pipes and drains have been tested and passed.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-2
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 61 of 549
Where the trenches are excavated in soil, the filling shall be done with earth on the sides and top of pipes in layers not exceeding 150 mm, watered, rammed and compacted taking care that no damage is caused to the pipe below. Filling of trenches shall be carried out simultaneously on both sides of the pipe in such a manner that unequal pressures do not occur. In case of excavation of trenches in rock, the filling upto a depth of 300 mm or the diameter of the pipe whichever is more, above the crown of pipe or barrel shall be done with fine material such as earth, moorum, disintegrated rock or ash according to the availability at site. The remaining filling shall be done with rock filling of boulders of size not exceeding 150 mm mixed with fine material as available to fill up the voids, watered, rammed and compacted. 3.7.5 Filling in Disposal Area Surplus material from excavation which is not required for backfilling will be disposed of in designated disposal areas. The spoils shall not be dumped haphazardly but should be spread in layers approximately 250 mm thick when loose and compacted with the help of compacting equipment. In wide areas rollers will be employed and compaction done to the satisfaction of the Engineer at the optimum moisture content which shall be checked and controlled by the Contractor. In certain cases the Engineer may direct disposal without compaction which can be done by tipping the spoils from a high bench neatly maintaining always a proper level and grade of the bench. 3.8 <u>APPROACHES AND FENCING</u> The Contractor should provide and maintain proper approaches for workmen and for inspection. The roads and approaches around the excavated pits should be kept clear at all times so that there is no hindrance to the movement of men, material and equipment of various agencies connected with the Project. Sturdy and elegant fencing is to be provided around the top edge of the excavation as well as the bottom of the fill at the surplus disposal area where dumping from a high bench is in progress.

3.9	<u>LIGHTING</u> Full scale area lighting is to be provided if night work is permitted or directed by the Engineer. If no night work is in progress, red warning lights should be provided at the corners of the excavated pit and the edges of the fill.	
4.0	<u>TESTING AND ACCEPTANCE CRITERIA</u>	
4.1	<u>EXCAVATION</u> On completion of excavation, the dimensions of the pits will be checked as per the drawings after the pits are completely dewatered the work will be accepted after all undercuts have been set right and all over excavations filled back to required lines, levels and grades by placing ordinary concrete of 1:4:8 proportion and/or richer and/or by compacted earth, as directed by the Engineer. The choice of grade of concrete will be a matter of unfettered discretion of the Engineer. Over excavation of the sides will be made good by the Contractor while carrying out the back-filling. The excavation work will be accepted after the above requirements are fulfilled and all temporary approaches encroaching inside the required dimension of the excavation have been removed.	
4.2	<u>BACK-FILLING</u> The degree of compaction shall be sufficient to achieve a dry density of not less than 95% of proctor's dry density at optimum moisture content as per IS-2720 (Part-VII) or a relative density of 75% as per IS-2720 (Part-XIV) as applicable depending on the nature of back filling material as stated in clause no. 3.7.2 of this specification. The work of back-filling will be accepted after the Engineer is satisfied with the degree of compaction achieved.	
5.0	<u>INFORMATION TO BE SUBMITTED</u>	
5.1	<u>WITH TENDER</u> Details of Equipment proposed to be used for excavation, back-filling and compaction have to be submitted along with the tender.	

CONSULTANT : PROCON ENGINEERS

5.2 <u>AFTER AWARD</u> After award of the Contract the successful tenderer shall submit the following for approval and adoption: (a) The Contractor shall submit a detailed programme of the work as proposed to be executed giving completion dates of excavation of the various foundations and the time required for back-filling and compaction after completing the foundation for structures. The programme should show how the excavation and back-filling quantities will be balanced, minimising temporary stacking of spoils. It is to be noted that the Engineer even after initial approval of the programme, may instruct to enhance or retard the progress of work during the actual execution, in order to match with the progress of foundations without attracting any claims from the Contractor. The initial programme being submitted by the Contractor should have sufficient flexibility to take care of such reasonable variations. (b) The Contractor shall submit drawings showing details of slopes, shorings, approaches, sump pits, dewatering lines, fencing etc. for approval of the Engineer for adoption.

1.0 <u>SCOPE</u> 1.1 <u>GENERAL</u> This specification covers all the requirements, described hereinafter for general use of Plain and Reinforced Cement Concrete work in Structures and locations, cast-in-situ or precast, and shall include all incidental items of work not shown or specified but reasonably implied or necessary for the completion of the work. 1.2 This specification shall also apply to the extent it has been referred to or applicable with the special requirements of structures covered in SCOPE of IS:456. 1.3 IS:456 shall form a part of this specification and shall be complied with unless permitted otherwise. For any particular aspect not covered by this Code, appropriate IS Code, specifications and/or replacement by any International Code of practice as may be specified by the Engineer shall be followed. All codes and Standards shall conform to its latest revisions. A list of IS codes and Standards is enclosed hereinafter for reference. 2.0 <u>GENERAL</u> 2.1 <u>WORK TO BE PROVIDED FOR BY THE CONTRACTOR</u> The work to be provided for by the Contractor, unless otherwise specified shall include but not be limited to the following:- (a) Furnish all labour, supervision, services including facilities as may be required under statutory labour regulations, materials, forms, templates, supports, scaffolds, approaches, aids, construction equipment, tools and plants, transportations, etc. required for the work (b) Contractor shall prepare progressively and submit for approval detailed drawings and Bar Bending Schedules for reinforcement bars showing the positions and details of spacers, supports, chairs, hangers etc

(c) Design and prepare working drawings of formworks, scaffolds, supports, etc. and submit for approval (d) Submit for approval shop drawings for various inserts, anchors, anchor bolts, pipe sleeves, embedment, hangers, openings, frames etc. (e) Submit for approval detailed drawings of supports, templates, hangers, etc. required for installation of various embedments like inserts, anchor bolts, pipe sleeves, frames, joint seals, frames, openings etc. (f) Submit for approval detailed schemes of all operations required for executing the work, e.g. Material handling, Concrete mixing, Placement of concrete, Compaction, curing, services, Approaches, etc. (g) Design and submit for approval concrete mix designs required to be adopted on the job. (h) Furnish samples and submit for approval results of tests of various properties of the following: (i) The various ingredients of concrete. (ii) Concrete. (iii) Embedments (iv) Joint seals (i) Provide all incidental items not shown or specified in particular but reasonably implied or necessary for successful completion of the work in accordance with the drawings and specifications. (j) For supply of certain materials normally manufactured by specialist firms, the Contractor may have to produce, if directed by the Engineer, a guarantee in approved proforma for satisfactory performance for reasonable period as may be specified, binding both

the manufacturers and the Contractor, jointly and severally. 2.2 <u>WORK BY OTHERS</u> No work under this specification will be provided by any agency other than the Contractor unless specifically mentioned elsewhere in the contract. 2.3 <u>INFORMATION TO BE SUBMITTED BY THE TENDERER</u> 2.3.1 With Tender The following technical information are required with the tender: (a) Source and arrangement of processing of aggregates proposed to be adopted. (b) Type of plant and equipment proposed to be used. (c) Names of firms, if any, with which association is sought for to, execute the special items of work in the contract. (d) Types of formwork proposed to be used. 2.3.2 After Award The following information and data including samples where necessary shall be submitted by the Contractor progressively during the execution of the contract. (a) Programme of Execution and Requirement of Materials The Contractor will submit a Master Programme for completion of the work giving monthwise requirements of materials for the procurement. This Master Programme may have to be reviewed and updated by the Contractor, quarterly or at more frequent intervals as may be directed by the Engineer depending on the exigencies of the work.

Detailed day to day programme of every month is to be submitted by the Contractor before the end of the previous month (b) Samples Samples of the following materials and any other materials proposed to be used shall be submitted as directed by the Engineer, in sufficient quantities for approval. Approved samples will be preserved by the Engineer for future reference. The approval of the Engineer shall not, in any way, relieve the Contractor of his responsibility of supplying materials of specified qualities: (i) Coarse and fine aggregates (ii) Admixtures. (iii) Plywood for Formwork (iv) Embedded and anchorage materials as may be desired by the Engineer (v) Joint sealing strips and other waterproofing materials (vi) Joint filling compounds (vii) Foundation quality Rubber Pads (c) Design Mix Design mix as per Clauses 2.1 (g) & 3.4 of this specification giving proportions of the ingredients, sources of aggregates and cement, along with accompanying test results of trial mixes as per relevant I.S., is to be submitted to the Engineer for his approval before it can be used on the works. (d) Detail Drawings and Bar Bending Schedules Detailed working drawings and Bar Bending Schedules in accordance with Clause 2.1(b) and 3.16.1 of this specification.

(e) Detailed Drawings and Designs of Formworks to be used Detailed design data and drawings of standard formworks to be used as per clause 2.1 (c). (f) Detailed Drawings for Templates & Temporary Supports for Embedments. As per Clause 2.1 (e). (g) Mill Test Reports for Cement & Reinforcing Steel. (h) Inspection Reports Inspection Reports in respect of Formwork and Reinforcement and any other item of work as may be desired by the Engineer in accordance with Clause 2.4 of this specification. (i) Test Reports Reports of tests of various materials and concrete as required under Clause 4.0: SAMPLING & TESTING of this specification. (j) Any other data which may be required as per this specification. 2.4 CONFORMITY WITH DESIGN The Contractor will prepare check lists in approved proforma which will be called 'Pour Cards'. These Pour Cards will list out all items of work involved. The Contractor will inform the Engineer, sufficiently in advance, whenever any particular pour is ready for concreting. He shall accord all necessary help and assistance to the Engineer for all checking required in the pour. On satisfying himself that all details are in accordance to the drawings and specifications, the Engineer will give written permission on the same 'Pour Card' allowing the Contractor to commence placement of concrete. Details of all instructions issued by the Engineer and the records of compliance by the Contractor, deviations allowed by the Engineer and any other relevant information will be written on accompanying sheets attached to the Pour Cards. These sheets, termed as 'Progress Cards', will be

prepared by the Contractor on approved proforma. The Pour Cards along with accompaniments will be handed over to the Engineer before starting placement of concrete. One of the mix designs developed by the Contractor as per the I.S. Specifications and established to the satisfaction of the Engineer by trial mixes shall be permitted to be used by the Engineer, the choice being dictated by the requirements of designs and workability. The methods of mixing, conveyance, placement, vibration, finishing, curing, protection and testing of concrete will be as approved or directed by the engineer. 2.5 <u>MATERIALS TO BE USED</u> 2.5.1 General Requirement All materials whether to be incorporated in the work or used temporarily for the construction shall conform to the relevant IS Specifications unless stated otherwise and be of best approved quality. 2.5.2 Cement Generally cement shall be 33 grades ordinary Portland cement conforming to IS 269 .In special cases any of the following type of cement may be permitted or directed to be used with prior approval by the Engineer (a) 43 Grade ordinary Portland Cement conforming to IS-8112 (b) 53 Grade ordinary Portland Cement conforming to IS-12269 (c) Rapid hardening Portland Cement conforming to IS-8041 (d) Portland slag cement conforming to IS-455 (e) Portland Pozzolona Cement (flyash based) Conforming to IS-1489 (Part-1) (f) Portland pozzolona Cement (calcined clay based) conforming to IS-1489 (Part-2) (g) Hydrophobic Cement conforming to IS-8043

2.5.3 (h) Low heat Portland Cement conforming to IS : 12600 (i) Sulphate Resisting Portland Cement conforming to IS-12330 Aggregates Aggregates shall be natural or crushed gravel or crushed rock and free from deleterious material. It shall comply with the requirements of IS-383. All fine and coarse aggregate shall be tested for susceptibility to Alkali Silicate reaction in a laboratory approved by the Engineer. (a) Coarse Aggregate Aggregate of sizes ranging between 4.75 mm and 150 mm will be termed as Coarse Aggregate. Only Coarse Aggregate from approved quarries and conforming to IS:383 will be allowed to be used on the works. Aggregates shall be washed to make it free from deleterious materials, if necessary The grading of coarse aggregates by sieve analysis shall be as per IS:383. If by the analysis the deficiency of a particular grain size is found, which could affect the density of the concrete, the Engineer may ask the contractor to avoid such quantities of aggregate of the particular size or and such quantity of aggregate of any particular size to achieve the required grading as per IS:383. (b) Fine Aggregate Aggregate smaller than 4.75 mm and within the grading limits and other requirements set in IS:383 is termed as Fine Aggregate or Sand. Only Fine Aggregate from approved sources and conforming to the above IS Specification will be allowed to be used on works. In certain cases there may be two types of sand, one very fine and the other very coarse. In such cases, the two types shall be combined to meet the requirements of a particular zone of IS:383. In all cases, the preferred zone is Zone - II. In certain cases crushed stone sand may be added to natural sand in order to achieve the required grading. Crushed stone sand alone may		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 76 of 549
be used only with the approval of the Engineer. 2.5.4 Water Water for use in Concrete shall be clear and free from injurious oils, acids, alkalis, organic matter, salt, silts or other impurities. Normally potable water is found to be suitable. Generally, IS:3550 will be followed for routine tests. Acceptance test for water shall be as per IS:3025, and Table-1 of IS:456. In case of doubt regarding development of strength, the suitability of water for making concrete shall be ascertained by compressive strength and initial setting time tests as per method of tests in accordance with the requirements of IS-516 & IS- 4031 respectively. The PH value of water shall generally be not less than 6 2.5.5 Admixture Only admixture of approved quality will be used when directed or permitted by the Engineer. The different types of admixtures which may be necessary to satisfy the concrete mix and the design requirement shall be as per the following I.S. Standards: IS : 2645 : Integral cement water proofing compound IS : 9103 : Indian standard specification for Admixtures Concrete or equivalent American Codes (ASTM C494 and ASTM C260) or British Codes (BS 5075, part 1 to 3)and may be one of the following: (a) Accelerating admixtures: (i) Set accelerating admixtures like "Sigunit Powder" or "Sigunit LN10" (b) Retarding admixtures: (i) Modified ligno sulphonate based set retarding concrete admixture like, "Plastiment R".		

CONSULTANT : PROCON ENGINEERS

(c) Water reducing admixtures: (i) Modified sulphonated melamine formaldehyde based water reducing concrete admixture like, "Sikament". (d) Air entraining admixtures: (i) Modified ligno sulphonate based air entraining concrete admixture like "FLOMO AEP "or surface - active agents like "Sika AER". (e) Water proofing admixtures (i) Modified lingo-sulphonate based waterproofing admixture like "Plastocrete Super". However, the Contractor shall furnish following technical information about the admixtures (along with the manufacturer's Catalogue) which he is planning to use in different areas within the scope of work for the approval of the Engineer. (i) Type of admixture (ii) Mix proportion & mode of application in concrete/mortar (iii) Manufacturer's specification & necessary quality assurance certificates (mainly on chloride & sulphate content, PH value infra red analysis & solid content) 2.5.6 Reinforcement Reinforcement shall be as per relevant IS Specification as mentioned in the Contract /Drawing/Instructions. All bars shall be of tested quality. 2.6 <u>STORAGE OF MATERIALS</u> 2.6.1 General All materials shall be so stored as to prevent deterioration or intrusion of		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 78 of 549
2.6.2 Cement	foreign matter and to ensure the preservation of their quality and fitness for the work. Any material, which has deteriorated or has been damaged or is otherwise considered defective by the Engineer, shall not be used for concrete and shall be removed from site immediately, failing which, the Engineer shall be at liberty to get the materials removed and Storage of materials shall conform to IS:4082. Sufficient space for storage, with open passages between stacks, shall be arranged by the Contractor to the satisfaction of the Engineer. Cement shall be stored off the ground in dry, leak proof, well-ventilated ware-houses at the works in such a manner as to prevent deterioration due to moisture or intrusion of foreign matter. Cement shall be stored in easily countable stacks with consignment identification marks. Consignments shall be used in the order of their receipts at site. Sub-standard or partly set cement shall not be used and shall be removed from the site, with the knowledge of the Engineer, as soon as it is detected. Different types of cement shall be clearly marked with the Type and different types of cement shall not be intermixed. 2.6.3 Aggregates Aggregates shall be stored on planks or steel plates or on concrete or masonry surface. Each size shall be kept separated with wooden or steel or concrete or masonry bulk-heads or in separate stacks and sufficient care shall be taken to prevent the material at the edges of the stock piles from getting intermixed. Stacks of fine and coarse aggregates shall be kept sufficiently apart with proper arrangement of drainage. The aggregates shall be stored in easily measurable stacks of suitable depths as may be directed by the Engineer. 2.6.4 Reinforcement Reinforcing steel shall be stored consignment-wise and size wise off the	

ground and under cover, if desired by the Engineer. It shall be protected from rusting, oil, grease and distortions. If necessary, the reinforcing steel may be coated with cement wash before stacking to prevent scale and rust. The stacks shall be easily measurable. Steel needed for immediate use shall only be removed from storage.

Quality Control

The quality control operation shall include but not be limited to the following items of work:

: For air entraining admixtures, dosage to be adjusted to maintain air contents within desirable limits

(c) Water : Impurities tests.

(e) Formwork : Material, shapes, dimensions, lines, elevations, surface finish, adequacy of form, ties, bracing and shoring and coating.

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3

	(f) Reinforcement : Shapes, dimensions, length of plices, clearances, ties and supports. Quality and requirement of welded splices. Material tests or certificates to satisfy relevant IS Specification (g) Grades of concrete : Usage and mix design, testing of all properties. (h) Batching & Mixing : Types and capacity of plant, concrete mixers and transportation equipment. (i) Joints : Locations of joints, water stops and filler materials. Dimension of joints, quality and shape of joint material and splices. (j) Embedded and Anchorage Items : Material, shape, location, setting. (k) Placing : Preparation, rate of pouring, weather limitations, time intervals between mixing and placing and between two successive lifts, covering over dry or wet surfaces, cleaning and preparation of surfaces on which concrete is to be placed, application of mortar/slurry for proper bond, prevention of cold joint, types of chutes or conveyors. (l) Compaction : Number of vibrators, their prime mover, frequency and amplitude of vibration, diameter and weight of vibrators, duration of vibration, hand-spreading, rodding and tamping. (m) Setting of base & Beaming plates : Lines, elevations and bedding mortar. (n) Concrete Finishes : Repairs of surface defects, screening, floating, steel trowelling and brooming, special finishes. (o) Curing : Methods and length of time.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 81 of 549
Copies of records and tests for the items noted above, as well as, records of corrective action taken shall be submitted to the Engineer for approval as may be desired. 3.0 <u>INSTALLATION</u> All installation requirements shall be in accordance with IS:456 and as supplemented or modified herein or by other best possible standards where the specific requirements mentioned in this section of the specification do not cover all the aspects to the full satisfaction of the Engineer. 3.1 <u>WASHING AND SCREENING OF AGGREGATES</u> Washing and Screening of coarse aggregate shall be carried out to remove fines, dirt or other deleterious materials. Washing of fine aggregate shall not be allowed, Fine aggregates shall be screened only to remove dirt or other deleterious materials. However, all washing & screening of aggregates shall be carried out by approved means to ensure compliance with the aggregate specification. 3.2 <u>ADMIXTURE</u> All concrete shall be designed for normal rate of setting and hardening at normal temperature. Variations in temperature and humidity under different climatic conditions will affect the rate of setting and hardening, which will, in turn, affect the workability and quality of the concrete. Admixtures may be permitted to be used in accordance with IS: 456 to modify the rate of hardening, to improve workability or as an aid to control concrete quality. The Engineer reserves the right to require laboratory test or use test data, or other satisfactory reference before granting approval. The admixture shall be used strictly in accordance with the manufacturer's directions and/or as directed by the Engineer.

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 82 of 549
3.3	<u>GRADES OF CONCRETE</u> Structural concrete shall be of M30 grade and for other part of the work shall be as shown on the drawing as per grade classification of IS-456. In case of liquid retaining structures, IS:3370 will be followed.	
3.4	<u>PROPORTIONING AND WORKS CONTROL</u>	
3.4.1	General	
	Proportioning of ingredients of concrete shall be made by any of the two following methods as directed by the Engineer:	
	(a) With preliminary tests by designing the concrete mix. Such concrete shall be called 'Design Mix Concrete'.	
	(b) Without preliminary tests adopting nominal concrete mix. Such concrete shall be called 'Nominal Mix Concrete'.	
	As far as possible, design mix concrete shall be used on all concrete works. Nominal mix concrete, in grades permitted in accordance with IS:456, may be used if shown on drawings or approved by the Engineer. In all cases the proportioning of ingredients and works control shall be in accordance with IS:456 and shall be adopted for use after the Engineer is satisfied regarding its adequacy and after obtaining his approval in writing.	
3.4.2	Mix Design Criteria	
	Concrete mixes will be designed by the Contractor to achieve the strength, durability and workability necessary for the job, by the most economical use of the various ingredients. In general, the design will keep in view the following considerations:	
	(a) Consistent with the various other requirements of the mix, the quantity of water should be kept at the lowest possible level.	
	(b) The nominal maximum size of coarse aggregate shall be as large as possible within the limits specified.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 83 of 549
(c) The various fractions of coarse and fine aggregates should be mixed in such a proportion as to produce the best possible combined internal grading giving the densest and most workable mix. (d) Chemical admixtures may be used to modify the rate of hardening, to improve workability (maintaining low water - cement ratio) or as an aid to control concrete quality. (e) The finished concrete should have adequate durability in all conditions, to withstand satisfactorily the weather and other destructive agencies which it is expected to be subjected to in actual service. The requirement of adequate structural strength is catered for by the choice of proper grade of concrete by the Engineer. The Contractor will strictly abide by the same in his design of concrete mix installation. Notwithstanding anything mentioned in various tables given in IS:456 giving specific values and degrees of workability for different condition of concrete placing, minimum cement content and maximum water-cement ratio for concrete exposed to sulphate attack and for concrete to ensure durability under different condition of exposure, strength requirement for different grades of concrete, proportion for nominal mix concrete, values given in the tables in IS:456, shall be followed. Various trials shall be given by the contractor with specific cement content on each trial. In some cases, plasticizers and other admixtures may be necessary to achieve the desired results.

(c)	100-175 mm	0.6	01:05.4	01:06.7	01:04.7	01:05.7
		0.7	01:06.2	01:07.4	01:05.5	01:06.5

NOTES:

1. Notwithstanding anything mentioned above, the cement/Total aggregate ratio is not to be increased beyond 1:9.0 without specific permission of the Engineer.
2. It should be noted that such high aggregate cement ratios will be required for concretes of very low slump and high water- cement ratios which may be required to be used in mass concrete work only.
3. The above figures are for guidance only, the actual cement/aggregate ratios are to be worked out from the specific gravities of coarse aggregates and sand being used and from trial mixes.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 89 of 549
3.5	<u>STRENGTH REQUIREMENTS</u> The strength requirements of both design mix and nominal mix concrete where ordinary Portland Cement or Portland slag cement is used, shall be as per Table-2 of IS:456. All other relevant clauses of IS:456 shall also apply.	
3.6	<u>MINIMUM CEMENT CONTENT</u> The minimum cement content for each grade of concrete shall be as per Table -5 of IS : 456.	
3.7	<u>WATER-CEMENT RATIO</u> The choice of water-cement ratio in designing a concrete mix will depend on- (a) The requirement of strength. (b) The requirement of durability.	
3.7.1	Strength Requirement In case of 'Design Mix Concrete', the water-cement ratio of such value as to give acceptable test results as per IS: 456 will be selected by trial and error. The values of water-cement ratios for different grade and mix designs will have to be established after conducting sufficiently large number of preliminary tests in the laboratory to the satisfaction of the Engineer. Frequent checks on test will have to be carried out and the water-cement ratios will be revised if the tests produce unsatisfactory results. Notwithstanding anything stated above the Contractor's responsibility to produce satisfactory test results and to bear all the consequences in case of default remains unaltered. In case of nominal mix concrete, proportions for different grades of concrete is specified in Table-9 of IS:456 and no tests are necessary. The acceptance test criteria for nominal mix concrete shall be as per IS: 456.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 90 of 549
3.7.2 Durability Requirement Table-5 of IS:456 gives the maximum water-cement ratio permissible from the point of view of durability of concrete subjected to adverse exposure to weather, sulphate attacks, and contact with harmful chemicals. Impermeability may also be an important consideration. Whenever the water-cement ratio dictated by durability consideration is lower than that required from strength criterion, the former shall be adopted. In general the water cement ratio between 0.4 and 0.45 will be desirable to satisfy the durability requirement and from the consideration of impermeability of concrete. The contractor may propose lower water cement ratio as mentioned above by addition of a suitable plasticizer/super-plasticizer. However the contractor has to propose specifically along with field trials in the event of lower cement content if found suitable along with a plasticizer. It will be preferable to use Melamine based plasticizer 3.8 <u>WORKABILITY</u> The degree of workability necessary to allow the concrete to be well consolidated and to be worked into the corners of formwork and around the reinforcement and embedment and to give the required surface finish shall depend on the type and nature of structure and shall be based on experience and tests. The usual limits of consistency for various types of structures are given below:		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B	
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3	
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 91 of 549	
<u>TABLE - III</u> <u>LIMITS OF CONSISTENCY</u>			
Degree of workability	Slump in mm with Standard Cone as per IS:1199		Use for which concrete is suitable.
	Min.	Max.	
Very low	0	25	Large Mass concrete structure with heavy compaction equipment, roads and like.
Low	25	50	Uncongested wide and shallow R.C.C. structures.
Medium	50	100	Deep but wide R.C.C. structures with congestion or reinforcement and inserts
High	100	150	Very narrow and deep R.C.C. Structures with congestion due to reinforcement and inserts.
(NOTE: Notwithstanding anything mentioned above, the slump to be obtained for work in progress shall be as per direction of the Engineer) With the permission of the Engineer, for any grade of concrete, if the water has to be increased in special cases, cement shall also be increased proportionately to keep the ratio of water to cement same as adopted in trial mix design for each grade of concrete. The workability of concrete shall be checked at frequent intervals by slump tests. Alternatively where facilities exist or if required by the Engineer, the compacting factor test in accordance with IS:1199.			
3.9 <u>SIZE OF COARSE AGGREGATES</u> The maximum size of coarse aggregates for different locations shall be as follows unless otherwise directed by the Engineer:-			

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 92 of 549
(a) Very narrow space : 12 mm (b) Reinforced concrete except foundation : 20 mm (c) Ordinary Plain concrete and Reinforced concrete foundations : 40 mm (d) Mass concrete : 80 mm (e) Mass concrete in very large structure : 150 mm Grading of coarse aggregates for a particular size shall conform to relevant I.S. Codes and shall also be such as to produce a dense concrete of the specified proportions, strength and consistency that will work readily into position without segregation. Coarse aggregate will normally be separated into the following sizes and stacked separately in properly designed stockpiles : 150 mm to 80 mm, 80 mm to 40 mm, 40 mm to 20 mm and 20 mm to 5 mm. In certain cases it may be necessary to further split the 20 mm to 5 mm fraction into 20 mm to 10 mm and 10 mm to 5 mm fractions. This separation of aggregates in different size fractions is necessary so that they may be remixed in the desired proportion to arrive at a correct internal grading to produce the best mix. 3.10 <u>MIXING OF CONCRETE</u> Concrete shall always be mixed in mechanical mixer unless specifically approved by the Engineer for concrete to be used in unimportant out of the way locations in small quantities. Water shall not normally be charged into the drum of the mixer until all the cement and aggregates constituting the batch are already in the drum and mixed for at least one minute. Mixing of each batch shall be continued until there is a uniform distribution of the materials and the mass is uniform in colour and consistency, but in no case shall mixing be done for less than 2 (two) minutes and at least 40 (forty) revolutions after all the materials and water are in the drum. When absorbent aggregates are used or when the mix		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
REV: R0	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 93 of 549
is very dry, the mixing time shall be extended as may be directed by the Engineer. Mixers shall not be loaded above their rated capacity as this prevents thorough mixing. The entire contents of the drum shall be discharged before the ingredients for the next batch are fed into the drum. No partly set or remixed or excessively wet concrete shall be used. Such concrete shall be immediately removed from site. Each time the work stops, the mixer shall be thoroughly cleaned & when the next mixing commences, the first batch shall have 10% additional cement to allow for loss in the drum. Regular checks on mixer efficiency shall be carried out as directed by the Engineer as per IS: 4634 on all mixers employed at site. Only those mixers whose efficiencies are within the tolerances specified in IS: 1791 will be allowed to be employed. Ingradients for design mix concrete shall be measured by weight. For small jobs portable swing weigh Bachers conforming to IS: 2722 may be used. Batching plant conforming to IS: 4925 shall be used for large jobs. The accuracy of the measuring equipment shall be within + 2% of the quantity of Cement, water or total aggregates being measured and within + 5% of the quantity of any admixture being used. The batching equipment shall be fitted with an accurate mechanism for weighing separately the cement, fine aggregate and coarse aggregate. Water may be measured by volume or by weight. All measuring equipment should be maintained in a clean serviceable condition, and their accuracy shall be checked periodically. Mechanical / electrical control shall be provided on the mixing equipment to ensure the batch cannot be discharged until approved mixing time has elapsed and the entire batch shall be discharged before the mixer is recharged. Where admixtures are employed, separate containers & measuring devices shall be used. For minor concreting works, batching by volume according to specific weight may be permitted by the Engineer. In that case the whole bags of cement shall be used and gauge boxes used for measuring aggregates.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 94 of 549
When hand mixing is permitted by the Engineer, it shall be carried out on a water-tight platform and care shall be taken to ensure that mixing is continued until the mass is uniform in colour and consistency. In case of hand-mixing, 10% extra cement shall be added to each batch. 3.11 <u>CONVEYING CONCRETE</u> Concrete shall be handled and conveyed from the place of mixing to the place of laying as rapidly as practicable by approved means and placed and compacted in the final position before the initial setting of the cement starts. Concrete should be conveyed in such a way as will prevent segregation or loss of any of the ingredients. For long distance haulage, agitator cars of approved design will be used. If, in spite of all precautions, segregation does occur during transport, the concrete shall be properly re-mixed before placement. During very hot or cold weather, if directed by the Engineer, concrete shall be transported in deep containers which will reduce the rate of loss of water by evaporation or loss of heat. If necessary, the container may have to be covered and insulated. Conveying equipments for concrete shall be well maintained and thoroughly cleaned before commencement of concrete mixing. Such equipments shall be kept free from set concrete. 3.12 <u>PLACING AND COMPACTING CONCRETE</u> Where specifically covered, the relevant I.S. Code will be followed for the procedure of surface preparation, placement, consolidation, curing, finishes, repairs and maintenance of concrete. If, however, there is no specific provision in the relevant I.S. Code for any particular aspect of work, any other standard Code of practice, as may be specified by the Engineer, will be adopted. Concrete may have to be placed against the following types of surfaces: (a) Earth foundation (b) Rock foundation (c) Formwork		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 95 of 549
(d) Construction joint in concrete or masonry The surface on or against which concrete is to be placed has to be cleaned thoroughly. Rock or old construction joint has to be roughened by wire brushing, chipping, sand blasting or any other approved means for proper bond. All cuttings, dirt, oil, foreign and deleterious material, laitance, etc. are to be removed by air water jetting or water at high pressure. All excavated areas for foundations, ring beams, plinths, pile caps etc. shall be rammed & consolidated properly before blinding with nominal mix plain concrete, as per drawing and / or direction of the Engineer and shall be allowed to cure prior to setting out steel fixing, shuttering and concrete pouring for the main structural element. Formwork, reinforcement, preparation of surface, embedment, joint seals etc., shall be approved in writing by the Engineer before concrete is placed. As far as possible, concrete shall be placed in the formwork by means approved by the Engineer and shall not be dropped from a height or handled in a manner which may cause segregation. Any drop over 1500 mm shall have to be approved by the Engineer. Rock foundation or construction joint will be kept moist for at least 72 hours prior to placement. Concrete will be placed always against moist surface but never on pools of water. In case the foundation cannot be dewatered completely, special procedure and precaution, as directed by the Engineer will have to be adopted. Formwork will be cleaned thoroughly and smeared lightly with form oil or grease of approved quality just prior to placement. A layer of mortar of thickness 12 mm of the same or less w/c ratio and the same proportion as that of the concrete being placed and cement slurry will be spread thoroughly on the rock foundation or construction joint just prior to placement of concrete. The cost of application of such cement slurry and mortar will be deemed to be included. After concrete has been placed, it shall be spread, if necessary and thoroughly compacted by approved mechanical vibration to maximum subsidence without segregation and thoroughly worked around shape. Vibrators shall not be used for pushing concrete into adjoining areas.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 96 of 549
Vibrators must be operated by experienced workmen and the work carried out as per relevant IS Code of Practice. In thin members with heavy congestion of reinforcement or other embedment, where effective use of internal vibrator is, in the opinion of the Engineer, doubtful, in addition to immersion vibrators the contractor may have to employ form vibrators conforming to IS: 4656. For slabs and other similar structures, the contractor will additionally employ screed vibrator as per IS: 2506. Hand tamping may be allowed in rare cases, subject to the approval of the Engineer. Care must be taken to ensure that the inserts, fixtures, reinforcement and formwork are not displaced or distorted during placing and consolidation of concrete. The rate of placement of concrete shall be such that no cold joint is formed and fresh concrete is placed always against green concrete which is still plastic and workable. No concrete shall be placed in open, during rains. During rainy season, no placement in the open is to be attempted unless sufficient tarpaulins or other similar protective arrangement for completely covering the still green concrete from rain is kept at the site of placement. If there has been any sign of washing of cement and sand, the entire affected concrete shall be removed immediately. Suitable precautions shall be taken in advance to guard against rains before leaving the fresh concrete unattended. No accumulation of water shall be permitted on or around freshly laid concrete. The size of the concrete pours must be carefully considered prior to commencement to ensure the structural elements are poured in on continuous shift to avoid cold joints. Slabs, beams and similar members shall be poured in one operation, unless otherwise instructed by the Engineer. Moulding, throating, drip course, etc., shall be poured as shown on the drawings or as directed by the Engineer. Holes shall be provided and bolts, sleeves, anchors, fastenings or other fixtures shall be embedded in concrete as shown on the drawings or as directed by the Engineer. Any deviation there from shall be set right by the Contractor as instructed by the Engineer. In case the forms or supports get displaced during or immediately after the placement and bring the concrete surface out of alignment beyond tolerance limits, the Engineer may direct to remove the portion and		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

reconstruct or repair the same. The Engineer shall decide upon the time interval between two placements of concrete of different ages coming in contact with each other, taking in consideration the degree of maturity of the older concrete, shrinkage, heat dissipation and the ability of the older concrete to withstand the load imposed upon it by the fresh placement. Once the concrete is deposited, consolidated and finished in its final position, it shall not be distributed. 3.13 <u>CONSTRUCTION JOINTS AND COLD JOINTS</u> 3.13.1 Construction Joints It is always desirable to complete any concrete structure by continuous pouring in one operation. However, due to practical limitation of methods and equipment and certain design considerations, construction joints are formed by discontinuing concrete at certain predetermined stages. These joints will be formed in a manner specified in the drawings/Instruction. Vertical construction joints will be made with rigid stop-board forms having slots for allowing passage of reinforcement rods and any other embedments and fixtures that may be shown. Next stage concrete shall be placed against construction joint as per clause 3.12. For water retaining structures and leak-proof buildings suitable approved water bars will be installed at the construction joints. Where the locations of the joints are not specified, it will be in accordance with the following: (a) In a column, the joint shall be formed 75 mm below the lowest soffit of the beam framing into it. (b) Concrete in a beam shall preferably be placed without a joint, but if provision of a joint is unavoidable, the joint shall be vertical and within the middle third of the span.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 98 of 549
(c) A joint in a suspended floor slab shall be vertical and within the middle third of the span and at right angles to the principal reinforcement. (d) Feather-edges in concrete shall be avoided while forming a joint. (e) A construction joint should preferably be placed in a low-stress zone and at right angles to the direction of the principal stress. (f) In case the Contractor proposes to have a construction joint anywhere to facilitate his work, the proposal should be submitted well in advance to the Engineer for study and approval without which no construction joint will be allowed. 3.13.2 Cold Joint An advancing face of a concrete pour, which could not be covered by fresh concrete before expiry of initial setting time (due to an unscheduled stoppage or delay on account of breakdown in plant, inclement weather, low rate of placement or any other reason), is called a cold joint. The Contractor should always remain vigilant to avoid cold joints. If, however, a cold joint is formed due to unavoidable reasons, the following procedure shall be adopted for treating it: (a) If the concrete is so green that it can be removed manually and if vibrators can penetrate the surface without much effort, fresh concrete can be placed directly against the old surface. The old concrete should be covered by fresh concrete as quickly as possible and the joint thoroughly and systematically vibrated. (b) In case concrete has hardened a bit more than (a) but can still be easily removed by a light hand pick, the surface will be raked thoroughly and the loose concrete removed completely without disturbing the rest of the concrete in depth. A rich mortar layer 12 mm in thickness, will be placed on the cold joint fresh concrete shall be placed on the mortar layer and the joint will be thoroughly and systematically vibrated penetrating the vibrator deep into the old layer of concrete.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 99 of 549
(c) In case the concrete at the joint has become so stiff that it cannot be remoulded and mortar or slurry does not rise inspite of extensive vibration, the joint will be left to harden for at least 12 - 24 hrs. It will then be treated as a regular construction joint, after cutting the concrete to required shape and preparing the surface as described under clause 3.12. 3.14 <u>REPAIRS, FINISHES AND TREATMENT OF CONCRETE SURFACES</u> 3.14.1 Adequate and sound concrete surfaces, whether formed or unformed, can be obtained by employing a concrete mix of proper design, competent formwork, and appropriate methods of handling, placing and consolidation by experienced workmen. Unsound concrete resulting from improper mix design, incompetent methods, equipment and formwork, poor workmanship and protection will not be accepted and will have to be dismantled, removed and replaced by sound concrete. The Engineer may, at his sole discretion, allow to retain concrete with minor defects provided the Contractor is able to repair it by approved methods. All concrete work shall be inspected by the Contractor immediately after the forms are removed and he will promptly report occurrence of any defects to the Engineer. All repair works will be carried out as per the instructions and in the presence of the Engineer or his representative. Generally, repair work will consist of any or all of the following operations : (a) Sack rubbing with mortar and stoning with carborundum stone. (b) Cutting away the defective concrete to the required depth and shape. (c) Cleaning of reinforcement and embedments. It may be necessary to provide an anti-corrosive coating on the reinforcement. (d) Roughening by sand blasting or chipping. (e) Installing additional reinforcement/welded mesh fabric. (f) Dry packing with stiff mortar.

(g) Plastering, guniting, shotcreting etc. (h) Placing and compacting concrete in the void left by cutting out defective concrete. (i) Grouting with cement sand slurry of 1:1 mix. (j) Repairing with a suitable mortar either cement or resin modified mortar. (k) Polyer modified patching and adhesive repair mortar for beams & columns. 3.14.2 Finishing Unformed Surface A few typical and common cases of treatment of concrete surface are cited below: (a) Floor Whenever a non-integral floor finish is indicated, the surface of reinforcement concrete slab shall be struck off at the specified levels and slopes and shall be finished with a wooden float fairly smooth removing all laitance. No over trowelling, to obtain a very smooth surface, shall be done as it will prevent adequate bond with the subsequent finish. If desired by the Engineer, the surface shall be scored and marked to provide better bond. Where monolithic finish is specified or required, concrete shall be compacted and struck off at the specified levels and slopes with a screed, preferably a vibrating type and then floated with a wooden float. Steel trowelling by hand or by rotary power float is then started after the moisture film and shine have disappeared from the surface and after the concrete has hardened enough to prevent excess of fines and water to rise to the surface but not hard enough to prevent proper finishing of aberrations. Steel trowelling properly done will flatten and smoothen sandy surface left by wooden floats and produce a dense surface free from blemishes,		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 101 of 549
ripples and trowel marks. A fine textured surface that is not slick and can be used where there is likelihood of spillage of oil or water can be obtained by trowelling the surface lightly with a circular motion after initial trowelling keeping the steel trowel flat on the surface. To provide a better grip the Engineer may instruct marking the floor in a regular geometric pattern after initial trowelling. (b) Beams, Columns & Walls If on such or any other concrete structure it is intended to apply plaster or such concrete surfaces against which brickwork or other allied works are to be built, the Contractor shall hack the surface adequately as soon as the form is stripped off so that proper bond can develop. Pattern, adequacy and details of such hacking shall meet with the approval of the Engineer, who shall be informed to inspect such surfaces before they are covered up. 3.15 <u>PROTECTION AND CURING OF CONCRETE</u> Newly placed concrete shall be protected by approved means from rain, sun and wind. Concrete placed below the ground level shall be protected against contamination from falling earth during and after placing. Concrete placed in ground containing deleterious substances, shall be protected from contact with such ground, or with water draining from such ground, during placing of concrete and for a period of at least three days or as otherwise instructed by the Engineer. The ground water around newly poured concrete shall be kept to an approved level by pumping out or other adequate means of drainage to prevent floatation or flooding. Steps, as approved by the Engineer, shall be taken to protect immature concrete from damage by debris, excessive loadings, vibration, abrasion, mixing with earth or other deleterious materials, etc. that may impair the strength and durability of the concrete. As soon as the concrete has hardened sufficiently, it shall be covered either with sand, polythene sheet, hessian, canvas or similar materials and kept continuously wet for at least 14 (fourteen) days after final setting. Curing by continuous sprinkling of water will be allowed if the Engineer is satisfied with the adequacy of the arrangements made by the Contractor.

If permitted by the Engineer, curing compound like "ANTISOLE (WP)" may be used for prevention of premature water loss in concrete and thereby effecting curing of concrete. This type of curing compound shall be sprayed on newly laid concrete surfaces to form thin film barrier against premature water loss without disturbances to normal setting action. The curing compound shall comply with ASTM requirements for acceptance. The curing compound shall be applied following the final finishing operation and immediately after disappearance of water sheen from concrete surface. It is important not to apply the curing compound when standing water is still present on concrete. The contractor shall arrange for the manufacturer's supervision. The Contractor shall remain extremely vigilant and employ proper equipment and workmen under able supervision for curing. The Engineer's decision regarding the adequacy of curing is final. In case any lapse on the part of the Contractor is noticed by the Engineer, he will inform the Contractor or his supervisor verbally or in writing to correct the deficiency in curing. If no satisfactory action is taken by the Contractor within 3 (three) hours of issuance of such instruction, the Engineer will be at liberty either to employ sufficient means through any agency to make good the deficiency and entirely at the discretion of the Engineer. 3.16 <u>REINFORCEMENT</u> Mild steel round bars, cold twisted and deformed bars as medium tensile or high yield strength steel, plain hard drawn steel wire fabric etc., will be used as reinforcement as per drawings and directions. In an aggressive environment an anti-corrosive coating on the reinforcement may be provided as per IS: 9077, as shown on the drawing or as directed by the Engineer. 3.16.1 Bar Bending Schedules The Contractor shall submit to the Engineer for approval Bar Bending Schedules with working drawings in triplicate, showing clearly the

arrangements proposed by the Contractor to match available stock of reinforcing steel, within one month of receipt of the Letter of Intent or of the receipt of the relevant design drawings, whichever is later. Upon receipt of the Engineer's final approval of the Bar Bending Schedule and drawings, the Contractor shall submit 6 (six) prints of the final drawings with one reproducible print after incorporating necessary modifications or corrections, for final record and distribution. Approval of such detailed drawings by the Engineer shall not relieve the Contractor of his responsibility for correctness nor of any of his obligations to meet the other requirements of the Contract. 3.16.2 Cleaning All steel for reinforcement shall be free from loose scales, oil, grease, paint or other harmful matters immediately before placing the concrete. 3.16.3 Cutting & Bending of Reinforcement Unless otherwise specified, reinforcing steel shall be bent in accordance with the procedure specified in IS:2502 or as approved by the Engineer. Bends and shapes shall comply strictly with the dimensions corresponding to the approved Bar Bending Schedules. Bar Bending Schedules shall be rechecked by the Contractor before any bending is done. No reinforcement shall be bent when already in position in the work, without approval of the Engineer, whether or not it is partially embedded in concrete. Bars shall not be straightened in a manner that will injure the material. Re bending can be done only if approved by the Engineer. Reinforcing bars above 16 mm diameter shall be bent by machine producing a gradual and even motion. Bars of 16 mm or below may be bent by hand. All the bars shall be cold bent unless otherwise approved. Bending hot at a cherry-red heat (not exceeding 845°C) may be allowed under very exceptional circumstances except for bars whose strength depends on cold working. Bars bent hot shall not be cooled by quenching. Reinforcing bars, whether high yield or mild steel shall be cut using either hand held shears, guillotines or foot operated pneumatic cutters. Cutting bars using cold chisels may be allowed by the Engineer at exceptional cases.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 104 of 549

3.16.4 Placing in Position

All reinforcements shall be accurately fixed and maintained in position as shown on the drawings by such approved and adequate means like mild steel chairs and/or concrete spacer blocks irrespective of whether such supports are payable or not. Bars intended to be in contact at crossing points, shall be securely tied together at all such points by No. 20 G annealed soft iron wire. Tack welding of bars should not be done unless permitted by the Engineer. Binders shall tightly embrace the bars with which they are intended to be in contact and shall be securely held. The vertical distance between successive layers of bars shall be maintained by provision of mild steel spacer bars. They should be spaced such that the main bars do not sag perceptibly between adjacent spacers.

Before actual placing, the Contractor shall study the drawings thoroughly and inform the Engineer in case he feels that placement of certain bars is not possible due to congestion. In such cases he should not start placing any bar before obtaining clearance from the Engineer.

3.16.5 Welding

Normal bond laps in reinforcement may be placed by lap or butt welding reinforcement bars, if asked by the Engineer, under certain conditions. The work should be done with suitable safeguards in accordance with relevant Indian Standards for welding of mild steel bars used in reinforced concrete construction as per IS:2751 and IS:456. Welded mesh fabrics conforming to IS: 1566 may also be used if specified in the Schedule of Items and Drawings.

3.16.6 Control

The placing of reinforcements shall be completed well in advance of concrete pouring. Immediately before pouring, the reinforcement shall be examined by the Engineer for accuracy of placement and cleanliness. Necessary corrections as directed by him shall be carried out. Laps and anchorage lengths of reinforcing bars shall be in accordance with IS: 456, unless otherwise specified. If the bars in a lap are not of the same diameter, the smaller will guide the lap length. The laps shall be staggered as far as practicable and as directed by the Engineer. Arrangements for

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 105 of 549
placing concrete shall be such that reinforcement in position do not have to bear extra load and get disturbed. The cover for concrete over the reinforcements shall be as shown on the approved drawings unless otherwise directed by the Engineer. Where concrete blocks are used for ensuring the cover and positioning reinforcement, they shall be made of mortar not leaner than 1 (one) part cement to 2 (two) parts sand by volume and cured in a pond for at least 14 (fourteen) days. The type, shape, size and location of the concrete blocks shall be as approved by the Engineer. 3.17 <u>COLD WEATHER CONCRETING</u> When conditions are such that any operation of concreting may be expected to be done at 5Deg.C atmospheric temperature or below the work shall conform to the requirement of Clause 14 of IS:456 and IS:7861. (Part. II). 3.18 <u>HOT WEATHER CONCRETING</u> When depositing concrete in very hot weather, the Contractor shall take all precautions as per IS:7861 (Part-I) and stagger the work to the cooler parts of the day to ensure that the temperature of wet concrete used in massive structures does not exceed 40 Deg.C while placing. Positive temperature control by pre cooling, post cooling or any other method, if required, will be specified`. 3.19 <u>CONCRETING UNDER WATER</u> When it is necessary to deposit concrete under water it shall be done in accordance with the requirements of clause 14 of IS:456. 3.20 <u>FORM WORK</u> 3.20.1 General Formwork shall conform to the shape, grade, lines, levels and dimension as shown on the drawings. The contractor shall prepare design & working drawings for formwork & temporary support system for important

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 106 of 549

structures and get them approved by the Engineer prior to commencement of actual work.

Materials used for the formwork inclusive of the supports and centering shall be capable of withstanding the working load and remain undistorted throughout the period it is left in service. All supports and scaffolds should be manufactured from structural or tubular steel except when specifically permitted otherwise by the Engineer.

The centering shall be true to vertical, rigid and thoroughly braced both horizontally and diagonally. Reckers are to be used where forms are to support inclined members. The forms shall be sufficiently strong to carry without undue deformation, the dead weight of the concrete as a liquid as well as the working load, in case the Contractor wishes to adopt any other design criteria, he has to convince the Engineer about its acceptability before adopting it. Where the concrete is vibrated, the formwork shall be strong enough to withstand the effects of vibration without appreciable deflection, bulging, distortion or loosening of its components. The joints in the formwork shall be sufficiently tight to prevent any leakage of slurry or mortar.

To achieve the desired rigidity, tie bolts, spacer blocks, tie wires and clamps as approved by the Engineer shall be used but they must in no way impair the strength of concrete or cause stains or marks on the finished surface. Where there are chances of these fixtures being embedded, only mild steel or concrete of adequate strength shall be used. Alternatively, except in case of water retaining structures through rods and the tie bolts shall be sleeved with PVC conduits to allow retraction of the ties on removal of the shutters. Where required, the annulus of the conduits will be filled with expanding mortar to seal the void. Bolts passing completely through liquid retaining walls/slabs for the purpose of securing and aligning the formwork shall not be used.

The formwork shall be such as to ensure a smooth uniform surface free from honeycombs, air bubbles, bulges, fins and other blemishes. Any blemish or defect found on the surface of the concrete must be brought to the notice of the Engineer immediately and rectified as directed by him.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 107 of 549
For exposed interior and exterior concrete surfaces of beams, columns and wall, plywood or other approved form shall be thoroughly cleaned and tied together with approved corrosion- resistant devices. Rigid care shall be exercised in ensuring that all column forms are plumb and true and thoroughly cross braced to keep them so. All floor and beam centering shall be crowned not less than 8 mm in all directions for every 5 metres span. Unless specifically described on the drawings or elsewhere to the contrary, bevelled forms 25 mm by 25 mm shall be fixed in the formwork at all corners to provide chamfering of the finished concrete edges. The formwork should lap and be secured sufficiently at the lift joints to prevent bulges and offsets. Temporary openings for cleaning, inspection and for pouring concrete shall be provided at the base of vertical forms and at other places, where they are necessary and as may be directed by the Engineer. The temporary openings shall be so formed that they can be conveniently closed when required, during pouring operations without leaving any mark on the concrete. 3.20.2 Cleaning and Treatment of Forms All parts of the forms shall be thoroughly cleaned of old concrete, wood shavings, saw dust, dirt and dust sticking to them before they are fixed in position. All rubbish, loose concrete, chippings, shavings, saw dust etc. shall be scrupulously removed from the interior of the forms before concrete is poured. Compressed air jet and/or water jet along with wire brushes, brooms etc. shall be used for cleaning. The inside surface of the formwork shall be treated with approved non-staining oil based shutter release agent like "Separol/Sika form oil/Siparol Concentrate" before it is placed in position. Care shall be taken that oil or other compound does not come in contact with reinforcing steel or construction joint surfaces. They shall not be allowed to accumulate at the bottom of the formwork. The oiling of the formwork will be inspected just prior to placement of concrete and redone wherever necessary. 3.20.3 Design The formwork shall be so designed and erected that the forms for slabs and the sides of beams, columns and walls are independent of the soffits of

beams and can be removed without any strain to the concrete already placed or affecting the remaining formwork. Removing any props or re propping shall not be done except with the specific approval of the Engineer. If formwork for column is erected for the full height of the column, one side shall be left open and built up in sections, as placing of concrete progress. Wedges, spacer bolts, clamps or other suitable means shall be provided to allow accurate adjustment and alignment of the formwork and to allow it to be removed gradually without jarring the concrete. The design of formwork shall take into account all vertical and lateral loads that the forms will carry or be subjected to during the construction process. Besides weight and pressures of reinforced concrete and weight of the forms themselves, the design shall consider loading due to unsymmetrical placement of concrete; impact from dumping of concrete; movement of men and construction equipment; wind action and any other imposed load during construction. The contractor shall assess the magnitude of vertical live load to be taken for design of formwork duly considering his method, sequence and rate of pour of concrete. However, minimum design vertical live load to be considered shall be 750 kg/sqm excluding weight of concrete. 3.20.4 Inspection of Forms Casting of Concrete shall start only after the formwork has been inspected and approved by the Engineer. The concreting shall start as early as possible within 3 (three) days after the approval of the formwork and during this period the formwork shall be kept under constant vigilance against any interference. In case of delay beyond three days, a fresh approval from the Engineer shall be obtained. 3.20.5 Removal of Forms Before removing any formwork, the Contractor must notify the Engineer well in advance to enable him to inspect the concrete if he so desires. The Contractor shall record on the drawing or in any other approved manner, the date on which concrete is placed in each part of the work and the date on which the formwork is removed there from and have this record checked and countersigned by the Engineer regularly.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

The Contractor shall be responsible for the safe removal of the formwork and any work showing signs of damage through premature removal of formwork or loading shall be rejected and entirely reconstructed by him. The Engineer may, however, instruct to postpone the removal of formwork if he considers it necessary. Forms for various types of structural components shall not be removed before the minimum periods specified herein and the removal after the minimum periods shall also be subject to the approval of the Engineer in each case.

be kept supported by formwork till its removal for the portion of beam, cast at a later date, is due and so approved by the Engineer. If any type of cement other than ordinary portland cement and Rapid hardening portland cement is used the time of removal of forms shall be revised as approved by the Engineer such that the strength of this cement at the time of removal of forms match with strength of portland cement at the time of removal of form as mentioned above. This has to be supported by regular tests. 3.20.6 Tolerance The formwork shall be so made as to produce a finished concrete, true to shape, lines, levels, plumb and dimensions as shown on the drawings subject to the following tolerances unless otherwise specified in this Specification or drawings or directed by the Engineer: For (a) Sectional dimension : + 5 mm (b) Plumb : 1 in 1000 of height (c) Levels : + 3 mm before any deflection has taken place The tolerance given above are specified for local aberrations in the finished concrete surface and should not be taken as tolerances for the entire structure taken as a whole or for the setting and alignment of formwork, which should be as accurate as possible to the entire satisfaction of the Engineer. Any error, within the above tolerance limits or any other as may be specially set up by the Engineer, if noticed in any lift of the structure after stripping of forms, shall be corrected in the subsequent work to bring back the surface of the structure to its true alignment. 3.20.7 Re-use of Forms Before re-use, all forms shall be thoroughly scraped, cleaned, joints and planes examined and when necessary repaired, and inside surface treated as		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 113 of 549
3.20.8	specified hereinbefore. Formwork shall not be used/re- used if declared unfit or unserviceable by the Engineer. Classification Generally, the 'ordinary' class formwork shall be used unless otherwise directed by the Engineer: (a) Ordinary : These shall be used in places where ordinary surface finish is required and shall be composed of steel and/or approved good quality partially seasoned timber. (b) Plywood : These shall be used in exposed surfaces, where a specially good finish is required and shall be made of approved brand of heavy quality plywood to produce a perfectly uniform and smooth surface conforming to the shape described in the drawing with required grain texture on the concrete. Re-use may only be permitted after special inspection and approval by the Engineer. He may also permit utilisation of used plywood for the 'ordinary' class, if it is still in good condition. (c) Ornamental: These shall be used where ornamental and curved surface are required and shall be made of selected best quality well seasoned timbers or of plywood, which can be shaped correctly. 3.21 <u>OPENING, CHASES, GROOVES, REBATES, BLOCKOUTS ETC.</u> The Contractor shall leave all openings, grooves, chases, etc. in concrete work as shown on the drawings or as specified by the Engineer. 3.22 Anchor Bolts, Anchors, Sleeves, Inserts, Hangers/Conduits/Pipe and Other misc. Embedded Fixtures. The Contractor shall build into concrete work all the items noted below and shall embed them partly or fully as directed and	

CONSULTANT : PROCON ENGINEERS

secure the same as may be required. The materials, if required to be supplied by the Contractor, shall be as specified and be of best quality available according to relevant Indian Standards of approved manufacture and to the satisfaction of the Engineer. Exposed surfaces of embedded materials are to be painted with one coat of approved anti-corrosive paint and/or bituminous paint. If welding is to be done subsequently on the exposed surface of embedded material the paint shall be cleaned off the member to a minimum length of 50 mm beyond each side of the weld line. Necessary templates, jigs, fixtures, supports etc. shall be used as may be required or directed by the Engineer. Items to be embedded. (a) Inserts, hangers, anchors, frames around openings, manhole covers, frames, floor clips, sleeves conduits and pipes. (b) Anchor bolts and plates for machinery, equipment and for structural steel work. (c) Steel structural to be left embedded for future extension, special connection etc. (d) Lugs or plugs for door and window frames occurring in concrete work. (e) Flashing and jointing in concrete work. (f) Any misc. embedment and fixture as may be required. Correct location and alignment, as per drawings/instruction of all these embedded items shall be entirely the responsibility of the Contractor. 3.23 <u>EXPANSION AND ISOLATION JOINTS</u> 3.23.1 General Expansion and isolation joints in concrete structures shall be provided at specific places as per details indicated on the drawings. The materials and types of joints shall be as specified hereinafter. In case of liquid retaining		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 115 of 549
structures, additional precautions shall be taken to prevent leakage of liquids as may be specified on the drawings or as directed by the Engineer. All materials are to be procured from reliable manufacturers and must have the approval of the Engineer. Where it is the responsibility of the Contractor to supply the material, the Engineer may demand test certificates for the materials and/or instruct the Contractor to get them tested in an approved laboratory. Joints shall be formed true to line, level, shape, dimension and quality as per drawings and specifications. Prior approval of the method of forming the joints should be obtained from the Engineer before starting the work. 3.23.2 Bitumen Board/Expanded Polystyrene Board (a) Bitumen Board Bitumen impregnated fibre board of approved manufacturer as per IS: 1838 may be used as fillers for expansion joints. It must be durable and waterproof. It shall be compressible and possess a high degree of rebound. The dimensions of the board should be equal to that of the joint being formed. It should, preferably be manufactured in one piece, matching the dimension of the joint and not prepared by cutting to size smaller pieces from larger boards at site. At the exposed end, the joint shall be sealed with approved sealing compound to a depth of at least 25 mm after application of an approved primer. The sealing compound and the primer shall be applied as specified by the manufacturer. (b) Expanded Polystyrene Boards If required, commercial quality\of expanded polystyrene products commonly used for thermal insulations may also be used as filler material in expansion joints. The thickness may vary from 12 mm to 50 mm. The material will have to be procured from reliable manufacturers as approved by the Engineer. The method of installations will be similar to that recommended by the manufacturers for fixing on cold storage walls. A coat of Bitumen paint may have to be applied on the board against which concrete will be placed.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 116 of 549

3.23.3 Joint Sealing Strips

Joint sealing strips may be provided at the construction, expansion and isolation joints as a continuous diaphragm to contain the filler material and/or to exclude passage of water or any other material into or out of the structure.

The sealing strips will be non-metallic like rubber or P.V.C.

Sealing strips will not have any longitudinal joint and will be procured and installed in largest practicable lengths having a minimum number of transverse joints. The material is to be procured from reputed manufacturers having proven records of satisfactory supply of joint strips of similar make and shape for other jobs. The jointing procedure shall be as per the manufacturer's recommendations, revised if necessary, by the Engineer. The Contractor is to supply all labour and material for installation including the material and tools required for jointing, testing, protection, etc. If desired by the Engineer, joints in rubber seals may have to be vulcanised.

Non - metallic sealing strips will be normally in Rubber or P.V.C. Rubber or P.V.C. joint seals can be of shape having any combination of the following features :

- (a) Plain
- (b) Central bulb
- (c) Dumb-bell or flattened ends
- (d) Ribbed and Corrugated Wings
- (e) V shaped

As these types of seals can be easily handled in very large lengths, transverse joints will be allowed only under unavoidable circumstances and with the specific approval of the Engineer.

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 117 of 549

The method of forming these joints, laps etc. shall be as specified by the Manufacturer and/or as approved by the Engineer taking particular care to match the central bulbs and the edges accurately.

3.23.3.1 Rubber Sealing Strips

The minimum thickness of Rubber sealing strips shall be 3 mm and the minimum width 100 mm. The actual size and shape will be as shown in drawings of items and/ or as directed by the Engineer. The material will be natural rubber and be resistant to corrosion, abrasion and tear and also to attacks from the acids, alkalis and chemicals normally encountered in service. The physical properties will be generally as follows. The actual requirements may be slightly different as decided by the Engineer:

(a)	Specific Gravity	:	1.1 to 1.15
(b)	Shore Hardness	:	65A to 75A
(c)	Tensile Strength	:	25 - 30 N/Sq.mm
(d)	Maximum Safe Continuous Temperature	:	75 Deg.C
(e)	Ultimate Elongation	:	Not less than 350%

3.23.3.2 P.V.C. Sealing Strips

The minimum thickness of P.V.C. sealing strips will be 3 mm and the minimum width 100 mm. The actual size and shape will be as shown in drawings/schedule of items and/or as directed by the Engineer. The material should be of good quality Polyvinyl Chloride highly resistant to tearing, abrasion and corrosion as well as to chemicals likely to come in contact with during use. The physical properties will generally be as follows. The actual requirements, which will be directed by the Engineer, may vary slightly:

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 118 of 549
(a) Specific Gravity : 1.3 to 1.35 (b) Shore Hardness : 60A to 80A (c) Tensile Strength : 10 - 15 N/Sq.mm (d) Maximum Safe Continuous Temperature : 70 Deg.C (e) Ultimate Elongation : Not less than 275% 3.23.4 Joint Sealing Compound When directed, the gap in expansion joints shall be thoroughly cleaned and bitumen compound lay as per manufacturer's specifications. The compound to be used shall be of approved manufacture and shall conform to the requirements of IS: 1834. Alternatively, when directed, the expansion Joints may be filled with joint sealing compound like "Sikalastic" or approved equivalent and shall be applied as per manufacturer's specification. 3.23.5 Isolation Joints Strong and tough alkathene or PVC sheet about 1 mm in thickness and as approved by the Engineer shall be used in isolation joints. It shall be fixed by an approved adhesive compound on the cleaned surface of the already set concrete, to cover it fully. Fresh concrete shall be laid against the sheet, care being taken not to damage the sheet in any way. 3.23.6 Rubber Pad Hard foundation quality rubber pads of required thickness and shapes shall be put below machine or other foundations as shown on the drawings or as directed by the Engineer. The rubber shall have a unit weight of 1500 Kg/Cu.m, a shore hardness-65A to 70A and be of best quality of approved manufacture, durable, capable of absorbing vibration and must be chemically inert in contact with moist or dry earth or any other deleterious material expected under normal conditions.

3.24 GROUTING UNDER MACHINERY OR STRUCTURAL STEEL BASES

If required, grouting under base plates of machines or structural steel etc. shall be carried out by the Contractor. In general, the mix shall be 1 (one) part cement and 1 (one) part sand and just enough water to make it flow as required. The areas to be grouted shall be cleaned thoroughly with compressed air jet and/or with water in locations where accumulated surplus water can be removed. Where directed by the Engineer, 6 mm down stonechips may have to be used in the mix. Surface to be grouted shall be kept moist for at least 24 hours in advance. The grout shall be placed under expert supervision, so that there is no locked up air. Edges shall be finished properly. If desired by the Engineer, admixtures like Aluminium powder; 'Ironite' etc. may have to be added with the grout in proportions to be decided by the Engineer. Admixture, if directed to be added, will be measured and paid separately.

Alternatively non-shrink, free flow, cementitious grout like "SikagROUT 214/Anchor NSG" or approved equivalent specifically selected for the type of equipment to be located (vibrating, static etc.) may also be used for grouting as per manufacturer's specification with necessary approval of the Engineer.

3.25 PRECAST CONCRETE

The Specification for precast concrete will be similar as for the cast-in-place concrete described herein and as supplemented in this section. All precast work shall be carried out in a yard made for the purpose.

This yard shall be dry, properly levelled and having a hard and even as well as well drained surface to prevent excessive uneven settlement due to softening of soil during casting & curing. If the ground is to be used as a soffit former of the units, it shall be paved with concrete or masonry and provided with a layer of plaster (1:2 proportion) with smooth neat cement finish or a layer of M.S. sheeting. Where directed by the Engineer, casting will have to be done on suitable vibrating table. The yard, lifting equipment, curing tank, finished material storage space etc. Shall be designed such that the units are not lifted from the mould before 10 (Ten) days of curing and can be removed for erection after 28 (twenty eight) days

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

of curing. The moulds shall preferably be of steel or of timber lined with G.I. sheet metal and must be rigid enough to prevent distortion during placing and compaction of the concrete. Other than normal curing by applying water through spray nozzles or perforated hose curing by high pressure steam, steam vapour or other accepted processes may also be employed to accelerate the hardening of the concrete and to reduce the curing time. Lifting hooks, where necessary or as directed by the Engineer, shall be embedded in correct position of the units to facilitate erection, even though they may not be shown on the drawings, and shall be burnt off and finished after erection. All members shall be indelibly marked with a unique identification mark on a surface which will not be permanently exposed to show on which production line they were manufactured, their type, the class of concrete, the data of casting and if they are of a symmetrical section the face which will be uppermost when the member is in its correct position after erection. Precast concrete units, when ready, shall be transported to site by suitable means approved by the Engineer. Care shall be taken to ensure that no damage occurs during transportation. All adjustments, levelling and plumbing shall be done as per instructions of the Engineer. The Contractor shall render all help with instruments, materials and men to the Engineer for checking the proper erection of the precast units. After erection and alignment, the joints shall be filled with grout or concrete as directed by the Engineer. If centerings have to be used for supporting the precast units, they shall not be removed until the joints have attained sufficient strength and in no case before 14 (fourteen) days. The joint between precast roof planks shall be pointed with 1:2 cement: sand mortar where called for in the drawings. 3.26 <u>WATERPROOFING OF CONCRETE STRUCTURE</u> 3.26.1 General Waterproofing of concrete structures shall be done by either suitable

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 121 of 549
extraneous treatment like applying waterproofing paints like "Sikatop Seal" fixing bitumen felts etc. or internally by suitable design of the concrete mix, addition of suitable admixtures conforming to IS: 2645 and equivalent American or British codes in the concrete or mortar at the time of mixing and/or installing water bars at the joints. The design, material and workmanship shall conform to the relevant I.S. Codes where applicable. The Engineer's approval of the materials shall be obtained by the Contractor before procurement. If desired by the Engineer, test certificates for the materials and samples shall be submitted by the Contractor. The materials shall be of best quality available indigenously, fresh clean and suitable for the duties called upon. 3.26.2 Water Bar/Seal/Special Treatment of Construction Joint Water bearing structures and underground structures may have water bar/seals installed at the joints. They may be rubber or P.V.C. The materials and installation will be as described under Clause 3.23.3. Construction joint should be provided as per clause 3.13.1 with or without water bar/Seal as shown on the drawing. In case of water bars being used at the construction Joint, fixing of the same has to be done carefully so that the water bar is not disturbed during concreting. The construction joint shall also be treated by any one of the following methods: (a) Method 1 A surface retarder in the form of a thixotropic gel shall be applied on the joint surface of the previous pour in case of joint on the wall and in case of floor the same shall be applied on the formwork against which previous pour of concreting shall be done. The retarder may be liquid or paste form depending on the type of formwork. The formwork shall be removed within 24 hours after concreting. Within 2 hours of striking of the formwork the retarder shall be washed off with strong water jet to make surface rough and clean. Then a rich cement mortar using cement, sand and aggregates (maximum size 8 mm) along with synthetic rubber emulsion type water resistant bonding agent shall be applied for a depth of 50 mm just before pouring the next stage of concreting in case of walls. The above bonding agent will be mixed with water which will be used for		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 122 of 549

making the cement mortar. The proportion of mixing of this bonding agent with water shall be as per manufacturer’s specification. In case of floor joint, however, after washing of retarder a solvent free two component epoxy resin bonding agent will be used at the joint before the next pour of concrete. The above bonding agent shall have the following properties after 28 days:

(i)	Compressive strength	:	55 to 60 N /Sq. mm
(ii)	Flexural Strength	:	25 to 30 N /Sq. mm.
(iii)	Tensile strength	:	15 N Sq. mm (approx)
(iv)	Bonding strength to concrete	to :	3 N / Sq. mm (approx)
(v)	Bonding strength to steel	:	20 N / Sq. mm (approx)

The whole operation shall be done as per manufacturer’s specification. The contractor shall provide manufacturer’s supervision.

(b) Method 2

One row of threaded nozzles at regular intervals not exceeding 1.5 m centre to centre shall be placed in concrete along the construction joint during casting. Injection of cement water together with a suitable waterproof expanding grouting admixture of approved quality shall be done through the nozzles after the construction joint in walls and slabs. The injection shall be done under pressure of approximately 2 to 4 Kg/Sq cm.

The nozzles shall be sealed off with suitable admixture after the injection is over. The whole operation shall be carried out as per manufacturer’s specification and supervision.

3.26.3 Waterproofing Admixtures

The waterproofing admixture for concrete and cement mortar / plaster shall conform to relevant IS code. The admixture shall not cause decrease of

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 123 of 549
strength of concrete / plaster at any stage and it is free from chlorides and sulphates. The admixture shall not affect the setting time by more than 5 % The maximum permissible dosage of admixture will be 3% (three percent) by weight of cement but a lower dosage will always be preferred. The product shall be stored in strong moisture proof packing. However, in case of important structures where M25 or higher grade concrete is specified, the use of melamine based, high range water resistant concrete admixture shall be used to provide a waterproof concrete around 410 Kg/ Cm.m a melamine based super plasticizer will be preferable. (a) In concrete : The approved admixture shall be based on modified lignosulphonate like "Plastocrete - N/Super" or approved equivalent. The method of application and other details shall conform to the manufacturer's specification and/or as instructed by the Engineer. The Contractor shall have the services of the manufacturer's supervisor to supervise the work, if desired by the Engineer. (b) In Plaster : The concrete surface, to be plastered, shall be hacked to Engineer's satisfaction, cleaned thoroughly and kept wetted for 24 hours. The plaster shall be in cement sand mortar mixed in proportion varying from 1:1 to 1:4 by volume along with the approved waterproofing admixture like "Noleak CP/Sika Latex" or approved equivalent and laid in appropriate thickness and in layers not exceeding 15 mm/layer or as per manufacturer's specification. The additive shall be of quality and type approved by the Engineer. If desired by the Engineer, the Contractor shall have the work supervised by the manufacturer's supervisor. On completion, the plastered surface shall be cured continuously for a minimum period of 14 days like concrete.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 124 of 549
3.26.4 Bituminous or Tar Coating on External Surface The surface to be waterproofed shall be rendered absolutely dry, clean and dust free. The surface shall be sand papered, cleaned and completely coated with hot coal tar pitch of approved manufacturer and quality as per IS:216 (not heated above 375 Deg.F) using not less than 2 Kg. per Sq.M. or with hot asphalt i.e., bitumen according to IS:73 (not heated above 400 Deg.F) using not less than 1.5 kg. per Sq.M. When the first coat has completely dried up and approved by the Engineer, the second coat shall be applied in the same manner using not less than 1.25 Kg. per Sq.M. in case of coal tar and 1 Kg. per Sq.M. in case of asphalt. Immediately after application of the second coat and before it is dried up, sand shall be spread on the surface to cover it completely. Sufficient time shall be allowed after spreading of sand before backfilling is done in order to allow the final coat to dry up completely. In place of hot application by coal tar/asphalt the coating of the outside surfaces of walls may be carried out using a ready to use liquid, bituminous emulsion/rubber protective coating of approved manufacturer. 3.26.5 Protective Coating on Inside Surface Two coats of cement based to components polymer modified flexible protective and waterproofing slurry having 1 mm thick for each coat shall be applied on the walls/floor after proper surface preparation as mentioned above. The slurry shall be applied by brush. 3.26.6 Bitumen Felt : Application for Tanking This specification shall cover laying the waterproof course on the outside and inside of the walls and bases of structures. The materials shall conform to IS: 1322, and the workmanship to IS: 1609. The bitumen felt shall be hessian base and/or fibre base as specified in Drawing/Schedule of Items. If required by the Engineer, tests as specified in relevant IS Codes shall be arranged by the Contractor. The Contractor shall execute this work in direct collaboration with one of the well known specialised approved by the Engineer.		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-3

Cleaning the surface, keeping it dry, providing necessary corner fillets and cement rendering and cutting chases, etc. shall be included in the rate for this item. If any protective brickwork on/against concrete sub-bases or walls are required, these will be paid extra under suitable items in the contract. A 20 (twenty) years' guarantee for satisfactory performances shall be given by the Contractor as well as his specialist sub-contractor jointly and severally, for this item of work. Free rectification of any defects noted in the work within this guarantee period will be carried out by the Contractor even if it is beyond the specified maintenance period of the contract as a whole.

3.26.7 Polyethylene Films : Application in Walls or base of Structures

Waterproof treatment shall be applied as outlined and as per sequence given hereunder:

- (a) the concrete surface shall be made smooth with 12 mm cement plaster 1:6
- (b) apply hot bitumen 80/100 grade (IS:73-1961) at the rate of 1.0 Kg/Sq.m minimum
- (c) lay black polyethelene film 250 micron (IS:2508-1977) with cut back bitumen adhesive in overlaps over hot bitumen surface, gently pressed, taking care not to puncture the film.

Alternatively, the overlaps shall be heat sealed by an electric iron having three parallel sealing bars. A long piece of plywood is to be placed below the polyethelene film to be heat sealed. On the plywood a rubber gasket is to be laid to provide a cushion for better welding of the film. On the rubber padding, a celophane tape is to be spread and on this the LDPE film, with 100 mm overlap, is to be stretched. On the overlapped film another celophane tape is to be placed to prevent the heat sealer from sticking to the LDPE film. After this, the electric iron is to be pressed on the overlap joint for sufficient time so as to allow perfect welding. The operation is to be repeated for subsequent lengths of joints. After heat sealing, the celophane tape is to be removed and the joints are to be tested for leaks.

	(d) Lay 100 gm brown craft paper laminated with a layer of straight run bitumen. (e) Lay hot bitumen 80/100 grade (IS: 73-1961) at 1.0 Kg/Sq.m minimum. (f) Lay 250 micron polyethelene film as second layer similar to (c) above. (g) Lay second layer of 100 gm. brown craft paper laminated similar to (d) above. (h) Apply hot bitumen (straight run grade) to IS: 73-1961 at 1.0 Kg/Sq.m dusted with fine sand. (i) Protecting with a layer of 75 mm plain cement concrete M-100 or a layer of brick lay in cement mortar 1:6. In case of wall apply a 12 mm thick plaster as shown on the drawing or a protective brick wall in 1:6 cement mortars as shown on the drawing.	
3.27	<u>PROTECTIVE COATING ON CONCRETE SURFACE</u>	
3.27.1	On Foundation	
	The outside faces of foundation of important structures will be protected from adverse effect of soil/underground water, if shown on drawing or instructed by the Engineer, by using bitumen emulsion protective coating of approved manufacturer.	
3.28	<u>WATERPROOFING BY PRESSURE /CHEMICAL GROUTING</u>	
	Where required, waterproofing for underground concrete structure shall be done by injecting high polymer based non-shrink waterproof grouting compound through nozzle under pressure as per manufacturer's recommendation. The pressure during injection shall not be less than 2.5 kg/Sq.cum and the thickness of epoxy resinous emulsion waterproof paint (to be applied on the external surface of walls/slabs) shall not be less than 700 microns.

4.0 <u>SAMPLING AND TESTING</u> 4.1 <u>GENERAL</u> The Contractor shall carry out all sampling and testing in accordance with the relevant Indian Standards and as supplemented herein for the following items at his own cost unless otherwise specified in this specification. The Contractor shall get the specimens tested in a laboratory approved by the Engineer and submit to the Engineer the test results in triplicate within 3 (three) days after completion of the test. 4.2 <u>CEMENT</u> Representative samples will be taken from each consignment of cement received from the manufacturer/supplier for carrying out the tests for fineness (by hand sieving), setting time and compressive strengths. Soundness Tests may also be required to be carried out if required by the Engineer. The tests shall be carried out free of charge by the Owner if cement is supplied by him. In case the Contractor is directed to arrange for the supply of cement as per the terms and conditions of the Contract the tests shall be carried out by him. In case due to any circumstances, the agency of supply is changed in the middle of the Contract, the party who bore the original contractual obligation will carry on with the test, free of charge to the other, till the end of the job. No cement from a particular consignment/batch will be used on the works unless satisfactory 3 (three) days and 7 (seven) days test results for compressive strength are known. The Owner, Engineer and Contractor will jointly associate themselves with the tests irrespective of whether they are carried out by the Owner or the Contractor. These tests are of great importance as their results will have a bearing on the acceptance of concrete or otherwise as per the terms and conditions of the Contract. 4.3 <u>AGGREGATES</u> The Contractor shall carry out any or all the tests aggregates as may be required by the Engineer in accordance with IS: 2386 PARTS-I to VIII. The acceptance criteria of the samples tested shall be in accordance with the requirements of the relevant Indian Standards.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 128 of 549
4.4	<u>WATER</u> Sampling and Testing of water being used for concrete works as per IS: 3550 will be carried out by the Contractor at regular intervals and whenever directed by the Engineer. The final acceptance criteria in case of doubt will be as per IS: 3025 & IS: 456.	
4.5	<u>ADMIXTURE</u>	
4.5.1	Air Entraining Agents (A.E.A)	
	Initially, before starting to use A.E.A., relationship between the percentage of air entrained and the cube crushing strength vis-a-vis quantity of A.E.A. used for all types of concrete will be established by the Contractor by carrying out sufficiently large number of tests. After then, at regular intervals and whenever directed by the Engineer, the Contractor will check up the actual percentages of air entrained and corresponding crushing strengths to correlate with the earlier test results.	
4.5.2	Other Admixtures	
	Tests for establishing the various properties of any other admixtures which may be required to be added shall be carried out by the Contractor.	
4.6	<u>CONCRETE</u>	
	The sampling of concrete, making the test specimens, curing and testing procedure etc. shall be in accordance with IS: 516 and IS: 1199 the size of specimen being 15 cm cubes. Normally, only compression tests shall be performed but under special circumstances the Engineer may require other tests to be performed in accordance with IS: 516.	
	Sampling procedure, frequency of sampling and test specimen shall conform to Clause 14 of IS: 456.	
	To control the consistency of concrete from every mixing plant, slump tests and/or compacting factor tests in accordance with IS: 1199 and as mentioned in Clause 3.6 of this Specification shall be carried out by the

Contractor every two hours or as directed by the Engineer. Slumps corresponding to the test specimens shall be recorded for reference. The acceptance criteria of concrete shall be in accordance with Clause 15 of IS: 456. Concrete work found unsuitable for acceptance shall have to be dismantled and replacement is to be done as per specification by the Contractor. No payment for the dismantled concrete, the relevant formwork and reinforcement, embedded fixtures, etc. wasted in the dismantled portion shall be made. In the course of dismantling, if any damage is done to the embedded items or adjacent structures, the same shall be made good to the satisfaction of the Engineer. 5.0 <u>ACCEPTANCE CRITERIA</u> 5.1 <u>STANDARD DEVIATION</u> Standard deviation shall be based on test results and determination of Standard deviation shall conform to clause 16 of IS: 456. 5.2 <u>ACCEPTANCE CRITERIA</u> The strength requirements and acceptance criteria shall conform to Clause 16 of IS: 456. 5.3 <u>INSPECTION AND CORE TESTS</u> Inspection of concrete work immediately after stripping the formwork and core test of structures shall conform to Clause 17 of IS: 456. 5.4 <u>LOAD TEST</u> Load tests of structural members may be required by the Engineer, when the strength of test specimen results falls below the required strength, as per Load Test on Parts of Structures', Clause 17.6 of IS: 456. If load testing is decided by the Engineer, the member under consideration shall be subjected to a test load equal to 1.25 (one and a quarter) times the specified live load used for design and this load shall be maintained for a period of		

CONSULTANT : PROCON ENGINEERS

24 (twenty four) hours before removal. The detailed procedure of the test is to be decided by the Engineer. Load tests shall not be made until the structure is at least 56 days old.

If the member shows evident failure, such changes as are necessary to make the structure adequately strong shall be made by the Contractor. Alternatively, if permitted under Statutory Regulations and at the discretion of the Engineer, the structure under test or a portion thereof may be retained as such without any modification by de-rating its load bearing capacity, provided the design criteria allows such de-rating.

A reinforced concrete beam, floor or roof shall be deemed to have passed the test if the maximum deflection at the end of 24 hours does not exceed the deflection given in Clause 17.6 of IS: 456.

The entire cost of load testing shall be borne by the Contractor. If a portion of the structure is found to be unacceptable, it shall be dismantled and replaced by a new structure as per specification.

If, in the course of dismantling, any damage is done to the embedded items and or other adjacent structures, the same will be made good by the Contractor to the satisfaction of the Engineer.

6.0 LIST OF I.S. CODES AND STANDARDS FOR REFERENCE

All work under this specification shall, unless specified otherwise, conform to the latest revisions and/or replacements of the following or any other India Standard Specifications and Codes of Practice. In case any particular aspect of work is not specifically covered by Indian Standard Specifications, any other standard practice, as may be specified by the Engineer, shall be followed :-

1.0 <u>SCOPE</u> This specification covers supply of all raw steel materials, fabrication, testing, painting and delivery to site of structural steelwork including supply of all consumable stores and bolts, nuts, washers, electrodes and other materials required for fabrication and field connections of all structural steelwork in general covered under the scope of the contract. However, for any special structures such as rail & road bridges, steel chimney, tanks, transmission towers, furnace structures, etc., the relevant Indian Standard or IRC specification and Codes of Practices shall be given due consideration over & above this specification. 2.0 <u>GENERAL</u> 2.1 <u>WORK TO BE PROVIDED FOR BY THE CONTRACTOR</u> The work to be provided for by the bidder unless otherwise specified elsewhere in the contract, shall include, but not be limited to the following: 2.1.1 Preparation of complete detailed fabrication drawings and erection marking drawings required for all the structures covered under the scope of the contract based on contractor's design drawings approved by the Owner / Consultants. 2.1.2 To submit revised design with calculations and detailed fabrication drawings in case any substitution of the designed sections are to be made. 2.1.3 To submit design calculations for joints and connections developed by the contractor along with detailed fabrication drawings 2.1.4 Furnish all materials, labour, tools and plant and all consumables required for fabrication and supply, all necessary bolts, nuts, washers, tie rods and welding electrodes for field connections. The field connection materials supplied by the contractor shall be in adequate quantity to avoid delay in erection.

2.1.5	Furnish shop painting of all fabricated steelwork as per requirements of this Specification.	
2.1.6	Suitably mark, bundle and pack for transport all fabricated materials.	
2.1.7	Prepare and furnish detailed Bill of Materials, Drawing Office Despatch lists, Bolt List and any other list of bought out items required in connection with the fabrication and erection of the structural steelwork.	
2.1.8	Insure, load and transport all fabricated steelwork field connection materials to site.	
2.2	<u>WORK BY OTHERS</u> No work under this specification will be provided for by any agency other than the bidder, unless specifically mentioned otherwise elsewhere in the contract.	
2.3	<u>CODES AND STANDARDS</u> All work under this specification shall, unless otherwise specified in the contract, conform to the requirements of the latest revision and/or replacements of the following or any other relevant Indian Standard specifications and codes of practice. In case any particular aspect of the work is not specifically covered by any Indian Standard Specification, any other standard practice, as may be specified by the Engineer shall be followed:	
2.3.1	Relevant To Fabrication Of Structural Steel Work (a) IS : 800 : Code of practice for general construction in steel. (b) IS : 801 : Code of practice for use of cold formed light gauge steel structural members in general building Construction (c) IS : 806 : Code of practice for use of steel tubes in general building construction.

2.4	<u>CONFORMITY WITH DESIGNS</u> The bidder shall design all connections, supply and fabricate all steelwork and furnish all connection materials in accordance with the approved drawings and/or as instructed by the Engineer keeping in view the maximum utilization of the available sizes and sections of steel materials. The methods of painting, marking, packing and delivery of all fabricated materials shall be in accordance with the provisions of the contract and/or as approved by the Engineer. Provision of all relevant Indian Standard Specifications and Codes of Practice shall be followed unless otherwise specified in the contract.	
2.5	<u>MATERIALS TO BE USED</u>	
2.5.1	General All steel material shall be free from all imperfections, mill scales, slag intrusions, laminations, pittings, rusts etc. that may impair their strength, durability and appearance. All materials shall be tested quality only unless otherwise permitted by the Engineer and/or consultant. If desired by the Engineer, Test Certificates of materials supplied by the contractor in respect of each consignment shall be submitted in triplicate. Whenever the materials are required to be used from unidentified stocks, if permitted by the Engineer, a random, sample shall be tested at an approval laboratory from each lot of 50 tonnes or less of any particular section. The arc welding electrodes shall conform to be relevant Indian Standard codes of Practice and Specifications and shall be heavily coated type and the thickness of the coating shall be uniform and concentric. With each container of electrodes, the manufacturer shall furnish instructions giving recommended voltage and ampereage (Polarity in case of D.C. supply) for which the electrodes are suitable.

2.5.2

Steel

All steel materials to be used in construction within the purview of this specification shall comply with any of the following Indian Standard Specifications as may be applicable :

(a)	IS : 801	:	Cold formed light gauge steel structural member
(b)	IS : 806	:	Steel tubes in general building construction.
(c)	IS : 1161	:	Steel tubes for structural purpose.
(d)	IS : 1977 St-42-0	:	Structural steel (Ordinary quality)
(e)	IS : 2062	:	Steel for general structural purpose
(f)	IS : 8500	:	Structural steel-microalloyed (Ordinary & high strength quality)

In case of imported steel materials being used, these shall conform to specifications equivalent to any of the above as may be applicable.

2.5.3

Electrodes

All electrodes to be used under the Contract shall comply with any of the following Indian Standard Specifications as may be applicable:

(a)	IS : 814	:	Covered electrodes for metal arc welding structural steel
(b)	IS : 815	:	Classification and coding of covered electrodes for metal arc welding of mild steel and low alloy high tensile steel
(c)	IS : 7280	:	Base wire electrode for submerged arc welding

2.5.4

Bolts and Nuts

All bolts and nuts shall conform to the requirements of Indian Standard

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4

2.5.6	Paints Paints to be used for shop coat of fabricated steel under the purview of this contract shall conform to the Indian Standard Specification IS:2074 - Ready mixed Paint, Air Drying, Red Oxide - Zinc Chromate Priming. In highly corrosive environment other type of primer such as epoxy resin based zinc rich primer (such as blast steel EZ1 of Shalimer Paints Ltd., may be necessary.	
2.6	<u>STORAGE OF MATERIAL</u>	
2.6.1	General All materials shall be so stored as to prevent deterioration and to ensure the preservation of their quality and fitness for the work. Any material which has deteriorated or has been damaged shall be removed from the contractor's yard immediately, failing which, the Engineer shall be at liberty to get the material removed. The Contractor shall maintain upto date accounts in respect of receipt, use and balance of all sizes and sections of steel and other materials. In case the fabrication is carried out in contractor's fabrication shop outside the plant site where other fabrication works are also carried out, all materials meant for use in this contract shall be stacked separately with easily identifiable marks.	
2.6.2	Steel The steel to be used in fabrication and the resulting cut-pieces shall be stored in separate stacks off the ground section-wise and lengthwise so that they can be easily inspected, measured and accounted for at any time. If required by the Engineer, the materials may have to be stored under cover and suitably painted for protection against weather.	
2.6.3	Electrodes The electrodes for electric arc welding shall be stored in properly designed racks separating different types of electrodes in distinctly marked

compartments. The electrodes shall be kept in a dry and warm condition if necessary by resorting to heating.		
2.6.4	Bolts, Nuts and Washers Bolts, nuts and washers and other fastening materials shall be stored on racks off the ground with a coating of suitable protective oil. These shall be stored in separate gunny bags or compartments according to diameter, length and quality.	
2.6.5	Paints Paints shall be stored under cover in air tight containers. Paints supplied in sealed containers shall be used up as soon as possible once the container is opened.	
2.7	<u>QUALITY CONTROL</u> The Contractor shall establish and maintain quality control procedures for different items of work and materials to the extent he deems necessary to ensure that all work is performed in accordance with this specification. In addition to the Contractor's quality control procedures, materials and workmanship at all times shall be subjected to inspection by the Engineer or Engineer's representative. As far as possible, all inspection by the Engineer or Engineer's representative shall be made at the Contractor's fabrication shop whether located at Site or elsewhere. The Contractor shall co-operate with the Engineer or Engineer's representative in permitting access for inspection to all places where work is being done and in providing all necessary help in respect of tools and plants, instrument, labour and materials required to carry out the inspection. The inspection shall be so scheduled as to provide the minimum interruption to the work of the Contractor. Materials or workmanship not in reasonable conformance with the provisions of this Specification may be rejected at any time during the progress of the work. The quality control procedure shall cover but not be limited to the following items of work:	

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

Design Drawings and before proceeding with the fabrication work, shall get the said shop drawings approved in accordance with the contract. The sequence of submission of shop drawings for approval shall match with the approved fabrication and delivery schedule. The approval for the shop drawings will be accorded only towards the general conformity with the design requirements as well as specification and will ensure the correctness of general arrangement for centreline dimensions and levels, Section sizes, and adequacy of connections including splice joints as to the no. of bolts, weld length, size of gusset/end plates. The correctness of all other details like cutting lengths, matching of holes, notch dimensions, match markings, bill of materials, bolt list etc. will be entirely the contractor's responsibility. The approval of the drawing however shall not relieve the contractor of his sole responsibility in carrying out the work correctly and fulfilling the complete requirements of contract documents. The shop drawings shall include but not be limited to the following: - Assembly drawings giving exact sizes of the sections to be used and identification marks of the various sections. - Dimensional drawings of base plates, foundation bolt location etc. - Details of all connections with supporting calculations. - Comparison sheets to show that the proposed alternative section, if any, are as strong as the original sections shown on the Design Drawings. - Complete Bill of Materials and detailed drawings of all sections as also their billing weights. - Any other drawings or calculations that may be required for the clarification of the works or substituted parts thereof. The shop drawings shall give all the necessary information for the fabrication, erection and painting of the steelwork in accordance with

the provisions of this Specification. Shop drawings shall be made in accordance with the best modern practice and with due regard to sequence, speed and economy in fabrication and erection. Shop drawings shall give complete information necessary for fabrication of various components of the steelwork, including the location, type, size and extent of welds. These shall also clearly distinguish between shop and field bolts and welds and specify the class of bolts and nuts. The drawings shall be drawn to a scale large enough to convey all the necessary information adequately. Notes on the shop drawings shall indicate those joints or groups of joints in which it is particularly important that the welding sequence and technique of welding shall be carefully controlled to minimize the locked -up stresses and distortion. Welding symbols used shall be in accordance with the requirements of the Indian Standard Specification - IS:813 - Scheme of symbols for Welding, and shall be consistent throughout. Weld lengths called for on the drawings shall mean the net effective length. The Contractor shall be responsible for and shall pay for any alterations of the work due to any discrepancies, errors or omissions on the drawings or other particulars supplied by him, whether such drawings or other particulars have been duly approved or not in accordance with the Contract. 3.0 <u>WORKMANSHIP</u> 3.1 <u>FABRICATION</u> 3.1.1 General All workmanship shall be equal to the best practice in modern structural shops, and shall conform to the provisions of the Indian Standard IS:800 - Code of Practice for use of Structural Steel in General Building Construction and other relevant Indian Standards.

3.1.2 Straightening Material Rolled materials before being laid off or worked, must be clean, free from sharp kinks, bends or twists and straight within the tolerances allowed by the Indian Standard Specification IS:1852 - Specification for rolling and cutting tolerance for hot-rolled steel products. If straightening is necessary, it may be done by mechanical means or by the application of a limited amount of localized heat. The temperature of heated areas, as measured by approved methods, shall not exceed 600 Deg. C. 3.1.3 Cutting Cutting shall be effected by shearing, cropping or sawing. Use of a mechanically controlled gas cutting torch may be permitted for mild steel only. Gas cutting of high tensile steel may also be permitted provided special care is taken to leave sufficient metal to be removed by machining, so that all metal that has been hardened by flame is removed. Gas cutting without a mechanically controlled torch may be permitted if special care is taken and done under expert hand, subject to the approval of the Engineer. To determine the effective size of members cut by gas, 3 mm shall be deducted from each cut edge. Gas cut edges, which will be subjected to substantial stress or which are to have weld metal deposited on them, shall be reasonably free from gouges. Occasional notches or gauges not more than 4 mm deep will be permitted. Gouges greater than 4mm, that remain from cutting, shall be removed by grinding. All re-entrant corners shall be shaped notch-free to a radius of at least 12 mm. Shearing, cropping and gas cutting shall be clean, reasonably square and free from any distortion. 3.1.4 Planning of edges Planning or finishing of sheared or cropped edges of plates or shapes or of edges gas-cut with a mechanically controlled torch shall not be required unless specifically required by design and called for on the drawings, included in a stipulation for edge preparation for welding or as may be required after the inspection of the cut surface. Surface cut with hand flame shall generally be ground, unless specifically instructed otherwise by the Engineer.

3.1.5 Clearances The erection clearance for cleated ends of members connecting steel to steel shall preferably be not greater than 2 mm at each end. The erection clearance at ends of beams without web cleats shall be not more than 3 mm at each end, but where, for practical reasons, greater clearance is necessary, suitably designed cleatings shall be provided. 3.2 <u>BOLTED CONSTRUCTION</u> 3.2.1 Holes Holes through more than one thickness of material for members, such as compound stanchions and girder flanges, shall be drilled after the members are assembled and tightly clamped or bolted together. Punching may be permitted before assembly, if the thickness of the material is not greater than the nominal diameter of bolt plus 3 mm subject to a maximum thickness of 16 mm provided that the holes are punched 3 mm less in diameter than the required size and reamed after assembly to the full diameter. Holes for rivets or black bolts shall be not more than 1.5 mm or 2.0 mm (depending on whether the diameter of the bolt is less or more than or equal to 25 mm) larger in diameter than the nominal diameter of the black bolt passing through them. Holes for turned and fitted bolts shall be drilled to a diameter equal to the nominal diameter of the shank or barrel subject to a tolerance grade of H8 as specified in IS: 919. Parts to be connected shall be firmly held together by tacking welds or clamps and the holes drilled through all the thicknesses in one operation and subsequently reamed to size. Holes not drilled through all thickness in one operation shall be drilled to a smaller size and reamed out after assembly. Holes for bolts shall not be formed by gas cutting process.

3.2.2 Assemble Drifting to enlarge unmatching holes shall not generally be permitted. In case drifting is permitted to a slight extent during assembly, it shall not distort the metal or enlarge the holes. Holes that must be enlarged to admit the bolts shall be reamed. Poor matching of holes shall be cause for rejection. The component parts shall be so assemble that they are neither twisted not otherwise damaged, and shall be so prepared that the specified cambers, if any, are maintained. Bolted construction shall be permitted only in case of field connections if called for on the Drawings and is subjected to the limitation of particular connections as may be specified. In special cases, however, shop bolt connections may be allowed if directed by the Engineer. Washers shall be tapered or otherwise suitably shaped, where necessary, to give the heads and nuts of bolts a satisfactory bearing. The threaded portion of each bolt shall project out through the nut at least one thread. In all cases the bolt shall be provided with a washer of sufficient thickness under the nut to avoid any threaded portion of the bolt being within the thickness of the parts bolted together. In addition to the normal washer, one spring washer or lock-nut shall be provided for each bolt for connections subjected to vibrating forces or otherwise as may be specified on the Drawings. 3.3 <u>WELDED CONSTRUCTION</u> 3.3.1 General Welding shall be in accordance with relevant Indian Standards and as supplemented in the Specification. Welding shall be done by experienced and good welders who have been qualified by tests in accordance with IS:817.		

CONSULTANT : PROCON ENGINEERS

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 157 of 549
3.3.2 Preparation of Material Surface to be welded shall be free from loose scale, slag, rust, grease, paint and any other foreign material except that mill scale which withstands vigorous wire brushing may remain. Joint surfaces shall be free from fins and tears. Preparation of edges by gas-cutting shall, wherever practicable, be done by a mechanically guided torch. 3.3.3 Assembling Parts to be fillet welded shall be brought in as close contact as practicable and in no event shall be separated by more than 4 mm. If the separation is 1.5 mm or greater, the size of the fillet weld shall be increased by the amount of the separation. The fit of joints at contact surfaces which are not completely sealed by welds, shall be close enough to exclude water after painting. Abutting parts to be butt-welded shall be carefully aligned. Misalignments greater than 3 mm shall be corrected and in making the correction the parts shall not be drawn into a sharper slope than two degrees (2 Deg.). The work shall be positioned for flat welding whenever practicable. 3.3.4 Welding Sequence In assembling and joining parts of a structure or of built-up members, the procedure and sequence of welding shall be such as will avoid needless distortion and minimize shrinkage stresses. Where it is impossible to avoid high residual stresses in the closing welds of a rigid assembly, such closing welds shall be made in compression elements. In the fabrication of cover-plated beams and built-up members, all shop splices in each component part shall be made before such component part is welded to other parts of the member. Long girders or girder sections may be made by shop splicing not more than three sub-sections, each made in accordance with this paragraph. When required by the Engineer, welded assemblies shall be stress relieved by heat treating in accordance with the provisions of the relevant Indian Standard or any other Standard approved by the Engineer.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 158 of 549
3.3.5 Welding technique All complete penetration groove welds made by manual welding, except when produced with the aid of backing material not more than 8 mm thick with root opening not less than one-half the thickness of the thinner part joined, shall have the root of the initial layer gouged out on the back side before welding is started from that side, and shall be so welded as to secure sound metal and complete fusion throughout the entire cross section. Groove welds made with the use of the backing of the same material as the base metal shall have the weld metal thoroughly fused with the backing material. Backing strips need not be removed. If required, they may be removed by gouging or gas cutting after welding is completed, provided no injury is done to the base metal and weld metal and the weld metal surface is left flush or slightly convex with full throat thickness. Groove welds shall be terminated at the ends of a joint in a manner that will ensure their soundness. Where possible, this should be done by use of extension bars or run-off plates. Extension bars or run-off plates need not be removed upon completion of the weld unless otherwise specified elsewhere in the Contract. To get the best and consistent quality of welding, automatic submerged arc process shall be preferred. The technique of welding employed, the appearance and quality of welds made, and the methods of correcting defective work shall all conform to the relevant Indian Standards. 3.3.6 Temperature No welding shall normally be done on parent material at a temperature below (-) 5 Deg.C. However, if welding is to be undertaken at low temperature adequate precautions as recommended in relevant Indian Standard shall be taken. When the parent material is less than 40 mm thick and the temperature is between (-) 5 Deg. C and 0 Deg. C, the surface around the joint to a distance of 100 mm or 4 times the thickness of the material, whichever is greater, shall be preheated till it is handwarm. When the parent material is more than 40 mm thick, the temperature of the area mentioned above shall be in no case be less than 20 Deg.C. All requirements regarding preheating of the parent material shall be in

accordance with the relevant Indian Standard. 3.3.7 Peening Where required, intermediate layers of multiple-layer welds may be peened with light blows from a power hammer, using a round-nose tool. Peening shall be done after the weld has cooled to a temperature warm to the hand. Care shall be exercised to prevent scaling or flaking of weld and base metal from over peening. 3.3.8 Equipment These shall be capable of producing proper current so that the operator may produce satisfactory welds. The welding machine shall be of a type and capacity as recommended by the manufacturers of electrodes or as may be approved by the engineer. 3.4 <u>FINISH</u> Column splices and butt joints of compression members depending on contact for stress transmission shall be accurately machined and close-butted over the whole section with a clearance not exceeding 0.2 mm locally at any place. In column caps and bases, the ends of shafts together with the attached gussets, angles, channels etc., after welding together, should be accurately machined so that the parts connected butt over the entire surfaces of contact. Care should be taken that those connecting angles or channels are fixed with such accuracy that they are not reduced in thickness by machining by more than 2.0 mm. 3.5 <u>SLAB BASES AND CAPS</u> Bases and caps fabricated out of steel slabs, except when cut from material with true surface, shall be accurately machined over the bearing surface and shall be in effective contact with the end of the stanchion. A bearing face which is to be grouted direct to a foundation need not be machined if such face is true and parallel to the upper face. To facilitate grouting, holes shall be provided, where necessary, in stanchion bases for the escape of air.

3.6	<u>LACING BARS</u> The ends of lacing bars shall be neat and free from burrs.	
3.7	<u>SEPARATORS</u> Rolled section or built-up steel separators or diaphragms shall be required for all double beams except where encased in concrete, in which case, pipe separators shall be used.	
3.8	<u>BEARING PLATES</u> Provision shall be made for all necessary steel bearing plates to take up reaction of beams and columns and the required stiffeners and gussets whether or not specified in Drawings.	
3.9	<u>ARCHITECTURAL CLEARANCES</u> Bearing plates and stiffener connections shall not be permitted to encroach on the designed architectural clearances.	
3.10	<u>SHOP CONNECTIONS</u> (a) All shop connections shall be welded as specified on the Drawings. (b) Certain connections, specified to be shop connections, may be changed to field connections if desired by the Engineer for convenience of erection and the Contractor will have to make the desired changes.	
3.11	<u>CASTINGS</u> Steel castings shall be annealed.	
3.12	<u>SHOP ERECTION</u> The steelwork shall be temporarily shop-erected complete or as directed by the Engineer so that accuracy of fit may be checked before despatch. The

3.13 3.13.1	parts shall be shop-erected with a sufficient number of parallel drifts to bring and keep the parts in place. In case of parts drilled or punched using steel jigs to make all similar parts interchangeable, the steelwork shall be shop erected in such a way as will facilitate the check of interchange ability. <u>SHOP PAINTING</u> General Unless otherwise specified, steelwork which will be concealed by interior building finish need not be painted; steelwork to be encased in concrete shall not be painted. Unless specifically exempted, all other steelwork shall be given one coat of shop paint, applied thoroughly and evenly to dry surfaces which have been cleaned, in accordance with the following paragraph, by brush, spray, roller coating, flow-coating or dipping as may be approved by the Engineer. After inspection and approval and before leaving the shop, all steelwork specified to be painted shall be cleaned by hand-wire brushing or by other mechanical cleaning methods to remove loose mill scale, loose rust, weld slag or flux deposit, dirt and other foreign matter. Oil and grease deposits shall be removed by solvent. Steelwork specified to have no shop paint shall, after fabrication, be cleaned of oil or grease by solvent cleaners and be cleaned of dirt and other foreign material by through sweeping with a fibre brush. After completion of the precleaning, the metal surface shall immediately painted with red oxide zinc chromate primer conforming to IS : 2074. In highly corrosive environment, all steelwork shall be given a coat of shop paint, applied thoroughly and evenly to dry surfaces which have been cleaned by sand blasting to SA 2/1/2 grade minimum. The shop paint shall be epoxy resin based zinc rich primer such as Blast Steel EZ1 of Shalimer Paint Limited.

3.13.2 Inaccessible parts Surfaces not in contact, but inaccessible after assembly, shall receive two coats of shop paint, positively of different colours to prove application of two coats before assembly. This does not apply to the interior of sealed hollow sections. 3.13.3 Contact surfaces Contact surface shall be cleaned in accordance with Sub-clause 3.13.1 before assembly. 3.13.4 Finished surfaces Machine finished surfaces shall be protected against corrosion by a rust inhibiting coating that can be easily removed prior to erection or which has characteristics that make removal unnecessary prior to erection. 3.13.5 Surfaces adjacent to field welds Unless otherwise provided for, surfaces within 50 mm of any field weld location shall be free of materials that would prevent proper welding or produce objectionable fumes while welding is being done. 3.14 <u>GALVANIZING</u> 3.14.1 General Structural steelwork for switchyard or other structures as may be specified in the Contract shall be hot dip galvanized in accordance with the American Society for Testing and Materials Specification ASTM-A 123 or IS : 2629 - Recommended practice for Hot-Dip Galvanising of Iron and steel. Where the steel structures are required to be galvanized the field connection materials like bolts, nuts and washers shall also be galvanized.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 163 of 549
3.14.2 Surface Preparation All members to be galvanized shall be cleaned, by the process of pickling of rust, loose scale, dirt, oil, grease, slag and spatter of welded areas and other foreign substances prior to galvanizing. Pickling shall be carried out by immersing the steel in an acid bath containing either sulphuric or hydrochloric acid at a suitable concentration and temperature. The concentration of the acid and the temperature of the bath can be varied, provided that the pickling time is adjusted accordingly. The pickling process shall be completed by thoroughly rinsing with water, which should preferably be warm, so as to remove the residual acid. 3.14.3 Procedure Galvanizing shall be carried out by hot dip process in a proper and uniformly heated bath. It shall meet all the requirements when tested in accordance with IS:2633 - Method for testing uniformity of coating on Zinc Coated Articles and IS:4759 - Specification for Hot-dip zinc coatings on Structural Steel & other allied products. After finishing the threads of bolts, galvanizing shall be applied over the entire surface uniformly. The threads of bolts shall not be machined after galvanizing and shall not be clogged with zinc. The threads of nuts may be tapped after galvanizing but care shall be taken to use oil in the threads of nuts during erection. The surface preparation for galvanizing and the process of galvanizing itself, shall not adversely affect the mechanical properties of the materials to be galvanized. Where members are of such lengths as to prevent complete dipping in one operation, great care shall be taken to prevent warping. Materials on which galvanizing has been damaged shall be acid stripped and re-galvanized unless otherwise directed, but if any member becomes damaged after having been dipped twice, it shall be rejected. Special care shall be taken not to injure the skin on galvanized surfaces during transport

and handling. Damages, if occur, shall be made good in accordance with the provisions of this Specification or as directed by the Engineer.		
4.0	<u>INSPECTION, TESTING, ACCEPTANCE CRITERIA AND DELIVERY</u>	
4.1	<u>INSPECTION</u>	
Unless specified otherwise, inspection to all work shall be made by the Engineer or Engineer's representative at the place of manufacture prior to delivery. The Engineer or his representative shall have free access at all reasonable times to those parts of the manufacturer's works which are concerned with the fabrication of the steelwork under this Contract and he shall be afforded all reasonable facilities for satisfying himself that the fabrication is being done in accordance with the provisions of this Specification. The Contractor shall provide such labour, materials, electricity, fuel, water, stores, tools and plant, apparatus and instruments as may be required by the Engineer to carry out inspection and/or tests in accordance with the Contract. The Contractor shall guarantee compliance with the provisions of this Specification.		
4.2	<u>TESTING AND ACCEPTANCE CRITERIA</u>	
4.2.1	General	
The Contractor shall carry out sampling and testing in accordance with the relevant Indian Standards and as supplemented herein for the following items at his own cost, unless otherwise specified in the Contract. The Contractor shall get the specimens tested in a laboratory approved by the Engineer and submit to the Engineer the test results in triplicate within 3 (three) days after completion of the test.		
4.2.2	Steel	
All steel supplied by the Contractor shall conform to the relevant Indian		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4

Standards. Except otherwise mentioned in the Contract, only tested quality steel having mill test reports shall be used. In case unidentified steel materials are permitted to be used by the Engineer, random samples of materials will be taken from each unidentified lot of 50 M.T. or less of any particular section for tests to conform to relevant Indian Standards. All material shall be free from all imperfections, mill scales, slag intrusions, laminations, pittings, rusts etc. that may impair their strength, durability and appearance. 4.2.3 Testing Criteria for checking Lamination in raw steel plates All raw steel plate of thickness more than 20 mm supplied by the contractor shall be checked against lamination before procurement & prior to commencement of fabrication work in the following ways as directed by the Engineer. (a) Ultrasonic testing along the edge of specified points of the plates shall be carried out to delete lamination in the plates, if any. (b) If the results of the tests in (a) are not satisfactory, the whole area of the plates shall be checked by ultrasonic testing at specified nodal points formed at equidistant grid locations. The spacing of the grids shall be determined from tests in (a) or as directed by the Engineer. If the results of the above tests are not satisfactory, the plates shall not be taken up for fabrication work. Even after fabrication at shop, if the Engineer requires any ultrasonic testing to detect lamination of plates, the same shall be carried out by the Contractor. If the plates in the fabricated item is found to be laminated, the component will be rejected 4.2.4 Welding All electrodes shall be procured from reliable manufacturers with test certificates. The correct grade and size of electrode which has not deteriorated in storage shall be used. The inspection and testing of welding shall be performed in accordance with the provisions of the relevant Indian Standards or other equivalents. For every 50 tonnes of welded fabrication, the Engineer may ask for at least 1 (one) test-destructive or non-

destructive including X-ray, ultrasonic test or similar. In the event of further tests as may be desired by the Engineer, if the results are found to be unsatisfactory; and if the test shows no defect. In cases of the test results showing deficiency, the Engineer shall have option to reject or instruct any remedial measures to be taken.		
4.2.5	Bolts, nuts and washers All bolts, nuts and washers shall be procured from reputed manufacturer approved by the Engineer and shall conform to the relevant Indian Standards. If desired by the Engineer, representative samples of these materials may have to be tested in an approved laboratory and in accordance with the procedures described in relevant Indian Standards.	
4.2.6	Shop painting All paints and primers shall be of standard quality and procured from approved manufacturers and shall conform to the provisions of the relevant Indian Standards.	
4.2.7	Galvanizing All galvanizing shall be uniform and of standard quality when tested in accordance with IS:2633 - Method for testing uniformity of coating on Zinc Coated Articles and IS:4759 -specification for Hot-Dip Zinc Coatings on Structural Steel & other allied products.	
4.3	<u>TOLERANCE</u> The tolerances on the dimensions of individual rolled steel components shall be as specified in IS:1852 - specification for rolling and Cutting Tolerances for Hot-rolled Steel Products. The tolerances on straightness, length etc. of various fabricated components (such as beams and girders, columns, crane gantry girder etc.) of the steel structures other than steel railway & road bridges, structures subjected to dynamic loading (like wind, seismic etc.) and thin walled construction (like box girders) shall be as specified in IS:7215 - Tolerances for Fabrication of Steel Structures.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 167 of 549
4.4	<u>ACCEPTANCE</u> Should any structure or part of a structure be found not to comply with any of the provisions of this Specification, the same shall be liable to rejection. No structure or part of the structure, once rejected, shall be offered again for test, except in cases where the Engineer considers the defects rectifiable. The Engineer may, at his discretion, check the test results obtained at the Contractor's works by independent tests at an approved laboratory and should the items, so tested, be found to be unsatisfactory. When all tests to be performed in the Contractor's shop under the terms of this contract have been successfully carried out, the steelwork will be accepted forthwith and the Engineer will issue an acceptance certificate, upon receipt of which, the items will be shop painted, packed and despatched. No item to be delivered unless an acceptance certificate for the same has been issued. The satisfactory completion of these tests or the issue of the certificates shall not bind the Owner to accept the work, should it, on further tests before or after erection, be found not in compliance with the Contract.	
4.5	<u>DELIVERY OF MATERIALS</u>	
4.5.1	General	
	The Contractor will deliver the fabricated structural steel materials to site with all necessary field connection materials in such sequence as will permit the most efficient and economical performance of the erection work the Owner may prescribe or control the sequence of delivery of materials, at his own discretion	
4.5.2	Marking	
	Each separate piece of fabricated steelwork shall be distinctly marked on all surfaces before delivery in accordance with the markings shown on approved erection drawings and shall bear such other marks as will further facilitate identification and erection.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

4.5.3 Packing and Shipping

All projecting plates or edges and all ends of members of joints shall be stiffened, all straight members and plates, shall be bundled, all screwed ends and machined surfaces shall be suitably packed and all bolts, nuts, washers, and small loose parts shall be packed separately in order to prevent damage or distortion during shipping.

Shipping shall be strictly in accordance with the sequence stipulated in the agreed programme. Payment may be held up for items sent in advance of the sequence till they could be erected. The Contractor shall include and provide for in his rates, the freight and other charges for despatching the materials to the worksite and also for securely protecting and packing the materials to avoid loss or damage during transport by rail, road or water. All packing shall allow for easy removal and checking at site. Special precautions shall be taken against rusting, corrosion, breakage or damage otherwise of the materials. All parts shall be adequately braced to prevent damage in transit.

Each bundle, bale or package delivered under this contract shall be marked on as many sides as possible and such distinct marking (all previous irrelevant markings being carefully obliterated) shall show the following:-

- (a) Name and address of the consignee
- (b) Name and address of the consignor
- (c) Gross weight of the package in tonnes and its dimensions.
- (d) Identification marks and/or number of the package
- (e) Custom registration number, if required.

All markings shall be carried out with such materials as would ensure quick drying and indelibility.

Each component or part or piece of material when shipped, shall be indelibly marked and/or tagged with reference to assembly drawings and

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-4
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 169 of 549

corresponding piece numbers.

Each packing case shall contain in duplicate in English a packing list pasted on to the inside of the cover in a water-proof envelope, quoting especially:

- (a) Name of the Contractor
- (b) Number and date of the Contract
- (c) Name of the office placing the contract
- (d) Nomenclature of stores
- (e) A schedule of parts or pieces, giving the parts or piece number with reference to assembly drawings and the quantity of each.

The shipping dimensions of each package shall not exceed the maximum dimensions permissible for transport over the Indian Railways/Roads.

After delivery of the materials at site, all packing materials shall automatically become the property of the Owner.

Notwithstanding anything stated hereinbefore, any loss or damage resulting from inadequate packing shall be made good by the Contractor. When facilities exist, all shipments shall be covered by approved Insurance Policy for transit at the cost of the Contractor.

The contractor shall ship the complete materials or part on board a vessel belonging to an agency approved by the Owner or on rail and/or road transport as directed. The Contractor shall take all reasonable steps to ensure correct appraisal of freight rates, weights and volumes and in no case will the Owner be liable to pay any warehouse, wharfage, demurrage and other charges.

If, however, the Owner has to make payment of any of the above mentioned charges, the amount paid will be deducted from the progressive bills of the Contractor.

equipment, manpower, the total capacity and the capacity that will be available exclusively for this contract shall be submitted (c) Matching Steel A rough indication of the quantities and details of matching steel sections required to start the work shall be furnished. 5.2 <u>AFTER AWARD</u> After award of the Contract the successful Tenderer is to submit the following: (a) Complete fabrication drawings, material lists, cutting lists, bolt lists, field welding schedules based on the design drawings in accordance with the approved schedule. (b) Monthly Progress Report with necessary photographs in six (6) copies to reach the Engineer on or before the 7th day of each month, giving the upto date status of preparation of detailed shop drawings, bill of materials, procurement of materials, actual fabrication done, shipping and all other relevant information. (c) Results of any test as and when conducted and as required by the Engineer. (d) Manufacturer's mill test report in respect of steel materials, bolts, nuts and electrodes as may be applicable.

1.0 <u>SCOPE</u> This specification covers the erection of structural steelwork including receiving and taking delivery of fabricated structural steel materials arriving at Site and installing the same in position, painting and grouting the stanchion bases all complete as per Drawings, this Specification and other provision of the Contract. 2.0 <u>GENERAL</u> 2.1 <u>WORK TO BE PROVIDED FOR BY THE CONTRACTOR</u> The work to be provided for by the Contractor, unless otherwise specified in the Contract, shall include but not be limited to the following:- (a) The Contractor shall provide all construction and transport equipment, tools, tackle, consumables, materials, labour and supervision required for the erection of the structural steelwork. (b) Receiving, unloading, checking and moving to storage yard at Site including prompt attendance to all insurance matters as necessary for all fabricated steel materials arriving at Site. The Contractor shall pay all demurrage and/or wharf age charges etc. on account of default on his part. (c) Transportation of all fabricated structural steel materials from Site storage yard, handling, rigging, assembling, bolting, welding and satisfactory installation of all fabricated structural steel materials in proper location according to approved erection drawings and/or as directed by the Engineer. If necessary suitable temporary approach roads to be built for transportation of fabricated steel structures. (d) Checking center lines, levels of all foundation blocks including checking line, level, position and plumb of all bolts and pockets. Any defect observed in the foundation shall be brought to the notice of the Engineer. The Contractor shall fully satisfy himself regarding the correctness of the foundations before installing the fabricated steel structures on the foundation blocks.

(e) Aligning, plumbing, levelling, bolting, welding and securely fixing the fabricated steel structures in accordance with the Drawings or as directed by the Engineer. (f) Painting of the erected steel structures if required by the Contract. (g) All minor modifications of the fabricated steel structures as directed by the Engineer including but not limited to the following : (i) Removal of bends, kinks, twists etc. for parts damaged during transport and handling. (ii) Cutting, chipping, filling, grinding etc. if required for preparation and finishing of site connections. (iii) Reaming of holes for use of higher size bolt if required. (iv) Welding of connections in place of bolting for which holes are either not drilled at all or wrongly drilled during fabrication. Welding in place of bolting will be permitted only at the discretion of the Engineer. (v) Refabrication of parts damaged beyond repair during transport and handling or Refabrication of parts which are incorrectly fabricated. (vi) Fabrication of parts omitted during fabrication by error, or subsequently found necessary. (vii) Drilling of holes which are either not drilled at all or are drilled in incorrect location during fabrication. (viii) Carry out tests in accordance with this Specification if directed. 2.2 <u>WORK BY OTHERS</u> No work under this Specification will be provided for by any agency other than the Contractor unless specifically mentioned elsewhere in the Contract.		

CONSULTANT : PROCON ENGINEERS

2.3 <u>CODES AND STANDARDS</u> All work under this Specification shall, unless specified otherwise, conform to the latest revisions and/or replacements of the following or any other Indian Standard Specification and codes of Practice of equivalent:- (a) IS-800 : Code of Practice for general construction in steel (b) IS-456 : Code of Practice for plain or reinforced concrete (c) IS-7205 : Safety Code for erection of Structural Steel work (d) IS-12843 : Tolerance for erection of Steel Structures 2.4 <u>CONFORMITY WITH DESIGNS</u> The Contractor will erect the entire fabricated steel structure, align all the members, complete all field connections and grout the foundations all as per the provisions of this specification and the design criteria detailed in the approved erection drawings and/or other stated document. All work shall conform to the provisions of the relevant Indian Standard Specifications and/or the instructions of the engineer. . Where specific Indian Standard is not available, the most stringent specification from the relevant American/German/British Standards shall be adopted. The testing and acceptance of the erected structures shall be in accordance with the provisions of this Specification and/or the instructions of the Engineer. 2.5 <u>MATERIAL</u> 2.5.1 General The Contractor will check the quantity, quality and the sizes of the fabricated materials and verify the adequacy of the same in accordance with the Drawings and Specifications. The Contractor shall make good any deficiency, if detected, either by repair or with fresh material as may be directed by the Engineer.		

CONSULTANT : PROCON ENGINEERS

All consumables like oxygen and acetylene gas, paints, fuels, lubricants, oil, grease, cement, sand, aggregates and any other material that may be required for the execution of the works in accordance with the contract will be supplied by the contractor for erection work and will be deemed to have been included in this rates. 2.5.2 Materials to conform to Indian Standards All materials required to be supplied by the Contractor under this Contract shall conform to the relevant Indian Standard Specifications. 2.6 <u>STORAGE OF MATERIALS</u> 2.6.1 General All material shall be so stored as to prevent deterioration and to ensure the preservation of their quality and fitness for use in the works. Any material which has been deteriorated or damaged beyond repairs and has become unfit for use shall be removed immediately from the site, failing which, the Engineer shall be at liberty to get the materials removed by agency. 2.6.2 Yard The Contractor will have to establish a suitable yard in an approved location at site for storing the fabricated steel structures and other materials which will be delivered to him by the Owner according to the Contract. The yard shall have proper facilities like, drainage, lighting, suitable access for large cranes, trailers and other heavy equipments. The yard shall be fenced all around with security arrangement and shall be of sufficiently large area to permit systematic storage of the fabricated steel structures without overcrowding and with suitable access for cranes, trailers and other equipment for use in erection work in proper sequence in accordance with the approved programme of work. The Tendered should visit the site prior to submission of his Tender to acquaint himself with the availability of land and the development necessary by way of filling, drainage, access roads, fences, sheds etc. all of which shall be carried out by the Contractor as directed by the Engineer.

2.6.3 Covered Store All field connection materials, paints, cement etc. shall be stored on well designed racks and platforms off the ground in a properly covered store building to be built. 2.7 <u>QUALITY CONTROL</u> The contractor shall establish and maintain quality control procedures for different items of work and materials as may be directed by the Engineer to assure compliance with the provisions of the Contract and shall submit the records of the same to the Engineer. The quality control operation shall include but not be limited to the following items of work:- (a) Erection: Lines, levels, grades, plumbs, joint characteristics including tightness of bolts. (b) Grouting: Cleaning and roughness of foundation, quality of materials used for grouting, admixtures, consistency and strength of grout. (c) Painting : Preparation of surface for painting, quality of primers and paints, thinners, application and uniformity of coats. The Contractor shall salvage, collect and deliver all the packing materials to the Owner. 3.0 <u>WORKMANSHIP</u> 3.1 <u>ERECTION</u> 3.1.1 Plant and equipment The suitability and adequacy of all erection tools and plant and equipment proposed to be used shall be efficient, dependable, in good working condition and shall have the approval of the Engineer.		

CONSULTANT : PROCON ENGINEERS

3.1.2 Method and sequence of erection The method and sequence of erection shall have the prior approval of the Engineer. The Erection shall arrange for most economical method and sequence available to him consistent with the Drawings and Specifications and such information as may be furnished to him prior to the execution of the Contract. 3.1.3 Temporary bracing Unless adequate bracing is included as a part of the permanent framing, the erector during erection shall install temporary guys and bracings where needed to secure the framing against loads such as wind or seismic forces comparable in intensity to that for which the structure has been designed, acting upon exposed framing as well as loads due to erection equipment and erection operations. If additional temporary guys are required to resist wind or seismic forces acting upon components of the finished structure installed by others during the course of the erection of the steel framing, arrangement for their installation by the erector shall be made. The responsibility of the Contractor in respect of temporary bracings and guys shall cease when the structural steel is once located, plumbed, levelled, aligned and grouted within the tolerances permitted under the specification and guyed and braced to the satisfaction of the Engineer. 3.1.4 Temporary floors for buildings It shall be the responsibility of the Contractor to provide free of cost planking and to cover such floors during the work in progress as may be required by any Act of Parliament and/or by-laws of state, Municipal or other local authorities. 3.1.5 Setting out Positioning and levelling of all steelwork, plumbing of stanchions and placing of every part of the structure with accuracy shall be in accordance		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 183 of 549
with the approved Drawings and to the satisfaction of the Engineer. Concrete foundations, where required, shall be made by other agencies. Anchor bolts and other anchor steel shall be embedded by other agencies. The Contractor shall check the positions and levels of the anchor bolts, etc. before concreting and get them properly secured against disturbance during pouring operations. He shall remain responsible for correct positioning. For heavy columns, etc. the Contractor shall set proper screed bars if desired by the Engineer, to maintain proper level. Each tier of column shall be plumbed and maintained in a true vertical position subject to the limits of tolerance allowable under this Specification. No permanent field connections by bolting or welding shall be carried out until proper alignment and plumbing has been attained. 3.1.6 Field bolting All relevant portions in respect of bolted construction of the Specification for Fabrication of Structural Steelwork applicable to the Project shall also be applicable for field bolting in addition to the following: Bolts shall be inserted in such a way so that they may remain in position under gravity even before fixing the nut. Bolted parts shall fit solidly together when assembled and shall not be separated by gaskets or any other interposed compressible materials. When assembled, all joint surfaces, including those adjacent to the washers shall be free of scales except tight mill scales. They shall be free of dirt, loose scales, burns, and other defects that would prevent solid seating of the parts. Contact surfaces within friction-type joints shall be free of oil, paint, lacquer, or galvanizing. All high tensile bolts shall be tightened to provide, when all fasteners in the joint are tight, the required minimum bolt tension by any of the following methods. (a) Turn-of-nut method When the turn-of-nut method is used to provide the bolt tension, there shall first be enough bolts brought to a "snug tight" condition to ensure that the parts of the joint are brought into good		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 184 of 549

contact with each other. "snug tight" is defined as the tightness attained by a few impacts of an impact wrench or the full effort of a man using an ordinary spud wrench. Following this initial operation, bolts shall be placed in any remaining holes in the connection and brought to snug tightness. All bolts in the joint shall then be tightened additionally by the applicable amount of nut rotation specified in Table-1 with tightening progressing systematically from the most rigid part of the joint to its free edges. During this operation there shall be no rotation of the part not turned by the wrench.

TABLE - I

SR. NO.	BOLTS LENGTH NOT Exceeding 8 x dia. or 200 mm	BOLT LENGTH Exceeding 8x dia. or 200 mm	REMARKS
(i)	1/2 turn	2/3 turn	Nut rotation is relative to bolt regardless of the element (nut or bolt) being turned. Tolerance on rotation – 30 over or under.

Bolts may be installed without hardened washers when tightening is done by the turn-of-nut method. However, normal washers shall be used.

Bolts tightened by the turn-of-nut method may have the outer face of the nut match-marked with the protruding bolt point before final tightening, thus affording the inspector visual means of noting the actual nut rotation. Such marks can be made by the wrench operator by suitable means after the bolts have been brought up snug tight.

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 185 of 549

(b) Torque Wrench tightening

When torque wrenches are used to provide the bolt tensions, the bolts shall be tightened to the torques specified in TABLE - II. Nuts shall be in tightening motion when torque is measured. When using torque wrenches to install several bolts in a single joint, the wrench shall be returned to touch up bolts previously tightened, which may have been loosened by the tightening of subsequent bolts, until all are tightened to the required tension.

TABLE - II

SR. NO.	Nominal Bolt Diameter (mm)	Torque to be applied (Kg.M) for bolt class 8.8 of IS : 1367
(i)	20	59.94
(ii)	22	81.63
(iii)	24	103.73

NOTE:

The above torque values are approximate for providing tensions of 14.7 MT for 20 mm dia., 18.2 MT for 22 mm dia; and 21.2 MT for 24 mm dia. bolts under moderately lubricated condition. The torque wrench shall be calibrated at least once daily to find out the actual torque required to produce the above required tension in the bolt by placing it in a tension indicating device. This torques shall be applied for tightening the bolts on that day with the particular torque wrench.

In either of the above two methods, if required, for bolt entering and wrench operation clearances, tightening may be done by turning the bolt while the nut is prevented from rotating.

Impact wrenches if used shall be of adequate capacity and sufficiently supplied with air to perform the required tightening of each bolt in approximately ten seconds.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 186 of 549
Holes for turned bolts to be inserted in the field shall be reamed in the field. All drilling and reaming for turned bolts shall be done only after the parts to be connected are assembled. Tolerances applicable in the fit of the bolts shall be in accordance with relevant Indian Standard Specifications. All other requirements regarding assembly and bolt tightening shall be in accordance with this sub clause. 3.1.7 Field Welding All field assembly and welding shall be carried out in accordance with the requirements of the specification for fabrication work applicable to the project, excepting such provisions therein which manifestly apply to shop conditions only. Where the fabricated structural steel members have been delivered painted, the paint shall be removed before field welding for a distance of at least 50 mm on either side of the joints. 3.1.8 Holes, cutting and fitting No cutting of sections, flanges, webs, cleats, bolts, welds etc. shall be done unless specifically approved and/or instructed by the Engineer. The erector shall not cut, drill or otherwise alter the work of other trades, or his own work to accommodate other trades, unless such work is clearly specified in the Contract or directed by the Engineer. Wherever such work is specified the Contractor shall obtain complete information as to size, location and number of alterations prior to carrying out any work. 3.2 <u>DRIFTING</u> Correction of minor misfits and reasonable amount of reaming and cutting of excess stock from rivets will be considered as permissible. For this, light drifting may be used to draw holes together and drills shall be used to enlarge holes as necessary to make connections. Reaming, that weakens the member or makes it impossible to fill the holes properly or to adjust accurately after reaming shall not be allowed.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 187 of 549
Any error in shop work which prevents the proper assembling and fitting of parts by moderate use of drift pins and reamers shall immediately be called to the attention of the Engineer and approval of the method of correction obtained. The use of gas cutting torches at erection site is prohibited. 3.3 Grouting of stanchion bases and bearings of beams and girders on stone, brick or concrete (Plain or reinforced)+ Grouting shall be carried out with Ordinary Cement grout as described below: The mix shall be one (1) part cement and one (1) part sand and just enough water to make it workable. The positions to be grouted shall be cleaned thoroughly with compressed air jet and wetted with water and any accumulated water shall be removed. These shall be placed under expert supervision, taking care to avoid air-locks. Edges shall be finished properly. If the thickness of grout is 25 mm or more, two (2) parts of 6 mm down graded stone chips may be added to the above noted cement-sand group mix, if required, by the Engineer or shown on the drawings. Admixtures like aluminium powder, "ironite" may be required to be added to the grout to enhance certain desirable properties of the grout. Alternatively, the grouting may be done with non-shrink high strength free flow cementitious grout (ready mixed) like "Sika grout - 214", or "Anchor NSG" or approved equivalent. No grouting shall be carried out until a sufficient number of bottom lengths of stanchions have been properly lined, levelled and plumbed and sufficient floor beams are tied in position. Whatever method of grouting is employed, the operation shall not be carried out until the steelwork has been finally levelled and plumbed, the stanchion bases being supported meanwhile by steel wedges, and immediately before grouting, the space under steel shall be thoroughly cleaned.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 188 of 549
3.4 <u>PAINING AFTER ERECTION</u> Field painting, if required to be done by the erection Contractor, shall only be done after the structure is erected, levelled, plumbed, aligned and grouted in its final position, tested and accepted by the Engineer. However, touch up paintings, making good any damaged shop painting and completing any unfinished portion of the shop coat shall be carried out by the erection Contractor to the Owner. The materials and specification for such painting in the field shall be in accordance with the requirements of the specification for fabrication of structural steelwork applicable for the project. Painting shall not be done in rainy or foggy weather or when humidity is such as to cause condensation on the surfaces to be painted. Before painting of steel, which is delivered unpainted, is commenced, all surfaces to be painted shall be dried and thoroughly cleaned from all loose scale and rust. All field bolts, welds and abrasions to the shop coat shall be spot painted with the same paint used for the shop coat. Where specified, surfaces which will be in contact after site assembling shall receive a coat of paint (in addition to the shop coat, if any) and shall be brought together while the paint is still wet. Surface which will be inaccessible after field assembly shall receive the full specified protective treatment before assembly. Bolts and fabricated steel members which are galvanized or otherwise treated and steel members to be encased in concrete shall not be painted. The specification for paint and workmanship shall be in accordance with the requirements of the specification for fabrication of structural steelwork applicable to the project. The number of coats and the shades to be used shall be as specified or as directed by the Engineer. 3.5 <u>STAINLESS STEEL PLATE LINING IN BUNKER HOPPER</u> The hopper portion of the coal bunkers shall be lined with stainless steel plates of 3 mm thickness. The stainless steel shall be of AISI-316 quality. The		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 189 of 549
work includes supply, fabrication, welding and fixing of stainless steel lining plate to bunker M.S. plate as per drawing. The stainless steel liner shall be fixed to the Bunker hopper by plug welding using special electrodes (such as, Inox-CW coding AWS-310-16 ISMBOS- 311 or Inox-D2 coding AWSE-309-16, ISMB 04-311 manufactured by Advani Oerlikon Ltd). Such plug welding shall be done by drilling 21.5 mm dia. holes at 300 mm centre to centre both ways. The plug welding shall be ground flush with the lining plate. 3.6 <u>FINAL CLEANING UP</u> Upon completion of erection and before final acceptance of the work by the Engineer, the Contractor shall remove all false work, rubbish and all Temporary Works resulting in connection with the performance of his work. 3.7 <u>SAFETY MEASURES DURING ERECTION</u> The safety measures to workmen and supervisors during all types of erection work (e.g., use of lifting appliances, slingning, welding, gas cutting, etc.) should be taken as per IS: 7205. When any statutory provisions exist, the same shall be complied with in addition to the provisions contained in the above code. 4.0 <u>TESTING AND ACCEPTANCE CRITERIA</u> 4.1 <u>GENERAL</u> Loading tests shall be carried out on erected structures, if required by the Engineer, to check adequacy of fabrication and/or erection. Any structure or a part thereof found to be unsuitable for acceptance as a result of the test shall have to be dismantled and replaced with suitable member. In course of dismantling, if any damage is done to any other parts of the structure or to any fixtures, the same shall be made good by the Contractor responsible, to the satisfaction of the Engineer. The structure or structural member under consideration shall be loaded with its actual dead load for as long a time as possible before testing and the tests shall be conducted as indicated in the following Sub-clauses 4.1.1, 4.1.2		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 190 of 549
and 4.1.3. The method of testing and application of loading shall be as approved by the Engineer. 4.1.1 Stiffness Test In this test, the structure or member shall be subjected, in addition to its actual dead load, to a test load equal to 1.5 times the specified superimposed load, and this loading shall be maintained for 24 hours. The maximum deflection attained during the test shall be within the permissible limit. If, after removal of the test load, the member or structure does not show a recovery of at least 80 per cent of the maximum strain or deflection shown during 24 hours under load, the test shall be repeated. The structure or member shall be considered to have sufficient stiffness, provided that the recovery after this second test is not less than 90 percent of the maximum increase in strain or deflection recorded during the second test. 4.1.2 Strength Test The structure or structural member under consideration shall be subjected, in addition to its actual dead load, to a test load equal to the sum of the dead load and twice the specified superimposed load, and this load shall be maintained for 24 hours. In the case of wind load, a load corresponding to twice the specified wind load shall be applied and maintained for 24 hours, either with or without the vertical test load for more severe condition in the member under consideration or the structure as a whole. Complete tests under both conditions may be necessary to verify the strength of the structure. The structure shall be deemed to have adequate strength if, during the test, no part fails and if on removal of the test load, the structure shows a recovery of at least 20 per cent of the maximum deflection or strain recorded during the 24 hours under load. 4.1.3 Structure of same design Where several structures are built to the same design and it is considered unnecessary to test all of them, one structure, as a prototype, shall be fully tested, as described in previous Sub-clauses, but in addition, during the first application of the test load, particular note shall be taken of the strain or		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.		Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1		Section-5
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS		Page 191 of 549
deflection when the test load 1.5 times the specified superimposed load has been maintained for 24 hours. This information is required as a basis of comparison in any check test carried out on samples of the structure. When a structure of the same type is selected for a check test, it shall be subjected, in addition to its actual dead load, to a superimposed test load, equal to 1.5 times the specified live load, in a manner and to an extent prescribed by the Engineer. This load shall be maintained for 24 hours, during which time, the maximum deflection shall be recorded. The check test shall be considered satisfactory, provided that the maximum strain or deflection recorded in the check test does not exceed by more than 20% of the maximum strain or deflection recorded at similar load in the test on the prototype. 4.1.4 Repair for subsequent test and use after strength tests An actual structure which has passed the "Strength Test" as specified in Sub-clause 4.1.2 hereinbefore and is subsequently to be erected for use shall be considered satisfactory for use after it has been strengthened by replacing any distorted members and has subsequently satisfied the 'Stiffness Test' as specified in Sub-clause 4.1.1. Here in before. 4.2 <u>TOLERANCES</u> Some variation is to be expected in the finished dimensions of structural steel frames. Unless otherwise specified, such variations are deemed to be within the limits of good practice when they are not in excess of the cumulative effect of detailed erection clearances, fabricating tolerances for the finished parts and the rolling tolerances for the profile dimensions permitted under the Specifications for fabrication of structural steelwork applicable to this Project and as specified below: 4.2.1 For Buildings Containing Cranes			
	Component	Description	Variation Allowed
4.2.1.1	Main columns	(a) Shifting of column axis at foundation level with respect to building line

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS		Page 193 of 549
	Component	Description	Variation Allowed
		same level.	
4.2.1.2	Trusses	(a) Deviation at centre of span of upper chord member from vertical plane running through centre of bottom chord.	1/1500 of the span or not greater than 10 mm whichever is the least.
		(b) Lateral displacement of top chord at centre of span from vertical plane running through centre of supports.	1/250 of depth of truss or 20 mm whichever is the least.
4.2.1.3	Crane Girders & Tracks	(a) Difference in levels of crane rail measured between adjacent columns.	2.0 mm
		(b) Deviation to crane rail gauge	3.0 mm
		(c) Relative shifting of ends of adjacent crane rail in plan and elevation after thermit welding.	1.0 mm
		(d) Deviation of crane rail axis from centre line of web.	3.5 mm
4.2.1.4	Setting of Expansion gaps	At the time of setting of the expansion gaps, due regard shall be taken of the ambient temperature above or below 30 °C. The coefficient of expansion or contraction shall be taken as 0.000012 per °C per unit length.	
4.2.2	For Building without Cranes The maximum tolerances for line and level of the steel work shall be 3.0 mm on any part of the structure. The structure shall not be out of plumb

more than 3.5 mm on each 10M section of height and not more than 7.0 mm per 30 M section. These tolerances shall apply to all parts of the structure unless the drawings issued for erection purposes state otherwise.		
4.3	<u>ACCEPTANCE</u> Structures and members which have passed the tests and conform to all requirements specified in the foregoing Sub-clause 4.1, 4.1.1, 4.1.2, 4.1.3 and 4.1.4 and other applicable provisions of this Specification and are within the limits of tolerances specified in Sub-clause 4.2 and/or otherwise approved by the Engineer shall be treated as approved and accepted for the purpose of fulfilment of the provisions of this Contract.	
5.0	<u>INFORMATION TO BE SUBMITTED</u>	
5.1	<u>BEFORE TENDER</u> Along with the Tenders the Tenderers will be required to submit the following information:	
5.1.1	Tentative Programme The Tendered shall submit a tentative programme based on the information available in the Tender Document and visit to Site indicating the structure wise erection schedule proposed to be maintained by the Contractor to complete the job in time in accordance with the Contract.	
5.1.2	Constructional Plant and Equipment, Tools, Temporary Works & Manpower A detailed list of all Constructional Plant & Equipment like cranes, derricks, winches, welding sets, erection tools etc. along with their make, model, present condition and location available with the Tenderer which he will be able to employ on the job to maintain the progress of work in accordance with the Contract shall be submitted along with the Tender. The total number of each category of experienced personnel like fitters, welders, riggers etc. that he will be able to employ on the job shall also be

indicated. 5.1.3 Erection yard A site plan showing the layout and location of the erection yard proposed to be established by the Tenderer shall be attached with the Tender indicating the storage space for fabricated steel materials, site-fabrication and repair shop, covered stores, offices, locations of erection equipments and other facilities. The Engineer shall have the right to modify the arrangement and location of the proposed yard to suit site conditions and the Contractor shall comply with the same without any claim whatsoever. 5.2 <u>AFTER AWARD OF THE CONTRACT</u> After award of the contract, the Contractor shall submit the following:- 5.2.1 Detailed Programme The Contractor shall submit a detailed erection programme for completion of the work in time in accordance with the Contract. This will show the target programme, with details of erection proposed to be carried out in each fortnight, details of major equipment required and an assessment of required strength of various categories of workers in a proforma approved by the Engineer. 5.2.2 Fortnightly Progress Report The Contractor shall submit fortnightly progress reports in triplicate to the Engineer showing along with necessary photographs, 125 mm x 90 mm size, and all details of actual achievements against the target programme specified in Sub-clause 5.2.1 above. Any shortfall in the achievement in a particular fortnight must be made up within the next fortnight. Along with this report, the Contractor shall also furnish details of fabricated materials in hand at site and the strength of his workers.

1.0 <u>SCOPE</u> This specification covers plain and reinforced cement concrete work, steel flues and insulation work, painting and protective treatment work, connected with construction of RCC single flue Stack. 2.0 <u>GENERAL</u> 2.1 <u>WORK TO BE PROVIDED FOR BY THE CONTRACTOR</u> Work to be provided by the Contractor, unless specified otherwise, shall include but shall not be limited to the following: (a) Furnish all labour, supervision, services, insurance, material, power, Furnish all labour, supervision, services, insurance, material, power, construction equipment, approaches, transportation etc. required for the entire work. (b) Design and prepare working drawings for formworks, scaffoldings, supports, staging hoisting arrangement for men and material etc. and submit them for approval. (c) Prepare and submit for approval, as per approved schedule, detailed drawings for RCC work in shell, platforms at various levels, roof and ground floor and bending schedules for reinforcement bars, showing the positions and details of spacers, chairs, supports, hangers, openings etc. (d) Prepare detailed fabrication and erection marking drawings for steel flues including flue expansion compensators, steel flue supports and restraint arrangements along with fittings and accessories and submit them for approval. (e) Prepare and submit for approval detailed shop drawings, with list of materials and material specifications for Load Bearing Insulation Blocks and Lateral Restraint Insulation Blocks.

(f) Prepare and submit for approval detailed schemes for operations like material handling, placement of concrete erection of steel flues, fixing of insulations, installation, dismantling and maintenance of flue expansion compensator etc. and for items like approaches, services etc. (g) Design and submit for approval mix proportions for concrete to be adopted on job. (h) Furnish samples and submit for approval the results of tests for various properties of the following materials : (i) Ingredients of concrete, (ii) Concrete, (iii) Acid/Chemical Resistant Tiles, (iv) Castable refractories, (v) Insulation materials, (vi) Paints. (vii) S/S liner. (i) Provide all incidental items not specified or shown on drawings in particulars but reasonably implied or necessary for successful completion of the work in accordance with drawings and specifications. (j) Produce, if directed by the Engineer, a guarantee, in approved proforma, for satisfactory performance, for a specified period, of material manufactured by specialist firms.

(zzz) IS:8183 : Bonded Mineral Wool. (aaaa) IS:9595 : Recommendation for Metal Arc Welding of Carbon and Carbon Manganese steels. NEPA NO. 78 Code of protection against lightning. The Indian Electricity Rules. The requirements of Department of Civil Aviation, Govt. of India. 2.4 CONFORMITY WITH DRAWINGS AND SPECIFICATIONS The contractor shall carry out all the work in strict accordance with the drawings stamped "Released for Construction" and specification issued to him and as per Contractor's detailed drawings approved by the Consulting Engineer. Prior to concreting, the Contractor shall prepare a check list on a set format of all items of work involved, and inform the Engineer well in advance so that the Engineer shall have the opportunity of satisfying himself if the works mentioned in the format are done according to drawings and specification, and he can allow the Contractor in writing to start pouring of concrete. The entire operation of concreting shall be carried on as per specification, to the complete satisfaction of the Engineer. No deviation from the drawings will be allowed unless otherwise directed by the Engineer in writing. For Load Bearing Thermal Insulation block assembly and lateral restraint insulation block assembly, Contractor shall design sizes of all components of the blocks and details of their connections supply and fabricate the same in accordance with the approved shop drawings prepared by him. For steelwork and metal work, the Contractor shall design all connections, inserts for scaffolding, supply and fabricate all steelwork and metal work and furnish all connection materials in accordance with approved shop drawings prepared by him and/or as instructed by the Engineer, keeping in view the maximum utilisation of the available sizes and shapes for metal components.

2.5 <u>MATERIALS TO BE USED</u> 2.5.1 General Requirement All materials, whether to be incorporated in the work or to be used temporarily for the construction, shall conform to the relevant IS specifications unless stated otherwise and shall be of the quality approved by the Engineer. 2.5.2 Cement Portland Cement shall be as per the requirements laid down in IS: 269. 2.5.3 Coarse Aggregate Coarse aggregate shall be graded crushed or broken stone from approved sources, free from impurities and shall be screened free of dust and other deleterious matter. It shall conform to IS: 383 or IS: 515 and shall be washed clean, if necessary. The maximum size of coarse aggregate for stack superstructure shall be 25 mm down graded, unless otherwise stated (vide serial 5(b) of clause 3.03.06). Grading for a particular size shall conform to relevant IS Codes and shall be such as to produce a dense concrete of specified proportion and strength and shall be of consistency that will work readily into position without segregation. 2.5.4 Fine Aggregate Fine aggregate shall be river or pit sand, free from any clay, earth, vegetable matters, salt or other impurities and shall be clean and fit for use, to the satisfaction of the Engineer. Sand acceptable for the work shall normally have a grading falling within the limits of one of the three grades, mentioned in the relevant IS Specifications. 2.5.5 Water The water for both mixing and curing of concrete shall be clean, free from oil, acid, alkali, organic or other deleterious substances. Contractor shall test the water as and when required by the Engineer.

2.5.6	Reinforcement Mild steel or Medium or High Tensile steel deformed bars specified for reinforcement shall conform to the latest relevant IS Specifications and shall be of tested quality under ISI Certification Scheme. The reinforcement shall be free from any oil, foreign material or mill or rust scales.	
2.5.7	Steel Flue	
2.5.7.1	All mild steel material to be used in construction of steel flue shall comply with IS:2062, IS:1239, IS:1367, IS:1608, IS:800 and with other relevant IS Specifications. The ultimate tensile strength of this steel shall not be less than 410 N/Sq.mm.	
2.5.7.2	Stainless steel liners shall be fabricated using materials conforming to the requirements of relevant IS Specifications and/or AISI 316L or BS:1449 Part-2. Grade of Stainless steel shall be equivalent to BS:1449 (Part-2) 316 S.12.	
2.5.7.3	Materials to be used for fabrication of Flue expansion compensator shall be suitable for the flue gas temperature and shall be acid resisting.	
	The Expansion compensator shall comprise several layers of materials given below in order from the gas side.	
	(a) Two layer of insulation, each consisting of heavy weight texturized glass cloth impregnated with graphite suspension, having an approximate weight of 1.00 Kg/Sq.m	
	(b) A continuous filament glass cloth coated both sides with a fluoro-elastomer having an approximate weight of 1.5 Kg/Sq.m.	
	(c) Two layers of PTFE (Poly Tetra Fluoro-Ethylene) film of minimum thickness 0.15 mm each.	
	(d) A layer of glass felt of minimum thickness 10 mm and an approximate weight of 1.5 Kg/Sq.M.

2.5.8 Stainless steel Liners Stainless steel liners shall be provided with a minimum of 5 m above the roof Top. The portion of liner with stainless steel shall be provided with a grade of steel conforming to the requirements of AISI 316 or equivalent and the minimum thickness of the stainless steel liner shall be 8mm. The individual cans of the liners shall be jointed together by butt welding internally all round for full strength, after connecting the flanged portion of the cans with high tensile treaded fasteners conforming to IS: 1367. The bidder shall test all welds in the presence of the OWNER to meet the following requirements: (a) The bidder shall test at random at least 10% of the butt welds by radiographic/ultrasonic testing method. (b) At least 10% of the fillet welds shall be tested at random by dye penetration tests. (c) 10% of the root welds for butt-welding shall be tested at random by dye penetration tests. All tests shall be conducted in the presence of the ENGINEER IN CHARGE. If any test fails, the weld shall be cut out, remade and retested to the Engineer's satisfaction. 2.5.9 Paints Paints to be used for shop coat of fabricated steel shall conform to the IS: 2074. Paint for treatment of outside face of Chimney with Cement water proof paint shall conform to IS: 5410. 2.5.10 Acid Resistant Tiles and Castable Refractories		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

Acid resistant tiles to be provided over roof of stack should conform to IS: 4457. Matching mortars to be used for tiles. Castable refractories shall be of hydraulic setting, rapid hardening type. It shall have refractory properties similar to Fire bricks conforming to IS:6, Group-A and working temperature shall be upto 1350 Deg.C. 2.5.11 Insulations 2.5.11.1 Thermal Insulation The insulation shall be semi-rigid, resin bonded type, in the form of slabs and shall conform to IS: 8183. Blanket type insulation shall not be used. The density of insulation shall not be less than 64 kg/cu.m for resin bonded glass wool insulation and 100 kg/cu.m for resin bonded rock wool. The insulation thickness shall be determined based on the maximum ambient temperature, surface air velocity worked out based on the draught of ventilation air in the annular space between the flue liner and chimney shell, insulation surface emissivity of 0.3 and the insulation cold face maximum temperature not exceeding 55C. The draught of air in the annular space shall be the natural draught created by the heating of air by the flue liner and the air being vented out through the openings in the chimney shell. The increase in the annulus air temperature due to the rising heated air shall be taken into account while calculating the insulation thickness. The insulation thickness shall not be less than 100 mm, in any case, and shall be provided in two layers with the second layer of insulation covering the joints of the first layer. The insulation shall be wrapped on the outer-most surface with galvanised wire mesh. 2.5.11.2 At Load Bearing and Side Restraints of Flues Load bearing insulation assembly to have (i) a properly machined mild steel plate with recess at its top for seating PTFE (Poly Tetra Fluoro Ethylene) sheets conforming to BS:5400 (ii) saddle plate (MS) in the middle having stainless steel plate fixed at its bottom surface and lead/elastomeric sheet at top, and (iii) top plate formed of two numbers insulation blocks each made of minimum 50mm thick rigid, non-combustible asbestos fibre reinforced lime-silica board (SINDANYO BLOCKS NATURAL GRADE CS-51) bonded to mild steel plates at top and bottom. For side restraints assembly of insulation blocks of SINDANYO Natural Grade CS-51 and stainless steel

plate shall be used. All stainless steel in these assemblies shall conform to AISI-316L and Mild steel to IS-2062. SINDANYO BLOCKS shall be suitable for operation at 320 Deg.C and shall primarily satisfy the following physical properties : (a) Minimum compressive stress prior to onset of compression yield of not less than 12 N/Sq.mm. (b) Minimum shear strength of 30 N/Sq.mm when tested in accordance with BS:3497-1979. (c) Thermal conductivity shall not exceed 0.67 W/m Deg.C at a mean temperature of 200 Deg.C and its coeff. of linear expansion not to exceed 1.2×10^{-5} per Deg.C. (d) Adhesive used for bonding purposes shall be of material with equivalent high temperature properties as approved by the Engineer. It may be of "Fortafix Fiborclad Adhesive" as manufactured by Fortafix Ltd., England. 2.6 <u>STORAGE OF MATERIALS</u> 2.6.1 General All materials shall be so stored as to prevent deterioration and intrusion of foreign matter and to ensure the preservation of their quality and characteristics for the work. Any material, which is deteriorated or is damaged or is otherwise, considered defective by the Engineer, shall not be used for construction and shall be removed from site immediately, failing which the Engineer shall be at liberty to get the materials removed. The Contractor shall maintain an upto date accounts of receipt, issue and balance of all materials issued by the Owner. 2.6.2 Cement Contractor shall store cement in water-tight and properly designed stores so that the Cement can be kept dry and the stock can be handled in rotation. The doors of stores shall be at least 30 cm. above G.L. Deteriorated cement

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 214 of 549
shall be removed immediately from the site. Not more than ten bags of cement shall be stacked one above the other.		
2.6.3	Aggregate	
Different materials shall be transported, handled and stored separately in such a manner as to prevent damage, deterioration or contamination. Stock piles of fine and coarse aggregates shall be allowed to drain, so that aggregates do not contain too much water.		
2.6.4	Reinforcement	
Reinforcement shall be stored preferably under cover and stacked off ground in size and grade-wise separate stacks for easy identification.		
2.6.5	Steel, Metal and Fittings	
All steel, metal and fittings to be used for fabrication and erection shall be stored sectionwise and lengthwise in separate stacks, off ground, so that they can be handled, inspected, measured and accounted for easily at any time. If required by the Engineer, the materials may have to be stored in a covered shed.		
2.6.6	Paints	
Paints shall be stored under cover, in air-tight containers. Paints supplied in sealed containers shall be used as soon as possible once the container is opened. Left over paints shall be kept in air-tight containers.		
2.6.7	Steel Flue	
Fabricated pieces of steel (flue) liner shall be stored systematically for ease of handling.		
2.6.8	Insulation Material	
All insulation materials like bearing insulation blocks, restraint insulation blocks, glass or mineral wool, asbestos ropes etc. shall be stored in packing

(i) Mortar Compressive and tensile strength, adhesion and acid resistance test. (j) Insulation Thermal conductivity, density, heat and acid resistance tests. Bearing capacity will be tested for bearing/restraint insulation blocks. 3.0 <u>EXECUTION</u> 3.1 <u>CONCRETE</u> 3.1.1 Trial Mix, Grades of Concrete At least three weeks before commencing any concreting in the work the Contractor shall make trial mixes using samples of coarse aggregates, sand, water and cement, typical of those to be used in the work. A clean dry mixer shall be used for mixing and the first batch shall be discarded. For guidance in designing the mix, standard tables for maximum allowable water-cement ratio, minimum cement content, maximum proportion of aggregates and limits of consistency may be used by the Contractor. The Contractor's design mix shall fall within limits of the following tables: (a) Strength requirements of concrete: Table-2 of IS: 456-2000. (b) Concrete Mix Proportion: Table-3 of IS: 456-2000. (c) Minimum cement content/Cu.m. of finished concrete shall be as per Table 5 of IS 456-2000. (d) Limit of consistency: Refer Table in Item 3.1.4 of this specification. (e) Cement/Total Aggregate Ratio: As per the following table.

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-6
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 218 of 549
NOTE-1: Notwithstanding anything mentioned above, the cement / Total aggregate ratio is not to be increased beyond 1:9 without specific permission of the Engineer. It should be noted that such high aggregate cement ratios will be required for concretes of very low slump and high water-cement ratios which may be required to be used in mass concrete work only. NOTE-2: The above figures are for guidance only, the actual cement/ aggregate ratios are to be worked out from the specific gravities of coarse aggregates and sand being used and from trial mixes. For each grade of concrete, a set of eighteen cubes shall be made. Of these not more than six may be made on any day and further, of the six cubes made in one day not more than two cubes may be made from any single batch. Nine of these cubes each representing a different batch of concrete shall be tested at the age of seven days and remaining at twenty eight days. The making of the cubes, their curing, storing, transporting and testing shall be in accordance with the relevant IS Specifications. The test shall be carried out in laboratory approved by the Engineer. If the average strength of the concrete cubes falls below the requirement, the method described above shall be repeated till acceptable results are obtained. The method may have to be repeated whenever there is a significant change in the quality of any of the ingredients for concrete, at the discretion of the Engineer. 3.1.2 Batching of Concrete For controlled concrete, only weigh batching shall be allowed. All concrete ingredients, except water, shall be batched by weight, using an approved make of weigh batcher. Batching shall be accurate to 1/2 Kg. The batcher shall be tested for accuracy of calibration, first before commencement of work and at least once a fortnight or as directed by the Engineer thereafter. Water shall be batched by weight or by volume measures, as approved by the Engineer. 3.1.3 Mixing of Concrete Materials for concrete shall be emptied in rotation into the mixer. When all the ingredients are in the drum, the drum will rotate for one minute for dry mixing. After that water shall be added in measured quantities in the		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-6
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 219 of 549
manner specified. The mixer shall then rotate for at least two minutes, or at least forty revolutions or until there is apparent uniform distribution of the materials and till the mass is uniform in colour. The entire content of the drum shall be discharged before the ingredients for the succeeding batch are fed into the drum. The mixer shall be thoroughly cleaned to the satisfaction of the Engineer, before a different quality of concrete is put through the mixer and also at the end of day's work. 3.1.4 Workability of Concrete The degree of workability necessary to allow the concrete to be well consolidated and to be worked into the corners of formwork and around the reinforcement and embedments, and to give the required surface finish shall depend on the type and nature of structure and shall be based on experience and tests. 15 mm. to 40 mm. slump in chimney works shall be adopted subject to Engineer's approval unless stated otherwise (vide serial 1(d) of clause no. 3.3.6). The usual limits of consistency for various types of structure are given below:

LIMITS OF CONSISTENCY

Sr. No.	Degree of Workability	Slump in mm. with Standard Concrete		Use for which Concrete is suitable
		Min.	Max.	
(a)	Very Low	0	15	Large mass concrete work with heavy compaction equipment.
(b)	Medium	35	65	Deep and wide RCC structures with congestion of reinforcement and inserts.
(c)	High	65	100	Very narrow and deep RCC structures with congestion due to reinforcement and inserts.

NOTE: The above table is for guidance only. Notwithstanding anything mentioned above, the slump to be obtained for work in progress shall be as per direction of the Engineer.

With the permission of the Engineer, for any grade of concrete, if the water has to be increased in special cases, cement shall also be increased proportionately, to keep the ratio of water to cement same, as adopted in trial mix design, for each grade of concrete.

The workability of concrete shall be checked at frequent intervals by slump tests. Alternatively, where facilities exist or if required by the Engineer, the compacting factor test, in accordance with IS:1199, shall be carried out.

3.1.5 Placing and Compaction of Concrete

Concreting shall proceed in a manner directed by the Engineer; concrete shall be placed in forms as soon as possible but in no case later than twenty minutes, after mixing.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 222 of 549
The height of any single lift of concrete, for different structural members, shall be decided by the Engineer. The concrete shall be placed in the forms gently and not dropped from a height which may cause segregation of aggregates. Each layer of concrete shall be compacted fully before the succeeding layer is placed and separate batches shall follow each other so closely that the succeeding layer shall be placed and fully compacted before the layer immediately below has taken an initial set. The concrete, after placing, shall be consolidated only by power driven vibrators. The vibrators shall be of a make and size, approved by the Engineer. In using the vibrator, the standard practice and the Engineer's directions, shall be followed. Vibration shall begin as soon as one batch of concrete has been placed and shall continue till the entire section being poured has been thoroughly consolidated. To secure even and dense surfaces, free from aggregate pockets, vibration shall be supplemented by tamping or rodding by hand in the corners of forms and along the form surfaces while the concrete is plastic, without damaging or endangering the stability of the formwork. A sufficient number of spare vibrators including petrol vibrators shall be kept readily accessible to the place of deposition of the concrete to assure adequate vibration in case of breakdown of those in use. 3.1.6 Curing of Concrete Curing of exposed surface of concrete shall commence immediately after the concrete has set. Exposed sides shall be covered with canvas etc. immediately after stripping of forms, and curing shall be continued for a period of not less than 14 days, reckoned from the date and hour of completion of concreting. All surfaces of the pour shall be kept wet with water at all times after concreting and till the curing period is over. The Contractor shall plan and employ proper equipment and sufficient labour considered adequate by the Engineer under able supervisor for curing.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-6
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 223 of 549
3.1.7	Construction Joints In concreting the chimney shell one full ring lift shall be completed in a day's pour. Before the formwork for the following pour starts the horizontal surface of the Chimney shell shall be chipped, cleaned and washed with water, and when the formwork is complete, the surface shall be cleaned and washed again and covered with 1:2 sand cement slurry before fresh concrete is placed. The horizontal construction joints shall be so arranged and made that they are regular and neat. No vertical joint shall be allowed. No separate payment shall be allowed to the Contractor for forming joints or chipping and cleaning them or cover with slurry prior to concreting. The number of construction joint shall be kept minimum and the spacing should not exceed three (3) meters. The Contractor shall submit to the Engineer, any proposal of providing construction joints to facilitate his work, for the study and approval of the Engineer well in advance.	
3.1.8	Ordinary Concrete Ordinary concrete like lean concrete shall be of nominal mix as per relevant clauses of IS: 456.	
3.2	<u>REINFORCEMENT</u>	
3.2.1	Bending of Reinforcement All bars shall be carefully and accurately bent by the Contractor in accordance with approved Drawings and bar bending schedules. Special care shall be taken to ensure correct lengths of laps. The bars shall not be bent or straightened in any manner that will injure the bars or impair the bond between reinforcement & concrete. Bends and hooks are to be provided as laid down in the IS: 2502.	
3.2.2	Placing All reinforcement shall be placed and maintained in the position shown in the drawings. Contractor shall provide approved type of cover blocks to suit the requirement of the Drawings. Where reinforcement is to be provided on two faces of the shell, the Contractor shall provide adequate number of separators, with the approval of the Engineer. Any additional

support to the reinforcing cage, if required at the time of concreting, shall also be provided, to the satisfaction of the Engineer. Lapping of reinforcement as specified in the drawings or as directed by the Engineer, shall be provided. Laps shall be staggered and too many laps shall be avoided. Welded laps shall be provided only when directed or approved by the Engineer.		
3.2.3	Fixing of Reinforcement 18 SWG annealed steel wire shall be used as binding wire. Bar crossing one another and contact laps shall be bound with this wire twisted tight to make the skeleton or network rigid so that the reinforcement is not displaced during placing of concrete.	
3.3	<u>FORMS</u> Construction by Slip-form Method Slip-form construction shall be for construction of the wind shield. Type of Slip-form proposed should be indicated in the offer with sketches, drawings and construction statement as explained hereinafter. Number, type and capacities of jacks, the control system and achievable rate of progress in mm/hour should also be indicated. The chosen scheme shall be of a past proven design. A certified performance record of the scheme should be submitted with the offer to guarantee workability of the scheme both from execution time and safety point of view. The Tenderer should furnish a brief but comprehensive statement indicating the planning & programme and method of work to be followed, for the approval of Owner at the time of submitting Tender. This statement shall include the following items:	
3.3.1	Type and description of Slip-form equipment and its accessories.	
3.3.2	Design of scaffolding and staging.	
3.3.3	Description of materials including admixtures to be used for construction.	
3.3.4	Manpower planning, construction spaces required, standby arrangement.	

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-6
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 225 of 549
3.3.5 Rate of Slip-forming. 3.3.6 Proposed workability requirement of concrete and type of cement & admixture to be used. 3.3.7 Quality assurance programme. 3.3.8 Method of Transportation of material 3.3.9 Method of curing and rectification of defects. 3.3.10 Planned interruption, if proposed, and activities during planned interruption. Treatment of construction joint. 3.3.11 Contingency solution for unplanned interruptions. 3.3.12 Time of completion. While selecting the Contractor, due consideration will be given to the merit of the above mentioned statement proposed by the Tenderer. Notwithstanding what have been specified in earlier clauses, following guide lines are being presented which should be kept in view by intending Tenderers, while quoting for Slip-form method of construction: (a) Care to be taken to prevent dragging of concrete alongwith upward movement of the shuttering. For this purpose following steps are advisable: (i) Shutter plates have to be smooth and should be thoroughly clean. Before fixing them in position all the surfaces which will be coming in contact with concrete to have a coat of epoxy paint. (ii) In areas where concrete thickness is 750 mm or more rate of pouring should be such that minimum slipping of shuttering is 100 mm per hour.		

CONSULTANT : PROCON ENGINEERS

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-6
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 226 of 549
(iii) Mix design should be so done that it will be self-lubricant at the contact face of shutter and concrete and thus reduce friction. Suitable cement of approved manufacturer (conforming to relevant I.S. Specification) may be used for the purpose. An optimum ratio of coarse/fine aggregate should be established to suit the purpose depending on availability of aggregates. (iv) Mix design also should be so done that it has a slump of 50 mm at the point where concrete is placed under an ambient temperature of around 40 Deg.C. This will also keep vibration by needle vibrators to required minimum. Slump should not drop down to zero in less than 45 minutes. Suitable retarding agent and plasticizer of approved manufacture may be added in mix to achieve this purpose. These admixtures to be properly identified by preliminary tests both for performance and for compatibility with particular type of cement proposed to be used. Additional steps like spraying of water over the shutters and keeping down the temperature of coarse aggregates by continuous spraying of water over those may be resorted to if ambient temperature is more than 40 Deg.C. (b) Care must be taken to prevent twist, which predominantly occurs in the initial stages because of low slipping rate, in the horizontal plane of Slip-form assembly. A thorough check on this aspect must be kept at every 15 minutes interval. One person should exclusively be assigned this work together with rectifying any defect. (c) Every endeavour has to be made so as not to occur any tilt in the shutter assembly. To achieve this following steps need be taken: (i) Performance of jacks has to be closely observed and any defective one needs immediate replacement. Difference in levels of opposite jacks at any instant of time should not exceed 5 mm.		

CONSULTANT : PROCON ENGINEERS

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 227 of 549
(ii) Loading on Slip-form truss/yokes has to be fairly equal. (iii) Sleeve through which jacking rod passes has to be of sufficient length so that later gets an uniform clearance and does not get any chance to tilt. Sleeve should have a minimum wall thickness of 3.25 mm and should be such that jacking rod gets a maximum clearance of 1 mm to 1.5 mm all- round. (d) For taper walled chimneys overlapping of shutters which are kept to effect the tapering, needs careful attention otherwise these may be filled with concrete slurry. (e) In designing the mix following aspects should be borne in mind : (i) Cement used should have an initial setting time of not less than 50 minutes (ii) Coarse and fine aggregates should be well graded and rounded aggregates offer better performance in Slip-form technique. These help to keep down water/cement ratio and also offers better lubrication between concrete and shutter surface. 40 mm down size of coarse aggregates should preferably be used unless reinforcement detailing calls for lesser size aggregates. (iii) From the point of view of creep, shrinkage as well as initial setting property of concrete, cement content should not preferably be more than 400 Kg. per Cu.M of concrete. (iv) Minimum compressive strength (after 4 to 6 hours of mixing) of concrete immediately below the shutter as slipform proceeds should be between 0.1 to 0.2 Newton/ Sq.mm. (v) It is advisable to use cement from a single source during the entire operation of slipform technique since once the system starts, there might not be any time left for conducting trial mixes if the source of procurement of cement changes.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 228 of 549
(f) Large diameter vibrator needles should not be used for vibrating concrete. Sizes of these needles should preferably be restricted to 25 mm diameter and to 40 mm diameter - only in exceptional cases. At least two nos. standby vibrator units should always be maintained on top of working deck at all time during the entire period of slipform operation. (g) It is preferable to have membrane curing compounds sprayed on fresh surfaces emerging out of shutter panels for ensuring proper curing at great heights. In case such spraying is not envisaged then elaborate arrangement has to be made for adequate supply of water both on inside and outside vertical surfaces with spraying arrangement, necessary length of pipelines and pump of adequate head to serve the purpose. It is always advisable to have a stand-by pump for effective utilisation of the system. (h) If Slipforming is carried out in summer, rate of slipping should be around 400 mm per hour. If lesser value is contemplated appropriate retarders should be specified. (i) Exact number and capacity of jacks as well as spacing of yoke frames are to be determined taking into account various loadings including self weight of the system, dead and live loads on working and other platforms, horizontal load on formwork, wind load etc. It is desirable that jacking system, based on which the entire slipform system works, should consist of jacks 3 Tonne/ 6 Tonne capacity and a hydraulic pump with necessary pipe connections. Spacing of yoke legs should preferably be kept within 2 metres to prevent overloading on jacks and consequent failure resulting in twist of the formwork. Jacking rods should be of 25 mm diameter for 3 Tonne Jacks and 32 mm diameter for 6 Tonne Jacks.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-6
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 229 of 549
(j) At least 30% spare jacks and jacking rods should be kept ready during the entire operation. It is obligatory to maintain spare hydraulic pump alongwith a set of loose pipes in perfect working condition on top of working deck. (k) In sections where thickness is 500 mm or more it is prudent to go in for two nos. of jacks for each slipform yoke. (l) For effective utility of this technique following areas need careful attentions at the very conceptual stage: (i) Detailed quality assurance programme. (ii) Advance Planning and preparations. (iii) Arrangement for on site supervision and adequate access facilities. (m) Construction methods including description and types of different equipment proposed to be used, structural arrangement and analysis of the system, description and type of different materials, planned interruptions, description and frequency of various checks and tests for Slipform technique as well as for material, method of preparing, transporting and pouring of concrete, solution for probable defects during slipping, sequence of operations during planned interruptions etc. should be prepared beforehand by executing agency and to be approved by Engineer before starting the actual work. (n) Placing and binding of reinforcement is also a very critical item and needs special attention. From practical considerations not more than two or three layers of horizontal steel can be tied at a time and this causes a definite limitation in placement of reinforcement. Vertical reinforcements should be kept vertical by providing suitable holders within the slipform system. (o) It is desirable to have a break of at least one day for every two weeks of continuous operation. Such break should be utilised for various maintenance activities, removal of jack rods etc.

(p) Numbers and locations of hoists for lifting concrete, reinforcement and other materials have to be planned well in advance. Capacity of hoists should be such as to match with hourly requirement of concrete and reinforcement. If felt necessary one hoist may be exclusively earmarked for transporting concrete. For movement of personnel supervising the work a separate hoist must be arranged for. (q) The system being operative round the clock it is obligatory to have adequate lighting arrangement both on various platform levels as well as on ground below. Arrangement has to be made for facilitating continuous upward movement of the entire system alongwith slipform. (r) Winches for lifting men and material and mixers, if located within unsafe area around chimney, should be protected by adequate shelter from possible damage. (s) Proper tele-communication system has to be established between the personnel working on top of Chimney and control room below. (t) A small laboratory should be maintained at site for testing different materials like cement, coarse and fine aggregates. A cube testing machine may also be installed at site for getting quick feed back results. Apart from using plumb bobs, level and theodolite instruments for survey purpose arrangement should also be kept for lasers. (u) In case of interruption in the course of slipping of formwork following measures should be taken : (i) Provision of a key and additional reinforcement at the junction of new and old concrete.

(ii) Slipform system should be brought up freely to have a minimum overlap of 100 mm or so over previously cast concrete. (iii) Washing of old concrete surface with compressed air and water jet and thereafter pouring a layer of neat cement grout. (iv) Clearing of shuttering panels of loose materials, concrete etc. by compressed air and applying a coat of epoxy paint, if felt necessary by Engineer. (v) Neatly finishing the interface of old or new concrete as soon as it comes out of shutter panel. (v) It is preferable to suspend the construction work under high wind condition. (w) It is of utmost importance that for effective implementation of this system an Engineer fully conversant with Slipform technique with enough experience in planning and control of formwork should be in overall command of the site and he should be ably supported by well trained mid level supervisory staff, skilled workers and operators. (x) Operation of slipform method of construction is a continuous one and it demands continuous/intermediate inspection of accuracies in line, level, dimensions and position and immediate rectification of any noticed deviation. All these ask for personnel of high quality having constant vigilance over the construction activity. (y) While all the activities in effective implementation of the work needs utmost care keeping safety of men and material in mind it is obligatory that all activities should be carried out under the guidance of a qualified and trained safety Engineer. Safety measures as listed below must be adhered to but should not be limited to only these: (i) Safety helmets and belts to be provided to all supervising staff and workers.

(ii) Safety nets to be provided below both inside and outside atforms as instructed by Engineer. (iii) Handrailing and toe guard to be provided around all openings and platforms. (iv) Regular maintenance of equipment, checking of hoists, scaffoldings etc. (v) Passenger hoist must have multiple ropes with adequate factor of safety. (vi) Emergency lights, coloured lamps to be provided in accordance with relevant Indian Standards and as supplemented in the Specification and to be operative in case of sudden power failure Emergency standby generator must be kept ready during the entire period of slipform method of construction. (vii) Emergency vehicles, first aid facilities must be kept ready during the entire period of work. (z) Permissible construction tolerances should be limited to the following: (i) Variation in wall thickness : (-) 5 mm, (+) 25 mm (ii) Variation from Design : (+_) 25 mm or (+_) 2.5 mm per 3 m dia. Whichever is larger, but in no case more than (+_) 5 mm. 3.4 <u>STEEL FLUES</u> 3.4.1 General		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-6

Fabrication and erection of Steel Flues shall conform to "Technical Specification for Fabrication and Erection of Structural Steelworks" furnished in this Specification.		
3.4.2	Fabrication Plates out of which flues will be fabricated, should be bent to the required shape on an appropriate machine. No smithy process shall be adopted for the purpose. Plates are to be prevented from distorting by more than the tolerances specified during transportation, storage, handling, erection and jointing. All components should be correctly located and brought into correct alignment and level within specified erection tolerances, before adjacent pieces are jointed or secured.	
3.4.3	Assembly Flue would be assembled from its Component "Cans" near to ground level within the wind-shield. Incomplete flue would be hung only from the flue support platform during assembly, and progressively hoisted to enable connection of further cans at its lower end. Upon completion of the initial sectional length, this length will be hoisted and supported in its final position at the flue support floor as indicated in the drawing. It is envisaged that flue will be assembled and hoisted in three sectional lengths; site joints between sectional length being located just above a steel floor level. Joints between individual cans should be flanged and bolted on outside and to have sealed welded joints on inside in accordance with clause 3.3.section-4 "Welded Construction" under Technical Specifications" for Fabrication of structural steel work. The Contractor shall submit a drawing showing proposals for erection and indicating locations of all site joints which should be kept to minimum.	
3.4.4	Flue Expansion Compensator For installation of Expansion Compensators, the manufacturer's instruction should form the basis of the Contractor's method. This method, in a statement, should be submitted to the Engineer for approval. Once approved it has to be followed throughout the installation sequence. Expansion Compensators should be prevented from distortion during

3.4.5	transportation, handling, erection and jointing, by more stringent tolerances than specified by the manufacturer. Tolerances Permissible tolerances in the fabrication and erection of steel flues are given below: (a) Internal diameter shall not : ± 12 mm vary by more than (b) Centre of any section shall : 10 mm in any 15 metre height not be eccentric from vertical centre line by more than (c) Centre of any section at : $(h/2500 + 10)$ mm, not be height 'h' is in mm. above vertical centre where line by GL shall more than (d) Local deviation from a true circular form should not exceed the shell thickness (Measurement should be made from a segmental circular template having radius of flue shown in drawing and a chord length equal to 0.15 of that radius). (e) Peaking or stepping at welded horizontal seams shall not exceed 4 mm. (Measurement shall be made with a straight edged template long enough to contact the straight shell on either side of the peaked area). 3.4.6 Erection Erection of Steel Flues and C.I. Chimney caps shall be done as per requirement of IS: 800. The Contractor shall submit to the Engineer a programme of erection for his approval. All plant, equipment, tools, tackle and any other accessories required for the erection shall be provided by the Contractor. Storing and handling of fabricated materials for erection, setting out of members, providing temporary supports, bracing, fasteners, bolts,

nuts etc. shall be the responsibility of the Contractor and shall be taken into account in quoting the rate. 3.5 <u>INSULATION AND PROTECTIVE TREATMENT</u> 3.5.1 Acid and Heat Resistant Paint Top 50 meters of the outside face of R.C.C. windshield, horizontal surface at the top of windshield and inside face of the windshield or as specified in the drawing shall receive a protective treatment of four coats of acid and heat resistant black impregnated bitumastic paint. The quality and type of the paint shall have the prior approval of the Engineer. For this, a small area shall be painted and a sample of paint shall be shown to the Engineer. The surface to be painted shall be prepared and primary coat, if required as per the paint manufacturer's specification and direction of the Engineer, shall be applied. The paint shall conform, unless otherwise stated, to the requirement of IS: 158. Necessary samples, test certificates and manufacturer's literature shall be submitted to the Engineer for his approval. The surface to be painted shall be completely dry before the paint is applied and the drying time between consecutive coats shall not be less than 5 hours. The overall combined thickness of paint shall be a minimum of 150 microns. 3.5.2 Synthetic enamel Paint The outside face of the Chimney shell, unless specified otherwise, shall be painted with Synthetic enamel paint. The quality shall be approved by the Engineer. Necessary samples shall be submitted to the Engineer for his approval. The surface of the shell shall be prepared as per paint manufacturer's specification. In addition, care shall be taken that the surface is free from stain, honey comb and any rough and uneven surface. The joints between two shuttering and two lifts of shuttering shall be so prepared that any unevenness, if by chance exists, shall be removed. If one coat of paint is not sufficient to give the required finish, the Contractor shall repaint the surface, until the Engineer is satisfied with the workmanship. The paint shall conform, unless otherwise stated, to IS: 5410. Necessary samples, test certificates and manufacturer's literature shall be submitted to the Engineer for approval.

3.5.3 Insulation and Packing All insulation material should be of dimension and type, shown in the drawing. Load bearing insulations at supports and side restraints of Steel liners should be an assembly of M.S. Plates, Stainless Steel Plates, PTFE (Poly Tetra Fluoro Ethylene) sheets and or/asbestos fibre reinforced boards (SINDANYO BLOCKS). Insulation to be fixed on outer surface of steel flues should be made of glass or mineral wool. (a) Load Bearing Insulation Block Load bearing assembly should consist of three units and be fabricated according to approved drawings. It would be fabricated from mild steel units with a stainless steel sheet bearing plate and load bearing insulation blocks as indicated in drawing. The first unit is bolted to the supporting beam. It consists of a M.S. base plate with bolt holes on which a machined M.S. plate is welded. This plate is provided with recess for PTFE sheet (conforming to BS : 5400) to seat, being lubricated with silicon grease. The second unit also consists of a M.S. plate having adequate size & thickness as shown in drawing. While one surface of the plate is provided with a stainless steel bearing plate the other surface has a thin layer of lead/elastomeric sheet. The side having stainless steel surface is placed on PTFE surface of First unit. The third unit consists of two layers of load bearing insulation blocks each having a minimum thickness of 50 mm and factory bonded to top & bottom M.S. plates. These are separated by 100 mm. long load bearing insulation dowels as shown in the drawing. These plates are in turn welded to two additional M.S. plates. Of the two surfaces thus created one shall be welded to bracket assembly while the other should rest on the lead sheet of second unit. Bearing assembly, thus formed, should be levelled by using suitable M.S. shims. Support arrangement typically consists of flue support shoe (a part of flue), flue support bracket connected to the shoe by precision bolted		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-6
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 237 of 549
connection. The bracket in turn is welded to the bearing assembly, which in turn is bolted to available supporting beams. Support brackets and bearing assembly are welded to locally thickened area of flue. These support the flue on support platform at suitable locations indicated on the drawing. The arrangement described above should cater for easy and smooth thermal movements of linear element. Suitable restraint brackets and M.S. stop plates need be provided as shown in drawings to prevent excessive movement and thus keeping different units of bearing assembly in proper position. (b) Insulation Block at Lateral Restraints At flue restraint platforms, necessary restraint arrangement with load bearing insulation blocks and stainless steel bearing plates fixed to the insulation blocks should be provided as indicated in drawings. Restraint and support brackets need be provided for the bottom supported portion of the flue which rests on the support platform provided at the base to cater for bearing and restraint requirements. (c) Glass or Rock Wool Insulation thickness shall be determine as is specified in clause 2.5.11 Thicker layer shall be put as first layer around the flue on its exterior surface. The insulation on the flue shall be fixed using chicken G.I. wire mesh, G.I. wire ties, insulation retaining studs, washers etc. All joints shall be staggered. The insulation shall be tightly secured to the exterior surface of the flue by impaling on the studs and fixing in place by means of 63mm round or square metal plated speed washers. 20 gauge galvanized wire netting shall be wrapped continuously over the entire exterior of insulation. The wire mesh shall be 25mm hexagonal pattern conforming to IS:1566. All joints in the mesh shall be tapped a minimum of 150 mm tied by 16 gauge soft annealed wire at 300 mm spacings. Lacing at joints shall not be used. The Contractor

before application of insulation, shall take prior approval of actual fixing arrangement from the Engineer. The insulation shall be able to sustain structural vibrations and shall not settle under such conditions during erection, construction & operation. The insulation shall be suitably tied to prevent dislocation under adverse conditions. (d) Vermiculite Concrete Vermiculite concrete shall be made by mixing exfoliated vermiculite, portland cement and water. It shall be of Grade-B, having a density of 210 Kg./Cu.M. The vermiculite aggregate size shall be maximum 6 mm. The mix shall be 1cement and 8 vermiculite by volume. 3.6 <u>ACID-PROOF/CHEMICAL RESISTANT PROTECTION TO ROOF SLAB</u> Acid-Proof/Chemical Resistant tiles bedded on acid proof/chemical resistant mortar shall be provided for the protection of roof slab. The intervening space between the tiles shall also be filled up by chemical resistant/acid-proof epoxy mortar grouts. The mortar shall be used immediately after mixing. Tiles shall be made of clay, feldspar or quartz and vitrified at a high temperature in ceramic kilns. These should be unglazed, free from deleterious materials and should conform to IS: 4457. Iron oxide in the raw materials used, shall not exceed 2 percent. They should show a fine grained, dense and homogenous fracture when broken. They shall be sound, true to shape, flat and free from flaws and other manufacturing defects. Dimensions of the tiles shall be 198.5 x 198.5 x 35 mm. Depth of the groove on the underside shall not be more than 3 mm. Compressive and tensile strengths of the tiles shall not be less than 70 N/Sq.mm and 3.5 N/Sq.mm respectively. 3.7 <u>FLUE ACID DRAINS AND MANHOLES</u> Flue acid drainage system, where provided, will comprise of collection sumps, dilution manholes, conveying pipes including connection to main drainage system.		

CONSULTANT : PROCON ENGINEERS

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-6
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 239 of 549
Stainless steel pipes, bends, collection sumps, fixing straps, bolts etc. conforming to the relevant Indian Standards (or in absence of which British Standard BS: 3605) shall be used in work. Pipes should be cut and joined as per manufacturer's instructions so as to leave the surface clean and square to the axis of pipe. Manhole should be constructed as per drawing. However, for general guidance it may be noted that pit of required dimensions should be excavated, lean concrete (1:2:4 mix) of required thickness to be laid, Acid-proof/Chemical resistant brick masonry in 1:4 acid resistant cement mortar of necessary thickness be built and both sides plastered by 12mm thick acid proof plaster (1:3 mix) having waterproof admixtures. Manholes should be covered by reinforced concrete slab on which a heavy duty (HD) manhole cover with frame having diameter 560mm and total weight 255 Kg (140 Kg for manhole and 115 Kg for cover) is to be fixed. For additional safety another inner cover or other approved methods may be adopted. The manhole cover shall be distinctively coded to indicate the type of drainage involved. Inside manholes necessary channels and benchings finished smooth by neat cement in cement concrete (1:2:4) and foot rungs made from 20mm round bars at 300mm centres and staggered should be provided. Rungs should project 100mm from wall face and be embedded 200mm inside cement concrete block made in that location of brick work. These foot rests shall be painted with coal tar in the projected portions and cement slurry in the embedded part. Joint of any pipe with brick work shall be rendered perfectly leak proof. Pipes and fittings in the connection pipe to the main drainage system shall be vitrified clayware conforming to relevant IS and laid to the line and level indicated in the drawings. 3.8 <u>ROOF DRAINAGE</u> 3.8.1 General Rainwater outlets and down comers to run along inner face of stack wall, shall be made of standard cast iron rainwater pipes conforming to IS:1230.

The brackets used to hold the pipes alongside the walls shall be wrought iron clevis type, split ring type or of perforated strap iron as approved by the Engineer. Each vertical pipe shall hang freely on its bracket fixed just below the socket. Suitable spacer blocks are to be kept in between the pipe and wall surface for fixing the pipe. All bends and junctions shall be provided with water tight clean-outs. 3.8.2 Pipe Joints All joints between pipes, pipes and fittings and manholes shall be gas-tight when above ground and water tight when under ground. Method of pipe cutting and jointing shall be as per instruction of the pipe and fittings manufacturer or as approved by the Engineer. However following guidelines may be followed in absence of any instruction available from the manufacturer. Socket and Spigot pipes shall be joined by cast lead joints. Spigot of the following pipe should be centred in the socket of the preceding pipe by tightly caulking in sufficient turns of tarred gasket or hemp yarn to have unfilled half the depth of socket. After the gasket or hemp yarn has been caulked tightly, a jointing ring shall be placed round the barrel and tightened against the face of the socket to prevent air lock. Molten lead shall then be placed round the barrel and tightened against the face of the socket. Thereafter molten lead should be poured in to fill the remainder of the socket and caulked with suitable tools tight round the joint to make up for shrinkage of the molten metal on cooling and should be finished 3mm behind the socket face. If any joint is suspected to be damaged it has to be opened out & redone. Joints in cast iron pipes with special jointing arrangements like "Tyton" joints etc. shall follow the instructions of the manufacturer. 4.0 <u>TESTING AND ACCEPTANCE CRITERIA</u> 4.1 <u>GENERAL</u> The Contractor shall carry out all sampling and testing in accordance with the relevant IS Specifications and as supplemented herein, for the following items or any other item as may be required by the Engineer unless otherwise		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

specified in this specification. The Contractor shall get the specimens tested in laboratory, approved by the Engineer and shall submit to him, the original test results in triplicate, within seven days after the completion of the test. Engineer may present himself while such tests are being carried out. 4.2 <u>CEMENT</u> Representative samples shall be taken as per the relevant IS Specification from each consignment of Cement received from the Purchaser/Manufacturer/Supplier for carrying out the tests for fineness (by hand sieving), setting time, compressive strength and soundness tests, and the Contractor shall carry out the above tests as per relevant Indian Standard. If the cement is supplied by the Contractor the test shall be carried out by him. The Contractor shall carry out any or all the tests on aggregates as may be required by the Engineer, in accordance with IS:2386 Parts-I to VIII. The acceptance criteria of the samples tested shall be in accordance with the requirements of the relevant IS specifications. 4.3 <u>WATER</u> Sampling and testing of water being used for concrete works shall be carried out as per IS: 3550, by the Contractor, at regular intervals and whenever directed by the Engineer. The final acceptance criterion in case of doubt shall be as per IS: 3025. 4.4 <u>CONCRETE</u> The Contractor shall take cubes for works test as per requirement laid down in IS: 516 regularly from the day's pour. The number of test cubes to be taken shall be as per IS: 456. The Engineer may also use his discretion in deciding the rate of cubes to be taken. The acceptance criteria is to meet the requirement of IS: 456. If the cube test results indicate that some portions of the work is below the required strength, the Engineer may order demolition of that portion of work which is below strength and ask the Contractor to rebuild, provided a satisfactory method of load testing is not possible. Such testing or demolishing and rebuilding shall be carried out by the Contractor.

4.5 <u>STEEL FLUE</u> All site and shop welded joints shall be inspected and tested in accordance with clause 4.00.00 of Technical specification for Fab. and Erection of structural steel work. 4.6 <u>INSULATIONS</u> The insulating materials shall be tested for its stipulated characteristics and properties in accordance with the latest editions of IS:3144 and IS:3346 and/or as directed by the Engineer. 5.0 <u>INFORMATION TO BE SUBMITTED</u> 5.1 <u>WITH TENDER</u> The following technical information are required with the tender: (a) Source and arrangement of processing of aggregates proposed to be adopted. (b) Type of plant and equipment proposed to be used. (c) Names of firms with which association is sought for to execute the special items of work e.g. flue expansion compensator, load bearing insulation blocks etc. in the contract. (d) Types of formwork proposed to be used. All details as per clause no. 3.03.06 to be submitted, if slip form method is proposed to be used. (e) Shop proposed for fabrication of steel (flue) liners. Detailed write-up on procedure of erection of complete liner system including details of equipment proposed for the same. (f) For insulating material tests to be offered for inspection & tests for which test certificates will be submitted. A drawing showing the details of fixing insulation on the flues at bearings, lateral restraints and exterior surface.

(g) Proposal for lifting of men and material in constructing the chimney. 5.2 <u>AFTER AWARD</u> The following information and data including samples where necessary, shall be submitted by the Contractor, progressively during the execution of the Contract. 5.2.1 Programme of Execution and requirement of Materials Within 30 days of the award of the Contract, the Contractor will submit a Master Programme for completion of the work giving month wise requirement of materials, particularly mentioning in details the materials which are to be supplied by the Owner and for the procurement of which the help of the Owner is required as per the terms & conditions of the Contract. In case the Contractor proposes to take on hire any machinery or tools and plants from the Owner, the detailed phased out programme of such hire is also to be submitted. The master programme may have to be reviewed and updated by the Contractor quarterly or at more frequent intervals as may be directed by the Engineer depending on the exigencies of the work. Detailed day to day programme of every month is to be submitted by the Contractor before the commencement of the month. 5.2.2 Samples Samples of all materials proposed to be used shall be submitted as directed by the Engineer, in sufficient quantities, for approval. All samples shall be submitted well in advance of starting work at site. Approved samples will be preserved by the Engineer for future reference. The approval of the Engineer shall not, in any way, relieve the Contractor of his responsibility of supplying material of specified quality.

5.2.3 Design Mix Design mix as per details of this specification giving proportions of ingredients, sources of aggregates and cement along with accompanying test results of trial mixes as per relevant IS Specifications shall be submitted to the Engineer, for his approval, before it can be used on the work. 5.2.4 Detail Drawings Following items shall be provided by the Contractor which are to be approved by the Owner and Consultant. (a) Detail drawings and designs of form work including scaffolding to be used. If slipform method of construction is adopted, then detail drawings showing all the arrangements for slipform technique including methods for reducing internal diameter and providing required slopes on outer diameter. (b) Detail drawings and bar bending schedules for concrete components. (c) Shop drawings for structural steel and metal work, including inserts etc. The Contractor shall submit his proposal for testing site and shop joints provided in steel members. (d) Detail drawings for templates and temporary supports for embedments. (e) Category wise requirements of MS, tor and structural steel including GI flats of various sizes for procurement. (f) Detailed drawings of steel flues indicating details of joints, supports and restraints including insulation blocks, and details of expansion compensator. (g) Detailed drawing of hoisting arrangement for men and material satisfying statutory regulations laid down for safety purpose.

1.0 <u>SCOPE</u> This specification covers all work required for the construction of road including box-cutting, edging, preparation of sub-base, water bound macadam, bituminous macadam, wearing course etc. excluding toppings and shall include all incidental items of work not shown or specified but reasonably implied or necessary for the completion of the work. Notwithstanding the provisions of the technical specification, all road works shall be carried out as per IRC / MORT&H specification This specification also includes all work required for drainage including road side RCC drain, RCC culverts, pipe-culverts, drainage pipes, manholes etc. and all other incidental items. 2.0 <u>GENERAL</u> 2.1 <u>WORK TO BE PROVIDED FOR BY THE CONTRACTOR.</u> The work to be provided for by the Contractor, unless specified otherwise, shall include but not be limited to the following: (a) Furnish all labour, supervision, services, materials, equipment, tools and plants, transportation etc. required for the work. (b) Submit for approval detailed schemes of all operations required for executing the work e.g. material handling, placement, services, approaches etc. (c) To carry out and submit to the Engineer results of tests whenever required by the Engineer to assess the quality of work. 2.2 <u>WORK TO BE PROVIDED FOR BY OTHERS</u> No work under this specification will be provided for by any agency other than the Contractor unless specifically mentioned elsewhere in the Contract.

2.3 <u>CODES AND STANDARDS</u> All work under this specification, unless specified otherwise, shall conform to the latest revision and/or replacements of the following or any other relevant I.S. Specifications and Codes of Practice. (a) Specification for road and bridge works of Ministry of Road Transport & Highways (Fourth Revision). Published by the IRC, New Delhi-2001. (b) IRC-19 Standard specifications and Code of Practice for Water Bound Macadam. (c) IRC: SP-11 Hand Book of Quality Control for Construction of Roads and Runways. (d) IS: 456 Indian Standard Code of Practice for Plain and Reinforced Concrete. (e) IS: 2212 Code of Practice for Brickwork. (f) IS: 783 Code of Practice for Laying of Concrete Pipes. (g) IRC: 36 Recommended Practice for Construction of Earthen embankments for Road Works. (h) IRC: 37 Guidelines for the design of Flexible pavements (i) Other specifications mentioned elsewhere in this specification. In case any particular aspect of work is not covered specifically by Indian Standard Specification, any other standard practice as may be specified by the Engineer shall be followed.

2.4 <u>CONFORMITY WITH DESIGNS</u> The contractor shall carryout the work as per the drawings issued to him and/or contractor's drawings which are approved by the Engineer and/or the Engineer's instructions. 2.5 <u>MATERIALS TO BE USED</u> 2.5.1 General All materials required for the work shall be of best commercial variety and as approved by the Engineer. Material to be used in the work shall conform to the specifications mentioned on the drawings, the requirements laid down in MORT&H Specification and specification for relevant items of work carried under these specifications. 2.6 <u>QUALITY CONTROL</u> The Contractor shall establish and maintain quality control for the various aspects of the work, method, materials and equipment used. All works performed shall conform to the lines, grades, cross sections and dimensions shown on the drawings or as directed by the Engineer. Permitted tolerances for road works are described hereinafter 2.6.1 Horizontal Alignments Horizontal alignments shall be reckoned with respect to the centre line of the carriageway as shown on the drawings. The edges of the carriageway as constructed shall be correct within a tolerance of 25mm there from the corresponding tolerance for edges of the roadway and lower layers of pavement shall be 40 mm. 2.6.2 Surface Regularity of Sub grade and Pavement Courses The surface regularity of completed sub-bases, base courses and wearing surfaces in the longitudinal and transverse directions shall be within the tolerances indicated in Table-I.		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 258 of 549
The longitudinal profile shall be checked with a 3 metre long straight edge, at the middle of each traffic lane along a line parallel to the centre of the road. The transverse profile shall be checked with a set of three camber boards at intervals of 10 metres. 2.6.3 Longitudinal Profile The levels of the sub grade and different pavement courses as constructed, shall not vary from those calculated with reference to the longitudinal and cross-profile of the road shown on the drawings or as directed by the Engineer, beyond tolerances mentioned below:		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 259 of 549

TABLE 1.**TOLERANCES IN SURFACE LEVELS (Table 900-1 of MORT&H)**

1.0	Sub grade	+ 20 mm
2.0	Sub-base + 10 mm :	- 25 mm
(a)	Flexible pavement	-20 mm
(b)	Concrete pavement (Dry lean concrete or Rolled concrete)	+6 mm - 10 mm
3.0	Base-course for flexible pavement	
(a)	Bituminous course	+ 6 mm - 6 mm
(b)	Other than bituminous	+ 10 mm
	(i) Machine laid	- 10 mm, + 15 mm
	(ii) Manually laid	- 15 mm
4.0	Wearing course for flexible pavement :	
(a)	Machine laid	+ 6 mm - 6 mm
(b)	Manually laid	+10 mm -10 mm
5.0	Cement concrete pavement	+ 5 mm - 6 mm *

* This may not exceed - 8 mm at 0- 30 cm from the edges.

Provided, however, that the negative tolerance for wearing course shall not be permitted in conjunction with the positive tolerance for base course, if the thickness of the former is thereby reduced by more than 6 mm for flexible pavements and 5 mm for concrete pavements.

For checking compliance with the above requirement for subgrade, sub-base and base courses, measurements of the surface levels shall be taken on a grid of points placed at 6.25 m longitudinally and 3.5 m transversely. For any 10 consecutive measurements taken longitudinally or transversely, not more than one measurement shall be permitted to exceed the tolerance as above, this one measurement being not in excess of 5 mm above the permitted tolerance.

9.0	Asphaltic Concrete	8	-	-	-	10***	4

NOTES :

- 1.0 **For surface dressing in all other cases, the standards of surface evenness will be the same as those for the surface receiving the surface dressing.
- 2.0 *** These are for machine laid surfaces. If laid manually due to unavoidable reasons, tolerance upto 50 percent above these values in this column may be permitted at the discretion of the Engineer. However, this relaxation does not apply to the values of maximum undulation for longitudinal and cross profiles mentioned in columns 3 and 8 on the table.
- 3.0 Surface evenness requirements in respect of both the longitudinal and cross profiles should be simultaneously satisfied.

2.7 <u>RECTIFICATION</u> Where the surface regularity of subgrade and the various pavement courses fall outside the specified tolerances, the Contractor shall be liable to rectify these in the manner described below and to the satisfaction of the Engineer. 2.7.1 Subgrade: Where the surface is high, it shall be trimmed and suitably compacted. Where the same is low, the deficiency shall be corrected by scarifying the lower layer and adding fresh material and recompacting to the required density. The degree of compaction and the type of material to be used shall conform to the requirements of Clause 305 of MORT&H. 2.7.2 Granular sub-base: Same as at (i) above, except that the degree of compaction and the type of material to be used shall conform to the requirements of Clause 401 of MORT&H. 2.7.3 Water Bound Macadam/Wet Mix Macadam Sub-base/Base: Where the surface is high or low, the top 75 mm shall be scarified, reshaped with added material as necessary and recompacted to Clause 404. This shall also apply to wet mix macadam to Clause 406 of MORT&H. 2.7.4 Bituminous Constructions: For bituminous construction other than wearing course, where the surface is low, the deficiency shall be corrected by adding fresh material over a suitable tack coat if needed and recompacting to specifications. Where the surface is high, the full depth of the layer shall be removed and replaced with fresh material and compacted to specifications. For wearing course, where the surface is high or low, the full depth of the layer shall be removed and replaced with fresh material and compacted to specifications. In all cases where the removal and replacement of a bituminous layer is involved, the area treated shall not be less than 5 m in length and not less than 3.5 m in width. Tolerance in wearing course shall not be permitted in conjunction with the positive tolerance for base course if the thickness of the former is thereby reduced by more than 6 mm.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

2.8 <u>QUALITY CONTROL TESTS DURING CONSTRUCTION</u> As per Clause 903 of MORT&H specification. 3.0 <u>EXECUTION</u> 3.1 <u>SHOULDER CONSTRUCTION</u> 3.1.1 Description This work shall consist of constructing shoulders on either side of the pavement, in accordance with the requirements of this specification and in conformity with the lines, grades and cross-sections shown on the drawings or as directed by the Engineer. 3.1.2 Materials Shoulder may be of selected earth or granular material conforming to the requirements of (MORT&H specification) embankment construction or granular sub-base construction respectively. 3.1.3 Construction Operations Shoulder The sequence of operations shall be such that the construction of paved shoulder is done in layers each matching the thickness of adjoining pavement layer. Only after a layer of pavement and corresponding layers in paved and earth shoulder portion have been laid and compacted, the construction of next layer of pavement and shoulder shall be taken up. Where the materials in adjacent layers are different, these shall be laid together and the pavement layer shall be compacted first. The corresponding layer in paved shoulder portion shall be compacted thereafter, which shall be followed by compaction of earth shoulder layer. The adjacent layers having same material shall be laid and compacted together.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 267 of 549
Compaction requirement of earthen shoulder shall be as per latest MORT&H specification. In the case of bituminous course, work on shoulder (earthen/hard/paved), shall start only after the pavement course has been laid and compacted. During all stages of shoulder (earthen/hard/paved) construction, the required crossfall shall be maintained to drain off surface water. Regardless of the method of laying, all shoulder construction material shall be placed directly on the shoulder. Any spilled material dragged on to the pavement surface shall be immediately removed, without damage to the pavement, and the area so affected thoroughly cleaned. 3.2 <u>KERB</u> 3.2.1 Material Kerb, if required for construction of footpath, shall consist of precast concrete blocks with a concrete grade of M-15. The blocks shall be 100 mm wide and of suitable length. The depth of blocks unless otherwise mentioned elsewhere, shall be 375 mm considering 225 mm height of footpath from the road level. 3.2.2 Laying The Kerb shall be laid by cutting trenches 150 mm deep. The width of the trench shall be minimum and just sufficient to insert the kerbs. The inside faces of the Kerbs shall be in plumb and the gap between the block shall not be more than 10 mm. The kerbs shall be thoroughly packed with a mixture of stone chips (50%) and moorum (50%) at the outside face. The laying and packing shall be done in a proper workmanlike manner acceptable to the Engineer. 3.3 <u>SUB-BASE (GRANULAR SUB-BASE)</u> 3.3.1 Description		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 268 of 549
This work shall consist of laying and compacting well-graded material on prepared sub grad in accordance with the requirements of these specifications. The material shall be laid in one or more layers as shown on the drawings and according to lines, grades and cross sections shown on the drawings or as directed by the Engineer. 3.3.2 Materials The materials to be used for the work shall be natural sand, moorum, gravel, crushed stone, crushed slag, crushed concrete, brick metal, laterite, kanker etc. or combinations thereof depending upon the grading required. The material shall be free from organic or other deleterious constituents and conform to one of the three gradings given in Table 4. While the gradings in Table 4 are in respect of close-graded granular sub-base materials, one each for maximum particle size of 75 mm, 53 mm and 26.5 mm, the corresponding gradings for the coarse-graded materials for each of the three maximum particle sizes are given at Table 5. The grading to be adopted for a project shall be as specified in the Contract.

TABLE 4**GRADING FOR CLOSE-GRADED GRANULAR SUB-BASE MATERIALS****(TABLE 400-1 of MORT&H)**

Sr. No.	IS Sieve	Per cent by weight passing the IS sieve		
		Grading I	Grading II	Grading III
	Designation			
1.0	75.0 mm	100	-	-
2.0	53.0 mm	80-100	100	-
3.0	26.5 mm	55-90	70-100	100
4.0	9.50 mm	35-65	50-80	65-95
5.0	4.75 mm	25-55	40-65	50-80
6.0	2.36 mm	20-40	30-50	40-65
7.0	0.425 mm	10-25	15-25	20-35
8.0	0.075 mm	3-10	3-10	3-10
9.0	CBR Value (Minimum)	30	25	20

Note :

- The material passing 425 micron (0.425 mm) sieve for all the three gradings when tested according to IS : 2720 (Part 5) shall have liquid limit and plasticity index not more than 25 and 6 percent respectively.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 270 of 549
3.3.3 Physical Requirements The fraction of material passing 20 mm sieve shall give a CBR value as specified in Table-II when tested in accordance with IS:2720 (Part XVI) after preparing the samples at maximum dry density and optimum moisture content corresponding to IS:2720 (Part VII) and soaking the same in water for 4 days. The material shall have a 10 per cent fines value of 50 kN or more (for sample in soaked condition) when tested in compliance with BS: 812 (Part III). The water absorption value of the coarse aggregate shall be determined as per IS: 2386 (Part 3); if this value is greater than 2 per cent, the soundness test shall be carried out on the material delivered to site as per IS: 383. For Grading II and III materials, the CBR shall be determined at the density and moisture content likely to be developed in equilibrium conditions which be taken as being the density relating to a uniform air voids content of 5 percent 3.3.4 Spreading and Compacting Immediately prior to the laying of sub-base, the sub grade already finished shall be prepared by removing all vegetation and other extraneous matter, lightly sprinkled with water, if necessary, and rolled with one pass of 8-10 tonne smooth wheeled roller. The sub-base material shall be spread on the subgrade with the help of a drag spreader, motor grader or other approved means. The thickness of loose layers shall be so regulated that the maximum thickness of the layer after consolidation does not exceed 150 mm. The sub-base material of grading specified in the Contract shall be spread on the prepared subgrade with the help of a motor grader of adequate capacity, its blade having hydraulic controls suitable for initial adjustment and for maintaining the required slope and grade during the operation or other means as approved by the Engineer. Manual mixing shall be permitted only where the width of laying is not adequate for mechanical operations, as in small-sized jobs. The equipment used for mix-in-place construction shall be a rotavator or similar approved		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 271 of 549
equipment capable of mixing the material to the desired degree. If so desired by the Engineer, trial runs with the equipment shall be carried out to establish its suitability for the work. Moisture content of the loose material shall be checked in accordance with IS:2720 (Part II) and suitably adjusted by sprinkling additional water from a hose line, truck mounted water tank or other approved means so that at the time of compaction it is from 1 percent above to 2 percent below the optimum moisture content corresponding to IS:2720 (Part VIII). While adding water, due allowance shall be made for evaporation losses. After water has been added, the material shall be processed by mechanical or other approved means if so directed by the Engineer until the layer is uniformly wet. Immediately thereafter, rolling shall be started with 8 to 10 tonne smooth wheeled rollers or other approved plant. Rolling shall commence at the edges and progress towards the centre longitudinally except that on super elevated portions it shall progress from the lower to the upper edge parallel to the centre line of the pavement. Each pass of the roller shall uniformly overlap not less than one third of the track made in the preceding pass. During rolling, the grade and camber shall be checked and any high spots or depressions which become apparent corrected by removing or adding fresh material. Rolling shall be continued till the density achieved is at least 95% of the maximum dry density for the material determined as per IS:2720 (Part VII). The surface of any layer of material on completion of compaction shall be well closed, free from movement under compaction plant and from compaction planes, ridges, cracks or loose material. All loose, segregated or otherwise defective areas shall be made good to the full thickness of layer and re-compacted. 3.4 <u>WATER BOUND MACADAM SUB-BASE/BASE COURSE</u> 3.4.1 Description Water bound macadam shall consist of clean, crushed aggregates mechanically interlocked by rolling,, and bonded together with screenings, binding material, where necessary and water, laid on a prepared subgrade		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A

or sub-base, as the case may be, and finished in accordance with the requirements of MORT&H Specifications and in conformity with the lines, grades and cross-sections shown on the drawings or otherwise directed by the Engineer.

3.4.2 Materials

(a) Coarse Aggregates

Coarse aggregates shall be either crushed or broken stone, crushed slag, overburnt (Jhama) brick aggregates or any other naturally occurring aggregates such as kankar and laterite of suitable quantity. The aggregates shall conform to the physical requirements set forth in Table 5.

TABLE 5 (Table 400-6 of MORT&H)

**PHYSICAL REQUIREMENTS OF COARSE AGGREGATES FOR WATER BOUND
MACADAM FOR SUB-BASE/BASE COURSES**

Sr. No.	Test	Test Method	Requirements
1.0	* Los Angeles Abrasion value	IS : 2386 (part – 4)	40 per cent (Max)
	OR * Aggregate Impact value	IS : 2386 (part-4) or IS : 5640**	30 per cent (Max)
2.0	Combined Flakiness and Elongation Indices (Total) ***	IS : 2386 (Part-1)	30 per cent (Max)

* Aggregate may satisfy requirements of either of the two tests.

** Aggregates like brick metal, kankar, laterite etc. which get softened in presence of water shall be tested for Impact value under wet conditions in accordance with IS : 5640.

*** The requirement of flakiness index and elongation index shall be enforced only in the case of crushed broken stone and crushed slag. (b) Crushed or Broken Stone Crushed or broken stone shall be hard, durable and free from excess of flat, elongated, soft and disintegrated particles, dirt and other objectionable matter. (c) Grading Requirements of Coarse Aggregates The coarse aggregates shall conform to one of the gradings given in Table 6, provided, however, the use of Grading No. 1 shall be restricted to sub-base courses only. <u>TABLE 6 (Table 400-8 of MORT&H)</u> <u>GRADING REQUIREMENTS OF COARSE AGGREGATES</u>			
Grading No.	Size Range	IS Sieve Designation	Per cent by weight passing
1.0	90 mm to 45 mm	125 mm	100
		90 mm	90-100
		63 mm	25-60
		45 mm	0-15
		22.4 mm	0-5

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 275 of 549
(e) Binding Material Binding material to be used for water bound macadam as a filter material meant for preventing ravelling, shall comprise of a suitable material approved by the Engineer having a Plasticity Index (PI) value of less than 6 as determined in accordance with IS : 2720 (Part-5). The quantity of binding material where it is to be used, will depend on the type of screenings. Generally, the quantity required for 75 mm compacted thickness of water bound macadam will be 0.06-0.09 m³/10m² and 0.08-0.10m³/10m² for 100 mm compacted thickness. The above mentioned quantities should be taken as a guide only, for estimation of quantities for construction etc. Application of binding materials may not be necessary when the screenings used are of crushable type such as moorum or gravel. 3.4.3 Construction Operations (a) Preparation of Base The sub-grade/sub-base to receive the water bound macadam coarse shall be prepared to the specified grade and camber and made free of dust and other extraneous material. Any ruts or soft yielding places shall be corrected in an approved manner and rolled until firm surface is obtained if necessary by sprinkling water. (b) Inverted Choke If the water bound macadam is to be laid directly over the subgrade, without any other intervening pavement course, a 25 mm course of screenings (Grading B) shall be spread on the prepared subgrade before application of the coarse aggregates is taken up.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 276 of 549
(c) Spreading Coarse Aggregate The coarse aggregates shall be spread uniformly upon the prepared surface in such quantities that the thickness of the compacted layer is 100 mm for grading 1 and 75-100 mm for gradings 2 and 3 for each layer. The spreading shall be done from stockpiles along the side of the roadway or directly from vehicles. In no case shall the aggregate be dumped in heaps directly on the surface prepared to receive the aggregate nor shall hauling over uncompacted or partially compacted base be permitted. The surface of the aggregates spread shall be carefully checked with templates and all high or low spots remedied by removing or adding aggregate as may be required. No segregation of large or fine particles shall be allowed and the coarse aggregate as spread shall be of uniform gradation with no pockets of fine material. The coarse aggregate shall not normally be spread more than 3 days in advance of the subsequent construction operations. (d) Rolling Immediately following the spreading of the coarse aggregate, rolling shall be started with three wheeled power rollers of 80 to 100 kN capacity or tandem or vibratory rollers of approved type. The weight of the roller shall depend upon the type of the aggregate and be indicated by the Engineer. Except on super elevated portions where the rolling shall proceed from inner edge to the outer, rolling shall begin from the edges gradually progressing towards the centre. First the edge/edges shall be compacted with roller running forward and backward. The roller shall then move inwards parallel to the centre line of the road, in successive passes uniformly lapping preceding tracks by at least one half width.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 277 of 549
Rolling shall continue until the aggregates are thoroughly keyed and the creeping of aggregates ahead of the roller is no longer visible. During rolling slight sprinkling of water may be done, if necessary. Rolling shall not be done when the subgrade is soft or yielding or when it causes a wave-like motion in the subgrade or sub-base course. The rolled surface shall be checked transversely and longitudinally with templates and any irregularities corrected by loosening the surface, adding or removing necessary amounts of aggregate and re-rolling until the entire surface conforms to desired camber and grade. In no case shall the use of screenings be permitted to make up depressions. (e) Applications of Screenings After the coarse aggregate has been rolled, screenings to completely fill the interstices shall be applied gradually over the surface. These shall not be damp or wet at the time of application. Dry rolling shall be done while the screenings are being spread so that vibrations of the roller cause them to settle into the voids of the coarse aggregate. The screenings shall not be dumped in piles but be spread uniformly in successive thin layers either by the spreading motion of hand shovels or by mechanical spreaders, or directly from trucks. Trucks operating for spreading the screenings shall be so driven as not to disturb the coarse aggregate. The screenings shall be applied at a slow and uniform rate (in three or more applications) so as to ensure filling of all voids. This shall be accompanied by dry rolling and brooming with mechanical brooms, hand-brooms or both. In no case shall the screenings be applied so fast and thick as to form cakes or ridges on the surface in such a manner as would prevent filling of voids or prevent the direct bearing of the roller on the coarse aggregate. These operations shall continue until no more screenings can be forced into the voids of the coarse aggregate.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 278 of 549
The spreading, rolling and brooming of screenings shall be carried out in only such lengths of the road which could be completed within one day's operation. (f) Sprinkling and Grouting After the screenings have been applied, the surface shall be copiously sprinkled with water, swept and rolled. Hand brooms shall be used to sweep the wet screenings into voids and to distribute them evenly. The sprinkling, sweeping and rolling operations shall be continued, with additional screenings applied as necessary, until the coarse aggregate has been thoroughly keyed, well-bonded and firmly set in its full depth and a grout has been formed of screenings. Care shall be taken to see that the base or subgrade does not get damaged due to the addition of excessive quantities of water during construction. (g) Application of Binding Material After the application of screenings, the binding material where it is required to be used shall be applied successively in two or more thin layers at a slow and uniform rate. After each application, the surface shall be copiously sprinkled with water, the resulting slurry swept in with hand brooms, or mechanical brooms to fill the voids properly, and rolled during which water shall be applied to the wheels of the rollers if necessary to wash down the binding material sticking to them. These operations shall continue until the resulting slurry after filling of voids, forms a wave ahead of the wheels of the moving roller. (h) Setting and Drying After the final compaction of water bound macadam course, the road shall be allowed to dry overnight. Next morning hungry spots shall be filled with screenings or binding material as directed, lightly sprinkled with water if necessary and rolled. No traffic shall be allowed on the road until the macadam has set. The Engineer shall have the discretion to stop hauling traffic from using the completed

water bound macadam course if in his opinion it would cause excessive damage to the surface. 3.5 <u>TACK COAT</u> 3.5.1 Description The work shall consist of application of a single coat of low viscosity liquid bituminous material to an existing road surface preparatory to another bituminous construction. 3.5.2 Materials Binder : The binder used for tack coat shall be bitumen of a suitable grade as directed by the Engineer and conforming to IS:73, 217 or 454, IS: 8887 of a type and grade as specified in the Contract or as directed by the Engineer as applicable, or any other approved cutback. 3.5.3 Construction Operations 3.5.3.1 Preparation of Base The surface on which the tack coat is to be applied shall be clean and free from dust, dirt and any extraneous material. Immediately before the application of the tack coat, the surface shall be swept clean with a mechanical broom and high pressure air jet, or by other means as directed by the Engineer. 3.5.3.2 Application of Binder Binder shall be heated to the temperature appropriate to the grade of bitumen used and approved by the Engineer and sprayed on the base at the rate specified below. The rate of spread in terms of straight-run bitumen shall be 5 kg. per 10 square metre area for an existing bitumen treated surface and 10 kg per 10 square metre area for an untreated water bound macadam surface. The binder shall be supplied uniformly with the aid of sprayers.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 280 of 549
The application of tack coat shall be at the rate specified in the Contract, and shall be applied uniformly. The normal range of spraying temperature for a bituminous emulsion shall be 20 degree Celsius - 70 degree Celsius and for a cutback 50 degree Celsius – 80 degree Celsius if RC-70/MC-70 grade is used. The method of application of the tack coat will depend on the type of equipment to be used, size of nozzles, pressure at the spray bar, and speed of forward movement. The contractor shall demonstrate at a spraying trial, that the equipment and method to be used is capable of producing a uniform spray, within the tolerances specified. The tack coat shall be applied just ahead of the on-coming bituminous construction. 3.6 <u>BITUMINOUS MACADAM BINDER COURSE</u> 3.6.1 Description This work shall consist of construction, in a single course, of 75 mm thickness of compacted crushed aggregates premixed with a bituminous binder, laid immediately after mixing, on a base prepared previously in accordance with the requirements of these Specifications, and in conformity with the lines, grades and cross sections shown on the drawings or directed by the Engineer. 3.6.2 Materials 3.6.2.1 Binder The Binder shall be straight run bitumen of a suitable grade as directed by the Engineer complying with IS: 73. 3.6.2.2 Aggregates The aggregates shall consist of crushed stone, crushed gravel (shingle) or other stones. They shall be clean, strong, durable, of fairly cubical shape and free of disintegrated pieces, organic and other deleterious matter, and adherent coats. The aggregates shall preferably be hydrophobic and of low porosity. The aggregates shall satisfy the physical requirements set forth in Table-8

directed by the Engineer. The surface shall be thoroughly swept and scraped clean and free from dust and foreign matter. 3.6.3.3 Tack Coat A tack coat shall be applied over the base. 3.6.3.4 Preparation and Transport of Mix Hot mix plant of adequate capacity shall be used for preparing the mix. The temperature of binder at the time of mixing shall be in the range 150 Deg.- 165 Deg.C and that of aggregates in the range 125 Deg. - 150 Deg.C, provided that the difference in temperature between the binder and aggregate at no time exceeds 25 Deg.C. Mixing shall be thorough to ensure that a homogenous mixture is obtained in which all particles of the aggregates are coated uniformly. The mixture shall be transported from the mixing plant to the point of use in suitable vehicles. The vehicles employed for transport shall be clean and be covered over in transit if so directed by the Engineer. 3.6.3.5 Spreading The mix shall be spread immediately after mixing by means of a self propelled mechanical paver with suitable screeds capable of spreading, tamping and finishing the mix to the specified lines, grade and cross sections. However, in restricted locations and in narrow widths, where the available plants cannot operate in the opinion of the Engineer, he may permit manual laying of the mix. The temperature of mix at the time of laying shall be in the range 110 Deg. - 135 Deg.C. In multilayer construction, the longitudinal joint in one layer shall offset that in the layer below by about 150 mm. However, the joint in the topmost layer shall be at the centre line of the pavement.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 286 of 549
Longitudinal joints and edges shall be constructed true to the delineating lines parallel to the centre line of the road. All joints shall be cut vertical to the full thickness of the previously laid mix and the surface painted with hot bitumen before placing fresh material. 3.6.3.6 Rolling After the spreading of mix, rolling shall be done by 8 to 10 tonne power rollers or other approved plant. Rolling should start as soon as possible after the material has been spread. Rolling shall be done with care to keep from unduly roughening the pavement surface. Rolling of the longitudinal joint shall be done immediately behind the paving operation. After this, the rolling shall commence at the edges and progress towards the centre longitudinally except that on super-elevated portions it shall progress from the lower to the upper edge parallel to the centre line of the pavement. The initial or breakdown rolling shall be done as soon as it is possible to roll the mixture without cracking the surface or having the mix pick up on the roller wheels. The second or inter mediate rolling shall follow the break down rolling as closely as possible and be done while the paving mix is still at a temperature that will result in maximum density. The final rolling shall be done while the material is still workable enough for removal of roller marks. When the roller has passed over the whole area once, any high spots or depressions which become apparent shall be corrected by removing or adding fresh material. The rolling shall then be continued till the entire surface has been rolled to compaction, there is no crushing of aggregate and all roller marks have been eliminated. Each pass of the roller shall uniformly overlap not less than one third of the track made in the preceding pass. The roller wheels shall be kept damp if necessary to avoid the bituminous material from sticking to the wheels and being picked up. In no case shall fuel lubricating oil be used for this purpose. Rolling operations shall be completed in every respect before the temperature of the mix falls below 80 Deg.C.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 287 of 549
Rollers shall not stand on newly laid material while there is a risk that it will be deformed thereby. The edges along and transverse of the bituminous macadam laid and compacted earlier shall be cut to their full depth so as to expose fresh surface which shall be painted with a thin surface coat of appropriate binder before the new mix is placed against it. The bituminous macadam shall be provided with final surfacing without any delay. If there is to be any delay, the course shall be covered by a seal coat before allowing any traffic over it. 3.7 <u>OPEN-GRADED PREMIX CARPET</u> 3.7.1 Description This work shall consist of laying and compacting an open-graded carpet of 2 cm thickness in a single course composed of suitable small sized aggregates premixed with a bituminous binder on a previously prepared base, to form a wearing course, in accordance with the requirements of these specifications. 3.7.2 Materials 3.7.2.1 Binder The binder shall be bitumen of a suitable grade, as directed by the Engineer, and satisfying the requirements of IS:73, 217, 454 or other approved cutback as applicable. 3.7.2.2 Aggregates The aggregates shall consist of angular fragments of clean, hard, tough and durable rock of uniform quality throughout. They shall be obtained by crushing rock, gravel or river shingle and be free of elongated and flaky pieces, soft and disintegrated materials, and vegetable or other deleterious matter. They shall preferably be hydrophobic type. The aggregates shall satisfy the quality requirements set forth in Table 8 except that the Flakiness Index shall be limited to a maximum of 30. 3.7.2.3 Proportioning of Materials

3.7.3 Construction Operation 3.7.3.1 Weather and Seasonal Limitations Open-graded premix carpet shall not be laid during rainy weather or when the base course is damp or wet or when the atmospheric temperature in shade is 16 Deg.C or below. 3.7.3.2 Preparation of Base The underlying base on which the bituminous carpet is to be laid shall be prepared, shaped and conditioned to the specified lines, grade and cross section in accordance with Table I as directed by the Engineer. The surface shall be well cleaned by removing caked earth and other foreign matter with wire brushes, sweeping with brooms and finally dusting with sacks as necessary. 3.7.3.3 Tack Coat A tack coat complying with clause 3.5 shall be applied over the base preparatory to laying of the carpet. Application of tack coat shall, however, not be necessary when the laying of carpet follows soon after the provision of a bituminous course. 3.7.3.4 Preparation of Premix Mixers of approved type shall be employed for mixing the aggregates with the bituminous binder. The binder shall be heated to the temperature appropriate to the grade of bitumen approved by the Engineer, in boilers of suitable design avoiding local overheating and ensuring a continuous supply. The aggregates shall be dry and suitably heated to a temperature as directed by the Engineer before these are placed in the mixer. After about 15 seconds of dry mixing, the heated binder shall be distributed over the aggregates at the rate specified.

The mixing of binder with chippings shall be continued until the chippings are thoroughly coated with the binder. The mix shall be immediately transported from the mixer to the point of use in suitable vehicles or wheel barrows. The vehicles employed for transport shall be clean and be covered over in transit if so directed. 3.7.3.5 Spreading and Rolling The premixed material shall be spread on the road surface with rakes to the required thickness and camber or distributed evenly with the help of a drag spreader, without any undue loss of time. The camber shall be checked by means of camber boards and inequalities evened out. As soon as sufficient length of bituminous material has been laid rolling shall commence with 6 to 8 tonne power rollers, preferably of smooth wheel tandem type, or other approved plant. Rolling shall begin at the edges and progress toward the centre longitudinally, except that on the super elevated portions it shall progress from the lower to upper edge parallel to the centre line of the pavement When the roller has passed over the whole area once, any high spots or depressions which become apparent shall be corrected by removing or adding premixed materials. Rolling shall then be continued until the entire surface has been rolled to compaction and all the roller marks eliminated. In each pass of the roller, preceding track shall be overlapped uniformly by at least 1/3 width. The roller wheels shall be kept damp to prevent the premix from adhering to the wheels and being picked up. In no case shall fuel/lubricating oil be used for this purpose. Rollers shall not stand on newly laid material while there is a risk that it will be deformed thereby. The edges along and transverse of the carpet laid and compacted earlier shall be cut to their full depth so as to expose fresh surface which shall be painted with a thin surface coat of appropriate binder before the new mix is placed against it. 3.7.3.6 Seal Coat A seal coat conforming to clause 3.8 shall be applied to the surface

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 291 of 549
immediately after laying the carpet. No traffic shall be allowed on the road till the seal coat has been placed. 3.8 <u>SEAL COAT</u> 3.8.1 Description This work shall consist of application of a seal coat for sealing the voids in a bituminous surface laid to the specified levels, grade and camber. Seal coat shall be of either of the two types below, as specified: Type A : Liquid seal coat comprising of an application of a layer of bituminous binder followed by a cover of stonee chippings. Type B : Premixed seal coat comprising of a thin application of fine aggregate premixed with bituminous binder. 3.8.2 Materials 3.8.2.1 Binder The binder shall be bitumen of a suitable grade as directed by the Engineer and conforming to the requirements of IS:73, 217 or 454 as applicable or any other approved cutback The quantity of binder to be utilised, in terms of straight run bitumen shall be 9.8 kg and 6.8 kg per 10 square metre area for Type A and Type B seal coat respectively. 3.8.2.2 Stone Chippings for Type A Seal Coat The stone chippings shall consist of angular fragments of clean, hard, tough and durable rock of uniform quality throughout. They shall be free of elongated or flaky pieces, soft or disintegrated stone, vegetable or other deleterious matter. Stone chippings shall be of 6 mm size defined as 100 percent passing through 10 mm sieve and retained on 2.36 mm sieve. The quantity used for spreading shall be 0.09 cubic metre per 10 square metre

area. The chippings shall satisfy the quality requirements spelled out in Table VI except that the upper limit for flakiness Index shall be 30. 3.8.2.3 Fine Aggregate for Type B Seal Coat The fine aggregate shall be sand or fine grit and shall consist of clean, hard, durable, uncoated dry particles and shall be free from dust, soft or flaky material, organic matter or other deleterious substances. The aggregate shall pass 1.7 mm sieve and be retained on 180 micron sieve. The quantity used for premixing shall be 0.06 cubic metre per 10 square metre area. 3.8.3 Construction Operations 3.8.3.1 Preparation of Base The seal cost shall be applied immediately after the laying of bituminous course which is required to be sealed. Before application of seal coat materials the surface shall be cleaned free of any dust or other extraneous matter. 3.8.3.2 Construction of Type A Seal Coat The binder shall be heated in boilers of suitable design, to the temperature appropriate to the grade of bitumen approved by the Engineer and sprayed on the dry surface in a uniform manner preferably with the help of mechanical sprayers. Excessive deposits of binder caused by stopping or starting of the sprayer or through leakage or any other reason shall be suitably corrected before the stone chippings are spread. Immediately after the application of binder, stone chippings in a dry and clean state, shall be spread uniformly on the surface, preferably by means of a mechanical gritter, otherwise manually so as to cover the surface completely. If necessary, the surface shall be broomed to ensure uniform spread of chippings. Immediately after the application of the cover material, the entire surface shall be rolled with a 8-10 tonne smooth wheeled roller. Rolling shall commence at the edges and progress towards the centre except in super elevated portions where it shall proceed from the inner edge to		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

3.8.3.3	the outer. Each pass of the roller shall uniformly overlap not less than one third of the track made in the preceding pass. While rolling is in progress additional chippings shall be spread by hand in whatever quantities required to make up irregularities. Rolling shall continue until all aggregate particles are firmly bedded in the binder and present a uniform closed surface. Construction of Type B Seal Coat Mixers of approved type shall be employed for mixing the aggregates with the bituminous binder. The binder shall be heated in boilers of suitable design, to the temperature appropriate to the grade of bitumen approved by the Engineer. Also the aggregates shall be dry and suitably heated to a temperature directed by the Engineer before the same are placed in the mixer. Mixing of binder with aggregates to the specified proportions shall be continued till the latter are thoroughly coated with the former. The mix shall be immediately transported from the mixing plant to the point of use and spread uniformly on the bituminous surface to be sealed. As soon as sufficient length has been covered with the premixed material, the surface shall be rolled with 6-8 tonne smooth wheeled power rollers. Rolling shall be continued till the pre-mixed material completely seals the voids in the bituminous course and a smooth uniform surface is obtained. 3.8.4 Opening to Traffic In the case of Type B Seal coat, traffic may be allowed soon after final rolling when the premixed material has cooled down to the surrounding temperature. However, as regards Type a seal coat, traffic shall not be permitted until the following day. 3.9 <u>REPAIR OF EXISTING WATER BOUND MACADAM SURFACE</u> Pot holes or patches and ruts in water bound macadam base or surface course, which is to be surface treated, shall be repaired by removal of all	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 294 of 549
loose material by cutting in rectangular patches and replacing with suitable materials. The repair shall be done as under : Pot holes, patches and ruts shall be drained of water and cut to regular shape with vertical sides, and then be filled either with i) coarse aggregate and screenings conforming to the specification for water bound macadam and compacted with rollers or other approved rammer or ii) premixed material conforming to the specification for open graded premix carpet and compacted with rollers or other approved means after painting the sides and bottom of the holes with a thin application of bitumen or a combination of both as directed by the Engineer. The above is only applicable in case of damage to the existing water bound macadam surfaces. In case, however, it is found that there has been damage to the granular sub-base as well, the area of the damaged surface shall be repaired by removal of all loose materials, cut to regular shape with vertical sides and re-laid with graded material as per specification of granular sub-base and then surfaced with water bound macadam as per specification for the same. 3.10 <u>BITUMINOUS CONCRETE</u> 3.10.1 Scope This clause specifies the construction of bituminous concrete, for use in wearing and profile corrective courses. This work shall consist of construction in a single or multiple layers of bituminous concrete on a previously prepared bituminous bound surface. A single layer shall be 25 mm to 100 mm in thickness. 3.10.2 Materials (a) Bitumen The bitumen shall be paving bitumen of penetration grade complying with Indian Standard Specification for Paving Bitumen. IS:73 and of the penetration indicated in Table 500-18 of MORT&H, for bituminous concrete or this bitumen as modified by one of the methods specified in clause 521 of MORT&H, or as otherwise		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/A
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 295 of 549
specified in the contract. Guidance on the selection of an appropriate grade of bitumen is given in The Manual for Construction and Supervision of Bituminous Works. (b) Coarse Aggregates The coarse aggregates shall be generally as specified in clause 507.2.2 of MORT&H, except that the aggregates shall satisfy the physical requirements of Table 500-17 of MORT&H. (c) Fine Aggregates The fine aggregates shall be all as specified in clause 507.2.3 of MORT&H. (d) Filler Filler shall be generally as specified in clause 507.2.4 of MORT&H. Where the aggregates fail to meet the requirements of the water sensitivity test in Table 500-17 of MORT&H then 2 percent by total weight of aggregate, of hydrated lime shall be added without additional cost. (e) Aggregate grading and binder content When tested in accordance with IS:2386 Part 1 (Wet grading method), the combined grading of the coarse and fine aggregates and added filler shall fall Within the limits shown in Table 500-18 of MORT&H for gradings 1 or 2 as specified in the Contract. 3.10.3 Mixture Design (a) Requirements for the mixture Apart from conformity with the grading and quality requirements for individual ingredients, the mixture shall meet the requirements set out in Table 500-19 of MORT&H.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 296 of 549
The requirements for minimum percent voids in mineral aggregate (VMA) are set out in Table 500-12 of MORT&H. (b) Binder content The binder content shall be optimised to achieve the requirements of the mixture Set out in Table 500-19 of MORT&H and the traffic volume as specified in the Contract. The Marshall method for determining the optimum binder content shall be adopted as described in the Asphalt Institute Manual MS-2, replacing the aggregates retained on the 26.5 mm sieve and retained on the 22.4 mm sieve, where approved by the Engineer. (c) Job mix formula The procedure for formulating the job mix formula shall be generally as specified in clause 507.3.3 of MORT&H and the results of tests enumerated in Table 500-19 of MORT&H as obtained by the Contractors. (d) Plant trials-permissible variation in job mix formula The requirements for plant trials shall be all as specified in clause 507.3.3 of MORT&H and the results of tests enumerated in Table 500-19 as obtained by the contractors. (e) Laying trials The requirements for plant trials shall be all as specified in clause 507.3.5 of MORT&H. 3.10.4 Construction Operations (a) Weather and seasonal limitations The provisions of clause 501.5.1 of MORT&H shall apply.

(b) Preparation of base The surface on which the bituminous concrete is to be laid shall be prepared in accordance with clauses 501 and 902 of MORT&H as appropriate, or as directed by the engineer. The surface shall be thoroughly swept clean by mechanical broom and dust removed by compressed air. In locations where a mechanical broom cannot access, other approved methods shall be used as directed by the engineer. (c) Tack coat Where specified in the Contract, or otherwise required by the Engineer, a tack coat shall be applied in accordance with the requirements of clause 503 of MORT&H. (d) Mixing and transportation of the mixture The provisions as specified in clauses 501.3 and 501.5.4 of MORT&H shall apply. (e) Spreading The general provisions of clauses 501.5.3 and 501.5.4 of MORT&H shall apply. (f) Rolling The general provisions of clauses 501.6 and 501.7 of MORT&H shall apply, as modified by the approved laying trials. 3.10.5 Opening to traffic The newly laid surface shall not be open to traffic for at least 24 hours after laying and the completion of compaction, without the express approval of the engineer in writing.

3.10.6 Surface finish and Quality control The surface finish of the completed construction shall conform to the requirements of clause 902 of MORT&H. All materials and workmanship shall comply with the provisions set out in section 900 of this specification. 3.10.7 Arrangements for traffic During the period of construction, arrangements for traffic shall be made in accordance with the provisions of clause 112 of MORT&H. 3.11 <u>ROAD SIDE DRAINS</u> 3.11.1 Formation of Drains The road side drains shall be made in sizes and slopes as shown on drawings and/or as instructed by the Engineer. The minimum side slope shall be as instructed by the Engineer. The sides and bottom shall be neatly dressed after excavation. Proper connections shall be made to the culverts, outside plant area, as per instructions of the Engineer. The excavated spoils shall be transported and filled in low areas within the plant area or in embankments as instructed by the Engineer. The lining for the drains shall be as per Dwg. and as mentioned in the Schedule of items. Lining of drains may be of bricks or cement concrete blocks of M15 grade concrete as shown on drawing or as directed by the Engineer. If instructed by the Engineer or shown on drawing, drains may be of R.C.C. construction with necessary slopes. 3.12 <u>CULVERTS</u> Excavation in trenches for foundation of culverts and wing walls shall be done with side slopes as per the instructions of Engineer after clearing the site, etc. as per specifications of earthwork. Backfilling with ramming and watering shall be done after construction of the foundations. The construction of culverts shall be done true to lines and levels and as shown on the drawing. The specification for Masonry and/or Plain and Reinforced Cement concrete shall be followed, as applicable.

3.13 <u>PIPE CULVERTS AND DRAINAGE PIPES</u> 3.13.1 Materials The drainage pipes unless otherwise shown on drawings or instructed by the Engineer shall be made of R.C.C. and shall be either Class NP2 or NP3. Pipe culverts shall be made of reinforced concrete pipe and shall be of class NP3 or of RDSO class for railway as decided by the Engineer or shown in the drawing. All pipes shall meet the requirements of IS: 458- Latest edition and shall be procured from approved manufacturers with collars as per manufacturer's standard specifications. The tendered shall specifically mention the particular manufacturer's product he proposes to use. Cement shall be ordinary Portland Cement as per IS:269,8112 - Latest edition. Aggregates shall be as per IS:383 - Latest edition - Maximum size shall not exceed one third the thickness of the pipe or 20 mm whichever is smaller. Fine aggregates for concrete shall be as per IS: 383 - Latest edition. 3.13.2 Laying of Pipes Laying of concrete pipes shall correspond to IS:783 - Latest edition – and to specification given below: (a) The foundation bed for pipe shall be excavated true to lines and grades shown on the drawings or as directed by the Engineer. When trenching is involved its width on either side of the pipe shall not be less than 150 mm nor more than one-third the diameter of pipe unless otherwise instructed/permitted by the Engineer. The sides of the trench shall be as nearly vertical as possible. Side slope, shoring, bailing out water, etc. as required shall be done by the Contractor without the Owner. Side slips, if there be any, shall be removed by the Contractor. After laying of the pipes are completed, backfilling of the trenches shall be done in 250 mm layers, measured loose, clods and lumps broken, watered and compacted with iron rammers to the satisfaction of the Engineer. The surplus

spoils shall be transported and filled in low areas within the plant area, as instructed by the Engineer. When bed-rock or boulder strata are encountered, excavation shall be taken down to at least 200 mm below the bottom level of the pipe with prior permission of the Engineer and all rock/boulders in the area shall be removed and space filled with approved earth free from stone or fragmented material, shaped to the requirements and thoroughly compacted to provide adequate support for the pipe. Filling of trench shall be carried out simultaneously on both sides of the pipe in such a manner that unequal pressures do not occur. When two or more pipes are to be laid adjacent to each other, they shall be separated by a distance equal to at least half the diameter of the pipe subject to a minimum of 450 mm. Laying of pipes shall start from the outlet and proceed towards inlet. All pipes and fittings shall be gradually lowered into the trench or placed on the supports by approved means taking due care not to damage them. Under no circumstances the pipes shall be dropped into the trench or on supports from a height. (b) Pipe bedding shall be first class projection bedding for positive projecting pipes as per IS:783 - Latest edition -having a projection ratio of not greater than 0.70, in which the pipe is carefully bedded on fine granular materials in an earth foundation carefully shaped to fit the lower part of the pipe exterior for at least ten percent of its overall height, and in which earth filling material is thoroughly rammed and tamped in layers not exceeding 15 cm in depth around the pipe for the remainder of the lower 30 percent of its height. If the pipe is laid in trench, pipe bedding shall be first class bedding as per IS:783. When indicated on the drawings or directed by the Engineer, the pipe shall be bedded on a cradle constructed of concrete having a

mix not leaner than M15. The shape and dimension of the cradle shall be as indicated on the drawing or directed by the Engineer. The pipe shall be laid on the concrete bedding before the concrete has set. (c) The drop walls shall be made with first class brickwork in 1:4cement mortar. (d) The pipe culverts shall be made with proper care regarding the invert of the pipe, gradient, if any, etc. as specified on drawings and/or as instructed by the Engineer. (e) Where R.C.C. pipes are encased in concrete at road crossings or at other places the pipes need be suitably supported avoiding reinforcements of concrete blocks, joints properly done before concreting is taken up. Concreting of total height of block may be done in a single operation or may be done up to some height for pipes to be properly laid in position and remaining height of block to be concreted subsequently. (f) The R.C.C. pipes shall be joined with cement mortar. Cement mortar shall consist of 1 part cement and 2 parts of clean sand with only enough water for workability. Procedure of jointing shall be as per IS: 783 - latest edition. 3.13.3 Relation with Water Supply Pipeline Unless specifically cleared by the Engineer, under no circumstances shall drainage pipes be allowed to come close to water supply pipelines. 3.14 Manholes and Inspection Chambers The maximum distance between manholes shall be 30 meter unless specifically permitted otherwise. In addition at every change of alignment, gradient or diameter there shall be a manhole or inspection chamber. The distance between manhole or inspection chamber and gully chamber shall not exceed 6 meters unless permitted otherwise. Manhole shall be constructed so as to be water-tight under test. The channel or drain at the bottom of chamber shall be plastered with 1:2 cement sand mortar and finished smooth to the grade. The channels and drains shall be shaped and

laid to provide smooth flow. Connection to existing pipelines shall be through a manhole Manholes shall be provided with standard covers, usually C.I. or as directed by the Engineer. The covers shall be close fitting so as to prevent gases from coming out. 3.15 <u>MASONRY</u> 3.15.1 Brick Masonry All bricks shall be of first class (Class A) quality, well burnt, of uniform size, shape and colour free from cracks, flaws or nodules of free lime. Bricks shall be soaked in water for at least two hours prior to use and shall be laid truly horizontal and vertical in headers and stretchers with cement mortar consisting of one part of cement and four parts of sand, unless otherwise mentioned in the schedule of Items or directed by the Engineer, in layers not exceeding 1.5 M in height. Each layer shall be allowed at least 24 hours to settle itself before another layer is placed on it and every layer cured with water until the starting of next layer above it. Materials for mortar such as sand and cement shall be of approved quality. Mortar shall be well mixed, first dry mixed and then by adding water slowly to have a thick workable consistency. Mortar shall be mixed in small batches consistent with the rate of consumption so that no mortar is used after one hour of mixing. Mortar joints shall be kept uniformly 10 mm thick and all joints should be full of mortar. Brickwork shall be carried up regularly in plumb every course being horizontal. No vertical joints shall come directly over one another. Joints of the brickwork shall be raked minimum 10 mm deep using raking tool while mortar is still green to provide bond for plaster or pointing. Where plaster or pointing is not provided, the joints shall be struck flush and finished immediately. The brickwork shall be kept moist for 14 days.

All bricks which absorb water more than 20% of their own dry weight after being immersed in water for 24 hours shall be rejected. Brick should be as per IS: 1077. Bricks shall have minimum crushing strength of 50 kg/Sq.cm 3.15.2 Stone Masonry All stones shall be from approved quarries, hard, tough, durable, compact grained, uniform in texture and colour and free from decay, flaws, veins, cracks and sand holes. A stone shall not absorb more than 5 percent of its weight of water after 24 hours immersion. Samples shall be submitted by the Contractor and approved samples shall be retained by the Engineer for comparison of bulk supply. Stone shall be thoroughly soaked before laying. Stones shall be laid on their natural quarry beds. Individual stones shall be fitted with mallet and properly wedged to reduce thickness of mortar joints. Thickness of joint shall not be less than 8 mm and not greater than 25 mm. At least two stones shall run the full width of the wall for every square meter of surface area. 3.15.3 Pointing to Masonry After raking out of the joints, the brickwork shall be brushed down with a stiff wire brush, so as to remove all loose dust from the joints and thoroughly washed with water, mortar consisting of 1 part cement and 3 parts clean, sharp, well graded sand by volume shall be pressed carefully into the joints and finished with suitable tools to shape as shown on the drawings. Any surplus mortar shall be scraped off the wall face leaving the surface clean. The pointed surface shall be kept wet for at least three days for curing. 3.16 <u>PLASTER TO MASONRY AND CONCRETE</u> Before application of plaster the surface shall be cleaned of all dirt, grease or loose particles by hard brush and water. The surface shall be thoroughly moist to prevent absorption of water from the base course. Any excess water shall be mopped up. Unless otherwise mentioned in the schedule of items plastering shall be done with cement sand mortar - 1 part by volume of cement to 4

parts by volume of clean, sharp, well graded sand. For sand cement plaster, sand and cement in the specified proportion shall be mixed dry on a watertight platform and minimum water added to achieve working consistency. For lime gauge plaster, lime putty or hydrated lime and sand in the required proportion shall be mixed on a watertight platform with necessary addition of water and thoroughly ground in mortar mill. This mix shall then be transferred to a mechanical mixer to which the required quantity of cement is added and mixed for at least 3 minutes. No mortar which has stood for more than half an hour shall be used. Plaster, when more than 12 mm thick, shall be applied in two coats. All plaster work shall correspond to IS: 1661- latest edition. 3.16.1 Finish Generally, all plastered surfaces shall have a standard finish unless otherwise shown on the drawing or directed by the Engineer. The interior plaster shall be finished to a smooth surface by steel trowelling. The exterior surfaces shall be finished with a wooden float. However, if shown on the drawing or directed by the Engineer the plastered surface shall have a neat cement finish. Immediately after achieving a true plastered surface with the help of a wooden straight edge, the entire area shall be uniformly treated with a paste of neat cement at the rate of one (1) kg per Sq.M. and rubbed smooth with a trowel 3.17 <u>CEMENT CONCRETE (PLAIN AND REINFORCED)</u> Shall be as laid down in "Technical Specification for Cement Concrete (Plain and Reinforced)" Section - III. 4.0 <u>TESTING AND ACCEPTANCE CRITERIA</u> 4.1 <u>ROADS</u> All testing, as mentioned in the body of the specification and as mentioned in Clause No. 900 of Specification for Roads and Bridge Works, 1983 published by IRC on behalf of Ministry of Shipping and Transport (Roads Wing) shall be carried out by the Contractor as per direction of the

1.0 <u>SCOPE</u> This specification covers all work required for the construction of concrete road including box-cutting, edging, sub-base, sub grade, unreinforced / reinforced concrete pavement include all incidental items of work not shown or specified but reasonably implied or necessary for the completion of the work. This specification also includes all work required for drainage including road side drain, R.C.C. culverts, pipe-culverts, drainage pipes, manholes etc. and all other incidental items. 2.0 <u>GENERAL</u> 2.1 <u>WORK TO BE PROVIDED FOR BY THE CONTRACTOR</u> The work to be provided for by the Contractor, unless specified otherwise, shall include but not be limited to the following: (a) Furnish all labour, supervision, services, materials, equipment, tools and plants, transportation etc. required for the work. (b) Submit for approval detailed schemes of all operations required for executing the work e.g. material handling, placement, services, approaches etc. (c) To carry out and submit to the Engineer results of tests whenever required by the Engineer to assess the quality of work. 2.2 <u>WORK TO BE PROVIDED FOR BY OTHERS</u> No work under this specification will be provided for by any agency other than the Contractor unless specifically mentioned elsewhere in the Contract.

2.3 <u>CODES AND STANDARDS</u> All work under this specification, unless specified otherwise, shall conform to the latest revision and/or replacements of the following or any other relevant I.S. Specifications and Codes of Practice. (a) Specification for road and bridge works of Ministry of shipping & Transport (Roads wing) Published by the IRC. (b) IRC: 58 Guidelines for the design of Rigid Pavements for highways (c) IRC: SP-11 Hand Book of Quality Control for Construction of Roads and Runways. (d) IS:456 Indian Standard Code of Practice for Plain and Reinforced Concrete. (e) IS: 2212 Code of Practice for Brickwork. (f) IS: 783 Code of Practice for Laying of Concrete Pipes. (g) IRC: 15 Standard Specifications and Code of Practice for Construction of Concrete Roads. In case any particular aspect of work is not covered specifically by Indian Standard Specification, any other standard practice as may be specified by the Engineer shall be followed. 2.4 <u>CONFORMITY WITH DESIGNS</u> The contractor shall carryout the work as per the drawings issued to him and/or contractor's drawings which are approved by the Engineer and/or the Engineer's instructions. 2.5 <u>MATERIALS TO BE USED</u> 2.5.1 General		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/B
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 313 of 549
2.5.2	All materials required for the work shall be of best commercial variety and as approved by the Engineer. Quality Control The Contractor shall establish and maintain quality control for the various aspects of the work, method, materials and equipment used. All works performed shall conform to the lines, grades, and cross sections and dimensions shown on the drawings or as directed by the Engineer. Permitted tolerances for road works are described hereinafter. (a) Horizontal Alignments Horizontal alignments shall be reckoned with respect to the centre line of the carriageway as shown on the drawings. The edges of the carriageway as constructed shall be correct within a tolerance of ± 25 mm there from. The corresponding tolerance for edges of the roadway and lower layers of pavement shall be ± 40 mm. (b) Longitudinal Profile The levels of the sub grade and different pavement courses as constructed, shall not vary from those calculated with reference to the longitudinal and cross-profile of the road shown on the drawings or as directed by the Engineer, beyond tolerances mentioned below : Sub-grade ± 25 mm Sub-base ± 20 mm 3.0 EXECUTION 3.1 SHOULDER CONSTRUCTION 3.1.1 Description This work shall consist of constructing shoulders on either side of the pavement, accordance with the requirements of this specification	

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/B
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 314 of 549
and in conformity with the lines, grades and cross- sections shown on the drawings or as directed by the Engineer. 3.1.2 Materials Shoulder may be of selected earth or granular material conforming to the requirements of embankment construction or granular sub- base construction respectively. Hard Shoulders shall be 80mm thick PCC interlocking blocks(grade M-35) over PCC M-7.5 with sand bedding on an under-bed of 150mm thick WBM on either side of the roads. Precast Kerb stone, for construction of shoulder, shall be of precast concrete blocks having a concrete grade of M-25. The blocks shall be 100 mm wide and of suitable length and depth 3.1.3 Construction Operations Except in the case of bituminous constructions, shoulders shall be constructed in advance of the laying of pavement courses. The compacted thickness of each layer of shoulder shall correspond to the compacted layer of pavement course to be laid adjacent to it. After compaction, the inside edges of shoulders shall be trimmed vertical and included area cleaned of all spilled material before proceeding with the construction of the pavement layer. Regardless of the method of lying, all shoulder construction material shall be placed directly on the shoulder. Any spilled material dragged on to the pavement surface shall be immediately removed, without damage to the pavement and the area so affected thoroughly cleaned. During all stages of shoulder construction, the required cross fall shall be maintained to drain off surface water. 3.2 <u>KERB</u> 3.2.1 Material Kerb, if required for construction of footpath, shall consist of precast concrete blocks with a concrete grade of M-15. The blocks shall be 100 mm		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/B
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 315 of 549
3.2.2	wide and of suitable length. The depth of blocks unless otherwise mentioned elsewhere, shall be 375 mm considering 225 mm height of footpath from the road level Laying The Kerb shall be laid by cutting trenches 150 mm deep. The width of the trench shall be minimum and just sufficient to insert the kerbs. The inside faces of the Kerbs shall be in plumb and the gap between the block shall not be more than 10 mm. The kerbs shall be thoroughly packed with a mixture of stone chips (50%) and moorum (50%) at the outside face. The laying and packing shall be done in a proper workmanlike manner acceptable to the Engineer. 3.3 <u>SUB-BASE (GRANULAR SUB-BASE)</u> 3.3.1 Description This work shall consist of laying and compacting well-graded material on prepared sub grade in accordance with the requirements of these specifications. The material shall be laid in one or more layers as shown on the drawings and according to lines, grades and cross sections shown on the drawings or as directed by the Engineer. 3.3.2 Materials The materials to be used for the work shall be natural sand, moorum, gravel, crushed stone, crushed slag, crushed concrete, brick metal, laterite, kanker etc. or combinations thereof depending upon the grading required. The mixed materials shall be free from organic or other deleterious constituents and conform to one of the three grading given in Table-I below

TABLE-I**GRADING FOR GRANULAR SUB-BASE MATERIALS**

Sr. No.	Sieve designation	Percent by weight passing the sieve		
		Grading 1	Grading 2	Grading 3
1.0	80 mm	100	100	100
2.0	63 mm	90-100	90-100	90-100
3.0	4.75 mm	35-70	40-90	50-100
4.0	75 micron	0-20	0-25	0-30
5.0	CBR Value (Minimum) for fraction of material passing 20 mm sieve	30%	25%	20%

Note: The material passing 425 micron sieve for all the three grading when tested according to IS: 2720 (Part V) shall have liquid limit and plasticity index of not more than 25 percent and 6 percent respectively.

3.3.3 Physical Requirements

The fraction of material passing 20 mm sieve shall give a CBR value as specified in Table-II when tested in accordance with IS:2720 (Part XVI) after preparing the samples at maximum dry density and optimum moisture content corresponding to IS:2720 (Part VII) and soaking the same in water for 4 days.

3.3.4 Spreading and Compacting

Immediately prior to the laying of sub-base, the sub grade already finished shall be prepared by removing all vegetation and other extraneous matter, lightly sprinkled with water, if necessary, and rolled with one pass of 8-10 tonne smooth wheeled roller.

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/B
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 318 of 549
The sub-base material shall be spread on the sub grade with the help of a drag spreader, motor grader or other approved means. The thickness of loose layers shall be so regulated that the maximum thickness of the layer after consolidation does not exceed 150 mm. Moisture content of the loose material shall be checked in accordance with IS: 2720 (Part II) and suitably adjusted by sprinkling additional water from a hose line, truck mounted water tank or other approved means so that at the time of compaction it is from 1 percent above to 2 percent below the optimum moisture content corresponding to IS: 2720 (Part VIII). While adding water due allowance shall be made for evaporation losses. After water has been added, the material shall be processed by mechanical or other approved means if so directed by the Engineer until the layer is uniformly wet. Immediately thereafter, rolling shall be started with 8 to 10 tonne smooth wheeled rollers or other approved plant. Rolling shall commence at the edges and progress towards the centre longitudinally except that on super elevated portions it shall progress from the lower to the upper edge parallel to the centre line of the pavement. Each pass of the roller shall uniformly overlap not less than one third of the track made in the preceding pass. During rolling the grade and camber shall be checked and any high spots or depressions which become apparent corrected by removing or adding fresh material. Rolling shall be continued till the density achieved is at least 100% of the maximum dry density for the material determined as per IS:2720 (Part VII). The surface of any layer of material on completion of compaction shall be well closed, free from movement under compaction plant and from compaction planes, ridges, cracks or loose material. All loose, segregated or otherwise defective areas shall be made good to the full thickness of layer and re-compacted. 3.4 <u>CEMENT CONCRETE (PLAIN AND REINFORCED)</u> 3.4.1 General All concrete work shall be according to ISI relevant Codes unless mentioned

otherwise herein and the ISI Codes particularly IS:226, IS:455, IS:385, IS:1786 & IS:456 latest editions shall form a part of the present specification. 3.4.2 Materials (a) Cement : The cement used shall be ordinary Portland cement/ Blast Furnace slag cement/ Portland Pozzolana cement, sulphate resistant cement of approved manufacture and shall be fresh when delivered. Consignments shall be used in the order of delivery. Damaged or partly set cement shall not be permitted to be used and shall be removed from site at once. Admixture shall be used only if approved by the Engineer. The Contractor shall furnish to the Engineer, the manufacturer's certificate for cement for each consignment, procured by the Contractor direct. If at any time, the Engineer feels that the quality of cement is not upto the specification, he can stop the work and send samples of cement for testing to an approved laboratory. The Contractor shall have no claim for any loss arising out of such suspension of work. If the cement is procured by the Owner and issued to the Contractor, the Contractor shall satisfy himself at the time of taking delivery that quality and freshness of cement are upto the specified standard. No complaint will be entertained later on from the Contractor for poor concrete work due to the poor quality of cement supplied by the Owner. All rectification work on this account shall be done entirely by the Contractor at his own expenses (b) Aggregate : (i) General Aggregate shall consist of natural sand, crushed stone procured from a source known to produce satisfactory aggregate for concrete and shall be chemically inert strong,		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/B
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 320 of 549
hard, durable against weathering, of limited porosity and free from adhering coatings, clay lumps, coal and coal residues, clinkers, slag, organic and other impurities that may cause corrosion of the reinforcements or may impair the strength and/or durability of the concrete. They shall conform to IS: 383 - latest edition. (ii) Sand and Fine Aggregate : It shall be clean, sharp and coarse and free from all impurities and shall be washed and/or screened at the site if so demanded by the Engineer. Sand and fine aggregate shall correspond to IS: 383 - latest edition. The fine aggregate shall not contain more than 3 percent of clay or foreign matter. Fineness modulus of sand shall not be less than 2.5. (iii) Coarse Aggregate: This shall consist of broken trap, basalt or granite or some other suitable stone from a source to be approved by the Engineer and shall meet the requirements of IS: 383 - latest edition. The coarse aggregate shall be machine crushed, hard, strong, durable, free from clayey films or loamy admixtures, vegetable or organic matters and shall be washed with water and/or screened if so demanded by the Engineer. The aggregate shall be well graded. The pieces shall be angular in shape and shall have granular or crystalline surface. Friable, flaky and laminated pieces, mica and shell may be present only in such quantities that will not affect adversely the strength and/or durability of concrete and to the approval of the Engineer. The maximum size of coarse aggregate shall be 38 mm for lean concrete and M10 Grade concrete and 20 mm for M15 Grade concrete. Where permitted by the Engineer, the maximum size of the coarse aggregate may be large. All aggregate shall be uniformly graded. The amount of fine particles occurring in the Free State or as loose adherent shall not exceed 1% when determined by laboratory sedimentations tests. After 24 hours		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/B
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 321 of 549
immersion in water, a previously dried sample shall not have gained more than 10% of the weight. (c) Water : Water shall be clean, fresh and free from organic or deleterious matter in solution or in suspension in such amounts that may impair the strength or durability of the concrete. The Contractor shall, however, satisfy himself that the quality is upto the desired standard and shall also submit an analysis from an approved analyst if so desired by the Engineer, free of charge. (d) Reinforcements : The reinforcement shall be mild or to steel bars conforming to the latest edition of IS: 432 or IS: 1786. All reinforcing bars must be completely free from grease, oil, dirt, scales, scrap able rust, bituminous material, paint, pitted surface and manufacturing defects. (e) Tie bars. Tie bars in longitudinal joints shall be deformed steel bars of strength 415 Mpa complying with IS: 1786 and in accordance with the requirements given below. The bars shall be free from oil, dirt, loose rust and scale. Design of tie bar shall be as per IRC: 58. (i) Tie bars projecting across the longitudinal joint shall be projected from corrosion for 75mm on each side of the joints by a proactive coating of bituminous paint with the approval of the Engineer. The coating shall be dry when the tie bars are used. (ii) Tie bars in longitudinal joints shall be made up into rigid assemblies with adequate supports and fixings to remain firmly in position during the construction of slab. Alternatively, tie bars at longitudinal joints may be mechanically or manually inserted into the plastic concrete		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/B
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 322 of 549
from the above by vibration using a method which ensure correct placement of bars and reoccupation of the concrete around the tie bars. (iii) Tie bars shall be positioned to remain within the middle third of the slab depth as indicated in the drawing and approximately parallel to the surface and approximately perpendicular to the line of joints, with the centre of each bars on the intended line of the joints within a tolerance of ± 50 mm, and with a minimum cover of 30mm below the joint groove. (f) Separation Membrane. Separation membrane shall be used between the concrete slab and the sub base. Separation membrane shall be impermeable plastic sheeting 125 micron thick laid flat without creases. Before placing the separation membrane, the sub base shall be swept clean of all the extraneous materials using air compressor. Wherever overlap of plastic sheets is necessary, the same shall be at least 300mm and any damaged sheeting shall be replaced at the Contractors expense. The separation membrane may be nailed to the lower layer with concrete nail. (g) Joints The location and type of joints shall be shown in the drawing. The location of the joints should be transferred accurately at the site and mechanical saw cutting of joints done as per stipulated dimensions. It should be ensured that the full required depth of cut is made from edge to edge of the pavement. Transverse and Longitudinal joints in the pavement and sub base shall be staggered so that they are not coincident vertically and are at least 1m and 0.3m apart respectively. Sawing of joints shall be carried out with diamond studded blades soon after the concrete has hardened to take the load of the sawing machine and personal without damaging the texture of the pavement. Sawing operation could start as early as 6-8 hours depending upon the season. All joints shall be designed as per IRC: 58.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 323 of 549
(h) Transverse joints. Location of construction joints/ expansion joints shall be as per drawing. Transverse joints shall be straight within the following tolerance along the intended line of joints which is the straight line transverse to the longitudinal axis of the carriageway at the position proposed by the Contractor and agreed to by the Engineer, except at the junction or roundabouts where the position shall be as described in the drawing. (i) Deviations of the filler board in the case of expansion joints from the intended line of the joint shall not greater than $\pm 10\text{mm}$. (ii) The best fit straight line through the joints grooves as constructed shall not more than 25mm from the intended line of the joint. (iii) Deviations of the joint groove from the best fit straight line of the joint shall not be greater than 10mm. (iv) Transverse joints on each side of the longitudinal joint shall be in line with each other and of the same type and width. (i) Longitudinal joints. The longitudinal joints shall be saw cut as per details of the joints shown in the drawing. The groove may be cut after the final set of the concrete. Joints should be sawn to at least $1/3$ the depth of the $\pm 5\text{mm}$ as indicated in the drawing. (i) Dowel bars Dowel bars shall be mild steel rounds in accordance with details/ dimensions as indicated in the drawing and free from oil, dirt, loose rust or scale. They shall be straight free of irregularities and burring restricting slippage in concrete. The sliding ends shall be sawn or cropped clearly with no protrusions outside the normal diameter of the bar. The dowel		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/B
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 324 of 549
bar shall be supported on cradles/dowels chairs in pre-fabricated joint assemblies positioned prior to the construction of the slabs or mechanically inserted with vibration into the plastic concrete by a method which ensures correct placement of the bars besides full reoccupation of the concrete around the dowel bars. Unless shown otherwise on the drawings, dowels bars shall be positioned at mid depth of the slab within a tolerance of $\pm 20\text{mm}$, and cantered equally about intended lines of the joint within a tolerance of $\pm 25\text{mm}$. Dowel bars shall be covered by a thin plastic sheath for at least two thirds of the length from one end for dowels bars in contraction joints or half the length plus 50mm for expansion joints. The sheath shall be tough, durable and of an average thickness not greater than 1.25mm. For expansion joints, a closely fitting cap 100mm long consisting of waterproofed cardboard or an approved synthetic material like PVC or GI pipes shall be placed over the sheathed end of each dowel bar. An expansion space at least equal in length to the thickness of the joint filler board shall be formed between the end of the cap and the end of the dowel bar by using compressible sponge. To block the entry of the cement slurry between dowels and cap it may be taped. Design of dowel bars shall be as per IRC: 58. (j) Joint sealing compound. The joint sealing compound shall be hot poured, electrometric type or cold polysulphide type having flexibility, resistance to age hardening and durability. If the sealant is of hot poured type it shall confirm to AASHTO M282 and cold applied sealant shall be in accordance with BS5212 (PART 2).		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 325 of 549
3.4.3 Storage of Materials (a) Cement : Cement shall be stored at the works in such a manner as to prevent deterioration either through moisture or intrusion of foreign matter. Sufficient storage shall be arranged by the Contractor to ensure continuity of consumption. Cement shall be stored in easily countable stacks of minm. Cap. 2000 M.T (b) Aggregates : Aggregates shall be stored on planking, steel plates or concrete. Different sizes shall be separated with wooden, steel, or concrete bulkheads. Care shall be taken to prevent any segregation of various sizes of particles. The aggregates must not be allowed to come in contact with dirt, clay and other injurious substances at any stage. The aggregate shall be stored in easily measurable stacks. Procurement must be at least two months in advance of consumption in dry season and four months in advance in rainy season. (c) Reinforcement : Reinforcing steel shall be stored as far as possible under cover. It shall be protected from oil, grease, dirt, etc. The stacks shall be easily measurable. 3.4.4 Workmanship (a) Reinforcement (i) Bending : Reinforcement bars shall be bent by machine or other approved means producing a gradual and even motion. All the bars shall be cold bent unless otherwise approved. Bars correctly bent only will be used. Bends and shapes shall comply strictly with the dimensions in the approved bar bending schedule. Bending schedule shall be prepared by the Contractor and got		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/B
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 326 of 549
approved by the Engineer before bending and he shall be entirely responsible for its correctness. No reinforcement shall be bent when in position in the work without approval of the Engineer, whether or not it is partially embedded in concrete. Unless described otherwise, lapping dimensions shall conform to IS:456 - latest edition and all bending shall correspond to IS:2502 - latest edition. (ii) Placing in Position : Fixing of reinforcement shall correspond to IS: 2502 - latest edition. Reinforcements shall be accurately fixed and maintained in position by such means as mild steel chairs and concrete spacer pieces, Bars intended to be in contact at passing points shall be securely bound together at all such points by No. 20G annealed soft iron wire conforming to IS:280 - latest edition. Binders and the like shall tightly embrace the bars with which they are intended to be in contact and shall be securely bound. The vertical distances between successive layers of bars shall be maintained by provision of mild steel spacer bars at such intervals that the main bars do not sag perceptibly between adjacent spacer bars. The placing of reinforcement shall be completed well in advance of concreting immediately before concreting; the reinforcement shall be examined for accuracy of placing and cleanliness by the Engineer and corrected if it is so desired by him. The cover for concrete over the reinforcements shall be as shown or as specified on the approved drawings. Unless otherwise directed, all laps shall be minimum 52 times the diameter of the bar in case of H.T. deformed bar and 40 times diameter of the bar in case of mild steel. If the bars in a lap are not of same diameter, the smaller will guide the lap length. The Where concrete blocks are used for ensuring the cover and position, they shall be made of mortar not leaner than one (1) part cement to two (2) parts sand and cured for at least seven days.

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-7/B
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 327 of 549
(b) Formwork : The formwork shall conform to the shape, line and dimensions as shown on the plans and shall be made of timber close and tight to prevent leakage of mortar with necessary props, bracings and wedges sufficiently strong and stable so that it should not yield on laying of concrete. Formwork shall conform to IS: 456 - latest edition - in respect of above and stripping time, cleaning and oiling, etc. (c) Concrete : Mix: The following concrete mixes shall be used for concrete roads. Grade M15 with minimum cement content of 325 kg/cum shall be used for DLC layer below PQC and minimum grade of M35 with minimum cement content of 360 kg/cum shall be used for PQC. (i) Water cement ratio and slump shall be determined to suit strength requirements of the concrete mix. (ii) Mixing : The aggregate and sand shall be washed free from all dust and earthy matter if required by the Engineer. The above materials will then be accurately measured in boxes. The quantity of cement shall be determined by weight. The quantity of water shall be predetermined after allowing for moisture content in the aggregate. All the ingredients as proportioned shall then be mixed in a mechanical mixer till the mass is uniform in texture and consistency, but in no case the mixing time shall be less than two minutes. Hand mixing if permitted by the Engineer as a special case shall be carried out on a water tight platform using 10% extra cement at Contractor's cost and care shall be taken to ensure that the mixing is continued till the mass is uniform in colour and consistency.

(iii) Placing and Compacting : Concrete shall be transported from the place of mixture to the place of final deposit within 45 minutes after water has been added and shall be compacted before initial setting commence and should not be subsequently disturbed. Method of transporting and placing shall be such as to preclude segregation. Concrete shall be thoroughly worked around the reinforcements, etc. and into all corners of formwork. For compaction of concrete, mechanical vibrators shall be used. Concrete shall not be placed in water. Mixing, transporting, placing and compacting of concrete shall conform to IS:456 - latest edition. (iv) Curing : Concrete shall be cured for at least 28 days from the date of placing of concrete. (v) Testing of Concrete : Concrete shall be tested in accordance with IS:516 - latest edition and accepted in accordance with IS:456 - latest edition. 4.0 <u>TESTING AND ACCEPTANCE CRITERIA</u> 4.1 <u>ROADS</u> All testing, as mentioned in the body of the specification and as mentioned in Clause No. 900 of Specification for Roads and Bridge Works, 1983 published by IRC on behalf of Ministry of Shipping and Transport (Roads Wing) shall be carried out by the Contractor as per direction of the Engineer. No extra payment shall be made for such tests.

1.0 <u>SCOPE</u> This specification covers furnishing, installation, repairing, finishing, curing, protection, maintenance and handing over of masonry and allied works for use in structures and locations covered under the scope of the Contract. 2.0 <u>INSTALLATION</u> 2.1 <u>SOLING</u> 2.1.1 Brick Soling The ground shall be dressed, consolidated by ramming or by light rolling and a 12 mm thick cushion of sand laid. On the sand cushion the bricks shall be laid with fine joints and placed firmly in position by hammering with wooden mallet. The surface shall be free from undulations. The 'frog' side shall be on the underside. The joints shall be broken the in all direction and bricks cut as required. Orientation shall be as desired by the Engineer. After laying of each layer of bricks sand shall be spread over and worked into the joints to pack the bricks tight. 2.1.2 Stone Soling The stones for soling shall be selected on the basis of thickness of soling as shown as the drawings. The larger stones shall be laid and the gaps filled by smaller stones. The interstices shall then be firmly packed with sand by flooding with water. 2.2 <u>BRICK EDGING</u> Excavation shall be done close to the brick dimensions and in perfect alignment. Bricks shall be firmly placed by hammering with wooden mallets and sides and joints packed firmly with earth so that the edging is not disturbed easily. Alignment and level shall be acceptable to the Engineer.

2.3 <u>MASONRY</u> 2.3.1 All masonry work shall be true to lines and levels as shown on drawings. All masonry shall be tightly built against structural members and bonded with dowels, inserts etc. as shown on drawings. 2.3.2 Mortar Mix for mortar shall be specified in the Schedule of Items. When lime is used hydrated lime shall be mixed with water to form putty and stored with care to prevent evaporation for at least 24 hours before use. Quick lime shall be slaked with enough water to make a cream, passed through a No. 10 sieve and stored avoiding evaporation for seven days before use. Lime putty and sand in proper proportion shall be mixed on a water-tight platform with necessary addition of water and thoroughly ground in a mortar mill. This mix shall be transferred to a mechanical mix, required quantity of cement added and the content mixed for at least 3 minutes. Mixtures of lime putty and sand may be stored avoiding drying out. For cement sand mortar cement and sand in requisite proportions shall be mixed dry in a mechanical mixer and then water added and mixed further. Minimum quantity of water shall be added to achieve working consistency. Surplus mortar droppings from masonry, if received on surface free from dirt may be mixed with fresh mortar if permitted by the Engineer who may direct addition of additional cement. No mortar which has stood for more than half an hour shall be used. 2.3.3 Brick Masonry Bricks shall be soaked by submergence in clean water for at least two hours in approved vats before use. Bricks shall be laid in English bond unless specified otherwise. Broken bricks shall not be used. Cut bricks shall be used if necessary to complete bond or as closers. Bricks shall be laid with frogs upwards over full mortar beds. Bricks shall be pressed into mortar and tapped into final position so as to embed fully in mortar. Inside faces shall

be buttered with mortar before the next bricks is placed and pressed against it. Thus all joints between bricks shall be fully filled with mortar. Mortar joints shall be kept uniformly 10 mm thick. All joints on face shall be raked to minimum 10 mm depth using raking tool while the mortar is still green to provide bond for plaster or pointing. Where plaster or pointing is not provided, the joints shall be struck flush and finished immediately. Brickworks two bricks thick or more shall have both faces in true plane. Brickwork of lesser thickness shall have one selected face in true plane. 2.3.4 Exposed Brickwork Brickwork in superstructures which is not covered by plaster shall be as shown on drawing and executed by specially skilled mason. Courses shall be truly horizontal and vertical joints truly vertical. Wooden straight edges with brick course graduations and position of window sills and lintels shall be used to control uniformity of brick courses. Masons must check workmanship frequently with plumb, spirit level, rule and string. All brickwork shall be cleaned at the end of days work. If face bricks are specified in the drawings, the brickwork shall be in composite bricks, with face bricks on the exposed face and balance in routine bricks, but maintaining the bond fully. Where face bricks are not specified, bricks for the exposed face shall be specially selected from routine bricks. All exposed brickwork on completion of work shall be rubbed down, washed clean and pointed as specified. Where face bricks are used carborandum stone shall be used for rubbing down. 2.3.5 Reinforced Brickworks Reinforcements shall be as specified in the drawings. All reinforcements shall be thoroughly cleaned and fully embedded in mortar. Where M.S. bars are used as reinforcement, these shall be lapped with dowels if left in R.C. columns or welded to steel stanchions.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 338 of 549
2.3.6 Stone Masonry Stones shall be thoroughly soaked before laying. Stones shall be laid on their natural quarry beds. Individual stones shall be fitted with mallet and properly wedged to reduce thickness of mortar joints. Thickness of joint shall be not less than 8 mm and not greater than 25 mm. At least two stones shall run the full width of the wall for every square meter of surface area. 2.3.7 Exposed Stonework Stonework which is to be kept exposed shall be as shown on drawing or described in the Schedule of Items. It shall be executed by specially skilled mason. Stones used for exposed face shall be specially selected. All exposed stone faces shall be kept clean and free from mortar and pointed up neatly as the work proceeds in a manner called for in the drawings or instructions. A sample wall, 10 sq.m. in area shall be built and approved by the Engineer and all works shall match with this sample. 2.3.8 Composite Masonry Where stonework facing with brick masonry backing is specified the bond between them shall be achieved by bond stones of dimensions and frequency as desired by the Engineer. 2.3.9 Expansion & Separation Joints Location of joints shall strictly be as shown on drawings or as instructed by the Engineer. Expansion joints shall be as shown on drawings. Expansion joint filler boards and sealing strips shall have minimum transverse joints. Transverse joints shall meet the approval of the Engineer. Separation joints shall be with standard water proof paper or with alkathene sheets about 1 mm in thickness. Length and sealing of laps shall be to the satisfaction of the Engineer

2.3.10 Mouldings, Cornices, Drip Course These shall be made as shown in drawings. Bricks or stone shall be cut and dressed as required. If no subsequent finish is envisaged, these shall be rubbed to correct profile with carborandum stone. 2.3.11 Curing Masonry shall be cured by keeping it wet for seven days from the date of laying. In dry weather at the end of days work top surface of masonry shall be kept wet by ponding. 2.3.12 Embedding of fixtures All fixtures shall generally be embedded in mortar and masonry units shall be cut as required. 2.3.13 Encasing of Structural Steel This shall be done by building masonry work round flanges, webs etc. and filling the gap between steel and masonry by minimum 12 mm thick mortar. Encased members shall be wrapped with chicken wire mesh when shown on drawings or instructed by the Engineer. The minimum lap in chicken wire mesh shall be 50 mm. 2.4 <u>DAMP PROOF COURSE</u> Unless otherwise specified Damp-proof course shall be 40 mm or as per schedule thick 'artificial stone' in proportion 1:1-1/2:3 cement sand stone- chips (10 mm down) with admixture of a waterproofing compound as approved by the Engineer. The percentage of admixture shall be as per manufacturer's specifications but not less than 2% by weight of cement. The top surface shall be double chequered and cured by pond for seven days.

2.5 <u>DAMP PROOF MEMBRANE</u> Damp proof treatment using fibre or hessian base bitumen felt shall be 6, 8 or 10 course treatment as specified in IS: 1609. The number of courses shall be as mentioned. Sequence or work shall be as directed by the Engineer. Extreme care shall be taken to prevent damage to felt during and after laying. The Contractor shall be obliged to rectify any leakage appearing within 5 years of installation by removing and renewing the coats at the point of leakage. Where shown on drawing, damp proof membrane with one layer bitumen paper or one layer alkathene sheet shall be laid with minimum 150 mm lap under slabs on grade. 3.0 <u>I.S. CODES</u> Some of the important relevant codes for this section are: (a) IS:1127 : Recommendations for dimensions and workmanship of natural building stones for masonry work. (b) IS:1597 : Code of Practice for Construction of stone Masonry. (c) IS:1609 : Code of Practice for laying Damp-proof treatment using bitumen felts. (d) IS:2212 : Code of Practice for Brickwork. (e) IS:2250 : Code of Practice for preparation and use of Masonry Mortar. (f) IS:5134 : Bitumen Impregnated Paper & Board.

1.0 <u>SCOPE</u> This Specification covers furnishing, installation, repairing, finishing, curing, testing, protection, maintenance till handing over of finishing items for masonry and concrete. This shall also include the work to be done to make the surface suitable for receiving the finishing treatment. Before commencing finishing items the Contractor shall obtain the approval of the Engineer regarding the scheduling of work to minimise damage by other trades. He shall also undertake normal precaution to prevent damage or disfiguration to work of other trades or other installation. 2.0 <u>INSTALLATION</u> 2.1 <u>PREPARATION OF SURFACE</u> All joints in masonry walls shall be raked out to a depth of at least 10 mm with a hooked tool made for the purpose while the mortar is still green. Walls shall be brushed down with stiff wire brush to remove all loose dust from joints and thoroughly washed with water. All laitance shall be removed from concrete to be plastered. For all types of flooring, skirting and dado work, the base cement concrete slab or masonry surface shall be roughened by chipping and cleaned of all dirt, grease or loose particles by hard brush and water. The surface shall be thoroughly moist to prevent absorption of water from the base course. Any excess of water shall be mopped up. At any point, the level of base shall be lower than the theoretical finished floor level by the thickness of floor finish. Any chipping or filling to be done to bring the base in the required level shall be brought to the notice of the Engineer and his approval shall be taken regarding the method and extent of rectification work required. Prior to commencement of actual finishing work, the approval or the Engineer shall be taken as to the acceptability of the base.

2.2 <u>PLASTERING</u> 2.2.1 Mortar Mortar for plastering shall be as specified in the drawings. For sand cement plaster, sand and cement in the specified proportion shall be mixed dry on a watertight platform and minimum water added to achieve working consistency. For lime gauged plaster, lime putty or hydrated lime and sand in the required proportion shall be mixed on a watertight platform with necessary addition of water and thoroughly ground in mortar mill. This mix shall then be transferred to a mechanical mixer to which the required quantity of cement is added and mixed for at least 3 minutes. No plaster which has stood for more than half an hour shall be used; plaster that shows tendency to become dry before this time, shall have water added to it 2.2.2 Application of Plaster Plaster, when more than 12 mm thick, shall be applied in two coats - a base coat followed by the finishing coat. Thickness of the base coat shall be sufficient to fill up all unevenness in the surface; no single coat, however, shall exceed 12 mm in thickness. The lower coat shall be thicker than the upper coat, the overall thickness of the coats shall not be less than the minimum thick-ness shown on the drawings. The undercoat shall be allowed to dry and shrink before applying the second coat of plaster. The under- coat shall be scratched or roughened before it is fully hardened to form a mechanical key. The method of application shall be 'thrown on' rather than 'applied by trowel'. To ensure even thickness and true surface, patches of plaster about 100 mm to 150 mm square or wooden screed 75 mm wide and of the thickness of the plaster, shall be fixed vertically about 2000 mm to 3000 mm apart, to act as gauges. The finished wall surface shall be true to plumb, and the Contractor shall make up any irregularity in the brickwork with		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-9
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 347 of 549
plaster. All vertical edges of brick pillars, doorjambs etc. shall be chamfered or rounded off as directed by the Engineer. All drips, grooves, mouldings and cornices as shown on drawing or instructed by the Engineer shall be done with special care to maintain true lines, levels and profiles. After the plastering work is completed, all debris shall be removed and the area left clean. Any plastering that is damaged shall be repaired and left in good condition at the completion of the job. 2.2.3 Finish Generally, the standard finish shall be used unless otherwise shown on drawing or directed by the Engineer. Wherever any special treatment to the plastered surface is indicated, the work shall be done exactly as shown on the drawings, to the entire satisfaction of the Engineer regarding the texture, colour and finish. (a) Standard Finish Wherever punning is indicated, the interior plaster shall be finished rough. Otherwise the interior plaster shall generally be finished to a smooth surface. The exterior surface shall generally be finished with a wooden float. (b) Neat Cement Finish Immediately after achieving a true plastered surface with the help of a wooden straight edge, the entire area shall be uniformly treated with a paste of neat cement at the rate of one (1) kg. Per Sq.M. and rubbed smooth with a trowel. (c) Coloured Plaster Finish This shall be done in the same way as specified in Clause 2.2.2 of this specification but using coloured cement in place of ordinary cement. When coloured plastering is specified in more than one coat, the top coat only shall be made with coloured cement.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-9
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 348 of 549
Coloured cement shall be either ready mixed material or may be obtained by mixing pigments and cement at site, as approved by the Engineer. The pigments to be mixed with cement shall conform to Appendix-A of IS: 2114 latest edition. Samples of colouring material shall be submitted to the Engineer for approval and material procured, shall conform in all respects to the approved samples, which shall remain with the Engineer. All coloured cement and/or pigments shall be stored in an approved manner in order to prevent deteriorations. (d) Pebble-dash Finish Mortar of required thickness consisting of 1 part cement and 4 parts sand by volume shall be applied in the usual manner as described under plastering Clause 2.2.2. of this specification. While the mortar is still plastic small pebbles or crushed stone of size generally from 10 mm to 20 mm as approved by the Engineer shall be thrown on the plastered surface. The aggregate shall be lightly tapped into the mortar with a wood float or the flat end of a trowel, in order to ensure satisfactory bond between the dashing and the mortar. (e) Rough-Cast Finish A wet plastic mix of 3 parts coloured cement 6 parts sand and 4 parts aggregate by volume (gravel or crushed stone of size from 6 mm to 12 mm as approved by the Engineer) shall be thrown on to the wall by means of a plaster's trowel and left in the rough condition. (f) Scraped Finish Ordinary plaster as described under Clause 2.2.2 of this specification after being levelled and allowed to stiffen for a few hours, shall be scraped with a steel straight edge to remove the surface skin. The pattern shall be as approved by the Engineer. (g) Textured Finish Mortar consisting of 1 part cement and 3 parts sand by volume shall be applied in a manner as specified under "Plastering" Clause		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-9
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 349 of 549
2.2.2. of this specification Ornamental treatments in the form of horizontal or vertical rib texture fan texture etc. shall be applied by means of suitable tools to the freshly applied plastered surface, as approved by the Engineer 2.2.4 Curing All plastered surfaces after laying, shall be watered, for a minimum period of seven days, by an approved method, and shall be protected from excessive heat and sunlight by suitable approved means. Moistening shall commence, as soon as the plaster has hardened sufficiently and not susceptible to damage. Each individual coat of plaster shall be kept damp continuously, for at least two days, and then dried thoroughly, before applying the next coat. 2.3 <u>POINTING TO MASONRY</u> All joints of brickwork shall be raked out to a depth of 10 mm with a hooked tool made for the purpose while the mortar is still green. The brickwork shall then be brushed down with a stiff wire brush, so as to remove all loose dust from the joints and thoroughly washed with water. Mortar consisting of 1 part cement and 3 parts clean, sharp, well graded sand by volume shall be pressed carefully into the joints and finished with suitably tools to shape as shown on the drawings. Any surplus mortar shall be scraped off the wall face leaving the surface clean. The pointed surface shall be kept wet for at least three days for curing. 2.4 <u>PLASTER WITH METAL LATH</u> The supports, hangers, brackets, cleats etc. shall be as shown on drawings and/or as approved by the Engineer. These shall have a coat of prime paint before and another coat of approved paint after erection. The metal lath shall be expanded metal, with 12 mm x 38 mm mesh, 16 BG thick and 3 mm wide strands. Side laps shall be minimum 12 mm and end laps 25 mm minimum. The plastering shall be minimum 20 mm thick measured from the back of lath and applied in two layers.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-9
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 350 of 549
The mortar for plastering shall consist of 1 part cement, 1/2 part lime and 4 parts sand by volume, or 1 part cement and 4 parts sand by volume mixed as specified in plastering, Clause 2.2.1. of this specification. The application, finish etc. shall be as specified under relevant clause above. A 2 mm Plaster of Paris punning shall be applied over plaster as a finishing coat to give perfectly smooth and even finish. 2.5 <u>LIME PUNNING</u> For plastered surfaces, where an even smooth surface is specified, lime punning with 5 parts of shell lime properly slaked, strained and aged, mixed with 1 part clean, washed, sieved, fine sand by volume shall be done. The thickness of lime punning shall be not less than 2 mm and more than 3 mm. The plastered surface shall be saturated with water before application of the lime punning. The punning shall be applied by skilled workman and given a smooth and even finish free from undulations, cracks etc. and to the satisfaction of the Engineer. 2.6 <u>PLASTER OF PARIS PUNNING</u> Plastered surfaces, where specified shall be finished with Plaster-of-Paris punning. The material shall be from approved manufacturers and approved by the Engineer. The thickness of the punning shall be 2 mm and shall be applied by skilled workmen. The finish shall be smooth, even and free from undulation, cracks etc. Before bulk work is taken in hand, a sample of punning shall be done on roughly 10 Sq. M. area and approval of the Engineer taken. The work shall then be taken in hand as per approved sample. 2.7 <u>STONE FACING</u> Stone facing where specified shall be done as shown on design drawings and approved shop drawings. The stone shall be as specified on drawings. Samples of stone shall be submitted to the Engineer for approval and then bulk purchase made. The Contractor shall submit three copies of shop drawing for the Engineer's approval before commencing the work.

The thickness of facing stone shall be not less than 25 mm unless otherwise specified on drawings. The stone slabs shall be cut and finished to sizes as per pattern shown on drawings. They shall be fastened to wall with suitable non-corrodable anchorage as approved by the Engineer. Where mild steel clamps, stays etc. are used for anchorage, they shall be galvanised (weight of zinc coating shall not be less than 700 gms per square meter of surface) to prevent rust stains developing on the finished surface. There shall be at least 12 mm gap between the stone and masonry, which shall be filled up and packed by a mortar of 1 part cement and parts of sand by volume. After the mortar is set and cured for at least four days, the exposed surface shall be rubbed and polished as approved by the Engineer. The completed surface shall be neat, or uniform texture and acceptable to the Engineer. Where pointing is specified on drawings it shall be done by mortar as specified on drawings. 3.0 <u>ACCEPTANCE CRITERIA</u> Finish to masonry and concrete shall fully comply instructions of the Engineer with respect to lines, levels, thickness, colour, texture, pattern and any other special criteria as shown on drawings. 4.0 <u>I.S. CODES</u> Important relevant code for this Section: (a) IS 1661 : Code of practice for cement and cement-lime plaster finish on walls & ceilings (b) IS4101 : Code of practice for external facings and veneers

(vii) Stone Slab 1.1 <u>BASE</u> The base to receive the finish is covered under other relevant specifications. 1.2 <u>SEQUENCE</u> Commencement, scheduling and sequence of the finishing works shall be planned in detail and must be specifically approved by the Engineer in view the activities of other agencies working in that area. However, the Contractor for the finishing items shall remain fully responsible for all normal precautions and vigilance to prevent any damage whatsoever till handing over. 2.0 <u>INSTALLATION</u> 2.1 <u>SPECIAL MATERIALS</u> Basic materials are covered under Specification "Properties Storage and Handling of Common Building Materials". Special materials required for individual finishing items are specified under respective items. In general, all such materials shall be as per relevant I.S. Codes where available. In all cases these materials shall be of the best quality available indigenously, unless specified otherwise. The materials for finishing items must be procured from well-reputed specialised manufacturers and on the basis of approval of samples by the Engineer. The materials shall be ordered, procured and stored well in advance to avoid compulsion to use substandard items to maintain in the construction schedule. 2.2 <u>WORKMANSHIP</u> Only workers specially experienced in particular items of finishing work shall be engaged, where such workers are not readily available, with the Engineer's permission, experienced supervisor recommended by the manufacturer shall be engaged. In particular cases where the Engineer so desires the Contractor shall get the finishing items installed by the manufacturer.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 359 of 549
2.3 <u>PREPARATION OF THE BASE SURFACE</u> The surface to be treated shall be thoroughly examined by the Contractor. Any rectification necessary shall be brought to the notice of the Engineer and his approval shall be taken regarding method and extent of such rectification work. For all types of flooring, skirting, dado and similar locations, the base to receive the finish shall be adequately roughened by chipping, raking out joints and cleaning thoroughly all dirt, grease etc. with water and hard brush and detergent if required, unless otherwise directed by the manufacturer of any special finishing materials or specifically indicated in this specification under individual item. To prevent of water from the finishing treatment the base shall be thoroughly soaked with water and all excess water mopped up. The surface shall be done dry where adhesives are used for fixing the finishes. Prior to commencement of actual finishing work the approval of the Engineer shall be taken as per the acceptability of the surface. 2.4 <u>IN SITU FINISHES</u> 2.4.1 Integral Finish to Concrete Base While the surface of the concrete laid as per specification for 'Cement Concrete' has been fully compacted and levelled but the concrete is still 'green' a thick slurry made with neat cement shall be applied evenly and worked in with iron floats. When the slurry starts to set it shall be pressed with iron floats to have a firm compact smooth surface without trowel mark or undulations. This finish shall be as thin as possible by using 2.2 kg. of cement per Sq. M. of area. The surface shall be kept in shade for 24 hours and then cured for at least 7 days continuously by flooding with water. The surface shall not be subjected		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 360 of 549
to any load or abrasion till 21 days after lying. As desired by the Engineer the surface, while still 'green' shall be indented by pressing strings, the marking shall be of even depth, in straight lines and the panels shall be of uniform and symmetrical patterns. 2.4.2 Red Oxide of iron Finish It shall consist of an underbed and a topping over already laid and matured concrete base. (a) Thickness Unless otherwise specified the total thickness of the finish shall be minimum 40 mm for horizontal and 25 mm for vertical surface of which the topping shall (not less than 10 mm) while the topping shall be of uniform thickness the underbid may vary in thickness to provide necessary slopes. The vertical surface shall project out 6 mm from the adjacent plaster or other finishes. Necessary cutting into the surface receiving the finish shall be done to accommodate the specified thickness. All junctions of vertical with horizontal shall be rounded neatly to uniform radius of 25 mm. (b) Mix (i) Underbed The underbed for floors and similar horizontal surfaces shall consist of a mix of 1 part cement, 2 parts coarse sand and 4 parts 10 mm down graded stone chips by volume. For vertical and similar surfaces the mix shall consist of 1 part cement to 3 parts coarse sand by volume. (ii) Topping For the topping cement, screened through a fine mesh and red oxide of iron pigment powder similarly screened shall be dry mixed thoroughly in right proportions to produce the

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 361 of 549
desired colour when laid. The mix shall then be prepared with 1 part cement (mixed with pigment) and 3 parts coarse sand volume. The whole quantity required for each visible area shall be prepared in one batch to ensure uniform colour. (c) Laying The underbed shall be laid in panels of mixing area 5 Sq. M. each and no side shall be more than 2.5 along. For outdoor locations the maximum area shall be 2.0 Sq. M. The forms for the panels shall have perfectly aligned edges to the full depth of the total thickness of finish. If specified aluminium or glass dividing strips shall be used. The panels shall be laid in alternate bays or in chequered board pattern. No panel shall be cast in contact with another already laid until the contraction of the latter has taken place. The underbed shall be laid, compacted, levelled and brought to proper grade with a screed or float. The topping shall be placed after about 24 hours while the underbed is still somewhat 'green' but firm enough to receive the topping. The surface of the underbed shall be roughened for better bonding. The topping shall be rolled for horizontal areas and thrown and pressed for vertical areas to extract all superfluous cement and water to achieve a compact dense mass fully bonded with the underbed. The topping shall then be levelled up by trowelling and finished smooth with a slurry made with already prepared cement and pigment mixture. About 2.0 Kg. of the mixture shall be consumed/per Sq.M. for horizontal surface, and 1.0 Kg. for vertical surface. The surface shall be cured for seven days by keeping it moist. (d) Polishing About 36 hours after laying when the surface has hardened sufficiently it shall be polished with polishing stone till a smooth shiny surface to the satisfaction of the Engineer, is achieved. The finish shall be washed and cleaned just before handing over.

2.4.3 Terrazo Finish : In Situ It shall consist of an underbed and a topping laid over an already laid and matured concrete base. (a) Thickness Unless otherwise specified the total thickness of the finish shall be minimum 40 mm for horizontal and 25 mm for vertical surface of which the topping shall be not less than 10 mm. While the topping shall be of uniform thickness the underbed may vary in thickness to provide necessary slopes. The vertical surface shall project cut 6 mm from the adjacent plaster or other finish. Necessary cutting into the surface receiving the finish shall be done to accommodate the specified thickness. All junctions of vertical with horizontal shall be rounded neatly to uniform radius of 25 mm. (b) Mix (i) Underbed The underbed for floors and similar horizontal surfaces shall consist of a mix of 1 part cement, 1.1/2 parts sand and 3 parts stone chips by volume. For vertical surfaces the mix shall consist of 1 part cement to 3 parts sand by volume. The sand shall be coarse. The stone chips shall be 10 mm down well graded. Only sufficient water to be added to give a workable consistency. (ii) Topping The mix for the topping shall be composed of cement, colour pigment, marble dust and marble chips. Proportions of the ingredients shall be such as to produce the terrazzo of colour texture and pattern approved by the Engineer. The cement shall be white or grey or a mixture of the two to which pigment shall be added to achieve the desired colour. To 3		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

parts of this mixture 1 part marble powder by volume shall be added and thoroughly mixed dry. To 1 part of this mix 1 to 1.1/2 parts of marble chips by volume shall be added and thoroughly mixed dry again. The pigment must be stable and no fading. It must be very finely ground. The marble powder shall be from white marble and shall be finer than IS Sieve No. : 30. The size of marble chips may be between 1 mm to 20 mm. Sufficient quantity to cover each visible area shall be prepared in one lot to ensure uniform colour. Water to make it just workable shall be added to a quantity that can be used up immediately before it starts to set. (c) Laying The underbed shall be laid in panels. The panels shall not be more than 5 sq.m in area of which no side shall be more than 2.5 M long. For exposed locations the maximum area of a panel shall be 2.0 Sq. M. The panel shall be laid in alternate bays or chequered board pattern. No panel shall be cast in contact with another already laid until the latter has contracted to the full extent. Dividing strips made of aluminium or glass shall be used for forming the panels. The strips shall exactly match the total depth of underbed plus topping. After lying, the underbed shall be levelled compacted and brought to proper grade with a screed or float. The topping shall be laid after about 24 hours while the underbed is still somewhat "green" but firm enough to receive the topping. Slurry of the mixture of cement and pigment already made shall be spread evenly and brushed in just before laying the topping. The topping shall be rolled for horizontal areas and thrown and pressed for vertical areas to extract all superfluous cement and water and to achieve a compact dense mass fully bonded with the underbed. The surface of the topping shall be trowelled over, pressed and brought to a smooth dense surface showing a minimum 75% area covered by marble chips in a even

pattern of distribution. (d) Curing The surface shall be left for curing for about 12 to 18 hours and then cured by allowing water to stand on the surface or by covering with wet sack for four days. (e) Grinding and Polishing When the surface has sufficiently hardened it shall be watered and ground evenly with rapid cutting coarse grade (no.60) grit blocks, till the marble chips are exposed and the surface is smooth. Then the surface shall be thoroughly washed and cleaned. A grout with already prepared mixture of cement and pigment shall be applied to fill up all pinholes. The surface shall be cured for 7 days by keeping it moist and then ground with fine grit blocks (no.: 120). It shall again be cleaned with water, the slurry applied again to fill up any pinholes that might have appeared and allowed to be cured again for 5 days. Finally, the surface is ground a third time with very fine grit blocks (no.: 320) to get smooth surface without any pinhole. The grinding shall be done by a suitable machine. Where grinding machine can not be used hand grinding may be allowed when the first rubbing shall be with carborundum stone of coarse grade (no.60), second rubbing with medium grade (no.: 80) and final rubbing and polishing with fine grade (no.: 120). The surface shall be cleaned with water, dried and covered with soil free, clean sawdust if directed by the Engineer. The final polishing shall be positioned till before handing over if desired by the Engineer. Just before handing over the surface shall be dusted with oxalic acid at the rate of 0.33 gm. per. Sq.M, water sprinkled on to it and finished by buffing with felt or hessian bobs. The floor shall be cleaned with soft moist rag and dried. However, all excess wax polish to be wiped off and the surface to be left glossy but not slippery. 2.4.4 Granolithic Finish Granolithic finish shall either be laid monolithically over base concrete or separately over hardened base concrete.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 365 of 549
(a) Thickness The finish shall be average 20 mm and minimum 12 mm thick, unless specified otherwise. (b) Mix The mix shall consist of 1 part cement: 1 part coarse sand: 2 parts coarse aggregate by volume. The coarse aggregate shall be very hard like granite and well graded between 6 mm and 12 mm. Minimum quantity of water to get workability shall be added. (c) Laying of Monolithic Topping The concrete base shall be laid as per specification "Cement Concrete" and levelled upto the required grade. The form shall remain sufficiently protruding to take the finish. Within about 3 hours of laying the base while it is still fully "green" the topping shall be laid evenly to proper thickness and grade. If considered necessary the surface of the base shall roughened by wire brushing. Unless manual operation is permitted by the Engineer, mechanical vibrators of suitable design shall be used to press the topping firmly and work vigorously and quickly to secure full bond with concrete base. The laitance brought to the surface during compression shall be removed carefully without disturbing the stone chips. The surface shall then be lightly trowelled to remove all marks. When sufficiently set, hand trowelling shall be done to secure a smooth surface without disturbing the stone chips. For large areas the laying shall be in panels of maximum 25 Sq.M area. The panels shall be laid in chequered board pattern. (d) Laying of Topping Separately on Hardened Base The base concrete shall be prepared as stated in clause 2.3 and a slurry of neat cement applied just prior to laying the granolithic		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 366 of 549
concrete mix (1:1:2). The method of compaction etc. shall be same as for monolithic topping. (e) Curing Immediately after laying, the finish shall be protected against rapid drying. As soon as the surface had hardened sufficiently, it shall be kept continuously moist for at least 10 days by means of wet gunny bags or ponding of water on the surface. The floor shall not be exposed to heavy traffic during this period. (f) Grinding If grinding is specified, it shall start only after the finish has fully set. Clause 2.4.3 (c) shall be followed. However, the ultimate polish required shall be decided upon by the Engineer. (g) Finishing Where specified, sodium silicate or magnesium or zinc silico fluoride treatment shall be done. The number of coats to be applied shall be as specified. The concentration and method of application of the solutions shall be as specified in IS : 5491. 2.4.5 Patent Stone It shall consist of an underbed and a topping laid on an already laid and matured concrete base. (a) Thickness The patent stone finish shall have thickness as stipulated under clause 2.4.2 (a) except that the topping shall be 6 mm thick. (b) Mix (i) Underbed The mix shall be as stipulated under clause 2.4.3 (b).		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 367 of 549
(ii) Topping The mix for the topping shall consist of 1 part cement and 1 part fine sand by volume. (c) Laying The Patent Stone finish, including the underbed shall be laid in alternate bays or in chequered board pattern. No panel shall be cast in contact with another already laid till the contraction of the latter has already taken place. The maximum area of each panel shall be 3 Sq.M of which no side shall be more than 2 M long. A cement grout shall be applied and worked into the surface to receive the finish, the underbed then laid, compacted and levelled to proper grade with a screed or float. The topping shall be applied evenly on the underbed while it is not fully set but firm enough and rolled and pressed to get full bond. The topping shall towelled to a dense finish to the satisfaction of the Engineer. All trowel marks shall be mopped out with a soft cloth to give a clean smooth surface. After the surface is sufficiently set, the finished floor shall be kept moist for 7 days for curing. If desired the finish shall be polished as directed by the Engineer. 2.4.6 Metallic Hardener Like "Ironite" Finish This will consist of a topping (incorporating iron particles) to bond with concrete base while the latter is "Green". (a) Thickness Unless otherwise specified the metallic hardener finish shall be of 12 mm depth.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 368 of 549
(b) Material The hardening compound shall be uniformly graded iron particles free from non-ferrous metal impurities, oil, grease, sand soluble alkaline compounds or other injurious materials. When desired by the engineer, actual samples shall be tested. (c) Mix Proportion of the metallic hardener shall be as specified or as indicated by the manufacturer. However, in absence of any such direction 1 part metallic hardener shall be mixed dry with 4 parts cement, by weight. To this mixture 6 mm nominal size stone chips shall be added in proportion of 1 part cement (mixed with hardener) to 2 parts of stone chips by volume and uniformly mixed. Minimum quantity of water shall be added to make it workable. (d) Laying The concrete floor shall be laid as per specification "Cement Concrete" a levelled upto the required grade. The forms, if any shall remain sufficiently projecting to take the finish. The surface shall be roughened by wire brush as soon as possible. The finish shall be laid while the concrete underbed is still very "green" within about 3 hours of laying of the latter. The finish shall be of uniform thickness and even dense surface without trowel marks, pin holes etc. This topping layer shall be pressed firmly and worked vigorously and quickly to secure full bond with the concrete base. Just when the initial set starts the surface shall be finished \smoothened with steel trowel. The finished floor shall be cured for 7 days by keeping it wet. 2.4.7 Mastic Asphalt Finish This is a one layer treatment on concrete or brick base.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10

(a) Thickness The thickness shall be as specified in the drawing (b) Materials Bitumen shall be industrial bitumen of the grades 90/15 and 75/15 conforming to IS: 702. Mineral filler shall be dry stone dust passing through 75-micron IS Sieve. Fine aggregate shall be crushed and graded natural lime stone or other hard-work. Coarse aggregate shall be crushed siliceous stone or other approved aggregate 6 mm stone chips shall be used for finish upto 20 mm thick & 10 mm chips for thicker finish. (c) Composition Bitumen mastic shall conform to IS:1195 and shall be either brought to site in blocks weighing about 25Kg. or prepared at site. If brought in blocks, these shall be remelted in mechanically agitated mastic cookers and coarse aggregate, preferably preheated fed in successive portions until the complete change is thoroughly incorporated. At no stage during the remelting and mixing process, shall the temperature exceed 205°C. (d) Laying The hot mastic shall be laid on dry base surface cleaned thoroughly by wire brushing and sweeping. The mastic shall be levelled and when cooled to some extent shall be finished with a wooden float with addition of small quantity of fine sand if required. No load shall be allowed till the finish has cooled to normal temperature. The mastic shall be laid in suitable panels of about 15 Sq.M in area each formed by formers. Succeeding panels shall be		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 370 of 549
laid overlapping the finish panel so as to melt its edges and form a continuous finish without joint. 2.4.8 Chemical Resistant in Situ Finish Chemical resistant in situ finish shall be as epoxy resin with suitable filler material over a primer or called for in the Schedule of Items. The minimum thickness shall be 6 mm. About its performance the Engineer shall have to be fully satisfied by test results and examination of similar treatment already in existence. The Contractor shall get it done by a specialised manufacturer, get guarantee of performance from the organisation and pass it on to the Owner in addition to his own guarantee. 2.5 <u>TILED FINISH</u> These shall include finish tiles, stone slabs and similar manufactured or natural items over already laid and matured base of concrete or masonry by means of an underbed or an adhesive layer. 2.5.1 Terrazzo Tile Finish The finish will consist of manufacture terrazzo tile and an underbed. (a) Thickness The total thickness including the underbed shall be minimum 40 mm for floors 30 mm for walls unless otherwise specified. The skirting, dado and similar vertical surfaces shall project out 6 mm uniformly from the adjacent plaster or other wall finishes. The necessary cutting into the surface receiving the tiled finish, to accommodate the specified thickness shall be done. (b) Tiles : Terrazzo The tiles shall, unless specifically permitted in special cases be machine made under quality control in a shop. The tile shall be pressed hydraulically to a minimum of 140 Kg. per Sq.cm.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 371 of 549
Each tile shall bear on its back permanent and legible trade mark of the manufacturer. All angles of the tiles shall be right angles all arises sharp and true, colour and texture of the wearing face uniform throughout. Maximum tolerance allowance length and breadth shall be + 1 mm and the thickness + 3 mm. Face of the tile shall be plane, free from pin holes and other blemishes. The tiles shall be composed of a backing and topping. The topping shall be of uniform thickness not less than 10 mm. The total thickness including the topping shall be as specified but not less than 20 mm in any case. The backing shall be composed of 1 part ordinary grey cement and 3 parts of stone chips by weight mixed with water. The topping shall be as specified under clause 2.4.3 (b). The tile shall be cured at the shop for at least 14 days before delivery to the site. First grinding shall be given to the tiles at the shop before delivery. Tiles shall be packed properly to prevent damage during transit and storage. The tiles must be carefully stored to prevent staining by damp, rust, oil, and grease or other chemicals. Tiles made in each batch shall be kept and used separately so that colour of each area of the floor may remain uniform. The manufacturer shall supply along with the tiles the grout mix containing cement and pigment in exact proportions as used in topping of the tiles. The containers for the grout mix shall be suitably marked to relate it to the particular type and batch of tiles. (c) Mix : Underbed The underbed for floor and similar horizontal surfaces shall be 1 part lime putty: 1 part surkhi : 2 parts coarse sand by weight mixed with sufficient water to form a stiff workable mass. For skirting and dado and all vertical surfaces it shall be about 12 mm thick and composed of 1 part cement and 3 parts coarse sand by weight.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 372 of 549
(d) Laying The underbed mortar shall be evenly spread and brought to proper grade and consolidated to a smooth surface. The surface shall be roughened for better bond. Before the underbed had time to set and while it is still fairly moist but firm, cement shall be hand dusted over it or a cement slurry applied and the tiles shall immediately be placed upon and firmly pressed by wooden mallet on to the underbed until it achieves the desired level. The tiles shall be kept soaked for about 10 minutes just before laying. The joints between tiles shall be as close as possible and not more than 1.5 mm wide. Special care shall be taken to check the level of the surface and the lines of the joints frequently so that they are perfect. When tiles are required to be cut to match the dimensions these shall be sawn and edges rubbed smooth. The location of cut tiles shall be planned in advance and approval of the Engineer taken. At the junction of horizontal surface with vertical surface the tiles on the former shall enter at least 12 mm under the latter. After fixing, the floor shall be kept moist and allowed to mature undisturbed for 7 days. Heavy traffic shall not be allowed. If desired dividing strips as specified under Clause 2.4.3 (c) may be used for dividing the work into suitable panels. (e) Grinding and Polishing Procedure shall be same as Clause 2.4.3 (e).Grinding shall not commence earlier than 14 days after laying of tiles. 2.5.2 Chequered Tile Finish The finish shall consist of manufactured grey or coloured cement tiles or terrazzo tiles with chequered face and an underbed laid over concrete or brick surface.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 373 of 549
(a) Thickness Thickness shall be same as in clause 2.5.1 (a). (b) Tiles : Chequered The tiles shall have chequers not less than 2.5 cm. c/c and not more than 5 cm c/c, Depth of grooves shall be not less than 5 mm. The grooves shall be uniform and straight. The tiles shall conform to clause 2.5.1 (b) except that these may have the topping in terrazzo or plain grey cement or colour pigment added to cement as specified. (c) Underbed As per clause 2.5.1 (c). (d) Laying As per clause 2.5.1 (d). (e) Grinding and Polishing As per clause 2.5.1 (e) except that the tiles shall be ground and polished by hand after laying taking special care in polishing the grooves properly and uniformly. 2.5.3 Glazed Tiles Finish This finish shall be composed of glazed earthenware tiles with an underbed laid over a concrete or masonry base. (a) Thickness The total thickness shall be between 20mm and 25mm including the underbed. The tile finish on vertical surface shall project out 6mm uniformly from the adjacent plaster or other wall finishes. The necessary cutting into the surface receiving the finish, to accommodate the specified thickness shall be done.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 374 of 549
(b) Tiles : Glazed The tiles shall be of earthenware, covered with glaze white or coloured, plain or with designs, of 150 mm x 150 mm nominal sizes and 10 mm thick unless otherwise specified. The tolerance shall be + 1.5 mm for length and breadth and + 0.5 mm for thickness specials like internal and external angles, beads, covers, cornices, corner pieces etc. shall match. The top surface of the tiles shall be glazed with a gloss or matt unfading stable finish as desired by the Engineer. The tiles shall be flat and true to shape. The colour shall be uniform and fractured section shall be fine grained in textures, dense and homogeneous. The tiles shall be strong and free from flaws like cracks, craze, specks, crawlings, etc. and other imperfections. The edge and the underside of the tiles shall be completely free from glaze and the underside shall have ribs or indentations for better anchorage with the fixing mortar. The coloured tiles, when supplied, shall preferably come from one batch to avoid difference in colour. (c) Mix : Underbed The mix for the underbed shall consist of 1 part cement and 3 parts coarse sand by weight mixed with sufficient water or any other mix if specified. (d) Laying Same as clause 2.5.1 (d). (e) Finishing The joints shall be cleaned and flush pointed with white cement and cured for 7 days by keeping it wet. The surface shall be cleaned with soap or suitable detergent, washed fully and wiped with soft cloth to prevent scratching before handing over.

2.5.4 Tesserae Finish (Mosaic etc.) This finish consists of manufactured vitreous, glass, ceramic or similar hard small pieces set in an underbed over a concrete or masonry surface, already laid. (a) Thickness The total thickness including the underbed shall be between 16 mm and 25 mm. (b) Tesserae Finish These shall usually be 6 mm thick small piece of ceramic vitreous china, tinted glass or similar hard wearing, strong and durable material in desired shapes and sizes and patterns. The supply shall come in the desired pattern in full or sections conveniently for handling, stuck to pieces of strong thick paper on the surface to be exposed. The gum used for this purpose must be water soluble and non-staining. The sections shall be properly marked to avoid mistakes and master drawing shall be available at the site for guidance. (c) Mix : Underbed Same as clause 2.5.3 (c) (d) Laying The specification for laying if given by the manufacturer of the item shall be followed provided it is approved by the Engineer. Otherwise clause 2.5.3 (d) shall generally be followed. However, instead of grey cement the slurry shall be made with white cement to fix the panels. The paper mounted patterns in sections shall be carefully placed and pressed in position true to lines and levels. Earliest possible the paper shall be peeled off and surface examined and cleaned, joints flush pointed with white cement and cured for 7 days by keeping it wet.

2.5.5 Chemical Resistant Tiled Finish This shall include all varieties of special tiles used for specific chemical resistance function and an underbed over already laid concrete or masonry. (a) Tiles The chemical resistant tiles as detailed in the Schedule of items shall be of the best indigenous manufacture unless otherwise specified and shall be resistant to the chemical described in the Schedule of Items. The tiles shall have straight edges, uniform thickness, plain surface, uniform non-fading colour and textures. Glazed tiles if permitted to act as chemical resistant finish shall be considered under clause 2.5.3 (b). Usually the chemical resistant tiles shall not absorb water more than 2% by weight. The tiles shall have at least compression strength of 700 Kg/cm². The surface shall be abrasion resistant and durable. (b) Laying The mortar used for setting or for underbed the tiles shall be durable and strong. The grout which shall be to the full depth of tile shall have equal chemical resistant properties. Joints shall be pointed if so desired. The setting and fixing shall be according to the manufacturer's specification approved by the Engineer. 2.5.6 Rubber, Vinyl or Vinyl Asbestos Tiles Finish This shall include various types of tiles manufactured from rubber, vinyl, etc. set with a adhesive on concrete or masonry base. An underbed may be required to secure desirable surface and grade. (a) Thickness The thickness of the tiles shall be mentioned in the Schedule or in drawing.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 377 of 549
(b) Tiles Unless otherwise desired the tiles shall be squares of approved dimensions. The tolerance in dimensions shall be 1.5mm. The face of the tiles shall be free from porosity, blisters, cracks, embedded foreign matters or either physical defects which affect appearance or serviceability. All edges shall be cut true and square. The colour shall be confiding and uniform in appearance, insoluble in water and resistant to alkalis, cleaning agents and usual floor polishes. Each tile shall be marked on the back legibly and indelibly with manufacturer's trade mark, the thickness, sizes, batch number and date of manufacturer. Tiles shall be delivered securely packed and stored in clean, dry well ventilated place at a temperature near about to that the tiles shall be called upon to stand ultimately. Adhesive to be used for sticking the tiles shall be approved by the tile manufacturer. The adhesive shall have a short drying time and long life in addition to toughness. (c) Mix : Underbed The underbed where required to make up the specified thickness or to give the required grade or to get the right type of surface shall be composed of 1 part like putty : 1 part cement: 4 parts coarse sand mixed with just sufficient water to make it workable. (d) Laying The tiles shall be kept in the room to be tiled for at least 24 hours to bring them to the same temperature as the room. For air conditioned space, the air-conditioning shall be completed before tiling is taken up.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 378 of 549
The surface to receive this finish shall be firm even textured but not too smooth, without undulations and other deficiencies. If an underbed is laid the same shall be cured for at least 7 days by keeping it moist and then fully dried. The surface shall be thoroughly cleaned. All loose dust particles shall be removed. Oil and grease if any shall be completely cleaned by use of detergent. The adhesive shall be applied to fully dry surface in desired thickness uniformly. The adhesive shall also be applied to the backs and edges of the tiles and allowed to surface dry. The tiles shall be placed neatly on the surface exactly to the approved pattern and set with a suitable tool. If the edges tend to curl, weights are to be used to keep the edges down. Special care shall be taken to avoid formation of air pockets under the tiles. The joints shall be very fine. Any adhesive squeezed out through the joints shall be removed immediately. (e) Finishing If any adhesive mark is there on the surface a soft cloth soaked in solvent shall be used to wipe it off. The surface shall be cleaned with soft soap, dried and polished with an approved type of polish just before handing over. 2.5.7 Stone Slab Finish : Marble, Stone and Similar Fine Grained Stone (a) Thickness The underbed shall be minimum 12 mm and average 20 mm thick. The slabs may be 25 mm, 30 mm or 40 mm thick as specified. (b) Stone Slab The stone slabs shall be made from selected stock which are hard, sound, homogeneous and dense in texture and free from flaws. Angles and edges shall be true, square, and free from chipping and surface shall be plane. The slabs shall preferably be machine cut to the required dimensions.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-10
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 379 of 549
Tolerance of 5 mm in dimensions and 2 mm in thickness will be allowed. Unless specified the slabs shall be minimum 300 mm x 300 mm. The stone slabs shall come from specific regions and in specified quality with top surface fine chisel dressed. All sides shall also be fine chisel dressed to the full depth to allow finest possible joints. The slabs shall be delivered to the site well protected against damages and stored in dry place under cover. (c) Mix : Underbed Same as clause 2.5.1 (c). (d) Laying The sides and top surface of the slabs shall be machine rubbed or table rubbed with coarse sand stone and washed clean before laying. The underbed mortar shall be evenly spread and brought to proper level on the area under each slab. The slab shall be laid over the underbed, pressed and tapped down with wooden mallet to the proper level. The slab shall then be lifted and the underbed corrected as necessary and allowed to stiffen a little. Next, thick cement slurry shall be spread over the surface. The edges of the slab shall be buttered with slurry of cement, grey/white/mixed with pigment matching the colour of the stone slabs. The slab shall be gently laid and tapped with wooden mallet to bed properly to a very fine joint and to the required level. All surplus cement slurry shall be removed and the surface mopped clean with wet soft cloth. The laid finish shall be cured for 7 days by keeping it wet. (e) Polishing, Finishing Fine chiselling shall be done to remove the slight undulations that usually exist at the joints. The polishing and finishing shall be

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 380 of 549
done as specified under clause 2.5.1 (e). However, the joints shall be so fine in the case of stone slabs that grouting shall not be called for. 2.5.8 Stone Slab Finish : Sand Stone and Similar Coarse Grained Stone Finish Generally clause 2.5.7 shall be followed except that the workmanship and finish shall not be fine as which are explained hereunder. The slabs shall be rough chiseled or fine chiseled as specified. Tolerance may be allowed upto + 6 mm for rough finish, but no sharp unevenness and shall be allowed. For fine chiseling the unevenness shall be limited to 2 mm. The sides shall be chisel dressed at least to half slab depth so that the maximum deviation from straight line shall be within 25 mm. Beyond this depth the edge may be slightly splayed. The joint thickness shall be kept limited to 5 mm in case of rough finish and 3 mm in case of fine finish unless wider joints are specified. The joints shall be grouted with white or coloured cement. 3.0 <u>ACCEPTANCE CRITERIA</u> The finish shall be checked specially for: (a) Level, Slope, Plumb as the case may be (b) Pattern and Symmetry (c) Alignment of joints, dividing strip etc. (d) Colour, texture (e) Surface finish (f) Thickness of joints (g) Details at edges, junctions etc. (h) Performance

1.0 <u>SCOPE</u> This specification covers supplying, installation, repairing, finishing, testing, protection and maintenance till handing over of removable free access false flooring systems consisting of an assembly of panels mounted on adjustable pedestal and supporting steel grid system to provide an under floor space. 2.0 <u>FALSE FLOORING SYSTEM</u> 2.1 <u>BASE</u> The system shall be placed over a base of R.C.C. floor slab and with necessary grouting etc. to fix the supporting structure. 2.2 <u>SUPPORTING STRUCTURE</u> The supporting structure shall comprise of fabricated jacks made out of 25 mm. dia. MS rounds having 150 mm. threads at top. This jack shall be welded to 100 mm x 100 mm x 6 mm thick MS base plate pedestal. Pedestals shall be vertically true and located at 600 mm centre to centre to conform to the size of the floor panels and shall be fixed to the RCC floor slab with ARALDITE. The jack shall be equipped with locking device to prevent loss of finished elevation. Adjustment shall be provided by the threaded rod member and elevating nut. The capital shall be of aluminium alloy die cast and shall receive cold rolled MS floor supporting channels of size 40 mm x 40 mm x 3.15 mm thickness as per drawings, both for main and cross runners. The pedestal shall be equipped with conducting grounding pad. All MS members shall be treated with steel protective paint as per drawing. 2.3 <u>FLOOR PANEL</u> 2.3.1 The floor panels shall be made of phenol for maldehyde bonded particle board treated with fire resistant paint as per schedule items. Size of each panel shall be 600 mm x 600 mm with all panel edges finished to a tolerance of + 0.25 mm on the diagonals. The edges of the floor panels shall be covered by 4 mm. thick rigid PVC edging. The underside of the panel

2.4	shall have 0.05 mm. thick Aluminium foil which shall be fixed to the particle board with resin-based adhesive. <u>STRENGTH</u> Each 600 mm x 600 mm floor panel must be capable of supporting an uniform minimum live load of 1220 Kg/Sq. M or a concentrated minimum load of 450 Kg. applied through a phenolic caster 75 mm in diameter and 45 mm wide, or a rolling minimum load of 450 Kg. at any point with a maximum deflection of 2 mm. The ultimate strength shall be capable of carrying a 2300 Kg. axial load without deformation of any part. 2.5 <u>SURFACE FINISH</u> All removable panels shall have the top surface finished with 2 mm thick Antistatic Vinyl Flooring bonded to the surface with adhesive as per manufacturer's specification. 2.6 <u>SKIRTING</u> Skirting shall be of the same Antistatic Vinyltiles, 150 mm. high and 2 mm. thick, completely matching with the false flooring surface and shall be fixed with the plastered wall surface as per manufacturer's specification. 2.7 <u>INSTALLATION</u> All steel surface are to be protected by pointing over a primer as per schedule of items and any damage to the paint during installation shall be made good. Finished floor surface, when specified by the Engineer-in-Charge shall be protected by the Contractor with kraft paper taped and sealed at edges to prevent tearing. Any damage to the sub floor during installation of the false flooring system shall be made good by the Contractor without to the owner.

1.0 <u>SCOPE</u> This shall include supply, fitting and fixing of timber frames to doors and windows with M S holdfasts, paneled or flush doors, windows, shutters, partitions, wall paneling, pelmets, shelves, furniture, etc. as shown in drawings, including a prime coat of approved paint, varnish, or fixing of decorative plastic laminate. This shall also include the supply and fixing of all hardware and fixtures shown in drawing. 2.0 <u>INSTALLATION</u> 2.1 <u>MATERIALS</u> 2.1.1 Timber Unless otherwise specified, all timber shall be best quality well seasoned C P teakwood free from large or loose, knots cracks or other defects. Where specified, timber shall be treated with approved wood preservative before use. Before starting the carpenters work, the Tenderer shall have the rough timber approved by the Engineer. 2.1.2 Plywood Plywood shall be commercial quality with decorative surface veneer. Unless specifically permitted otherwise, the adhesive used in plywood shall be phenol-formaldehyde resin of B W R grade conforming to IS:848. 2.1.3 Decorative Laminated Plastic Sheets The colour, pattern, finish and texture shall be approved by the Engineer and the bulk supply procured in sheet sizes which will ensure the least number or joints in one surface. 2.1.4 Flush Doors Flush doors shall be hollow or solid core doors with commercial or decorative faces and hardwood edges. The core for solid core doors shall be of block board or wood particle board. Manufacturer's literature and test

certificates shall be submitted for the approval of the Engineer. The Contractor shall give a guarantee that the adhesive used is phenol formaldehyde of B W R grade, conforming to IS:848. The thickness shall be as specified in the drawing.		
2.1.5	Panel Doors	
Panel door shall be of teakwood shutter frame and panels of teakwood. Other considerations shall be as mentioned in item (d) above.		
2.1.6	Fixtures	
Fixtures for doors, windows, furniture, etc. shall be as shown on drawing.		
2.2	<u>WORKMANSHIP</u>	
2.2.1	General	
The work shall be done by skilled carpenters as per details shown on drawing or instructed by the Engineer.		
Framing timber and other work shall be close-fitting with proper wood joinery, accurately set to required lines or levels and rigidly secured in place. The surface of frames etc. which will come in contact with masonry after fixing, shall be given two coats of approved paint before fixing. Mastic caulking shall be done after fixing external door and window frames. Special care shall be taken to match the grain of timber or plywood which will be subsequently polished. Screwing or nailing will not be permitted to the edge of plywood and particle board. The edge of all plywood, blockboard and particle board shall be finished with teakwood lipping unless otherwise shown on drawings.		
Fixing for frames and partitions shall generally be with 40 mm x 6 mm x 300 mm long M S holdfasts bifurcated at end and grouted with 1:2:4 cement concrete.		
The gap between masonry and external door and window frame shall be caulked with polysulphide mastic. M S grills or guard bars shall be provided to windows where called for in the drawings.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-12
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 397 of 549
2.2.2	Finish All carpentry work after finishing shall be sand papered smooth. A prime coat paint shall be given after inspection of the Engineer to all surfaces other than those which shall be subsequently polished or covered with laminated plastic sheet.	
2.2.3	Surface Treatment When shown on drawings decorative ply or laminated plastic sheets shall be bonded under pressure to the surface to be finished. The adhesive used shall be of approved brand and brought to site in sealed containers. The rate of application and the length of time for which the pressure is to be applied shall be as per the manufacturer's instructions. The edge of sheets shall be protected by teak lipping or beveled as shown on drawings.	
3.0	<u>ACCEPTANCE CRITERIA</u>	
3.1	<u>DOOR AND WINDOW FRAMES</u> All frames shall be square and flat at the time of delivery and shall be checked for dimensions and corner angles. After fixing they shall be on a fine vertical plane. All external door and window frames shall be caulked with mastic.	
3.2	<u>DOOR AND WINDOW SHUTTERS</u> Shall be of proper size, shape and design and free of warp. When fixed to frames, these shall operate smoothly without jamming and all latching or locking devices shall engage properly without undue pressure.	
3.3	<u>PARTITIONS, PANELING, PELMETS, FURNITURE, ETC</u>	
3.3.1	General These shall conform to drawings in all details. No unsightly nailmarks etc. shall be permitted. Plywood grains shall be matched to give a uniform and pleasing appearance.

3.3.2	Partition Shall be checked for rigidity of fixing, plumb and horizontal as well as vertical alignment.	
3.3.3	Pelmets Shall be checked for rigidity of fixing and adequate clearance of fixture.	
3.3.4	Cupboard Shutters Shall operate smoothly without jamming and locks, bolts and double ball catches shall engage securely. Single ball catches shall not be used.	
3.3.5	Drawers Shall operate smoothly and have back stops to prevent them from being pushed too far. Locks shall engage securely.	
3.3.6	Loose Furniture When placed on a level surface tables tops etc. shall be horizontal and the pieces stand stably on legs or supports.	
4.0	<u>I.S. CODES</u> Some of the important relevant Codes for the Section are: (a) IS:4021 : Timber door, window and ventilator frames (b) IS: 1003 : Timber paneled and glazed shutters (c) IS:2191 : Wooden flush door shutter (Cellular and hollow core type). (d) IS:2202 : Wooden flush door shutters (solid core type).

1.0 <u>SCOPE</u> This specification covers the furnishing of all materials, labour, tools, equipment, supervision and services necessary for incidental to the supply, installation, finishing and completion of suspended ceiling work of various profiles and at all elevations as per drawing, specification and instruction of Architect/Owner. The work shall also include providing openings in the ceiling for lighting fixtures, air conditioning diffusers etc as shown in drawing and instruction of Architect/Engineer. 2.0 <u>MATERIAL</u> 2.1 <u>ALUMINIUM GRID SUSPENSION SYSTEM</u> 2.1.1 Suspender : Shall be fabricated from 10 dia M.S. rod angle, flast or as required to suit ceiling profile and suspension system with turnbuckle for adjustment of levels. All M.S. works shall have one coat of synthetic enamel paint over a coat of red lead primer. 2.1.2 Frame work/grid : shall be of aluminium sections as follows : Wall angle - 25 x 25 x 1.6 mm. thick. Main Tee - 35 x 25 x 1.6 mm. thick Cross Tee - 25 x 25 x 1.6 mm. thick Tees shall be jointed with adequate cleats etc. 2.2 <u>CEILING PANEL</u> 2.2.1 For 150C Type Un-perforated False Ceiling (a) Un-perforated Aluminium panel of size 150mm wide x 15mm deep made up of 0.5mm thick square edged, panel length up to 6m. Panel shall be clipped to an Aluminium panel carrier of 32mm wide x 39mm

deep made of 0.95mm thick in standard length of 5m with cutouts to hold the panels in a module of 150mm. The carrier shall be suspended by means of GI suspension rod of 4mm diameter and a galvanized steel suspension spring clip at a distance of 1.5m (max.) centre to centre in both directions. The suspension rod shall be fixed to RCC ceiling / beam with suitable GI 'J' hook and nylon inserts (galvanization to be done as per IS 1367 – minimum coating 250 g/Sq.m.). The suspension spring clip shall be made of spring steel and shall have cutout and holes to fit into the carrier from one side and hold the rod hanger from another side. Providing and laying Rockloyd Resin Bonded Mineral Wool of density 48 Kg/M3 and thickness 50mm encased in black polythene. (b) The edge profile wherever required as per architectural drawings and direction of Engineer-in-Charge shall be 'L' shaped profile manufactured out of 0.5mm thick Al-Mg Alloy of approved colour and shall be fixed to walls or panels as required. (c) Aluminium panel splice made of 0.5mm thick, 150mm wide x 15mm deep shall be provided and installed to connect / join panels at each point. (d) Aluminium carrier splice made 0.95mm thick, 32mm wide and 39mm deep shall be provided and installed to connect / join carriers at each point. (e) All panels, panel splice, edge profiles shall be made of Aluminium coil coated on a continuous paint line and roll formed from corrosion resistant Aluminium Alloy AA-3105 or equivalent (Al-Mg) for higher strength and good roll forming characteristics. All carriers and their splices shall be made of Aluminium, stove enamelled alloy AA-5050 or AA-5052 or equivalent (Al-Mg) of black colour. (f) Mode of measurement : Measurement shall be wall to wall along with the ceiling. Fascias to be measured separately without any deductions for lights, diffusers, grills etc. Nothing extra shall be paid for cutting and framing around lights, diffusers etc. as well for

providing punched holes for sprinklers, smoke detectors etc. as per requirement of architectural drawings. 2.2.2 Aluminium Tile Ceiling of 600mm x 600mm size Tiles (a) The tile size shall be 600mm x 600mm made of 0.7mm thick bevel edged Aluminium Alloy AA-3105 sheet. The tile will be manufactured on advanced equipment, which includes several levelling stages in the manufacturing process. Tile ends will be raised with pipes and stop to ensure positive engagement into the spring to enable for demounting of individual panel. The tile sides will be sufficiently high to ensure a minimum deflection across the length of tile. All tiles will be polyester based, powder coated in white colour. Tiles shall be clipped into clip in profile of 0.5mm thick. The clip in profile shall be at a distance of 600mm center to center. The clip in profile shall be supported from RCC ceiling / beam by means of GI suspension rod shall be fixed to RCC surface by means of suitable expansion wedge hold fastener of minimum size 8mm dia 50mm long made of galvanized steel (galvanization to be done as per IS 1367 – minimum coating 250g/Sq.m.). Providing and laying Rocklloyd Resin Bonded Mineral Wool of density 48 Kg/M3 and thickness 50mm encased in black polythene. (b) Edge profile wherever required, as per architectural drawings and direction of Engineer-In-Charge shall be 'L' shaped or equivalent Aluminium profile of 23mm x 23mm and 0.7mm thick. This profile shall be used in the corner and places where the false ceiling shall be terminated. (c) All perforated panels (if perforated tiles are being selected by the owner in place of non-perforated tiles) shall have non-woven tissue lining black coloured and glazed to the clip-in-profile side for the purpose of acoustical insulation. (d) The clip in profile splice shall be made of 0.50mm thick GI sheet and use to connect clip in profile. (e) Mode of measurement : Measurement shall be wall to wall along with the ceiling. Fascias to be measured separately without any

deductions for lights, diffusers, grills etc. Nothing extra shall be paid for cutting and framing around lights, diffusers etc. as well for providing punched holes for sprinklers, smoke detectors etc. as per requirement of architectural drawings. 3.0 <u>INSTALLATION</u> 3.1 The ceiling grid shall be suspended from structural walls slabs, beams truss structural steel etc. with suspender fabricated from M.S.rod/ angles/flasts etc. to the required level. The entire suspension system shall be of sufficient strength and rigidity to allow placing of planks over the grid for movement of maintenance personnel to attend various electrical and air conditioning installation over the ceiling and to carry ceiling panels in true level and plane without exceeding a deflecting of 1/360th of their span. All ceiling panels shall be secured in position using hold down clips of sufficient number. All joints in ceiling panels shall run straight. The installation of ceiling system shall be strictly as per drawing. 4.0 <u>SHOP DRAWINGS</u> 4.1 Contractor shall prepare complete working details layout based on the conceptual layout and design of suspended ceiling and illumination and air conditioning layout shown on the drawings and obtain approval from the Architect/Owner before installation. 5.0 <u>WORKMANSHIP</u> 5.1 Shall be done in the best workmanlike manner by the manufacturer authorised agency in accordance with manufacturer standards and recommendations. 6.0 <u>SAMPLES</u> 6.1 3 (three) mock-up samples of reasonable size showing standard grid with panels and suspender etc. having desired finish, colour etc. shall be submitted to the Architect/Owner for approval before materials are Delivered at site. Installed material shall match approved samples.

1.0 <u>SCOPE</u> The work in general shall consist of supplying and/or erecting and installing of all metal doors, windows, ventilators, louvres, glazed partitions, etc. as shown on drawings with all materials complete excluding supply of glass and glazing. The scope of work shall also include the assembly and the Owner from the store at site shall supply erection of all doors, windows, louvres, glazed partitions, etc. for which fabricated materials. Supplying and/or fixing of all door and window accessories and hardware are also included in the scope. 2.0 <u>INSTALLATION</u> 2.1 <u>MATERIALS</u> Steel sections used for fabrication of doors, windows etc. shall be standard rolled steel sections specified in IS: 1038 and IS: 1361 or as specified in drawing and schedules. Steel sheets for frames, shutters, louver blades etc. shall be of gauge mentioned in drawings and schedules. Aluminium sections for fabricating doors, windows, partitions, etc. shall be extruded sections conforming to IS: 1948 and 1949 or as manufactured by Indian Aluminium Company Limited or approved equivalent. The alloy used shall conform to IS Designation HE 9-WP of IS: 733. Hardware and fixtures shall be as specified in "Schedule of Fixtures" and the best quality from approved manufacturers shall only be used. The Tenderer shall specifically state the particular manufacturer's materials he proposes to use. "Schedule of Fixtures" is for the purpose of stating the minimum requirement and improper alignment or faulty operation due to inadequate strength of hardware or fixture shall entirely be the Contractor's responsibility All hardware and fixtures shall be able to withstand repeated use. Door closers shall conform to IS: 3564 and shall be suitable for doors

weighing 61- 80 Kg. unless otherwise stated in schedule. Each closer shall be guaranteed against manufacturing defect for one year and any defect found within this period shall be rectified or the closer replaced free of charge. Concealed door closers shall be either floor mounted or transom mounted, suitable for installation with metal doors. It shall conform to the performance requirements & endurance test stated in IS: 3564 Appendix-A. The Contractor shall submit samples of each type of hardware to the Engineer. The approved samples shall be retained by the Engineer for comparison of bulk supply. The samples shall be returned to the Contractor towards the end for incorporation in the job. The mastic for caulking shall be of best quality from a manufacturer approved by the Engineer. In general, the mastic for fixing of metal frames shall be as per IS: 1081 and/or as approved by the Engineer. 2.2 FABRICATION 2.2.1 Steel Doors, Windows, Ventilators, Louvers, etc. (a) Door Frames Frames shall be fabricated from 16 G sheets. They shall be mortised, reinforced, drilled and tapped for hinges and lock and bolt strikes. Where necessary, frames shall be reinforced for door closers. Welded construction with mitered corners shall be used. Rubber door silencers shall be furnished for the striking jamb. Loose "T" masonry anchors shall be provided. Frames shall finish flush with floor and adjustable floor anchors shall be supplied. Frames shall be brought to site with floor ties/weather bars installed in place. (b) Double Plate Flush Door Shutters Door shutters shall be 45 mm thick, completely flush design and shall comprised of two outer sheets or 18 G steel sheets, rigidly connected and reinforced inside with continuous vertical 20 G stiffeners, spot welded in position at not more than 150 mm on centers.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-14
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 415 of 549
Both edges of doors shall be joined and reinforced full height by steel channels placed immediately inside and welded to the door faces. Top and bottom of doors shall be reinforced horizontally as shown on drawing by steel channels running full width of door. Doors shall not have more than 2.5 mm clearance at jambs and heads, shall have proper level on lock stiles and rails to operate without binding, and shall be reinforced at corners to prevent sagging or twisting. Pairs or double doors shall have meeting stile edges bevelled or rebated. Where shown on drawing or called for in the schedule of items the doors shall be sound deadened by filling the inside voids with mineral wool or other suitable approved materials. Doors shall be mortised, reinforced, drilled and tapped in shop for hinges, locks and bolts. They shall also be reinforced for closers, push-plates and other surface hardware where necessary. Any drilling and tapping required for surface hardware shall be done at site. Where shown in drawing, provision shall be made for fixing glazing, vision panels, louvers etc. glazing mouldings shall be of 18 G steel or extruded aluminium sections with profiles shown in drawing and suitable for fixing 6 mm glass. Louvers blades shall be V or Z shaped and made out of 16 G sheets. (c) Single Sheet Door Shutters Single sheet doors shall be made from best quality 18 G mild steel sheets and shall present a flush surface on the outside. The inside shall be stiffened with semi-tubular edge and central stiffening rail, which shall convey the lock and other furniture. The frames shall be made from best quality 16 G mild steel sheets. Wherever required as shown on drawings, provisions for fixing glass panes, louvers, etc. shall be made. The manufacturing shall be done as specified in clause No .2.2.1.b "Double Plate Flush Door Shutters". (d) Sliding Doors Sliding doors shall be either double plate or single plate construction		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-14
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 416 of 549
as called for in drawings and schedules made out of 18 gauge steel sheets with adequate stiffeners. The Contractor shall specify the weight of the door in his shop and submit the manufacturer's catalogue of the sliding gear he proposes to use. Where shown on drawings or call for in the Schedule of Items, the Contractor shall make provision for openings to the door for monorail beams. Doors shall close positively to exclude rainwater from seeping in. When called for in schedule, sliding doors shall withstand specified wind loads without buckling or jamming. The door shall slide freely under all ambient conditions. (e) Door Threshold Door threshold shall be provided as shown on drawing. Doors without threshold shall have bottom tie of approved type. (f) Steel Windows, Sashes, and Ventilators etc. These shall conform in all respects to IS: 1038 and IS: 1361 latest editions and as shown on drawings. The details as called for in the above codes shall be applicable for coupling mullions, transoms, weather bars, pivot arrangements for ventilators, etc. or as shown on drawings or called for in the Schedule of Items. All welds shall be dressed flush on all exposed and contact surfaces. Where composite unit openings are shown on drawings, the individual window units shall be joined together with requisite transoms and mullions as shown on drawings. All windows shall be outside glazed fixed with putty or metal glazing beads as shown on the drawings and/or specified under Schedule of Items. Where aluminium glazing beads are specified they shall be extruded aluminium channel 9.5 mm x 9.5 mm x 1.6 mm (Indal Section No. 2209) unless otherwise shown on drawings. Aluminium beads shall be given one coat of zinc chromate primer before fixing to windows. 2.2.2 Aluminium Door, Windows and Frames Extruded sections shall have a minimum 3 mm wall thickness. All sections shall be approved by the Engineer before fabrication is taken up. Doors,		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 417 of 549
frames, mullions, transom etc. shall be anodized in a bath of sulphuric acid to provide a clear coating of minimum 0.6 mm thickness. The anodized materials shall then be sealed by immersing in boiling water for 15 minutes. A protective transparent coating shall be applied to the sections before shipment from the factory. All work shall be fitted and shop assembled to a first class job and ready for erection. Shop joints shall be made to hairlines and then welded or braced by such method as will produce a uniform colour throughout the work. Work on the above, other than described, shall be carefully fitted and assembled with neat joints with concealed fasteners. Wherever possible, joints shall be made in concealed locations and on edges of doors. Field connections of all work may be made with concealed screws or other approved type of fasteners. Glazing beads shall be snap fit type without visible screws and shall be of sizes to accommodate 6 mm thick glazing. All work shall be adequately braced and reinforced as necessary for strength and rigidity. 2.2.3 Aluminium Structural Glazing Providing and fixing of barriered semi unitised structural glazing system at all levels through designing and selection of mullion and transoms profiles anodised (15 to 20 micron) or powder coated (50 to 70 micron), selected for their fixing on the structure depending on the structural conditions, functional, statistical requirement and should withstand the wind load criteria as per IS-875 (part-III) – 1987. System should provide proper rebate areas for air pressure compensation /water drainage at required stages. Double insulated hard coated toughened glass consist of 6mm outer single safety glass, 12mm inter space and 6mm inner clear glass panel glued onto the glass glazing frame profile selected according to the vision / spandrel panel (Aluminium Composite Panels) requirement with DC 995 structural sealant. Proper supporting element should be provided for taking care of the respective infill load and reliving in case of the glass bonding failure. (The profile sections shall be Hindalco Alupuram unit, HYDRO product or equivalent). Floor to floor height would be 4.2m approx and width of glazing supporting frame would be 1.0m approx.

2.3 <u>SHOP COAT OR PAINT</u> The shop paint for steel doors, windows, etc. shall be best lead or zinc chromate primer paint from approved manufacturer. All surfaces shall be thoroughly cleaned of rust, grease, loose mill scales etc. and given one coat of shop paint. Portions like mullions, transoms etc. that will be inaccessible after assembly of units shall be given an extra coat of paint before assembly. Where called for in the Schedule of Items all steel doors, windows, etc. shall be hot dip galvanised to give a coating weight of 1-1/2 - 2 Oz per sq. ft. One coat zinc chromate primer coat shall then be applied as shop paint. Portions of aluminium frame which come in contact with masonry construction shall before shipment from workshop be protected with a heavy coat of alkali paint. Aluminium coming in contact with other incompatible metals shall be coated with zinc chromate primer. 2.4 <u>HANDLING & STORAGE OF FABRICATED MATERIAL</u> All metal doors, windows, etc. shall be packed and crated properly before dispatch to ensure that there will be no damage to the fabricated materials. Loading into wagons and trucks shall be done with all care to ensure safe arrival of materials at site in undamaged condition. When taking delivery of items supplied by Owner, the Contractor shall satisfy himself that the items supplied are upto the specified standard. Any defect detected shall promptly be brought to the notice of the Engineer. All metal doors, windows, etc. shall be stored under cover in a way to prevent damage or distortion. Special care shall be taken to prevent staining of aluminum products by rust, mortar, etc. 2.5 <u>ASSEMBLY & ERECTION AT SITE</u> In general, the fixing of steel doors, windows, ventilators, louvers, etc. shall conform to IS: 1081 and as shown on drawings. The Contractor shall assemble and install all steel doors, windows, sashes, fixed metal louvers, etc. including transoms and mullions for composite units in

respective places as shown on drawing keeping proper lines and levels, and in approved workman like manner to give trouble free and leak-proof installations. The installation shall be done according to the instructions of the manufacturer, and/or as approved by the Engineer. If required by the Engineer, the installation shall have to be carried out under the supervision of the manufacturer's staff. The Contractor shall take every precaution against damage of the components during installation. Necessary holes, chases, etc. required for fixing shall be made by the Contractor and made good again as per original, after installation without any extra charge. After installation of steel doors, windows, etc. all abrasions to shop-coat of paint shall be retouched and made good with the same quality of paint used in shop coat. All coupling mullions, transoms, frames, etc. in contact with adjacent steel and other members, shall be well bedded in mastic. The Contractor shall bring to the site the mastic cement in original sealed containers of manufacturer and shall apply it as per the instructions. For all frames supplied by either the Owner or the Contractor mastic shall be supplied by the Contractor and caulking done properly as per drawings, specifications and as per instructions of the Engineer. Door shutters, partitions hardware fixtures etc. shall be fixed only after major equipments have been installed in rooms Wherever required nylon cords of approved quality shall be supplied along with pivoted sashes and shall be of adequate length to terminate one metre from the floor. Loose ends of cords shall end in metal or plastic pull as approved by the Engineer. 3.0 <u>ACCEPTANCE CRITERIA</u> 3.1 <u>FOR FABRICATED ITEMS</u> 3.1.1 Overall dimensions shall be within ± 1.5 mm of the size shown on drawings. 3.1.2 Mullions, transoms etc. shall be in one length and permissible deviations from straightness shall be limited to ± 1.5 mm from the axis of the member.

1.0 <u>SCOPE</u> The work in general shall consist of supplying and fixing all glass and glazing including all clips, putty, mastic cement etc. wherever required as shown on drawings and specifications, supply of metal glazing beads and neoprene gaskets shall not be included in this scope. This shall also include the fixing of all glass and glazing supplied by the Owner at his site stores. 2.0 <u>INSTALLATION</u> 2.1 <u>GENERAL</u> The Contractor shall supply and install all glass and glazing as required for various doors, windows, sashes, ventilators and fixed louvres, miscellaneous glazing and partitions, unless otherwise stated from approved manufacturer having uniform refractive index and free from flaws, specks and bubbles. The glass shall be brought to site in the original packing from the manufacturer and cut to size at site. 2.2 <u>MATERIALS</u> 2.2.1 Glare reducing or heat absorbing glass shall be of approved manufacturer and special care shall be taken to grind smooth and round off the edges before fixing. 2.2.2 Glass shall be float glass of required thickness and shall be clear or tinted as indicated. 2.2.3 Wired glass shall be thick rolled glass with centrally embedded 42g. Wire mesh of Georgian type. This may be of clear or coloured glass, as shown on drawings. 2.2.4 Obscure glass shall have a cast surface in one side. 2.2.5 Coloured and figured glass shall be as per approved sample.

2.2.6 In general, the putty shall conform to IS : 400 and be of best quality from approved manufacturer. It shall be brought to site in the manufacturer's original packing. Quick setting putty glass is used where it shall be non-setting type. 2.2.7 EPDM gaskets with snap-fit glazing beads shall be fixed as per manufacturer's instructions and shall sit snugly against glass to give a leak proof installation. 2.2.8 Float glass 2.2.9 Double glazing 2.3 <u>GLAZING, SETTING AND FINISH</u> All glazing clips, bolts, nuts, putty, mastic cement etc. as required shall be supplied by the Contractor. All glass shall be thoroughly cleaned before putting in position. Each glass pane shall be held in place by special glazing clips of approved type. As specified in relevant I.S. Codes, four glazing chips shall be provided per glass pane, except for large panes where six or more clips shall be used as per Engineer's instructions. All holes that may be necessary for holding the clips glazing heads and all other attachments shall be drilled by the Contractor. Glass panes shall be set without springing, and shall be bedded in putty and back puttied, except where moulding or gasket are specified, putty, mastic cement etc. shall be smoothly finished to the even line and figured glass shall be set with smooth side out. After completion of glazing work, the Contractor shall remove all dirt stains, excess putty etc. clean the glass panes and leave the work in perfectly acceptable condition. All broken cracked or damaged glass shall be replaced by new ones.

1.0 <u>SCOPE</u> This specification covers the design, supply of materials, fabrication, delivery and erection of Rolling Shutters/Grills with motor drive and/or manual operation including all accessories as hereinafter specified. 2.0 <u>INSTALLATION</u> 2.1 <u>COMPONENTS</u> 2.1.1 Slats for rolling shutters shall be made from tested bright cold rolled, annealed M.S. strips, not less than 0.9 mm thick for shutters upto 4.5 M wide and not less than 2.25 mm thick for shutters 5.5 M wide and above, machine rolled at 75 mm rolling centres, interlocking with each other. The profile will be such as to prevent excessive deflection under specified wind load. 2.1.2 Rolling grills shall be constructed out of 6 mm dia. rods at 35 mm on centres running horizontally flexible connected with vertical links spaced not more than 200 mm centres. Alternatively, rolling grills shall be made from perforated slats of approved design reinforced with 6 mm dia rods. 2.1.3 End locks shall be heavy type M.C.I./C.I. and shall be provided at each end of alternate slats unless specified otherwise in the Schedule. 2.1.4 Bottom bars shall be finished with two angles not less than 6 mm thick for external shutters. When shown on drawings, a flexible weather strip shall be applied to make tight contact with the floor. 2.1.5 Guides shall be of such depth as to retain the shutter under a wind pressure of 100 Kg/Sq.M or as specified in Schedule. 2.1.6 Shafts shall be of steel pipe of sufficient size to carry the torsion load with a maximum deflection of 1/360th of span. 2.1.7 Grease packed ball bearings or bushings shall be provided for smooth trouble free operation.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-16
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 436 of 549
2.1.8	Hoods shall be formed of not less than 20 gauge steel, suitable reinforced to prevent sag.	
2.1.9	Locks shall be slide bolt and hasp, or cylinder lock operable from one or both sides. Provision securing hand chain with pad-lock, provision for removable handle for hand cranks etc. shall be made as described in Schedule or as described by the Engineer.	
2.1.10	Power unit shall be suitable for 3 phase, 50 cycle, 400 volt A.C. power supply and shall be either floor or wall mounted unit. The motor shall be of sufficient capacity to move the shutter in either direction at a speed of 0.3 metres per second. In addition to the gear motor each standard power unit shall include a magnetic brake, a reversing starter with built-in overload protection, a geared limit switch and one push button station located inside the building unless otherwise stated drawing.	
	It is desirable that the bottom bar of motor operated doors shall be provided with a sensitive edge, electrically connected to stop the travel of the door on meeting an obstruction.	
2.1.11	Operating chains shall be of tested quality, heavily galvanised and with all ends rounded to assure smooth operation and hand protection.	
2.1.12	Reduction gears shall be high strength gray cast iron, machine moulded from machine out patterns.	
2.2	<u>MANUALLY OPERATED SHUTTERS/GRILLS</u> Manually operated shutters shall be easily operable by one person. The speed of operation shall be about 1.3 metres per second. In general, manually operated shutters shall be push pull type for openings upto 9 Sq. metre in area. Larger shutters shall be either chain and gear operated or crank and gear operated. The crank handle shall be removable. All shutters shall be lockable from one or both sides as described as desired by the Engineer.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-16
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 437 of 549
2.3	<u>POWER OPERATED SHUTTERS/GRILLS</u> These shall be operable from a push button station conveniently located beside the door or as shown on drawings. One emergency hand chain/crank operation shall also be provided for use in case of failure of the electric system. Where called for in Schedule, externally mounted shutters shall be operated by control mechanism located inside the building.	
2.4	<u>SHOP COAT</u> Shutters shall be painted with one coat of red lead or zinc chromate primer. Where specified, doors shall be galvanized and subsequently painted one coat of zinc chromate for adhesion of field coat.	
2.5	<u>ERECTION</u> Door shall be installed by the manufacturer or his authorised representative and all work shall be as per manufacturer's instructions. Any drilling or cutting to concrete, masonry etc. shall be made good after erection of shutters and all abrasion to shop coat shall be touched up. All electrical work shall be in strict accordance with the latest Indian Electricity Rules.	
3.0	<u>ACCEPTANCE CRITERIA</u>	
3.1	<u>SHOP INSPECTION</u> After completing the manufacture of the different components of the rolling shutter, an arrangement for shop inspection by the Engineer shall be made to check the conformity with approved shop drawings.	
3.2	<u>FIELD INSPECTION</u> After installing the shutters, the Contractor shall test the performance of the shutter in the presence of the Engineer. The doors shall be smoothly operable under all ambient conditions. All control and locking devices shall give fault-free performance.

1.0 <u>SCOPE</u> This specification shall generally be read in conjunction with section IV and V This shall include supply, fabrication and erection of miscellaneous metal items of light nature in gates, grills, balcony and stair handrails particulars, structural mullions and transoms, ladders hangers masonry anchors, shelf angles, anchor bolts, fasteners, etc. as shown on drawing or as instructed by the Engineer. The above items shall be of fabricated or cast M.S/Aluminium/Brass, cast iron, M.S. and galvanised M.S. Sheets, aluminium sheets, expanded metal, wire mesh etc. as shown on drawings and/or described. 2.0 <u>INSTALLATION</u> 2.1 <u>FABRICATION/CASTING</u> 2.1.1 General All work shall be done according to approved shop drawings. All workmanship shall be equal to the best practice in modern structural or foundry shop. 2.1.2 Shop Connections (a) All shop connections shall be riveted or welded except when noted otherwise on drawings. (b) Welding of steel shall be done in accordance with the IS: 816. Use of metal arc welding for general construction in Mild Steel. (c) Welding of aluminium shall be done in accordance with IS: 2812, Arc welding of Aluminium and Alloys, Special care shall be taken to grind smooth all welded surface that shall remain exposed to view. Welds shall be electrically continuous if so required by the Engineer.

2.1.3 Shop Coat Before leaving the shop, all metal work shall be thoroughly cleaned by effective means of all loose mill/ scale, rust and foreign matter. Except where encased in concrete, all steelwork shall be given one coat of approved metal protective paint, applied by brush thoroughly and evenly, well worked into joints and other open spaces. All paint shall be applied to dry surfaces. Steel work shall be galvanised or galvanized and painted with a coat of zinc chromate primer. Aluminium surfaces which shall come in contact with masonry shall be given one coat of zinc chromate primer. 2.2 <u>ERECTION</u> 2.2.1 Bracing The Contractor shall provide all necessary temporary guys and braces to ensure alignment and stability of the members and to take care of all loads to which the structure may be subjected including erection of equipment and operation of the same. 2.2.2 Temporary Bolting-Up As erection proceeds the Contractor shall plumb up and level all members and shall securely bolt up to take care of all dead load, wind load and erection stresses. Wherever piles of materials, erection equipment or other loads are carried during erection, proper provision shall be made to take care of the stresses resulting from the same. 2.2.3 Turned Bolt For field connections where bolting is specified, holes for the turned bolts may be reamed in the field, if required. All drilling or reaming for turned bolts shall be done after the parts to be connected are assembled. 2.2.4 Welding Where specified on drawings, welding shall be done in accordance with IS:

816 for steel and IS: 2812 for Aluminium and Alloys. 2.2.5 Cutting and Fitting No cutting of sections, flanges, webs of angles shall be done without the approval of the Engineer. Where indicated on the drawings, holes, cuttings, etc. shall be provided as required for installation, to the work by the other Contractors. No additional holes or cuttings, than those shown on drawings, shall be made without the approval of the Engineer. 2.2.6 Drifting Correction of minor misfits and a reasonable amount of reaming and cutting of excess stock from rivets may be permitted. For this, light drifting may be allowed to draw holes together. Twist drills shall be used to enlarge as necessary to make connections. Reaming that weakens the members or makes it impossible to fill the holes properly or to adjust accurately after reaming shall not be allowed. Any error in shop work which prevents the proper assembling and fitting of parts by moderate use of drift pins or a moderate amount of reaming and slight chipping and cutting shall immediately be called to the attention of the Engineer and approval of the method of correction obtained. The use of cutting torches to enlarge or alter rivet holes shall not be permitted. 2.2.7 Grouting All bearing plates, loose lintels and beams, etc. shall be set to proper grade and level by the Contractor and the Engineer's approval obtained before proceeding with the grouting. Grouting shall be done in 1:1.5:3 or 1:1- 1/2:3 concrete with 6 mm down stone chips. 2.2.8 Anchor Bolting When shown on drawings, the miscellaneous metal items shall be fixed to concrete by case hardened and drawn carbonizing steel expander nut and bolt. The Contractor shall submit the manufacturer's literature

showing the average pull out and average shear values for bolts of various sizes. The bolts shall be fixed strictly as per the manufacturer's instructions. 2.2.9 Pipe Joints M.S. Pipes shall be joined by threaded sockets or by welding. Cast iron pipes shall be socket and spigot jointed and caulked with hemp and molten lead. 2.2.10 Spot Painting All field rivets and bolts and also any serious abrasion to shop paint shall be spot painted with the same materials as used for the shop paint. 2.2.11 Making Good All cutting to concrete or masonry shall be made good to the satisfaction of the Engineer. 3.0 <u>ACCEPTANCE CRITERIA</u> 3.1 All items shall be of correct shape, size, weight etc. shown on drawings. 3.2 For installed items, the tolerances shall be follows : 3.2.1 Permissible deviation from straightness - 1 in 1000. 3.2.2 Seats, stiffener connections etc. Shall be as per approved drawings and shall not interfere with architectural clearances. 3.2.3 All castings shall be free from blow holes, cracks and other blemishes. 4.0 <u>I.S. CODES</u> (a) IS : 226 : Structural Steel (Standard Quality). (b) IS:800 : Code of practice for use of structural steel in general building construction..

1.0 <u>SCOPE</u> This specification covers painting, white washing, varnishing, polishing etc. of both interior and exterior surfaces of wood work, masonry, concrete plastering, plaster or Paris, Punning false ceiling, structural and other miscellaneous steel items, rain water down comer, floor and roof drains, soil, waste and service water pipes, and other ferrous and non-ferrous metal items as shown on drawings, or as directed by the Engineer. Copper, bronze, chromium plate, nickel, stainless steel, aluminium and monel metal shall generally not be painted or finished except if otherwise specified. The painting Contractor shall inspect the work of others prior to the application of paint. If surface to be finished cannot be put in suitable condition for painting by customary preparatory methods, the painting contractor shall notify the Engineer in writing or assume responsibility for and rectify unsatisfactory finishing that results. Before commencing painting, the painting Contractor shall obtain the approval of the Engineer in writing regarding the schedule of work to minimize damage, disfiguration or staining by other trades. He shall also undertake normal precautions to prevent damage, disfiguration or staining to work of other trades or other installations. 2.0 <u>INSTALLATION</u> 2.1 <u>MATERIALS</u> Materials shall be highest grade products or well-known approved manufacture and shall be delivered to the site in original sealed containers, bearing brand name, manufacturer's name and colour shade, with labels intact and seals unbroken. All materials shall be subject to inspection, analysis and approved by the Engineer. It is desired that materials of one manufacturer only shall be used as far as possible & paint or one shade is obtained the same manufacturing batch. All paint shall be subject to analysis from random samples taken at site from painter's bucket, if so desired by the Engineer.

All prime coats shall be compatible to the material of the surface to be finished as well as to the finishing coats to be applied. All unspecified materials such as shellac, turpentine or linseed oil shall be of the highest quality available and shall conform to the latest IS standards. All such materials shall be made by reputable recognised manufacturers and shall be approved by the Engineer. All colours shall be as per painting schedule and tinting and matching shall be done to the satisfaction of the Engineer. In such cases, where samples are required, they shall be executed in advance with the specified materials for the approval of the Engineer. 2.1.1 White Washing Shall be done from pure shell lime or fat lime, or a mixture of both as instructed by the Engineer; and shall conform to IS:712 latest edition. Samples of lime shall be submitted to the Engineer for approval, and lime as per approved sample shall be brought to site in unslaked condition. After slaking, it shall be allowed to remain in a tank of water for two days and then stirred up with a pole, until it attains the consistency of thin cream. 100 grams of gum to 6 litres of white wash water and a little quantity of indigo or synthetic ultramarine blue shall be added to the lime. 2.1.2 Dry distemper Shall be made from suitable pigments, extenders, lime proof tinters, water soluble binders etc. and shall conform to IS:427. 2.1.3 Oil Bound Washable Distemper Shall be of oil emulsion type, containing suitable preservatives and shall conform to IS: 428. 2.1.4 Waterproof Cement Paint Shall be made from best quality white cement and lime resistant colours with accelerators, waterproofing agents and fungicides. The paint shall

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-18
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 455 of 549
conform to IS: 5410. 2.1.5 Acrylic Emulsion Paint Shall be water-based acrylic copolymer emulsion with rutil titanium dioxide and other selected pigments and fungicide. It shall exhibit excellent adhesion to plaster and cement surface and shall resist deterioration by alkali salts. The paint film shall allow the moisture in wall to escape without peeling or blistering. The paint, after it is dried, shall be able to withstand washing with mild and water without any deterioration in colour, or without showing flaking, blistering or peeling. 2.1.6 Synthetic Enamel Paint Shall be made from synthetic resins and drying oil with rutil titanium dioxide and other selected pigments to give a smooth, hard, durable and glossy finish to all exterior and interior surfaces. White and pastel shades shall resist yellowing and darkening with aging. The paint shall conform to IS: 2932 and IS: 2933. 2.1.7 Aluminium Paint Shall be in two pack containers and shall resist weathering. The paint shall conform to IS: 2339. 2.1.8 Shall be best quality alkyd varnish suitable for brushing over the tint of paint or light natural wood and shall not darken or yellow with age. 2.1.9 French Polish Shall be made from best quality shellac, denatured spirit and other suitable alcohol soluble ingredients and made by a well known approved manufacturer. The material shall conform to IS:348. French polish shall not be used on bare wood. It shall only be used as finishing coat on wood after the wood is pre-treated with liquid wood filler conforming to IS: 345 is applied and rubbed out.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-18
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 456 of 549
2.2	<u>STORAGE</u> The Contractor shall arrange for safe and proper storage of all materials and tools. The storage space if allotted within the building shall be adequately protected from damage, disfigurement & stains. Paint shall be kept covered at all times and mixing shall be done in suitable containers. All necessary precautions shall be taken by the Contractor to prevent fire.	
2.3	<u>PREPARATION OF SURFACE</u>	
	Before starting the work the Contractor shall obtain the approval of the Engineer regarding the soundness & readiness of the surface to be painted on.	
2.3.1	Wood	
	All surfaces shall be free from dirt and loose or peeling paints. The surface shall be rubbed down smooth. All nails & screws shall be sunk below the surface and filled with putty after applying an under coat. Small knots that do not justify cutting and sap streaks shall be covered with minimum 2 coats of pure shellac coating applied thinly & extended 25 mm beyond the area. All large, loose or resinous knots shall be removed and filled with sound wood. All work shall be done as per IS: 2338.	
2.3.2	Masonry, Concrete and Plastered Surface	
	Surface shall be free from all oil, grease, efflorescence, mildew, loose paint or other foreign and loose materials. Masonry cracks shall be cleaned out and patch filled with mortar similar to the original surface and uniformly textured. Where this type of re-surfacing may lead to the finishing paint being different in shade from the original surfaces, the resurfaces area shall be treated with minimum one coat of cement primer, which should be continued to the surrounding area for a distance of minimum 100 mm.	
	Surface with mildew or efflorescence shall be treated as below:	
	(a) Mildew	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-18
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 457 of 549
All mildewed surfaces shall be treated with an approved fungicide such as ammonia cal wash consisting of 7g of copper carbonate dissolved in 80 ml. liquor ammonia and diluted to 1 litre with water, or 2.5 percent magnesium silicofluoride solution and allowed to dry thoroughly before paint is applied. 2.3.3 Metal All metal surfaces shall be absolutely clean, dry and free from wax, grease or dried soap films. In addition, all steel and iron surfaces shall be free from rust, surfaces shall be cleaned by mechanical power tools to remove mill scales unless otherwise approved by the Engineer for exposed chemical resistant paints, surfaces shall be blast cleaned to near white metal. All galvanised iron surfaces shall be pre-treated with a compatible primer according to the manufacturer's direction. Any abrasion in shop coat shall be touched up with the same quality of paint as the original coat. 2.4 <u>APPLICATION</u> 2.4.1 General The method of application shall be as recommended by the manufacturer. In case of selection of special shades and colour (not available in standard shades) the Contractor shall mix different shades and prepare test panels of minimum size 1 meter square as per instruction of the Engineer and obtain his approval prior of application of finishing paints. Proper tools and implements shall be used. Scaffoldings if used shall be independent of the surface to be painted to avoid shade differences of the freshly repaired anchor holes. Painting shall be done by skilled labours in a workmanlike manner. All materials shall be evenly applied so as to be free of sags, runs, crawls or other defects. All coats shall be of proper consistency. In case of application by brush, no brush marks shall be visible. The brushes shall be clean and in good condition before application of paint. All priming undercoats for painting shall be applied by brush only, and rollers spray equipments etc. shall not be used.		

CONSULTANT : PROCON ENGINEERS

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 458 of 549
No work shall be done under conditions that are unsuitable for production of good results. No painting shall be done when plastering is in progress or is drying. Application of paint, which seals the surfaces to moisture, shall only be done after the moisture on and below the surface has dried out. All coats shall be thoroughly dry before succeeding coat is applied. Coats of painting as specified are intended to cover surfaces perfectly. In case the surface is not covered properly by applying the specified number of coats, further coats shall be applied by the Contractor when so desired by the Engineer. All primers and undercoats shall be tinted to approximate the colour of the finishing coats. Finished coats shall be of exact colour and shade as per approved samples and all finish shall be uniform in colour and texture. All parts of mouldings and ornaments shall be left clean and true to finish. Painting on ferrous metal surface shall be done as per IS: 1477 (Part 1 & 2). The total dry thickness of the film should not be less than 120 micron. 2.4.2 White Washing The surface where white washing is to be applied shall be cleared of all loose materials and dirt. All holes and irregularities of the surface shall be filled up with lime putty and shall be allowed to dry up before application of the lime solution. One coat of whitewash shall consist of one stroke from top downwards, another from bottom upwards over the first stroke and another from left to right before the previous one dries up. Second coat shall be applied and in case the Engineer feels that one or more coats are required. No brush marks shall show on the finished surface. 2.4.3 Dry Distemper New plastered surface shall be allowed to dry for at least two months. New lime or lime cement plastered surface shall be washed with a solution of 1 part Vinegar to 12 parts water or 1:50 sulphuric acid solution and for		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-18
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 459 of 549
24 hours after which the wall shall be thoroughly washed with clean water. For cement plastered surface, the surface shall be washed with a solution of 100 gms. Of zinc sulphate to 1 litre of water and then allowed to dry. Dry distemping shall be done as per manufacturer's instruction. In applying the distempers the brush should first be applied horizontally and immediately crossed off perpendicularly. Brushing shall not be continued too long as otherwise brush marks may result. 2.4.4 Oil bound washable distemper The distemper shall be applied after surface is primed with an alkali resistant primer, and followed by minimum two coats of oil bound washable distemper all as per Manufacturer's instruction. 2.4.5 Waterproof Cement Paint Surface to be coated with cement paint shall be washed and brushed down. As soon as the moisture has disappeared, the surface shall be given one coat of paint. Care shall be taken so that the paint does not dry out too rapidly. After 4 to 6 hours, the water shall be sprinkled over the surface to assist curing and prevent cracking. After the first coat has dried (24 to 48 hours) the second coat shall be applied in a similar manner. The finished surface shall be kept moist by occasional sprinkling with water for seven days after painting. 2.4.6 Acrylic Emulsion Paint Lime gauged cement plastered surfaces shall not be painted for at least one month after plastering. A sample patch shall be painted to check alkali reaction if so desired by the Engineer. Painting shall be strictly as per manufacturer's specification.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-18

2.4.7 Synthetic Enamel Paint Shall be applied on properly prime red surface. Sub sequential coat shall not be applied till the previous coat is dry. The previous shall be lightly sand papered for better adhesion of subsequent coats. 2.4.8 Aluminium Paint The paint, supplied in two pack containers shall be mixed and applied strictly as per manufacturer's direction. When more than one coat of paint is required or indicated, the next coat shall only be applied after the previous coat become hard dry. 2.4.9 Clear Synthetic Varnish The paint, supplied in two pack containers shall be mixed and applied strictly as per manufacturer's direction The Varnish shall be applied on wood surface after (a) filling; (b) staining & (c) sealing operations are carried out. The application of a combination of filler and stain shall not be permitted. For the finishing coats of varnish, the surface shall be allowed to dry and be rubbed down lightly, wiped off and allowed to dry. Careful attention to cleanliness is required for varnishing. All dust and dirt shall be removed from the surface as well as from the neighbourhood. Damp atmosphere and draughts shall be avoided, and exposure to extreme heat or cold & dampness shall not be allowed. The varnish shall be applied liberally with a brush and spread evenly over a portion of the surface with light strokes to avoid frothing. It shall be allowed to flow on while the next section is being laid on excess varnish shall then be scrapped off the brush and the first section be crossed, recrossed and then laid off lightly. The varnish once it has began to set, shall not be retouched. In case of any mistake in application, the varnish shall be removed and the work started afresh. The varnish shall be minimum of two coats, with the first coat being a flattening varnish. This shall be allowed to dry hard and be flattened down,		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-18
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 461 of 549
before applying the next coat. Sufficient time must be allowed between coats to get a hard dry surface before next coat is applied. All work shall be as per relevant IS Code. 2.4.10 French Polish All unevenness of the surface shall be rubbed down to smoothness with sand paper and the surface shall well dusted. The pores in the wood shall be filled up with a paste of whitening in water or methylated spirit with a suitable pigment like burnt sienna or umber. After application of the filler paste, the French polish shall be applied with a pad of woollen cloth covered by a fine cloth. The pad shall be moistened with polish and rubbed hard on the surface in a series of overlapping circles so that the polish is sparingly but uniformly applied over the entire area to give an even surface. A trace of linseed oil may be used on the pad for ease of application. The surface shall be allowed to dry before further coats are applied in the same manner. To finish off, the pad shall be covered with a fresh piece of clean fine cloth, slightly dampened with methylated spirit and rubbed lightly and quickly with circular motions to leave the finished surface with a uniform texture and high gloss. 2.4.11 Chemical Resistant Paint For chemical resistant paints, epoxy, chlorinated rubber or vinyl butyl paint system shall be used manufacturer's recommendation regarding the paint system exposed to moderately severe corrosive condition and subject to acid/alkali spillage and fumes, shall be followed. 2.4.12 Epoxy coating/painting On the clean surface of concrete after properly drying of the following system is to be adopted as per manufacturers' specification: One coat of primer of following proportion to be applied over clean and dried concrete surface by brush application.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-18
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 462 of 549

ARALDITE GY 250 - 100 Parts by weight

HARDENER HY 840 - 50 Parts by weight

Over the primer, the uneven surface of concrete should be filled with levelling putty as mentioned above. The cost of putty is included in the item rate without fixing prior limit to consumption of putty. Two top coats of the protective treatment to be applied over the prepared smooth surface in the following proportion.

(a)	ARALDITE GY 250	:	100 Parts by weight
(b)	HARDENER HY 830	:	45 Parts by weight
(c)	HARDENER BY 850	:	15 Parts by weight
(d)	SILICA FLOUR	:	20 Parts by weight
(e)	FLOW CONTROL AGENT	:	2 Parts by weight

Pigment may be added if desired by Engineer. The first top coat is applied over the primer and is left to reach a tack free state. At this stage, the final top coat is applied.

2.5 PROTECTION

Furniture and other movable objects, equipments, fittings and accessories shall be moved, protected and replaced upon completion of work. All stationary equipments shall be well covered so that no paint can fall on them. Work finished by other agencies shall be well protected. All protections shall be done as per instructions of the Engineer.

2.6 CLEANING UP

In addition to provisions in general conditions the Contractor shall, upon completion of painting etc. remove all marks and make good surfaces, where paint has been spilled, splashed or splattered, including all equipments, fixtures, glass, furniture, fittings etc. to the satisfaction of the Engineer.

1.0 <u>SCOPE</u> This specification covers furnishing, installation, repairing, finishing, curing, testing, protection, maintenance till handing over of roof water-proofing, insulation and allied work for buildings and at locations covered under the scope of the Contract. 2.0 <u>INSTALLATION</u> 2.1 <u>GRADING UNDERBED</u> The surface to receive the underbed shall be roughened and thoroughly cleaned with wire brush and water. Oil patches if any shall be removed with detergent. The surface shall be soaked with water and all excess water removed just before laying of the underbed. The underbed shall not be laid under direct hot sun and shall be kept in shade immediately after laying so as to avoid quick loss of water from the mix and separation from the roof surface. The underbed shall be cured under water for at least 7 days. The underbed shall be laid to provide an ultimate run off gradient not less than 1 in 120 and as directed by the Engineer. Upto an average thickness of 25 mm the underbed shall usually be composed of cement and sand plaster. For higher thickness the underbed shall be made with cement concrete. The underbed shall be finished to receive the waterproofing treatment direct or insulation as the case may be the grading plaster shall be average 25mm thick maximum. It shall consist of cement and coarse sand in the ratio 1:4 nominal by volume. The same and cement shall be thoroughly mixed dry and then water added. Each batch of mix shall be consumed before the initial set starts The plaster shall be fully compacted to the desired grade in continuous operation. The surface shall be even and reasonably smooth.

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-19
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 470 of 549
2.2 <u>CONCRETE</u> The concrete shall be used where the sub grade is more than average 25mm thick. It shall consist of cement concrete 1:2:4 nominal mix by volume with 12mm down stone chips and coarse sand. The aggregate shall be mixed dry and minimum quantity of water shall be added to make the mix workable. The mix shall be laid to proper grade, fully consolidated and surface shall be smooth and even. 2.3 <u>INSULATION</u> The Tenderer shall along with the tender send specification of insulating materials he proposes to use and the proposed method of laying. Before bulk supply, the contractor shall send samples of insulating material to the Engineer, and after approval of the samples, the Contractor shall procure and transport the bulk material to the site. Whenever asked by the Engineer, the Contractor shall furnish test certificates from testing laboratory on the insulating and other properties of the materials. After laying the insulation the surface shall be made ready as required to receive the waterproofing treatment. If any plastering is used it shall be not leaner than 1:4 cement sand by volume and not thinner than 12mm and it shall be cured for seven days. 2.3.1 Foam Concrete This shall be of light weight foam concrete of average 75 mm thickness or as specified or as shown on drawings. This may be laid in situ in suitable panels or in precast blocks. The insulating properties shall be such that the thermal conductivity shall not exceed 0.125 Kcl m/m degree C. The weight of the insulating material shall be from 0.3 to 0.5 gm/cm. Before starting the laying of foam concrete samples shall be prepared at site and got tested for approval of the Engineer. The foam concrete laid shall be sufficiently strong to make the usual work load and standard loads expected on the roof. Any damaged portion shall be removed and replaced forthwith. Approval of the Engineer shall be taken before laying the waterproofing over the insulation.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-19
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 471 of 549
While laying the foam concrete, samples from each batch of the mix shall be kept for test if so desired by the Engineer. 2.3.2 Expanded Polystyrene Blocks The expanded polystyrene block insulation shall be fire retardant quality and shall have a maximum thermal conductivity of 0.026 KCl m/m degree C. It must be strong enough to withstand without deformation the workload and standard loads expected on the roof. The Contractor shall lay the expanded polystyrene block as per manufacturer's approved specification. Only specifically experienced workers shall be used for this work. If the Engineer is not satisfied about the efficiency of the workers the Contractor shall have to secure manufacturer's supervision. Either of above items (cl. No. 2.3.1 or 2.3.2) can be adopted subject to approval of engineer. 2.4 <u>FILLETS</u> Fillets at junction of roofs and vertical walls shall be provided with the same insulating material as provided for the main roof insulation. The fillets shall be 150 mm x 150 mm in size unless otherwise shown on drawings or instructed by the Engineer. Where there is no insulation over roof slab, fillets shall be cast-in-situ cement concrete (1:2:4) nominal mix by volume. 2.5 <u>WATER PROOFING BY EPOXY RESIN BASED APPLICATION</u> Exposed surfaces of cement concrete, lime concrete or brickwork to be treated for waterproofing by the resin based application shall be thoroughly cleaned and the epoxy resin based material to be applied as directed by the manufacturer. The material shall not have any adverse effect on the surface on which it is applied and must stick to it uniformly to make a strong durable bond. It shall not be affected by short duration from fire, sun, light traffic. The application shall be resistant to growth of fungus and		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-19
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 472 of 549
proof against saltpetre action. If desired by the Engineer, a sample shall be prepared in advance and tested for water proofness for 48 hours under 300 mm depth of standing water. The Contractor shall arrange the demonstration by providing free the materials and labours for the application.		
2.6	<u>FLASHING</u> Unless otherwise stated flashing shall be done in the same way as the water proofing except that the last layer, instead of being finished with pea- sized gravel, shall be finished with two coats of bituminous primer. The flashing shall be extended up the vertical surfaces as shown on drawing. The flashing shall end in grooves in vertical walls. The grooves shall be at least 65 mm deep and caulked with waterproof of mastic cement. The minimum overlap with horizontal roofing felt shall be 100 mm. Where specified on drawings or directed by the Engineer, metal flashing shall be provided. The metal flashing shall be done as shown on the drawings. The materials shall be 18g or 22g G.I. sheets, as specified on the drawings and/or as directed by the Engineer.	
2.7	<u>ELASTROMERIC MEMBRANE</u>	
2.7.1	Primer Coat It shall consist of polyurethane (P.U.) or any other equivalent material. Primer coat shall be a special blend of moisture curing urethane pre-polymers in solvent. A single coat of this primer shall be applied by brush /spray with airless pray equipment over the prepared bed as an adhesion coat with an application rate of 6-8 q.m per litre depending on the surface porosity. The primer shall be allowed to dry for a minimum period of 2 to 4 hours time before the successive finishing coats of P.U. liquid membrane are applied. In any case successive finishing coat shall be applied within 24 hours.	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-19
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 473 of 549
The substrate shall be properly prepared by removing all loose materials by vigorous brushings, fungal growth with proprietary fungicide as recommended. Priming coat shall not be applied to damp substrate. 2.7.2 Finishing Coats The finishing coats shall consist of two successive liquid coatings of high solid content urethane pre-polymers material to form an elastomeric membrane. Application shall be with brush or spray to form a uniform jointless elastomeric membrane. The overall dry film thickness shall be 1.5 mm subject to minimum 750 gm per sq.m per coat application rate. Each coat shall be allowed to dry for minimum 12 hours before applying the next coat. The surface should be dry and smooth before application. The coating shall be continued up the parapets/walls for minimum of 150 mm over the finished roof surface or fillet with suitable tucking into the vertical wall surface. It shall be continued into rain water pipes by at least 100 mm. The final coat of PU liquid when tacky shall be sprinkled with the sand. For edges, expansion joints and any vulnerable points a layer of polyscrim cloth/fabric are to be embedded between 2 finishing coats. The entire work shall be carried out under the supervision of approved authorized agency. 2.7.3 Surface Finish Areas of roof treatment shall be provided with wearing course consisting of minimum 25 mm thick PCC 1:11/2:3 (using 12.5 mm size aggregate) cast in panel of maximum size of 1.20 m x 1.20 m and reinforced with 0.56 mm diameter galvanized chicken wire mesh and sealing of joints using sealant or elastomeric compound.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 474 of 549
When the roof surface is subjected to foot traffic or used as a working area, a cement mortar (1:4) shall be applied over the top most layer of roofing treatment. Over this, a layer of chequered cement concrete flooring tiles conforming to IS:13801 shall be provided. The tiles shall be laid as per IS1443. 2.8 <u>WATERPROOFING WITH APP MODIFIED BITUMINOUS MEMBRANE</u> The RCC roof waterproofing with pre-fabricated APP (atactic polypropylene) modified waterproofing membrane with non woven polyester reinforcement treatment of 4 mm thickness, consisting 160 gsm high Molecular high- density non-woven polyester core, coated on both sides with APP modified bitumen which shall have high penetration, high heat resistance and high softening point. It should also achieve good bonding with substrate and a strong adhesion between overlaps. This polymeric Asphaltic mix shall be protected on the bottom with thermo fusible HMHDPE film, on the top with another layer of HMHDPE. The resultant membrane shall have very good elongation to absorb all structural movements. The cement sand plastered surface on foam concrete is first cleaned to eliminate all sharp projections. Suitable bituminous primer @ 0.27L/SQ.M. (IS:3384) is then coated on the surface. APP modified water proofing roll is unrolled over coated surface is first cleaned (with overlaps of 10cm) and bonded completely to the substrata. The overlaps & complete bottom are then thermo-fused by flame. Special care is taken at singularities such as drains , expansion joints etc. 2.9 <u>SURFACE FINISH</u> 18 mm thick cement sand mortar (1:4) with chicken wire mesh interposed shall be laid over water proofing treatment. Over this, a layer of chequered cement concrete flooring tiles conforming to IS:13801 shall be provided .The tiles shall be laid as per IS :1443. 3.0 <u>ACCEPTANCE CRITERIA</u> The surface level shall be such as to allow quick draining of rains without leaving any pool anywhere. The finishing course shall be fully secured and shall have an even density. There shall not be any bubble formation or

1.0 <u>GENERAL</u> 1.1 <u>DESCRIPTION</u> 1.1.1 Work included: This section covers the furnishing and installation of sandwich/double skin/single skin metal cladding with insulation for wall/roof as shown in contract drawings including making cut outs for various openings for doors, windows, ducts, pipes etc and fixing of such components with the cladding arrangement with necessary flashing, sealant as required as per contract drawings. The contractor shall furnish all labour, materials, tools and equipment required to complete the work. 1.2 <u>APPLICABLE CODES AND STANDARDS</u> 1.2.1 The following codes and standards are intended to provide an acceptable level of quality for materials and products. The contractor may propose alternative codes and standards provided they give an equivalent degree of quality as the referred codes and standards and are submitted for consultants/owner's approval. 1.2.2 ASTM - American Society for Testing Materials. (a) A446 Zinc-coated (Galvanized) steel sheets of structural quality Coils and cut lengths (b) A611 Steel, cold rolled sheet 1.3 <u>SUBMITTALS</u> 1.3.1 The contractor shall submit to the owner the following items for review before commencing work. (a) Samples (i) Three 300 x 300 mm pieces of each type of precoated and preformed metal sheet for top skin and bottom skin.

(ii) Three 300 x 300 mm pieces of each type of precoated and preformed metal sheet (iii) Type of insulation proposed for use and its thickness. (iv) Fabricated sandwich metal cladding. Sample size shall be 300 x 300 mm three nos. (v) Edge sealing and flashing. (b) Manufacturer's literature indicating the nature of preformed profiled, colour coating, manufacturer's recommended installation, instructions and maintenance procedure. (c) Manufacturer's certification of compliance with each delivery. (d) Shop Drawings Showing fabrication details of sandwich/double skin/single skin metal cladding with Insulation, preformed sheet profile and total colour thickness for profiled top skin and slightly ribbed bottom skin, thickness and nature of insulation, installation and erection, anchorage, fasteners and details of accessories, metal flashing and its fixing including various openings for doors, windows, louvres, pipes etc. 1.3.2 Test Reports Two copies of Test Reports and Source of Quality Control Tests. 1.3.3 Supplier Certificates Two copies of technical data showing that the proposed finish product is suitable for the environmental conditions of the job site and that the materials meet specification requirements.

1.4

PRODUCT HANDLING

1.4.1

Delivery of Materials to job site in manufacturer’s original unopened packaging.

1.4.2

Identify contents with name of manufacturer, brand name, thermal value and applicable standard.

1.4.3

Store materials in an area protected from adverse climatic conditions, moisture and open flame or spark and shall be stored off the ground with one end elevated for drainage. The sheets shall be protected from inclement weather with a waterproof covering with ventilation to avoid condensation.

2.0

PRODUCTS

2.1

GENERAL

2.1.1

All goods and products covered by these specifications shall be procured from manufacturer duly approved by the owner.

2.1.2

Cladding material shall be of “Rib and Flute” design to ensure wide spanning and quick recovery after being subjected to excessive load. Single skin materials shall be interlocking type 150mm wide strip.

2.1.3

Material shall be prefabricated panel shall be conformed to relevant ASTM or alternative codes and standard. Troughed galvanized M.S. sheets having 0.6 mm minimum base metal thickness (bare material) with minimum rate of galvanization of 275 gms./sq.m. as per IS-277 of minimum yield strength of 250MPa as per IS-513(or High tensile steel sheet coated with zinc aluminium alloy @ 150 gms./sq.m. of 0.5 mm minimum base metal thickness and having minimum yield strength of 350 MPa, as per AS-1397) shall be used for the cladding system.

2.1.4

The outer side (exposed face) shall be permanently colour coated with Silicon modified polyester paint of minimum DFT 20 microns over primer, of approved colour/shade and the inner side (internal face) shall be coated with same paint of minimum DFT 20 microns over primer of off-white shade

2.1.5 2.1.6 2.1.7 2.1.8 2.1.9	Roof insulation shall have a minimum R-value of 2.083 M² °K/Watt. Thickness of sandwich cladding shall be as required to meet the specified “R” values. Sandwich material shall be of “Rib and Flute” design to ensure wide spanning and quick recovery after being subjected to excessive load. Double skin materials shall be interlocking type 150mm wide strip and inner sheet shall be mild rib & flute type profile to ensure quick recovery after being subjected to excessive load. Material (a) Base Material : High tensile steel (b) Metal protection : Galvalume (c) Organic coating : Silicon Modified Polyester (SMP) Fluoro polymer (PVF2) and plastisols to resist aggressive climate of the jobsite. Material shall be prefabricated sandwich panel with polystyrene insulation /high density rock wool slab insulation shall be conformed to relevant ASTM or alternative codes and standard. Insulation shall be bonded to steel sheet with industrial grade adhesive. Sheeting material shall be preformed and precoated profile sheeting of thickness 0.60 mm or as recommended by manufacturer to resist the climate of the jobsite for Top skin (Weather side) and Bottom skin or inner side slightly ribbed type and minimum 0.5 mm thick or as recommended by manufacturer of similar pre coated panel Insulating core shall vary from 25 mm to 100 mm thick according to the climatic requirement of the site and shall be either polystyrene block or rock wool slab made to profile of the sheet. The maximum density shall be 32.35 Kg/ M³ for polystyrene and shall have minimum R-value 2.083 M² °K/Watt.

2.1.10 Panel size shall be largest available size. 2.1.11 Warranty for precoated profiled metal sandwich /double skin cladding shall be for a minimum period of 40 years. 2.1.12 Sealants Penetration and end laps in sheeting shall be sealed with a non-hardening approved sealant as recommended by the manufacturer. 2.1.13 Profile HDPE Filler (a) Profile HDPE Filler shall be die cut in profile to match the profile of the sheet. (b) Metal flashing shall be of similar material and colour of top skin. 3.0 <u>DOUBLE SKIN INSULATED METAL CLADDING</u> 3.1 <u>GENERAL</u> 3.1.1 Metal cladding may be of double skin separated by an approved insulation in between. External sheet shall be of interlocking type. 3.1.2 Double skin wall cladding shall be comprising of 150F external panels manufactured out of 0.6 mm TCT (Total coated thickness) aluminium alloy AA3105/5050 with stove enamelled coil coated finish, sufficient to withstand most aggressive climate, on both sides of approved shade. The 150mm wide panels (150F) shall be clipped on to the concealed runners and shall be interlocked with each other. The inner sheeting shall be Hi Rib 0.5mm TCT silicon modified polyester coated galvalume steel (AZ 150 gsm aluminium- Zinc alloy meta metallic coating of total 550 Mpa yield stress as per AS-1397). The external panels shall be 150mm wide 17mm deep. The inner sheet shall have 1000-1020 mm cover width 28-30 mm high crests @250-255mm c/c with side laps. The inner sheet shall be fixed to structural system by means of corrosion protected self-drilling, self-tapping fasteners. The sub girts of size 50mmx50mmx50mm manufactured out of 16 G G.I (1.6mm) 'Z' shape shall be fixed to inner sheeting on face side at purline		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

locations. The external panels shall be fixed with the help of concealed runners 34.5 wide x48mm deep out of 0.95 mm thick aluminium strip with cut outs to hold the panels in a module of 150mm at 1600mm c/c and fastened on side girts. The runners shall be concealed and no fasteners are to penetrate the panels. An insulation of 50mm thick resin bonded fiberglass roll insulation of density 16kg/m³ shall be fixed in the cavity between two sheets. Contractor shall make cut out of doors, windows, louvres, pipe, ducts or other cut outs as required as per contract drawings along with flashing, leak proof sealing etc as required for these cut outs/wall openings. 4.0 <u>EXECUTION</u> 4.1 <u>INSPECTION</u> 4.1.1 The contractor shall examine the area, which will be covered, and the masonry wall where the edge of the sandwich/double skin/single skin cladding will be fixed and the structural alignments. 4.1.2 Contractor shall correct any unsatisfactory conditions prior to start of work. 4.2 <u>INSTALLATION</u> 4.2.1 Sandwich / metal permanently coated panel shall be fixed over structural members with joints overlapped and fastened using stainless steel fasteners self-drilling type or as recommended by the manufacturer. 4.2.2 Double skin /single skin wall cladding shall be installed strictly as per manufacturer specification and details. 4.2.3 All end laps of profiled sheeting and joints of flashing shall be sealed properly with non-hardening natural cure silicon sealant or as recommended by the manufacturer. 4.2.4 Accessories like fasteners, tape, and foam fillers, flashing etc. as required shall be provided as per recommendation of manufacturer. 4.2.5 The external panels shall be fixed with the help of concealed runners aluminium strip with cut outs to hold the panels and fastened on side girts. The runners shall be concealed and no fasteners are to penetrate the panels.

1.0 <u>SCOPE</u> This section includes supply of all materials, labour and incidentals for water supply for residential, business and industrial and other types of buildings. The water supply system of a building or premises covers service pipes and the necessary connecting pipes, fittings, control valves and all appurtenances in or adjacent to the building or premises. 1.1 <u>MATERIALS</u> All materials, fittings, fixtures and appliances shall be of the best quality conforming to relevant Indian Standard and shall be procured from approved manufacturers. Unless specifically allowed by the Engineer, the Contractor shall submit samples of fittings and fixtures which will be retained by him for comparison when bulk supplies are received at the site. Ultimate choice of type, model and manufacturer lies completely with the Engineer. It shall be the responsibility of the Contractor to procure the materials selected by the Engineer. Hence order is to be placed with the manufacturers in time, so that the materials are available at the site well ahead of their requirement. The materials brought to the site, shall be stored in a separate secured enclosure away from the building materials. Pipe threads, sockets and similar items shall be specially protected till final installation. Brass and other expensive items shall be kept under lock and key. Fragile items shall be checked thoroughly when received at the site and items found damaged shall not be retained at the site. 1.2 <u>PIPES AND PIPE FITTINGS</u> Under scope of this specification, pipes and pipe fittings may be any or a combination of the following types : (a) Cast Iron (b) Steel: lined, coated with bituminous composition, out coated with

cement concrete or mortar or galvanised. (c) Reinforced Concrete (d) Priestesses Concrete (e) Lead (Not to be used for potable water) (f) P. V. C. (g) Copper (h) Brass (i) Wrought iron 1.3 <u>WATER RESERVOIRS</u> Water reservoirs like pressed steel tanks and G.I. tanks shall come under scope of this specification. Reservoirs made of concrete masonry or fabricated steel shall be covered by respective work specifications. 1.4 <u>RELATED WORKS</u> All works, like earthwork, masonry, concrete, steelwork, cutting holes, chases, repairs and rectification associated directly with installation of water supply systems shall come under scope of the Contractor unless specifically excluded. 1.5 <u>REGULATION</u> The work which is required to be carried out under the scope of this section, shall be executed by a licensed plumber only (engaged by the Contractor) and he shall obtain all necessary sanctions, permissions, certificates etc. from Municipal and/or other Local Authorities and shall abide by all the rules of such Authorities.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 495 of 549
2.0 <u>INSTALLATION</u> While basic layouts may be available in the drawings provided by the Owner, the details might have to be supplemented by the Contractor for approval of the Engineer. Special attention shall be given by the Contractor to economy. Symmetry of layout is very important. Fittings meant for operation shall be located and oriented to allow easy reach and operation. Maintenance, repairs and replacements of pipes, fittings and fixtures must be conveniently possible. 2.1 <u>PIPE LINES</u> 2.1.1 Laying In addition to fulfilling the functional requirements all pipelines shall be laid true to line, plumb and level. Any deviation shall need approval of the Engineer. Meticulous care shall be taken to avoid chances of airlock and water hammer. Pipes shall be laid on continuous unyielding surface or on reliable supports at least one near each joint and spacing as directed by the Engineer. The support must be strong, neat and shall have provisions for securing the pipes in every direction and easy maintenance. Pipes shall be encased or concealed in masonry or concrete if shown on drawing or directed by the Engineer. 2.1.2 Back Flow The layout of pipe work shall be such that there is no possibility of back flow towards the source of supply from any cistern or appliances, whether by siphonage or otherwise. All pipe works shall be so laid or fixed and maintained as to be and to remain completely water-tight, thereby avoiding waste of water, damage of property and the risk of contamination of the water conveyed.		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-21
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 496 of 549
2.1.3 Contamination There shall be no cross connection whatsoever between a pipe or fitting for conveying or containing wholesome water and a pipe or fitting for containing impure water or water liable to contamination or of uncertain quality of water which has been used for any purpose. No piping shall be laid or fixed so as to pass into or through any sewer, scour outlet or drain or any manhole connected therewith. 2.1.4 Underground Pipings Underground piping shall be laid at such a depth that it is not likely to be damaged by traffic and other loads and frost, where applicable. The size and depth of the trench shall be as approved by the Engineer. Back-filling shall be done with selected fine earth, unless otherwise permitted in 150 mm layers and carefully consolidated. Special care shall be taken while filling in the vicinity of the pipe to avoid damage. Before backfilling the laid pipe shall be fully tested and approved. Where the pipe rests on rock it may be bedded on a layer of fine selected material or concrete to avoid local point support. The trench shall be so treated by gradient and filling in the area that it does not act as a drainage channel. 2.1.5 Concealed Piping Where desired by the Engineer or shown on the drawings the pipes shall be concealed in masonry or concrete of the structure. The Contractor may co-ordinate with the building Contractor for leaving the chases, openings, conduits as necessary. However, the Contractor will rectify if required the chases, openings and conduits, supplement and make good after laying and testing of the concealed pipelines.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-21
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 497 of 549
2.1.6 Jointing of Pipes Jointing of pipes shall be completely leakproof and durable. Instruction of them manufacturer shall be followed unless desired otherwise by the Engineer. However, usually recommended practices are stated below for guidance: (a) Cast Iron (i) Spigot and Socket Joints Lead joint : The joint is made by first caulking in clean spun yarn upto half depth and filling the reminder by running in molten lead taking care that no dross enters the joint and then thoroughly caulking the lead. The lead need not extend into the joint further than the back of the groove formed in the socket. After completing the joint it shall not be allowed to move. For rectification the joint shall be completely redone. (ii) Flanged Joints : Flanged joints shall be made by jointing rings of good quality, smooth and hard compressed fibre board of thickness not less than 1.5 mm and of such width as to fit inside the circle of bolt. Diagonally opposite bolts shall be tightened in pairs and in stages so that degree of all bolts in a joint are similar. Damaged gaskets shall be replaced. (b) Steel Plain ended steel pipes may be jointed by welding. Screwed and socketed joints shall be carefully tightened. Care shall be taken to remove any burr from the ends of the pipes. Jointing compound, if used, shall be lead free and approved by the Engineer. Once a joint has been screwed up it shall not be backed off unless threads are reclined and new compound applied.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-21
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 498 of 549
(c) GI Pipes Threads shall be cut with sharp tools, and before jointing all scales shall be removed from pipes by suitable means. The screw / threads of the pipe shall be cleaned out and the joint made by screwing the fittings after treating the threads with approved pipe jointing compound. Once a joint has been screwed up it shall not be backed off unless threads are recleaned and new compound applied. (d) Lead Lead and lead alloy pipes shall be jointed with wiped solder joints. (e) Concrete Concrete pipes may be socket and spigot ended collar or band jointed. Joints shall be effected by caulking with 1:3 cement sand mortar. (f) P. V. C. Manufacturer's instruction shall be followed. For heating approved equipment with adequate control shall be used. (g) Tyton Joint The manufacturer's instruction shall be strictly followed in making such joints. Tyton joints shall be made by push-on type specification stipulated by the pipe manufacturer. The tools specified by the pipe manufacturer shall be used to secure the joint fully. 2.1.7 Painting Where mentioned in the Schedule, underground steel and cast iron pipes shall be given 2 coats of bituminous paint on the outside after laying, when painting is to be done above ground G.I. pipes shall be given a coat of zinc chromate primer, C.I. and M.S. pipes shall be given one coat of red lead		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-21
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 499 of 549
or zinc chromate primer. Top coats shall be minimum 2 coats of best quality paint. 2.2 <u>STORAGE TANK - PRESSED STEEL TANK</u> Unless otherwise mentioned, water storage tanks shall be pressed steel tanks of nominal size and capacity as mentioned in the Schedule and fabricated with all flanges external, all flanges internal, or bottom flange internal and side flanges external, as shown on drawings or schedule of items. The fabricator shall supply 6 prints of fabrication drawings to the Engineer for prior approval showing thickness of plates, method of jointing the plates, all supports, stays, gussets etc. Pads, cleats etc. required for supporting the tanks shall be supplied by the manufacturer. Inlet, overflow vent pipes, manholes etc. shall be arranged and provided as shown on \ drawing or mentioned in the schedule. Unless otherwise specified, the outlet pipe shall be 50 mm above the bottom of the tank and there shall be a 150 mm free board at the top of the tank. All tanks shall be supplied with mosquito-proof covered top with manhole not less than 450 mm diameter. Tanks deeper than 1.00 Metre shall be provided with m.s. Internal access ladder adjacent to the manhole. Water level indicator shall be provided if asked for. Two coats of anti-corrosive paint over a suitable primer shall be applied to both internal and external surface of tanks. Such paint if used shall not impart any taste or odour to water and be of lead free composition. Erection of tanks shall be in accordance with detailed drawings and manufacturer's instructions. The two finishing coats of paint shall be applied to outside after erecting is complete. 2.2.1 G. I. Water Tank G. I. water tanks shall be procured from a reputed manufacturer. The design shall be good enough to withstand the loads safely. Galvanised iron water storage tank shall be made of minimum 2 mm thick galvanised iron sheet. Plain sheets shall be fixed at the corner to angle iron frames by means 6 mm rivets at 40 mm pitch for tanks upto 1000 litres capacity and 8 mm rivets at 35 mm pitch for tanks above 1000 litres capacity. Tanks above 1000 litres shall have 20 mm dia. galvanised / iron stay rods, one fixed to		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-21
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 500 of 549
angle framing at top and two in the body of the tank for extra strength. Holes for riveting shall be drilled and not punched. White lead shall be applied to the joints before riveting. In case it is desired by the Engineer that corners of tank should be welded instead of riveted then the sheets shall be welded to form a tank will not have angle iron frame. Tanks shall have 400 mm dia. holes at the top with hinged covers. The covers shall be made of galvanised iron sheet with angle iron frame. The cover shall be just loose but close fitting to keep out dust and mosquito and will not be airtight. It shall be complete with lockable arrangement. Tanks shall be provided with rising main inlets of 40 mm dia. galvanised iron pipe or as shown on Drawing and 25 mm dia. G.I. overflow pipe. The rising main shall be connected to the tank with a ball valve near the top which disconnects the supply when tank is full up to the point of overflowing. The ball valve permits the entry of water when the tank is empty and disconnects the supply when the tank is full. It consists of a hollow floating ball made of copper, plastic or hand Tubers, 110 mm in diameter, attached to an arm which is so pivoted that the end near the pivot closes the orifice of the main when the ball is raised to the required height of water in the tank and opens the main as soon as the ball drops with the fall of water level as it is drawn off through the distribution pipes. The ball valve shall be fixed to the tank independent of the inlet pipe and set in such a position that the body of the ball valve cannot submerge when the tank is full upto the water line. The ball valve shall be so adjusted as to limit the level of the water line. The level of the water in the tank to 75 mm below the lip of the overflow pipe. Free surface shall be about 150 mm above the maximum water filled level. 2.3 <u>VALVE, COCKS, TAPS</u> All valves, stop cocks, taps etc. shall conform to relevant Indian Standard Specification and shall be of best quality from approved manufacturers.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-21
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 501 of 549
These shall be suitable for working pressures mentioned in the Schedule. Nominal size and material shall be as per schedule.		
2.4	<u>PROTECTION</u> Open end of each pipe shall be protected during installation by suitable covers or plugs so that the ends, threads, sockets or spigot are not damaged and no foreign material can find its way into the pipe line. Fittings and fixtures liable to be misused or stolen during the construction phase shall be fitted only before testing and handing over.	
3.0	<u>TESTING AND ACCEPTANCE</u>	
3.1	<u>INSPECTION BEFORE INSTALLATION</u> All pipes, fittings and appliance shall be inspected, before delivery at the site to see whether they conform to accepted standards. The pipes and fittings shall be inspected on site before laying and shall be sounded to disclose cracks. Any defective items shall be clearly marked as rejected and forthwith removed from the site.	
3.2	<u>TESTING OF MAINS AFTER LAYING</u> After laying and jointing, the main shall be slowly and carefully charged with water, so that all air is expelled from the main by providing a 25 mm inlet with a stop cock, allowed to stand full of water for a few days if time permits, and then tested under pressure. The test pressure shall be 5 Kg/CM² or double the maximum working pressure, whichever is greater. The pressure shall be applied by means of a manually operated test pump, or in the case of long mains or mains of a large diameter, by a power driven test pump, provided that the pump is not left unattached. In either case due precaution shall be taken to ensure that the required test pressure is not exceeded. Pressure gauges shall be accurate and shall preferably have been recalibrated before the test. The pump having been stopped, the test pressure shall maintain itself without measurable less for at least five minutes. The end of the main shall be closed by fitting a water-tight expanding plug and the plug shall be secured by struts to resist the end thrust of the water pressure in the mains.

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-21
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 502 of 549
3.3 <u>TESTING OF SERVICE PIPES AND FITTINGS</u> The service pipes shall be slowly and carefully charged with water allowing all air to escape avoiding all shock or water hammer. The service pipe shall then be inspected under working conditions of pressure and flow. When all draw-off taps are closed, the service pipes shall be absolutely water-tight. All piping, fittings and appliances shall be checked for satisfactory support and protection from damage, corrosion and frost. 4.0 <u>I.S. CODES</u> Important relevant IS Codes for this Specification are listed below : Latest editions shall always be consulted. (a) IS:2065 : Code for Practice for water supply in buildings (b) IS:1172 : Code of basic requirements for water supply, drainage & sanitation (c) IS:1200 : Laying of water and sewer lines including appurtenant items. (Pt. XVI) (d) IS:1239 : Specification for Mild Steel Tubes and Mild Steel Tubulars and other wrought steel pipe fittings (10 mm to 15 mm nominal diameter) (Pt. I & II) (e) IS:1536 : Specification for Centrifugally cast (Spun) iron pressure pipes for water gas and sewage (f) IS:1537 : Specification for vertically cast iron pressure pipes for water, gas and sewage. (g) IS:3486 : Specification for Cast iron spigot and socket drain pipes (80 mm to 250 nominal diameter) (h) IS:3589 : Specification for Electrically welded steel pipe for water, gas and sewage (200 mm to 2000 mm nominal diameter) (i) IS:784 : Prestressed concrete pipes

1.0 <u>SCOPE</u> 1.1 This section covers the layout and construction of drains for roof water, surface water and sewage together with all fittings and fixtures and inclusive of ancillary works, such as connections, manholes and inspection chambers used within the building and from the building to the connection to a public sewer or to treatment work, septic tank and soak pit dispersion trenches. 2.0 <u>INSTALLATION</u> 2.1 <u>GENERAL</u> All pipe lines, locations of fittings and fixtures, etc. shall be as per drawings or as directed by the Engineer. Correctness of lines, plumb, orientation, symmetry and levels shall be strictly ensured. All items shall be fully secured against movement in any direction and so located as to allow easy maintenance. All pipe lines, fittings and fixtures shall be installed leak proof. When the works under scope of this specification linked up with works executed by others, the connections shall be such as to prevent any splashing or spilling or emission of foul odour and gases. 2.2 <u>RAINWATER DOWNCOMERS</u> Rainwater down comers shall be standard Cast Iron Pipes. In case where specifically desired, M.S. pipes may also be used. M.S. pipes shall be painted outside with two coats of anticorrosive paints under a coat of primer. Rainwater downcomers shall run along and be secured to walls, columns etc. where desired by the Engineer these may have to be installed in chases cut in the structure All pipes shall be well secured and supported by adequately strong brackets.

The brackets may be wrought iron clevis type, split ring type or perforated strap iron type as approved by the Engineer. For vertical runs each pipe shall hang freely on its brackets fixed just below the socket. Suitable spacer blocks shall be provided against the vertical surface to which the pipe is fixed. All bends and junctions shall be supplied with watertight cleanouts. Roof and floor drains and yard gullies shall be installed, if required, by cutting into the structure and grouted with 1:2:4 cement concrete. All gutters shall be provided with removable gratings. All horizontal pipes shall have a minimum fall of 1 in 100. 2.3 <u>GUTTERS</u> The gutters shall be made of G.I. All gutters shall be supplied by reputable specialised firms. Each section shall be sufficiently rigid, edges and corners straight and the slopes perfectly uniform. G.I. gutters shall have the edges strengthened by suitable means. Unless noted otherwise the gutters shall have a minimum fall of 1 in 120. Adequate number of string supports shall be provided so that there is no reflection even when the gutter is full. Each joint must have a support. Unless otherwise specified the supports shall be fabricated M.S. brackets. All junctions shall be thoroughly watertight. The joints may be made by rivetting, bolting or soldering. All joints between successive lengths of gutters shall have an overlap of at least 5 cm. The drop in the overlap shall always be in the direction of the fall of the gutter. Ends of gutters shall be closed watertight. Junction with rainwater down comers shall be made fully watertight and secured. 2.4 <u>SOIL AND DRAINAGE PIPES</u> 2.4.1 Gradients If not specified the minimum gradients of soil and drainage pipe line shall be as follows.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-22
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 511 of 549
(a) 100 mm nominal dia : 1 in 35 (b) 150 mm nominal dia : 1 in 65 (c) 230 mm nominal dia : 1 in 120 (d) 300 mm nominal dia 1 in 200 2.4.2 Relation with water supply pipe lines Unless specifically cleared by the Engineer, under no circumstances shall special drainage and soil pipes be allowed to come close to water supply pipelines. 2.4.3 Laying Each separate pipe shall be individually set for line and for level. Where lengths of sewer or drain pipes are laid in trench, properly painted sight rails shall be fixed across the trench at a height, equal to length of the boning rod to be used, above the required invert level of the drain or sewer at the point where the sight is fixed. More sight rails shall be required at manholes, change of gradient and intermediate positions if the distance for sighting is more than 50 ft. apart. The excavation shall be boned in at least once in every 6 ft. The foot of the boning rod shall be set on a block of wood of the exact, thickness of the wall of the pipe. Each pipe shall be separately and accurately boned between sight rails. 2.4.4 Support and Protection on Pipelines All pipes shall be laid with sockets leading uphill. Preferably the pipe shall rest on solid and even foundations for the full length of the barrel. However, the pipe manufacturer's instruction as approved by the Engineer shall be followed in the matter of support and jointing. To achieve full and continuous support, concrete for bedding and packing is the best. Where pipes are not bedded on concrete, the floor shall be left slightly high and carefully placed so that the pipe barrels rest on undisturbed ground. If anywhere the excavation has been carried too low		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 512 of 549
packing shall be done in concrete. Where laid on rock or very hard ground which cannot be easily excavated to a smooth surface, the pipes shall be laid on a cradle of fine concrete floor of gravel and crushed stone overlaid with concrete or on a well consolidated gravel and crushed stone bed as desired by the Engineer. PVC or similar pipes shall be laid directly on stable soil and packed with selected soil. The minimum support and protection for glazed stoneware pipes shall be as follows: - When cover is less than 2 metre below ground level and where pipes are unavoidably exposed above ground surface, the pipes shall be completely encased or surrounded with concrete. - Where pipes are laid on soft soil with the maximum water table laying at the invert of the pipe, the sewer shall be bedded on concrete. - Where the pipes have to be laid on soft soil with the maximum water table rising above the invert of the pipe, but below the top of the barrel, the pipe sewer shall be haunched. - Where maximum water table is likely to rise above the top of the barrel or wherever the pipe is laid on soft soil the pipe sewers shall be completely encased or surrounded with concrete. Cast iron pipes and concrete pipes may be supported on suitable concrete or brick support, where specified. The supports shall be unyielding and strong enough. At least one support shall be located close to ends. Spacing of intermediate supports shall be as decided by the Engineer. Pipes shall be secured to the supports by approved means. Anchoring of pipes where necessary shall be achieved by suitable concrete encasing designed for the expected thrust. 2.4.5 Entry into structures For entry of the pipe lines into any building of structure suitable conduits under the structure or sleeves shall be used. The conduits and sleeves shall

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-22
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 513 of 549
be such as to allow easy repairs and replacement of the pipes. When openings or chases are required to be made in the structure for entry of pipe lines, locations and sizes shall be marked and checked by the Engineer. After laying of the pipeline the openings and chases shall be mended.		
2.4.6	Ducts	
Where solid, waste and ventilating pipes are accommodated in ducts, access to cleaning areas shall be provided. Connection to drain shall be through a gully with sealed cover to guard against ingress of sewer gas, vermin or backflow.		
2.4.7	Traps and Ventilating Pipes	
Pipes are carrying off the waste from water closets and waste water and overflow water from baths, wash basins, sinks to drains shall be trapped immediately beneath such fixtures. Traps shall have minimum water seal of 50 mm and shall be ventilated whenever such ventilation is necessary to maintain water seal of the trap.		
Ventilating pipes shall be carried up vertically from the drain to a height of at least 600 mm above the outer covering of the roof of the building or as shown on drawings. All vertical ventilating, anti-syphonage and similar pipe shall be covered on top with a cowl. The cowl shall be made of C.I. unless desired otherwise by the Engineer.		
2.4.8	Manhole and Inspection Chambers	
The maximum distance between manholes shall be 30 meter unless specially permitted otherwise. In addition, at every change of alignment gradient or diameter there shall be a manhole or inspection chamber. The distance between manhole or inspection chamber and gull chamber shall not exceed 6 metre unless desired otherwise.		
Manhole shall be constructed so as to be watertight under test. The bending at the sides shall be carried out in such a manner as to provide no lodgement for any splashings in case of accidental flashing of the chamber. The channel or drain at the bottom of chamber shall be plastered with 1:2 cement, sand mortar and finished smooth to the grade. The channels and drains		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-22
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 514 of 549
shall be shaped and laid to provide smooth flow. Connecting to existing sewer lines shall be through a manhole. Manholes shall be provided with standard C.I. covers. The covers shall be close fittings so as to prevent gases from coming out. Suitable heavy duty covers shall be used where necessary as decided by the Engineer. 2.4.9 Cutting of Pipes Manufacturer's instructions shall be followed for cutting of pipes where necessary. Suitable and approved tools shall be used for the cutting so as to leave surface clean and square to the axis of the pipe. 2.4.10 Jointing Jointing of laid pipes shall be so planned as to avoid completely any movement or strain to the joints already made. If any joint is suspected to be damaged it shall be opened out and redone. with the floor. Rod holes made in the channel up to the ground level 150 mm apart and the chemical emulsion poured along the channel at the rate of 7.5 litres per square meter of the vertical wall or column surface. The soil should be tamped back into place after this operation. All joints between pipes, pipes and fittings and manholes shall be gas-tight when above ground and water-tight when underground. Method of jointing shall be as per instructions of the pipe and fittings manufacturer and as approved by the Engineer. However, in the absence of any instruction available from the manufacturer the methods as detailed hereunder shall be used. (a) Cast Iron Pipes Socket and spigot pipes shall be jointed by the cast lead joints. The spigot shall be centered in the socket of the next pipe by tightly caulking in sufficient turns of tarred gasket or hemp yarn to have unfilled half the depth of socket. When the gasket or hemp yarn has been caulked tightly a jointing shall be placed round the barrel and tightened against the face of the socket to prevent airlock.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-22
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 515 of 549
Molten lead shall then be poured in to fill the remainder of the socket and caulked with suitable tools right round the joint to make up for shrinkage of the molten metal on cooling and shall be finished 3 mm behind the socket face. Joints in cast iron pipes with special jointing arrangements like 'Tyton' joints etc. shall follow the instructions of the manufactures. In special cases if flanged joints are accepted by the Engineer the joints shall be made leak proof by inserting approved type of rubber gaskets. The bolts shall be secured in stages to avoid uneven strain. (b) Concrete Pipes Care shall be taken to place the collar centrally over the joint. 2.5 <u>TRENCHES AND OTHER EXCAVATIONS</u> Width of the trench at the bottom shall be such as to provide 200 mm clearance on either side of the pipe for facility of laying and jointing. Excavated material shall be stacked sufficiently away from the edge of the trench and the side of the spoil bank shall not be allowed to endanger the stability of the excavation. Spoil may be carted away and used for filling the trench behind the work. Turf, top soil or other surface material shall be set aside, turf being carefully rolled and stacked for use in reinstatement. All excavation shall be properly timbered, where necessary. Efficient arrangements for dewatering during excavation and keeping it dry till backfilling shall be made to the satisfaction of the Engineer. Sumps for dewatering shall be located away from the pipe layout. Where the excavation proceeds through roads necessary permissions shall be secured by the Contractors from the appropriate authorities. Special care shall be taken not to damage underground services, cables etc. These when exposed shall be kept adequately supported till the trench is backfilled.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-22
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 516 of 549
The backfilling shall be done only after the pipeline has been tested and approved by the Engineer. Special care shall be taken under and sides of the pipe during hand packing with selected material. At least 300 mm over the pipe shall also be filled with soft earth or sand. Consolidation shall be done in 150 mm layers. The surface water shall be prevented from getting into the filled up trench. Traffic shall not be inconvenienced by heaping up unduly the backfilling material to compensate future settlement. All future settlements shall be made good regularly to minimise inconvenience of traffic where applicable. 2.6 <u>FIXTURES</u> The Tenderer shall mention in his bid the type and make of the fixtures he intends to use enclosing manufacturer's current catalogues. In the absence of any such agreement, the Engineer shall be at liberty to choose any type and make. All fixtures and fittings shall be of approved quality and type manufactured by well known manufacturers. All items brought to the site must bear identification marks of the type of the manufacturer. Procurements shall be made well in advance and inspected and approved immediately by the Engineer. All fixtures shall be adequately protected, covered and plugged till handed over. All fittings, gratings, fasteners, unless specified otherwise, shall be chromium plated. The connecting lead pipes and bends shall weigh at least 3 kg. per 25 mm dia per meter length. Where PVC or similar pipes are allowed the Contractor shall produce the test reports and convince the Engineer about their durability. Unless specified in the contract the fixtures shall be as specified hereinafter 2.6.1 Water closet (a) Raised type It shall include glazed vitreous china basin with siphon, open front solid plastic seat and plastic cover, low level glazed stoneware flushing cistern with valveless fittings, supply connections and

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 517 of 549
necessary fittings. All fittings shall be chromium plated. Colour of basin, cistern, seat and cover shall be as desired by the Engineer. (b) Squatting type It shall include glazed vitreous china pan with foot rests and high level cast iron flushing cistern with valve less fittings, supply connections and necessary fittings. All fittings shall be chromium plated. The foot rests shall be made of white glazed vitreous china with chequered surface. The flushing cistern shall be painted as desired by the Engineer. 2.6.2 Urinals It shall consist of wall type glazed vitreous china urinals, cast iron automatic flushing cistern complete with supply connections, flush pipe, lead pipes, gratings, traps and all other necessary fittings. Automatic flushing shall be approximately once every five minutes. For a number of urinals located together may be served by one cistern of adequate capacity. All fittings shall be chrome plated. 2.6.3 Wash basin It shall be made of glazed vitreous china. The basin shall be flat back, wall hung by painted cast iron brackets and complete with pattern with hot and cold brass faucets with nylon washers, waste chain, waste washers, lead waste pipes with traps, perforated waste complete with necessary fittings. All fittings including faucets shall be chromium plated. 2.6.4 Sink It shall be made of Marble or Granite. It shall be wall hung by painted cast iron brackets and complete with one brass faucet with nylon washers, waste chain, waste washers, and lead waste pipes with traps, perforated waste with necessary fittings. All fittings including faucets shall be chromium plated.

2.6.5	Bathroom mirror It shall be made of the best quality 6 mm thick glass and produced by a reputed mirror manufacturer. It shall be wall mounted with adjustable revolving brackets. The brackets, screws and other fittings shall be chromium plated.	
2.6.6	Glass shelves Glass shelves shall consist of 6 mm thick clear glass with guard rails and shall be wall mounted with brackets. All brackets, guard rails and screws shall be chromium plated.	
2.6.7	Towel rail Towel rails shall be 20 mm dia chromium plated MS pipes wall mounted with steel brackets. The brackets, screws etc. shall also be chromium plated.	
2.6.8	Soap holder It shall be made of chromium plated strong members. The holders shall be wall mounted with chromium plated screws.	
2.6.9	Liquid soap dispenser It shall be round and easily revolving with removable threaded nozzle. The body, bracket for wall mounting and screws shall be chromium plated.	
2.6.10	Toilet roll holder It shall be made of glazed vitreous china with suitable cover cum cutter. Wall mounting screws shall be chromium plated.	
2.6.11	Installation All plumbing fittings and fixtures shall be installed in most workmanlike manner by skilled workers. These shall be perfect in level, plumb, plane, location and symmetry. All items shall be securely anchored to walls and

	floors. All cuttings in walls and floors shall be made good by the Contractor.	
2.7	<u>EFFLUENT DISPOSAL</u>	
2.7.1	Effluent Disposal The effluent from the septic tank shall be disposed by allowing it into an open channel or a body of water if the concerned authority approves or into a soak pit for absorption by soil or shall be allowed to be absorbed by soil through open jointed CI pipes laid in a trench filled with broken bricks.	
2.7.2	Joining C.I. Pipes / dispersion trenches Minimum dia of the CI pipe shall be 150 mm nominal. The trench for laying the pipes shall be minimum 600 x 600 mm pipes. The joints of the pipes shall be made with lead. The entire length of the pipe within the trench shall be buried in 250 mm layer gravel or crushed stone of uniform size. On top of gravel/crushed stone layer is a 150 mm bed of well graded coarse aggregate. Ordinary soil is used for fill in the top of trench.	
2.8	<u>SEWAGE TREATMENT PLANT</u> Please refer. Annexure-I	
3.0	<u>TESTING AND ACCEPTANCE</u>	
3.1	<u>INSPECTION BEFORE INSTALLATION</u> All pipes, fittings and fixtures shall be inspected, before delivery at the site to see whether they conform to accepted standards. The pipes shall again be inspected on site before laying by sounding to disclose cracks. All defective items shall be clearly marked and forthwith removed from the site.	
3.2	<u>TESTING OF PIPELINES</u> Comprehensive tests of all pipe lines shall be made by simulating conditions of use. The method of actual tests shall be decided by the Engineer. All test data shall be recorded and submitted to the Engineer for review	

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-22
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 520 of 549
and instruction. The Engineer's discretion regarding tolerance shall be final. General guidance for the tests are given below: (a) Smoke test All soil pipes, waste pipes and vent pipes and all other pipes when above ground shall be approved gastight by a smoke test conducted under a pressure of 25 mm of water and maintained for 15 minutes after all trap seals have been filled with water. The smoke is produced by burning oily waste or tar paper or similar material in the combustion chamber of a smoke machine. Chemical smokes are not satisfactory. (b) Water test For pipes other than Cast Iron Glazed ware and concrete pipes shall be subjected to a test pressure of at least 1.5m head of water at the highest point of the section under tests. The tolerance figure of two litres per centimetre of diameter per kilometre may be allowed during a period of 10 (ten) minutes. The test shall be carried out by suitably plugging the low end of the drain and the ends of connections, if any, and filling the system with water. A knuckle bend shall be temporarily jointed in at the top end and a sufficient length of the vertical pipe jointed to it so as to provide the required test head or the top end may be plugged with a connection to a hose ending in a funnel which could be raised or lowered till the required head is obtained and fixed suitably for observation. Subsidence of test water may be due to one or more of the following cases : (i) Absorption by pipes and joints (ii) Sweating of pipes or joints (iii) Leakage at joints or from defective pipes		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-22
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 521 of 549
(iv) Trapped air. Allowance shall be made for (a) by adding water until absorption has ceased and after which the test proper should commence. Any leakage and the defective part of the work shall be cut out and made good. For cast iron pipes Cast iron sewers and drains shall be tested as for glazed ware and concrete pipes. The drain plug shall be suitably strutted to prevent their being forced out of the pipe during the test. (c) For straightness (i) By inserting at the high end of the sewer or drain a smooth ball of a diameter 13 mm less than the pipe bore. In the absence of obstruction, such as yarn or mortar projecting through the joints, the ball will roll down the invert of the pipe and emerge at the lower end; and (ii) By means of a mirror at one end of the line and lamp at the other. If the pipe line is straight, the full circle of light may be observed. The mirror will also indicate obstruction in the barrel if the pipe line is not straight. 3.3 <u>FIXTURES ETC.</u> All fixtures and fittings shall be connected by watertight joints. No dripping shall be accepted. 4.0 <u>CODES AND STANDARDS</u> Some of the important Codes and Standards relevant to this specification shall be followed: Latest editions shall always be consulted.

ANNEXURE –I

SEWAGE TREATMENT PLANT

DESIGN BASIS

The raw sewage quantity shall be estimated based on total no. of users. The anticipated no. of users may be considered as 1500 for design purpose. The proposed raw sewage and treated water characteristics are as follows:

(a)	Parameter	Unit	Inlet	Outlet
(b)	Total Suspended Solids (TSS)	mg/l	200	<10
(c)	BOD	mg/l	300	<10
(d)	COD	g/l	-	-
(e)	Oil & Grease	mg/l it	20	-

1.0 TREATMENT FACILITIES

1.1 The treatment facilities comprise the following process units:

1.1.1 Pre Treatment

1.1.2 Inlet Chamber and Screen Chambers

1.1.3 Raw sewage transfer pumping station

1.1.4 Grit Chamber & Fine screen chamber

1.1.5 Aeration Basin

1.1.6 Membrane Bio reactor

1.1.7 Disinfection

1.1.8 Treated water Reservoir

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

1.1.9	Sludge Sump	
2.0	<u>PROCESS DESCRIPTION</u>	
2.1	<u>INLET CHAMBER</u>	
	An Inlet chamber is provided to receive the raw Sewage from various building.	
2.2	<u>MEDIUM SCREEN</u>	
	Raw Sewage passes through medium bar screen with 20 mm opening wherein floating material of size greater than 20 mm will get trapped. The cleaning of the screens would be done manually.	
2.3	<u>RAW SEWAGE SUMP CUM EQUALISATION</u>	
	Raw sewage is collected in the sanitary water storage tank where besides arresting the turbulence, flow equalisation also takes place. The storage tank is designed for 1 day storage. Submersible pumps shall transfer the sewage from this sump to the grit chamber for further treatment.	
2.4	<u>GRIT CHAMBER</u>	
	The flow from the sanitary water storage tank shall be passed into the 2(1W+1S) grit chamber tanks for removal of grit/inorganic matter. It is a channel in which sewage flows continuously where grit/inorganic matter get settled down according to settling velocity of grit particles. The settled grit particles get disposed off through chute. Grit free sewage flows to Fine bar screen chamber.	
2.5	<u>FINE BAR SCREEN CHAMBER</u>	
	The grit free sewage is subjected to screening in the mechanical fine bar screens of 2mm opening. The fine material will be screened and lifted by the rake, taken out through belt conveyor and dropped on to the trolley.

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 527 of 549
2.6 <u>AERATION BASIN</u> The sewage from the fine bar screen is transferred into the aeration basin, where Air is supplied to provide oxygen for BOD removal and for nitrification process. 2.7 <u>MBR BASIN</u> Partially stabilized mixed liquor from aeration tank will flow into the MBR basin by gravity. Membranes are placed in the tank. Diffusers supply air for membrane cleaning and mixing requirements. Part of the mixed liquor is recycled back to the aeration basin. The excess sludge from aeration basin shall be sent to sludge holding tank. The sludge from Sludge holding tank will be disposed to ash pond by means of sludge transfer pumps. 2.8 <u>DISINFECTION</u> The treated sewage from MBR shall be chlorinated with sodium hypo chloride and the chlorinated water will be stored in treated sewage storage tank.

1.0

SCOPE

The scope of work is to set up a chemical barrier against attack by subterranean termites while the building is under construction.

2.0

EXECUTION

2.1

GENERAL

All work shall in general be executed as specified in IS: 6313 Part II-1981 and as per approved specification of the agency having special know-how for the job.

All necessary work to ensure uniform distribution and proper penetration of treatment of treating solution shall be done according to the instruction of the Engineer.

Soil treatment shall not be done when it is raining or when the soil is wet with rain or subsoil water. Once formed, the treated soil barrier shall not be disturbed.

2.2

CHEMICALS AND RATE OF APPLICATION

Any of the following chemicals (conforming to relevant Indian Standards) in water emulsion shall be applied by pressure pumps, uniformly over the area treated.

.

(a)

Chlorpyrifos Emulsifiable (IS 8944 - 1978)

:

1.0

(b)

Heptachlor Emulsifiable Concentrate (IS: 6439 - 1978) Chlordane Emulsifiable

:

0.5

(c)

Concentrate (IS: 2682 - 1984)

:

1.0

2.2.1

Treatment of Column Pits, Wall Trenches and Basement Excavations

Foundations, basements etc. may either be fully enveloped by the chemical

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-23
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 538 of 549
barrier or the treatment may start 500 mm below ground level. The bottom surface and sides of excavation (upto a height of about 300 mm) for column pits, walls trenches and basements shall be treated with chemicals at the rate of 5 litres / M2 of surface area. Backfills around columns, walls etc. shall be treated at the rate of 7.5 litres / Sqm of the vertical surface. Chemical treatment shall be done in stages following the compaction of earth in layers. The treatment shall be carried out after the ramming operation is done by rodding the earth at 150 mm centres close to the wall surface and spraying the chemicals in the specified dose.		
2.2.2	Treatment of Top Surface of Plinth Filling Holes 50 mm to 75 mm deep at 150 mm centres both ways shall be made with crowbars on the surface of compacted plinth fill. Chemical emulsion at the rate of 5 litres / M2 of surface shall be applied prior to laying soling or sub-grade. Special care shall be taken to maintain continuity of the chemical barrier at the junction of vertical and horizontal surfaces.	
2.2.3	Treatment of Soil Surrounding Pipes, Wastes and Conduits Special care shall be taken at the points where pipes and conduits enter the building and the soil shall be treated for a distance of 150 mm and a depth of 75 mm at the point where they enter the building.	
2.2.4	Treatment of Expansion Joints These shall receive special attention and shall be treated in a manner approved by the Engineer.	
2.2.5	Treatment at Junction of the Wall and the Floor Special care shall be taken to establish continuity of the vertical chemical barrier on inner wall surfaces from ground level up to the level of the filled earth surface. A small channel 30 x 30 mm shall be made at all the junctions of wall and columns with the floor. Rod holes made in the channel up to the ground level 150 mm apart and the chemical emulsion poured along the	

channel at the rate of 7.5 litres per square meter of the vertical wall or column surface. The soil should be tamped back into place after this operation.

The Contractor shall give a 10-year service guarantee in writing supplemented by a separate and unilateral guarantee from the specialised agency for the job to keep the building free of termites for the specified period.

Complete work of anti-termite treatment shall be measured for plinth area treated.

1.0 <u>SCOPE</u> This specification covers the erection of asbestos, C.G.I., aluminium or metal sheet covering to roof and side walls at various elevations and the fabrication and/or installation of asbestos, C.G.I or aluminium or metal gutters, flashings etc., as shown on drawings. 2.0 <u>STORAGE OF MATERIALS</u> 2.1 <u>CARE & STORAGE BEFORE INSTALLATION</u> All materials shall be stored by the Contractor in proper way to prevent all damage. If the materials are issued at site by the Owner, the Contractor shall at the time of issue, satisfy himself about the condition of issued sheets, gutters, etc. and no complaints shall be entertained later. The following points should be taken care of the Storing of Sheets: 2.1.1 Do not have uncovered sheets left lying in the open, Store in a covered area. If it is stored outside, cover the sheets with waterproof covers. Leave some space between the cover & the Sheetstacks, so that air circulation is possible. 2.1.2 The sheet should be stacked neatly, above the ground and in an inclined fashion/gentle sloping. This shall allow the rain water to drain off automatically. 2.1.3 It is advisable to keep each bundle of sheet, separately. 2.1.4 Do not store sheets, where people can walk over them. 2.2 <u>HANDLING AND HUMAN TRAFFIC MOVEMENT</u> On large building, handling time can be reduced by lifting sheet bundles with Crane, onto the roof frame. Care must be taken such that the weight of sheet bundle is not too much that it affects the structure. Where mechanical handling facilities are not present, sheets can be un-loaded & passed on to the roof, one at a time.		

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 546 of 549
Sheets should not be dragged over the ground or any rough surface. Sheets should also not be dragged over each other. Tools used for erection should be carried and not dragged over the sheets. During erection & maintenance time, worker should careful when walking on roof. General procedure of walking on roof are : 2.2.1 When walking parallel to the ribs, walk on at least two ribs. 2.2.2 When walking across the ribs, walk close to or over the roofing supports. 2.3 <u>FASTERS & SEALANT</u> The steel sheet be fastened with nominal 40 mm zinc coated or nominal 25 mm zinc-tin alloy coated, Hex head, Self-drilling screw as per As 3566-2002 class 3 fastner of approved make with EPDM washer. The fastner size shall be calculated as per the design or manufacturer's recommendations. Natural cure, Silicon sealants should be water resistant, non-corrosive, resistance to extreme temperatures, retain good flexibility and of approved make. It shall be applied at all end laps as per approval by the engineer-in-charge. 2.4 <u>WORKMANSHIP</u> The workmanship shall be according to best construction practice to give a water tight finish to the satisfaction of the Engineer fixing of gutters and down pipes shall be according to IS:2527. 2.4.1 <u>Asbestos Sheeting</u> Asbestos sheets of profiles as stated in the Schedule of Items, shall be fixed with minimum 150 mm end lap and side laps as per manufacturer's specification Hook bolts or J-bolts shall be 8 mm dia. at 305 centres 6 mm dia galvanised iron seam bolt and nut with G.I. flat washers and bitumen washers shall be used for stitching ridge capping, corner pieces, ventilators, north light curves etc.		

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-24
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 547 of 549
2.4.2 C.G.I. Sheetting and Aluminium Sheetting Side laps shall be 2 corrugations for roof and one corrugation for side sheetting. End laps shall be minimum 150 mm for roof and 100 mm for side sheetting. In ridges and hips where plain sheets are used the end laps shall be minimum 100 mm. Holes in C.G.I sheets shall preferably be made on the ground. The sheets should be placed on trestles and holes punched in the ridge of the corrugation from the outside inward for obtaining proper seating of limpet washers. Sheets shall be secured to sheet framing by 8 mm dia. galvanised iron hooks or J-bolts and maximum 305 mm apart. The length of the hook or J- bolts shall be to suit the sections of the bearers. Sheets shall also be bolted at the ends at every third corrugation with 6 mm dia. galvanised iron seam bolts and G.I. flat washers and bituminous washers. 2.4.3 Firbre Glass Reinforced Plastic Sheetting This shall be of thickness and profile as mentioned in the drawing. Colour and light transmittance shall be as mentioned in drawings and or schedules. Where used in conjunction with C.G.I. or asbestos sheetting the end and side laps and fixing device shall be same as used for general sheetting. Where used in lieu of glass, the fixing shall be by means of timber or metal glazing beads as mentioned in drawing. In all cases, the installation shall be completely watertight and able to withstand the designed wind-pressure. 2.4.4 Metal sheetting Sheetting should be fixed, strictly as per construction drawings. The maximum length of sheets should be the maximum transportable length. The number of sheets and the length of sheets to be worked out considering the minimum number of laps/joints in the roof system. The sheets and all accessories should be factory cut & then sent to site. Cutting of sheets at site should be avoided. If cutting of sheet at site is required, metal sheets should be cut by a Power saw with a metal cutting blade which leaves less redundant burr. Manufacturer's recommendations should be strictly followed. Before installation of roofing & cladding, it should be ensured that the supporting structure should be in true plans/perfect alignment, correctly placed & securely fixed. Cladding erection for each elevation		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	Section-24
REV: R0	CIVIL, STRUCTURAL AND ARCHITECTURAL WORKS	Page 548 of 549

should commence at the bottom & proceed towards the top in order to ensure tight fitting laps. The installed profiled sheets have a side lap of at least one corrugation. The end lap should have sufficient overlap depending upon the slope of the roof. The end laps should use sealant so as to ensure that there is no leakage of rain water from the joints.

The General guidelines :

	Roof Slope	End lap (min.) mm	End lap (max.) mm.
(a)	Less than 1 in 4 (15°)	150	250
(b)	Greater than 1 in 4 (15°)	150	250
(c)	Wall	100	200

The suggested end laps & no. of fasteners used should be as per manufacturer's recommendations.

During cutting, drilling operations, the resulting small, sharp left over metallic particles or swarf can result stains on the coated steel roof. Swarfs should be removed & the Coated steel surface properly cleaned. During fastener installation, the installer should stand 90° to the panel, facing the purlin & drive the fastener until it is tight and the washer is firmly seated. Fasteners should not be over-driven. Proper fastener driver as recommended by manufacturer should be used for self drilling screw.

3.0 ACCEPTANCE CRITERIA

The installations shall present a neat appearance and shall be checked for water tightness. The following shall be checked:

3.1 Side and end laps

3.2 Absence of cracks, holes or damages in sheet

 MAHAGENCO Maharashtra State Power Generation Co. Ltd.	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Volume: VI-B

34	1	19.1 (5)	For increase of every 5 mg/nm ³ in suspended particulate Matter (SPM) level (Considering lowest quoted SPM level as base). Bids with SPM level more than 50mg/nm ³ shall be rejected.	For Performance Guarantee, SPM shall be considered at 100% TMCR with one field out . Please confirm	Mahagenco confirms that Performance Guarantee, SPM shall be considered at 100% TMCR with one field out in each path .
35	1	22.2	Deviations without cost of withdrawal and not acceptable to Owner shall be deemed to be withdrawn by the bidder	Please appreciate that there could be deviations, for which, no cost can be allocated. In such deviations, we request the client to discuss the deviations mutually and agree before price bid opening. Please confirm.	Bid specification shall prevail
36	1	22.3 & 22.4	Separate Submission of Deviations associated with price	It is requested that for Part-1 of the bid, all the commercial and technical deviations may be listed in Annexure- VIIA and VIIIA respectively. The Annexure-VIIB and VIIIB may be used only for price bid.	Bid specification shall prevail
37	1	24.2	Enclosure-4 : Submission of Guaranteed Completion period in Part-1 of the bid	The Price Loading rate for various Guarantee factors Data is given in the tender document for the purpose of bid evaluation. Further, the tender specifies submission of the Guarantee Completion period (i.e. Schedule 7) in Part-1. This will straightway open the Differential Price (on account of loading on delivery schedule) to all the bidders before opening of the price bid. Hence it is requested to confirm that that the Guaranteed Completion Schedule may be submitted in the Price Bid (i.e. Part-2).	Pl refer corrigendum No.III

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - I					
S. No	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	MAHAGENCO Reply
42	1	28.4	The bid does not conform directly or indirectly, explicitly or implicitly shall be considered as substantially non-responsive hence rejected and shall not be considered for further evaluation and thereby opening of price bid.	Please allow bidder to <u>suggest deviation with cost of withdrawal.</u>	Bid specification shall prevail
43	1	28.4	The bid which is found to be meeting stipulated qualifying requirements, however, does not conform directly or indirectly, explicitly or implicitly, to the major commercial terms & conditions contained in Volume - I of this specification namely: 1. Duration of Completion of the Project and Project Network Schedule (Clause 18.0, Section - 1) 2. Contract Performance Security (Clause 14.0, Section- 2). 3. Bank Guarantees against the Contract (Clause 15.0, Section - 2) 4. Billing Break-up and Delivery Schedule for the Goods to be Supplied (Clause 11.0, Section- 2A). 5. Billing Break-up of Contract Value (Clause 26.0, Section - 2B) 6. Terms of Payment (Clause 12.0, Section- 2A and Clause 27.0, Section - 2B).	According to this clause, the bids which do not confirm to listed clauses will be treated as non-responsive and rejected. However GCC has provision for the Bidder to take deviations and give cost of withdrawal against such deviations. Hence such deviations will be completely withdrawn by the bidder, if the Owner so desires, and the cost of withdrawal of deviations will be added to the bid price for the purpose of bid evaluation. Please clarify that in such cases, the bids will not be treated as non-responsive.	Bid specification shall prevail

44	1	28.4	The bid which is found to be meeting stipulated qualifying requirements, however, does not conform directly or indirectly, explicitly or implicitly, to the major commercial terms & conditions contained in Volume - I of this specification namely: 1. -----13. shall be considered as substantially non-responsive hence rejected and shall not be considered for further evaluation and thereby opening of price bid.	Bidder requests Owner to consider exclusion on these terms & conditions specially "Terms of Payment" because the Terms of Payment shall result in serious cash flow issues to the Bidder , who is a newly established Indian Manufacturing facility and are yet to initiate full scale commercial operations. We request Owner to instead consider these terms & conditions as a loading factor for evaluation of Bids. We also request Owner to maintain the Terms of Payment same as NTPC Tenders which are win-win for both Owner and Contractor.	Bid specification shall prevail
45	1	28.4	Bids meeting the qualifying requirements shall be considered as substantially non responsive hence rejected and not considered for further evaluation and thereby opening of price bid.	Since post bid discussions allow addressal of deviations/ clarifications, the clause may be suitable modified as follows which incidently is also adopted by NTPC in the recent Bulk tenders " Bidders are not expected to take deviations on major commercial terms and conditions in Vol I. The employers determination of a bid's responsiveness is to be based on the content of bid itself without recourse to extrinsic evidence, If a bid is not substantially responsive, it may be rejected "	Bid specification shall prevail
46	1	28.4 (9)	Performance Guarantee test (clause 39.0 section 2)	Please confirm that PG test requirement listed under no deviation clause and explained in clause 39 of section 2 includes Category I guarantees only.	Mahagenco shall revert separately

47	1	29.1	After opening of Part - I i.e Techno-commercial bid in both electronic as well as physical form.....	Please confirm whether Part - I is also to be submitted in electronic form...this is contrary to what is specified in Cl. 24.1.	Pl refer corrigendum No.III
48	1	29.1	After opening of Part - 1 i.e. Techno-commercial bid in both electronic as well as physical form and preliminary evaluation as stipulated under Clause 28.0 above thereof,.....	Kindly clarify whether Part 1 (techno-commercial) shall be in both electronic as well as physical form because contrary clause 24.1 states "The Part - 1 is to be submitted in Physical form"	
49	1	29.4	By obtaining clarifications/ confirmations in respect of each of the technocommercial bids, all the bids will be brought at par as far as technical requirements and commercial terms & conditions are concerned	Various bidders possess different technologies for equipment design and manufacture. As far as functional requirements are concerned, all the bidders can be brought at par, however bringing the bidders technically at par is practically not possible. It is therefore requested that all the deviations agreed by MahaGenco with the individual bidders, may be circulated to all the bidders and on the basis of that, the bidders may be given the option to optimise their bid. Since it is two part bidding process, bidders may be allowed to submit, in the form of supplementary price bid, a lump-sum reduction in their prices which may result out from the optimisation. This will help MahaGenco in the reduction of overall cost of the project	Pl refer corrigendum No.III
50	1	31.1.3	Cost of withdrawal of deviations	What will be the policy of MahaGenco if during post bid discussions, the bidder agrees to withdraws the deviations (associated with price) without price implication	Bid specification is clear in this regard

285	3	6.3	Heat Rate: Increase in gross turbine cycle heat rate in kCal/kWh under rated steam conditions at 76 mm of Hg (back pressure) with zero make up at 100% unit load at generator terminals.....	Since this is an EPC contract, Owner is requested to give the Bidder freedom to choose the best condenser back pressure based on most optimized design for offering the best heat rate for the turbine. Owner may please consider and give their acceptance.	Bid specification shall prevail
286	3	6.3	Guaranteed Technical Parameters and LD for failure to meet performance guarantees - TG Cycle Gross Heat rate and SG efficiency	This being a turnkey EPC tender, we request that the performance guarantee is requested on Unit Gross Heat rate basis which incorporates the TG Cycle HR and SG efficiency	Bid specification shall prevail

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE -BID QUERIES

S. No	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	MAHAGENCO Reply
287	3	6.3	Auxiliary Power Consumption: Total auxiliary power consumption of all auxiliaries (as listed below) at 660 MW load with Zero make up, 76mm of Hg back pressure and 100% unit load with respect to the guaranteed Auxiliary Consumption as per Schedule - 7.	(1) As per Vol II, Section 8 cl. no. 1.2.5 for Performance Guarantee Schedule, 1% make up to be considered for auxiliary consumption. Please clarify, Quantity of make up water (0% or 1%) to be considered for auxiliary consumption guarantees. (2) As per Vol. I, Sec 3, cl. no. 6.3 for LD and Vol. I, Sec 1, cl. no. 19.1 for Loading for Bid Price, Auxiliary consumption are given in per kWh basis, however as per Vol. I, Sec. 1, Schedule 7 for guarantee schedule 7, auxiliary consumption is to be guaranteed in kW. Please confirm the evaluation and guarantees shall be on per kW basis. (3) As per Vol. I, Sec 3, cl. no. 6.3 for LD and Vol. I, Sec 1, cl. no. 19.1 for Loading for Bid Price, the auxiliary consumption is to be considered at 100% TMCR condition, however in the description of list of auxiliaries to be considered (Vol. I, Sec 3, cl. no. 6.3), it is specified that the individual plant and equipment are to considered at full load/capacity / design capacity. Please clarify the requirement.	Auxiliary Power consumption shall be at zero % make up. Pl refer corrigendum No.III The auxiliary power consumption shall be considered at 100% TMCR at design condenser pressure with zero% make up.
288	3	6.3	Auxiliary Power Consumption table, Sl. No. 5 - Excitation losses (in case of static excitation system with rectifier transformer)	As per Specification Vol III-B, Section-1, Cl. No. 3.3, electrical power generated at generator terminal is to be considered subtracting power taken by the exciter for heat rate and output calculations. Hence, Bidder proposes to remove excitation losses from auxiliary consumption list.	Bid specification shall prevail

30	Sec-3	1.15.5	... Variable Frequency drives (if applicable) for ID fans,---ABT panels & Synchronizing panels etc. for complete plant	VFD is not applicable for ID Fan. No separate Synchronising Panel be provided. Synchronising will be part of swgr. Or ECP as per requirement. If 'ABT' means Auto Bus Transfer Panel, then it will be provided . If 'ABT' means 'Avialability Based tariff Panel' Then it should be part of Switchyard package. Pl.confirm	ABT means auto bus Transfer
31	3	1.15.6	Generator isolated phase bus ducts, HT phase segregated bus ducts (for 11kV & 3.3 kV switchgears) & LT non phase segregated bus ducts.	If Layout does not allow, Bidder may be allowed to use Cables for connections between Switchgears and Transformers.	Bid specification prevail
32	3	1.15.14, 1.15.15	Local control panels, Local push button stations and Energy saving system panel.	Bidder requests Client to clarify "Energy Saving System Panel" and scope for the same.	Refer volume IV.Sec-7.Clause No.6.21
33	Sec-3	1.15.14 & 1.15.15	 Energy Saving system panels	The scope and description are not Clear. Pl. clarify	Refer volume IV.Sec-7.Clause No.6.21
34	3	1.15.20m	Workshop	Please clarify if workshop equipment and building are included in EPC scope.	Yes, Included; list will be sent.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 VOLUME-II

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
35	3	1.15.20 (m)	Workshop Equipment	Please furnish the list of workshop equipments.	Being furnished
36	Sec-3	1.15.20 (n)	 VFD equipment Building	AS VFD for ID fans are Not applicable, VFD equipment Building is not applicable.Pl.confirm	If radial fan is used, then VFD building is applicable.
37	3	1.15.20-ff	All the plants, areas, buildings etc. shown on plot plan & other drawings.	Bidder requests Client to amend this clause by excluding Electrical Work for Colony as the same is excluded in Main Scope of Work in Volume-II, Section-3, Clause No.-3.	If colony civil work excluded then colony electrical work also excluded.
38	3	1.15.21	However load flow & transient stability study which may be done on approved software.	Bidder wishes to clarify that load flow & transient stability is done on ETAP as per currently accepted Industry Practice. Bidder requests client to allow ETAP for all Electrical Studies.	Refer Corrigendum-II Master specification Volume - II
39	Sec-3	1.15.21 (a)	All the electrical system studies such as short circuit levels, voltage drops, grounding, relay setting, relay co-ordination etc & all sizing calculations such as transformers, busducts, switchgears, motors, cables, lighting, DC UPS system etc. manual calculations & E-Tap software	Following may please be noted with electrical system studies and sizing calculation viz software calculation and manual calculation: a. For Short Circuit levels, Voltage drops, Grounding, Relay setting, Relay co-ordination, Load flow and transient stability study will be done by E-Tap software. No manual calculation will provided for above studies. b. For Sizing calculation for transformer, busduct, cables, lighting, DC Battery & Charger only Manual calculation will be provided. Pl.confirm	Refer Corrigendum-II Master specification Volume - II

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Bid Specification No. DG/BSL U-6/2011/T-1 VOLUME-II

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
75	Volume-II/Section-3	5.1 (Page 60)	Land, free of charges as available for the construction of: (a) Residential accommodation to be built by the contractor at his own expense for his employees near the site.	We understand that the land for the construction of labour colony inside the plant shall be provided free of charges by the Owner. Please confirm.	Volume I section 2B clause no. 4.1.1 shall prevail
76	Volume II / Section-3	5.2 Page- 60 of 555	Construction power at 11 kV AC $\pm 10\%$, 3 Phase, 50 Hz $\pm 5\%$ and Construction water shall be made available at one point near the erection site by the Owner. Regarding charges, please refer Volume-I of this specification.	Bidder requests Owner to provide construction power of capacity 3 MVA approximate, at 11kV level at one location within plant boundary. Further downstream distribution of construction power shall be in Bidder scope of work.	Volume I section 2B clause no. 4.2 and 4.3 shall prevail
77	3	-	Scope of supply	Bidder's understanding is that Hydrogen Generation Plant is out of Bidder's scope of supply. Please Confirm	Confirmed
78	4	1.2	Codes and standards	Please review the requirement to include complete code or standard in English for any equivalent materials along with the tender. An extract can be provided in such case.	Bid specification prevails
79	4	1.6	Successful Bidder shall furnish two (2) sets of latest of national/international codes and standards to owner.	Bidder clarifies that furnishing national / international standards shall not be bidder's responsibility. It is difficult to quantify the required and relevant national / international codes and standards. It call for lot of extra work and cost implications. Laos, it is not allowed by the International standards committee to take & distribute the copies of the standards. Kindly accept.	Bid Specification prevails.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 VOLUME-II

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
80	4	1.6	Codes and standards	This requirement to provide copies of codes and standards is practically difficult due to following reasons: a) Copy right requirements. B) The specification does not indicate which type of standards should be furnished. For example there could be many minor standards referred in QAP or factory procedures for components. This extends to major and minor components. It is practically not possible to provide 2 sets of codes and standards for all such codes and standards. In many cases such reference to code/standard is made to only a insignificant portion of the code/standard itself. We request you to delete this requirement.	Bid Specification shall prevail
81	4	1.6	Successful bidder shall furnish two (2) sets of latest of national/ international codes and standards to the Owner	Bidder's understanding is that wherever codes and standards used are different from the specification requirement, in those cases only the codes and standards needs to be provided. Please clarify.	Bid Specification shall prevail

86	4	6.1.4	Floor slabs	The requirement for space between floor slabs is not applicable for cable vault/cellar, MCC rooms, office areas. Please confirm.	For cable vault, the clear distance will be 3.5 m . For the rest, Bid specification shall prevail
87	Volume-II/Section-4	6.1.4 (Page 69)	The minimum clear height available between two consecutive floor slabs shall not be less than five (5) meters.	The clear gap between two consecutive floor slabs shall be based on functional requirement and minimum 3.5m shall be provided.	For cable vault, the clear distance will be 3.5 m . For the rest, Bid specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 VOLUME-II

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
88	4	6.1.5	Multistorey bldg - Staircase	The number of staircase for multistorey building depends on the floor area. For smaller buildings, example single storey cable cellar+MCC room or control room, single staircase is adequate. In general the provision of number of staircase would follow TAC and relevant Indian building codes. Please review and confirm	Bid specification prevails
89	Vol II - Section 4	6.1.9	Cable racks / pipe racks shall have hand railings in walkways on both sides 'at appropriate heights.	We propose to provide single walkway with handrails on each tier.	Pipe / cable rack shall have single walk ways @centre of each tier.
90	Vol II - Section 4	6.1.9	Concept of various mechanical and electrical equipment location and building dimensions (including column-row spacing) as shown in Plot Plan/Floor Plan drawing are to be adhered as far as possible. Any departure from this suggestive layout is primarily not recommended.	Layouts and floor plans are machine specific and therefore, as per our standard practice/machine design, the TG building and Boiler layout will be different than what has been provided in the specification. For example, front mill configuration layout is completely different than what has been shown in your lay out which is on the basis of side mill orientation. Hence, if the layout meets the specific criterion of operation and maintenance space/requirements, same shall be accepted.	Bid Specification shall prevail
91	4	6.1.10	Concept of various mechanical and electrical equipment location and building dimensions (including column-row spacing) as shown in Plot Plan/Floor Plan drawing are to be adhered as far as possible. Any departure from this suggestive layout is primarily not recommended.	Statement is not clear. Owner to clarify if changes in building size, column-row spacing with respect to tender specs in view of techno-economic optimization is permitted.	Specification is self-explanatory

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 VOLUME-II

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
92	4	6.2.2	Mill and bunker building	We understand that being EPC contract, the Bidder is allowed to provide the dimensions of the mill building (width and length) different from those specified meeting the equipment requirements and complying with the layout guidelines of the specification. Please confirm.	Bid specification prevail
93	Vol II - Section 4	6.2.2	Mills shall be located by the side of Boiler. The width of Mill/Bunker building shall be 12.5 M and the length of the same shall be 10.5 M per Mill. A clear walkway of 1200 mm (min) shall be ensured between the mills/ its foundation/ mill reject vessel edge and inner face of mill bay column. Raw coal bunker shall be circular in shape unless otherwise approved.	As explained above, as per our standard practice, the Boiler is with Front mill/bunker arrangement in D - E bay and hence, layout shall be done accordingly. The advantage in this layout is obvious and would reduce capital cost substantially.	Bid specification prevail
94	4	6.2.9	Walkway	We request you to revise the dimension to 400 mm from column face instead of 600 mm as it is difficult to achieve at the column locations.	Bid specification prevail
95	4	12.0	Sec - 4 Cold start-up > 50 Hrs Warm Start-up 10 - 50 Hrs Hot Start-up < 10 Hrs Sec - 8 > 36 Hrs 8 - 36 Hrs < 8 Hrs	Client to note that there is a difference between the definitions of various start-up conditons as per section - 4 of the technical specification and as per section - 8 of the technical specification. Kindly resolve the discrepancy. Also refer to section 8 and clause 1.4.17 (a)	Clause No. 12.0 section -4 prevails.

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
96	4	12.0	PLANT LIFE AND MODE OF OPERATION (a) Cold start-up (>50hrs. shutdown): 20 per year (b) Warm start-up (between 10 to 50 hrs. of shutdown): 140 per year (c) Hot start-up (Less than 10 hrs. shutdown): 180 per year	"(a) Cold start-up (>~~36 50~~hrs. shutdown): 20 per year (b) Warm start-up (between ~~8 10~~ to ~~36 50~~ hrs. of shutdown): 140 per year (c) Hot start-up (Less than ~~8 10~~ hrs. shutdown): 180 per year" Reason: We understand start-up mode are described above according to Vol.II Section-8 clause 1.4.17 (GUARANTEES UNDER CATEGORY-III). Please confirm.	Clause No. 12.0 section -4 prevails.
97	Volume-II/ Section-4	12	The complete plant including all the equipment and systems individually and collectively shall be designed for continuous operation for an economic service life of thirty (30) years under the prevailing site conditions and for the type of duty intended. The allowable stresses shall be so selected so that life expectancy to minimum 2,00,000 hours of operation can be achieved.	Pressure parts material will be selected as per ASME using ASME published stress values which is considering 1,00,000 hrs creep life. With this approach, Bidder confirms that boiler will give expected life span of 30 years.	Bid Specification prevails.

Bid Specification No. DG/BSL U-6/2011/T-1 VOLUME-II

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
106	4	17.2.1	Maximum noise level shall not exceed 85 dB (A) when measured at 1.0 M away from the noise emission source.	We understand that the specified requirement refers to the maximum surface sound pressure level emitted by the equipment at a distance of 1m, and at a height of 1.5m above normally accessible walkways and platforms. As per definition of ISO 3746, the surface sound pressure level of an equipment / installation at a distance of 1m corresponds to the average noise level emitted by this equipment in free field conditions, on a measurement surface which envelops the equipment at a distance of 1m. According to this standard, the in-situ measured noise levels must be therefore corrected for both influences of the background noise and sound reflections (especially inside buildings), in order to determine the surface sound pressure level of the equipment. Please confirm our understanding is correct. Noise measurements will be carried out during the continuous operation of the Plant at base load, which corresponds to the most significant operating conditions in terms of noise emissions.	Shall not exceed 85 dB(A) 1.0 m equipment outline.
107	Volume II Section 4	17.2.1	Maximum noise level shall not exceed 85 dB (A) when measured at 1.0 meter away from the noise emission source.	Noise level may exceed 85 dB(A) at 1.0 m distance during transient/abnormal conditions.	Shall not exceed 85 dB(A) 1.0 m equipment outline.

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
113	4	18.2.3	Before any item of plant or equipment leaves its place of manufacture, the Owner shall be given the option of witnessing inspections and tests for compliance with the specification and related standards. Advance notice shall be given to the Owner as agreed in the Contract, prior to the stage of manufacture being reached, and the piece of plant must be held at this stage until the Owner has inspected the piece, or has advised in writing that inspection is waived. If having consulted the Owner and given reasonable notice in writing of the date on which the piece of plant will be available for inspection, the Owner does not attend the Contractor may proceed with manufacture having forwarded to the Owner duly certified copies of his own inspection and test results.	As per bidder's standard practice, witness points agreed with the customer are entered in the final negotiated versions of the I & T Program. The customer or his acceptance authority will be informed of the readiness for such witnessing within the period agreed upon. If in case of inspections defined as witness points, the witnessing party is unable to participate on the announced date, the inspection will be performed by an internal inspection unit, independent of manufacturing, and the work will be continued. In case of acceptance tests by official authorities, the work will be stopped until the witnessing party is able to attend. In case of inspections defined as customer hold points, the work will be stopped until the witnessing party is able to attend or witnessing is officially waived. Delays resulting from failure to respond to the notification will not be the responsibility of bidder's. In addition, the I & T Program contain information with regard to the type of quality records: for internal purpose only or quality record handed over to the customer as part of the final documentation, on completion of the contract supply. Please confirm acceptance of bidder's standard and proven practice.	Bid Specification shall prevail

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
153	8	1.2.1	Efficiency of the steam generator at 100% TMCR while firing the design coal at rated steam parameters, rated coal fineness and rated excess air.	We propose to offer, Plant gross cycle heat rate at 100% TMCR (taking into account the steam generator efficiency) with 0% make-up, generator power factor of 0.85, design cooling water inlet temperature and Design coal firing (based on GCV) at rated steam parameters. For Steam parameters refer our comments/ queries raised in the pre-bid queries lotI/II. We request you to accept our proposal.	Bid Specification prevails
154	8	1.2.3	Guaranteed Turbine Cycle Heat rate in kCal/kWh under rated steam conditions, design condenser pressure with zero make up at 100% and 80% rated load. A weightage of 4 (four) and 3 (three) shall be considered for 100% and 80% heat rate values for arriving at the net heat rate.	As per Vol I, Section 3, Cl. no. 6.3, LD is applicable on Gross TG heat rate guarantee at 100% TMCR. As per Vol I, Section 1, Cl. no. 19, evaluation loading is applicable on 100% unit load at generator terminals. Also As per Vol. I, Section 1, Schedule 7 maximum gross TG Heat rate to be guaranteed. However as per this clause weightage average shall be considered for 100% and 80% heat rate values for arriving at the net heat rate. In our opinion, plant gross heat rate for EPC contract should be applicable. Please confirm.	Bid Specification shall prevail
155	8	1.2.3	Heat rate	We understand that the heat rate to be guaranteed is the gross turbine cycle heat rate. The formula for weighted average heat rate is expected to be as below - $(4 \times \text{HR}(100\%) + 3 \times \text{HR}(80\%))/7$ Please confirm	Confirm

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 VOLUME-II

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
192	8	1.4.19	Generator Capability The Generator stator and rotor windings inclusive of main and neutral leads shall be provided with Class-F insulations but rated for class-B temperature rise. The maximum permissible temperature of different parts of the generator for continuous operation shall be as specified in IEC 34- 1/34-3 as applicable.	The generator is designed to operate within class B temperature rise limits acc. to IEC 60034-1 at rated cooling conditions as applicable. The temperature margin resulted from class F insulation and class B temperature rise limits provides temperature safety margin due to hot spots and generator reliability over its life time. Therefore, it is neither possible nor allowed to demonstrate the Class F insulation (155°C) by performing generator temperature rise test up to Class F insulation limit (155°C). Please note that the temperature rise test on site, if performed, is to prove that any of the measured temperatures of generator parts will not reach class B temperature rise limits acc. to IEC 60034-1 at rated load of the generator. All insulating materials used to insulate active parts of the generator are ordered from ALSTOM qualified suppliers with specified F insulation temperature class 155°C (at least) acc. to IEC 62114 and that is indicated on incoming material certificates. We request to delete the requiriment of catagory III guaantee as specified.	Bid specification prevail
193	8	1.4.20	Short Circuit Capability The Generator shall be capable of withstanding a 3-phase short circuit at the generator terminals when operating at maximum continuous rated MVA and rated power factor, 105% rated voltage and with fixed excitation for 3 seconds as per IEC 34-4.	This requirement specified is a design requirement and not a test requirement. IEC or IEEE standards also do not requires to demonstrate same at the specified conditions. Moreover, such sudden short-circuit is not normal operation condition. Hence we request to delete the requiriment of catagory III guarantee.	Bid specification prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 VOLUME-II

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
194	8	1.4.21	Excitation System Performance (a) The excitation system shall be capable of supplying field forcing for Thirty (30) seconds in case of all types of faults, including close in faults of the generator. (b) The ceiling voltage shall not be less than 150% of the machine excitation voltage. (c) Nominal excitor response ratio shall not be less than 3.0 per second.	These capabilities of the plant can be checked as a part of Commissioning test and hence we request you to delete the requirement of catagory III guarantee..	Bid specification prevail
195	8	1.4.22	Capacity with Reduced Hydrogen Pressure Generator shall be capable of operating at reduced capacity at reduced generator hydrogen pressure in accordance with values furnished.	These capabilities of the plant can be checked as a part of Commissioning test and hence we request you to delete the requirement of catagory III guarantee.	Bid specification prevail
196	8	1.4.23 (a)	(a) The value of design condenser pressure to be measured at 300 mm above the top row of condenser tubes shall be guaranteed under VWO condition, 1% make-up, design C.W. inlet temperature and C.W. flow. The condenser vacuum shall be measured with a vacuum grid utilizing ASME basket tips.	Since the condenser pressure is forming part of Heat rate guarantees, separate demonstration guarantee at other conditions are not requiried. we request you to delete the requirement of catagory III guarantee. We also request you to review the pre-bid query/comment regarding the condenser design point.	Bid specification prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**Pre - Bid Queries****Bid Specification No. DG/BSL U-6/2011/T-1 VOLUME-II**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
197	8	1.4.23 (b)	(b) Temperature of condensate, at outlet of condenser, shall not be less than saturation temperature corresponding to the condenser pressure at all loads.	Please appreciate that even with our highly optimised tube layout and uniform steam distribution arrangement, minimum subcooling or practically zero sub-cooling may not be ruled out at certain loads and hence Temperature of condensate, at outlet of condenser, shall be near to saturation temperature corresponding to the condenser pressure at all loads. This query was also raised in the first set of pre-bid queries. Please confirm. Also the tempearature of condensate at outlet of condenser is forming part of Heat rate guarantees, separate demonstration guarantee at other conditions are not requiried. Hence we request you to delete the requirement of catagory III guarantee.	Will be evaluated after receipt of detailed scheme by bidder.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

246	Vol- II Sect-9,	Annexure - A Page 197 of 555	Mandatory spares List (Mechanical)	We do not find list of mandatory spares for Mill Rejects Handling System in the mandatory spares list of tender technical specification. You may kindly consider inclusion of the same	Agreed ; list will be furnished to bidders.
247	9	PG 204 OF 556	Mandatory spares	We understand that where "sets" are specified, 1 set refers to requirements of one equipment; for example in case of ID fan bearings, 1 set refers to 1 set of bearings for 1 no. ID fan. Please confirm.	Specification is self explanatory. It means that bidder has to supply one set of mandatory spares for each equipment.
248	9	20 PG 244 OF 556	Mandatory spares for drain cooler	Client to note that the mandatory spares for the drain cooler are applicable only if an external drain cooler is offered otherwise the section is not applicable. Kindly confirm.	Specification is self-explanatory
249	9	23 PG 245 OF 556	Condenser Tubes - 10 %	Client to note that there is actually no requirement for providing 10% extra tubes separately for the condenser as the condenser is already designed at VWO, 1% MU heat load condition and the plant will actually operate at much lower heat load and hence even there is some tube leakage there will not be any effect on the turbine output at 100% TMCR guarantee case. Accordingly kindly delete the requirement.	Bid Specification shall prevail

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	RESOLUTION
12	1	2.2.12	Start-up drain and vent regulating valves and isolating valves shall ... at superheater and reheater outlets, lowest set pressure safety valves on the water separators shall be provided with silencers.	For once through supercritical boilers start-up vents are not envisaged since the boiler will be started with HP-LP bypass in operation. The vent valves provided will be used for air release purpose only during boiler filling. Hence motorised valves and silencers are not necessary.	Bid Specification shall prevail
	1	2.3.1.4	All vent pipes and safety valves escape pipes to a level of 1 meter above SG house roof.		
	1	2.3.2.5	Start-up drain and vent regulating valves with motor drives	As per the bidder standard the vent pipe shall be routed to the safe location.	
	1	2.3.2.6	Start-up drain and vent isolating valves with motor drives		
	1	2.3.2.8	All start-up vents, lowest set pressure spring loaded safety valves on Superheater outlet and Reheater outlet shall be provided with silencers.		
	1	5.25.2.3	The start-up vent lines shall be provided with one motorised isolating valve and one motorised regulating valve.		

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project
Pre - Bid Queries
Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	RESOLUTION
13	1	2.2.12	Electromatic relief valves at superheater and reheater outlets, lowest set pressure safety valves on the water separators shall be provided with silencers.	Inline with ASME guidelines for once through boilers Electromatic relief valves are only provided on SH outlet and no requirement of ERV at RH outlet. Further the plant is equipped with HP-LP bypass system which controls the reheater pressure and hence ERV is not required at RH outlet functionally. However spring loaded safety valves shall be provided at RH inlet and outlet. Also ERV at RH outlet is not mandatory as per IBR though IBR does not cover super critical boilers. In view of the above ERV in the RH outlet is not required both as per code and functional requirement.	Shall be considered as per regulatory norms.
	1	2.3.2.7	Electromatic Relief Valves shall be provided on SH and RH outlet,		
14	1	2.3.1.15	Provision of Auxiliary Steam for initial requirement from existing units (2x500MW) along with necessary piping, valves and fittings from auxiliary steam header of existing units (2x500 MW) is covered in Bidder's scope along with their drains, steam trapping equipment etc.	As per the Specification Clause, our understanding is that there is no provision of Auxiliary Boiler. Steam requirement for 660 MW unit shall be drawn from existing units. Under above circumstances, please note that supercritical unit require aux steam during start-up. Therefore please confirm the followings: - whether existing plant can feed the required aux. steam to this new supercritical unit of 660 MW @ approx. 70 tph, 16 bar, 250 degC - 660 MW unit can't start if aux. steam from existing plant is not available.	70 TPH steam @ 14 ata & 310 deg C is available at the TP.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	RESOLUTION
15	1	2.3.1.7	Steam Generator fill lines from Boiler Fill Pumps discharge line near Steam Generator area (in the Compressor room) and from the discharge of Boiler Booster Pump inside station building during start ups.	Boiler filling will be done by boiler fill pumps located near DM water storage tanks and no separate filling line is envisaged from discharge of boiler booster pump (BFP booster pump).	Bid Specification shall prevail
16	1	2.3.2.2	Feed check valve and isolating valve with motor drive; the feed check valve location to be ahead of isolating valve in the direction of flow. Isolation valve & feed check valve at economiser inlet.	client to note that the feed check valve shall be located at the downstream of the HP heaters. However there is no requirement to provide an isolation valve at such location as per Bidder's standard & proven practice. It shall be further noted that as per IBR amendment dated March 12, 2007 to regulation 520, feed water discharge piping for feed water system without economizer inlet isolating valve can be designed. Kindly confirm the acceptance.	Isolation valve at economiser outlet may be deleted; rest of the scheme will be evaluated after receipt of detailed scheme by bidder.
17	1	2.3.2.10	MSSV	we understand that the bypass line referred here is small capacity bypass for equalising. Please confirm.	motorised regulating as well as isolation valve for charging shall be provided.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project**Pre - Bid Queries****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-A**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	RESOLUTION
18	1	2.3.2.10	AC motor driven main steam stop valve with separate bypass line with one motor operated isolating and one regulating valve.	Some integral bypass valves will be provided for Large size gate valve, if necessary as per valve supplier recommendation. Basically, motor bypass valves are not provided.	
19	1 1	2.3.3 2.7	Thermal insulation for hot surfaces to limit the surface temperature to 60 deg C. ensure skin temperature of not more than 60°C with ambient temperature of 45°C and Steam Generator at 100% MCR.	The temperature differential between the surface temperature and ambient temperature should be 20 - 25 °C in order to have an optimum thickness with air velocity of 1 m/s.	Bid Specification shall prevail

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	RESOLUTION
26	1	2.13	Pulverisers and motors with handling devices. Number of Pulverisers shall be N+2 as described in Datasheet - A.	The number of mills shall be decided as per bidder standard based on the coal properties, boiler design parameters, mill size etc. Bidder propose the mill selection criteria as follows: N+2 at 100 % BMCR with design coal N+1at 100% BMCR with worst coal firing N= No. of operating mills, In line with the clause no 1.4.5 (b) maximum mill loading is considered as 90 % .	Bid Specification shall prevail
	1	Data sheet-A.	Number of pulverisers: N+2		
	1	Sr.No:14.2	Each coal mill shall be designed with 15% margin over coal mill flow at BMCR with worst / design coal whichever, as per specified design criteria works out maximum. Total number of mills shall be N+2 where N = 6 (minimum) for 100% TGMCR operation with worst coal.		
	1	5.16.3.1	Maximum loading of the mill with worst coal and design coal (for sizing which ever is higher) :85% at 100% BMCR		
	8	Data sheet-A. Sr.No:14.6 1.4.5 (b)	Capacity output shall also be demonstrated on four coal pulverisers (of Owner's choice) of Steam Generator, not less than the 90% of guaranteed value of (a) above, at 100% mill loading with the originally installed grinding elements in nearly worn-out condition or at the end of guaranteed wear life of grinding elements, whichever is earlier.		
27	1	2.23	Load carrying oil burner with a total capacity sufficient to produce up to 30% Boiler maximum continuous rating (BMCR).	The minimum stable load without fuel oil support shall be 40% of SGMCR load, with two adjacent mills in service and mill loading not less than 50%	Bid Specification shall prevail

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project Pre - Bid Queries Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-A					
Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	RESOLUTION
28		3.4	The design of Steam Generator shall be such as not to call for oil support for flame stabilisation above (30%) rated output while firing entire range of coal		
29		3.7	The Steam Generator and all interconnected piping shall be designed for full load operation as base load. However, plant and equipment shall be capable to operate continuously up to a reduced load of 30% BMCR with coal without oil support.		
30		2.2	Coal start -up fuel - LDO upto 10% BMCR, beyond 10% upto 30% HFO.		
31		2.3	Capacity of oil burners for load carrying - Upto 30% BMCR (Without Coal firing)		
32	1	2.23	Load carrying oil burner with a total capacity sufficient to produce up to 30% Boiler maximum continuous rating (BMCR).	LDO burners shall be designed for 10% BMCR of boiler heat output and the HFO burners shall be designed for 30% BMCR of boiler heat output basis.	2.23. Confirmed. 5.22.1.1 : Specification is self-explanatory
	1	5.22.1.1	The Oil Firing System shall include Heavy Oil System to be used up to 40% rated output for support to stabilize coal firing.		
33	1	2.5.1 (c) 13.8	Electrically operated guillotine type gas tight isolations: Before and after each regenerative air heater on both flue gas and air side Double multi louvre type isolation dampers shall be provided before and after each regenerative air heater on air side	Kindly confirm whether double multi louvre type isolation dampers can be provided on the gas side also from layout considerations.	Bid Specification shall prevail

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	RESOLUTION
34	1 / 29	3.10	The Steam Generator and auxiliaries shall perform continuously within the specified noise limit 85 db at a distance of 1.0 M.	The noise level from non continuous operating valves (like PCV, WDC valve etc,) may exceed 90dBA The noise level for safety valves including ERV shall be limited to 115dBA with silencer. Noise level around Mill will be 90dBA.	85 dB at a distance of 1 m from equipment shall be for continuous operating equipment.
35	1	3.14	Steam Generator shall be capable to undertake forced cooling under emergency.	This point is not clear. Please elaborate. However furnace cooling can be done by using the fan during boiler shut process.	Bidder's understanding is correct.
36	1	3.2	The boiler and auxiliaries shall be suitable for generation of 100% BMCR capacity with rated pressure and temperature for a fuel mix of 70: 30 ratio between DOMESTIC (Indian) coal and IMPORTED coal.	The coal blending (70 % Domestic and 30% imported) shall be considered based by Heat basis. Please confirm.	Shall be on weight basis.
37	1	3.2	The Steam Generator shall be capable of starting and picking up load without HP-LP bypass system with whole range of specified coal.	Once-through steam generator requires high water quality and if the boiler start-up is done without HP/LP bypass large amount of make-up water will be injected and it is difficult to keep high water quality during start-up . Hence it is not recommended for boiler start-up without HP-LP bypass system in operation.	Agreed.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project
Pre - Bid Queries
Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	RESOLUTION
38	1	3.6	The Steam Generator shall be designed for continuous operation with all the High Pressure Feed Water Heaters out of service,.....temperature, under such conditions. However, during cold start-up, feed water temperature may go down to 110 Deg C and even less at the time of black start (i.e. in absence of auxiliary steam). The superheater and reheater temperature control system shall be designed to maintain the rated steam temperature with the HP heaters out of service from 60% BMCR to 100% BMCR.	The boiler is not designed for all HP heaters out condition as the feed water temperature will be very low under such condition which will reduce the mill drying capacity. However the boiler is designed with One train HP heater out of service @ 100 % TMCR output and the boiler can be operated at reduced load with all HP heaters out of service with rated steam temperature.	Bid Specification shall prevail
39	1	5.2.6	The furnace walls shall be either spiral wound and vertical tubes or vertical rifle tubes, as per the manufacturer's practice.	As per Vol II, Sec 3, cl. No. 1.1.1, furnace/evaporator shall be with vertical wall. Bidder's standard design for furnace is with both spiral wall (Lower furnace) and vertical wall (Upper furnace) tubes design. Please confirm the acceptance.	Vol IIIA Section 1, Cl 5.2.6 prevails.
40	1	5.2.9	Coal bunkers	The storage capacity of 16 hours for the bunkers is quite large and would result in a very large structure. For other similar projects capacity of 10 to 12 hours is being adopted. Kinldy review.	Bid Specification shall prevail
41	1	5.2.9	Sixteen (16) Hrs storage of coal in bunkers shall be considered for structural design.	Twelve (12) hrs storage of coal in bunkers is considered. Please confirm

80	I	5.26.3	The design temperature shall be at least 40 deg.C above the maximum fluid temperature for convection zone and 50 C for radiant zone	Design temperature margin of 40 C is not applicable for economiser zone - pl confirm	Bid Specification shall prevail
81	1	5.26.3	a) 2 x 100% (sized for max flow). b) gland less zero-leakage type with overhung impeller. c) Submerge type with wet stator with water coolers. Motor for steam generator start-up recirculation pumps shall be a wet motor, specifically designed by the pump manufacturer.....	Bidder will provide one BCP sized for about 25%BMCR flow. As per bidder standard the boiler can be started even BCP is out of operation. Hence stand by BCP is not required and not provided.	Bid Specification shall prevail
	1	Data sheet- A. Sr.No:12	2 x 100% Boiler circulation pumps for initial start-up/ low load operation.		
82	1	5.27.1	Aux steam header	We understand Bidder can offer two aux steam headers (high temp and low temp) or single aux steam header design. Please confirm.	Spec is self explanatory
83	1	5.27.1	Auxiliary steam system shall consist of one (1) auxiliary pressure reducing station (APRS) and a desuperheater on the steam line tapped off from the main steam line.	The steam for the auxiliary steam system shall be tapped from CRH Steam instead of the main steam line. The tapping of steam from main steam line will result in loss of high temperature steam.	Bid Specification shall prevail
84	1	5.27.3	The interconnection between auxiliary steam systems of the adjacent unit shall also be provided with separate isolating valves on both the sides and with required steam trapping equipment.	Manual Isolating valves shall be provided on both ends of HT and LT Aux steam header for future unit connection. Please confirm	Will be evaluated after receipt of detailed scheme by bidder.

The HFO system shall be sized for load carrying upto 30 % BMCR. Boiler minimum stable load without oil support shall be 40% BMCR.
160	3	2.4	HFO system	Please clarify if electric heat tracing can be offered instead of steam tracing.	Bid Specification shall prevail
161	3	3.3	Oil water separator	Please review if a common oil water separator in the ETP area can be provided which can handle oily waste from fuel oil area and also other areas.	Bid Specification shall prevail

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	RESOLUTION
162	3	3.3 & 3.6	As per clause 3.3 oily water separator shall be provided. Also, as per clause 3.6 two (2) recovery pumps shall be provided to recirculate oil from oil water separator to HFO tanks. As per P & I diagram of Effluent Treatment System (PE-189-PI-250) oily water waste from fuel oil storage area shall be transferred to common oily water pit in ETP area.	We propose to proceed as per the following: Oily water waste from Fuel oil pressurizing pump house area and day tank dyke area shall be transferred to common oily water pit in ETP area as mentioned in ETP scheme. Hence, Oily water separation tank, recovery pumps shown in FO P&I D (PE-189-PI-252) will not be required. Further, drain oil from drain oil tank of Fuel oil day tank and pressurizing pump house area shall be transferred to HFO day tank by 2 X 100 % drain oil pump.	Bid Specification shall prevail
163	3	4.1	LDO tank	Please clarify capacity of LDO day tank.	500 m3
164	3	4.2.1	LDO transfer pump	Please review capacity specified. This appears to be high. HFO pump capacity specified is 125 cum/h only.	Bid Specification shall prevail
165	3	Volume - IIIF/4.5.2 (d) 6.1.10	As per Volume - IIIF, The strainer shall have screen of stainless steel (AISI 316) construction..... Where as as per Volume - IIIA, The strainer shall have screed of stainless steel (AISI 304) construction.	The strainer with screen of stainless steel (AISI 304) construction will be considered. Please confirm	AISI 316 shall be considered.

10	1	2.1.37	The scope of Instrumentation & Control shall include but not be limited to the following, as elaborated in Volume V. (g) Electro-hydraulic Governor with mechanical backup.	Electronic backup for electrohydraulic governor is provided as per bidder's proven practice. Mechanical backup is not applicable as per bidder's design. Please provide acceptance of bidder's standard design.	Bid Spec is self-explanatory
11	1	2.2.4	Bolt-heating device, tongue wrenches etc.	Pre Tensioned hydraulically expansion/elongated bolts are used as per bidder's standard and proven practice. Expansion/elongation bolts are provided with hydraulic stretching devices for pre stretching. Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail
12	1	2.2.8	Type of foundation for turbine and generator shall be of Conventional or spring supported RCC	We understand that the STG foundation shall be Conventional or Spring supported as decided by the bidder. Please clarify.	Specification is self-explanatory
13	1	2.2.9	A reserve feed water tank-cum-condensate surge tank of adequate capacity, with provision for filling, supplying make-up to Condenser hot well, boiler filling, receiving dumped condensate, supplying gland sealing water, overflow and vent through seal pots etc	We understand that the tanks in Cl. 2.1.23(a) page 16 of 308, Vol-III B and in Cl. 2.2.9 page 19 of 308, Vol-III B are same and are referred to Condensate Storage Tank. Please clarify.	Bidders' understanding is correct.
14	1	3.2.a&d/1.18	Pressure drop in extracion and Reheat circuit.	As this is an EPC contract, the pressure drops selection can be optimised by the bidder for the better performance. Please review and advise.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
15	1	3.2(e)	The Auxiliary steam flow tapped from CRH steam line shall be minimum 1% of Throttle flow and.....	Steam required for Auxiliary purpose for our standard 660 MW set from CRH line is 'x' T/hr. Hence, balance of steam between 1% & 'x' T/hr will be taken as boiler blow down. Please confirm that this is acceptable to MahaGenco	Specification is self-explanatory
16	1	3.2 (e)	The auxiliary steam tapped from cold reheat steam line shall be minimum 1% of throttle steam flow and the make-up system shall accordingly be designed.	Please clarify the design make-up quantity. it is 1% or 3% ?	1%.
17	1	3.3	Heat rate will be defined as follows..	It is clarified as follows, 1. Guaranteed HBDs will be based on 0% Mu condition only. So Mm and Hm need not be indicated. 3. The spary water tap off for super heater is at the economiser inlet .Hence Msx is not applicable .	1. Bid Specification shall prevail
18	1	3.4	The Bidder shall state the maximum continuous capability of the Turbine with valves wide open (VWO) and indicate the maximum flow passing ability of the machine corresponding to rated steam parameter and at rated condenser vacuum at 77 mm Hg absolute.	We understand that VWO condition as defined by tender is, when throttle steam flow is 105% of steam flow of TMCR condition and not 105% TMCR load. Please clarify.	VWO is 105% TMCR Load
19	1	3.6	The Turbine Generator unit shall be designed to operate satisfactorily under prevailing climate. It shall be suitable for indoor installation on reinforced concrete foundation mounted on springs and dampers.	We understand that the STG foundation shall be Conventional or Spring supported as decided by the bidder. Please clarify.	Specification is self-explanatory

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
20	1	3.10	The radiated sound level of the Turbine-Generator train shall not exceed 85 dB(A) when measured at a distance of one (1) meter in plan or elevation from the outline of the Turbine Generator at the shaft centerline elevation at any load considering the background noise of the other machine and auxiliaries.	Generator expected A-weighted surface sound pressure level of $L_{pA}=90(A)$ when measured 3ft (1m) in horizontal plane and at an elevation of 5ft (1.5m) from grade.	Bid Specification shall prevail on the noise level. The measurement is from the outline of the equipment.
21	1	3.10	The radiated sound level of the Turbine-Generator train shall not exceed 85 dB (A) when measured at a distance of one (1) metre in plan or elevation from the outline of the Turbine Generator at the shaft centreline elevation at any load considering the background noise of the other machine and auxiliaries. The radiated sound level of all auxiliaries supplied with the Turbine Generator shall not exceed 85 dB (A) when measured at a distance of one (1) metre from the noise emanating surface. For valves & orifices, the measurement shall be made one (1) metre down stream of the devices and one (1) metre from the surface of the pipe for any combination of pressure drop and flow.	As required in Section 8 - Clause 1.4.34 of the Master Specifications (Vol. II) regarding the Noise Performance Guarantees, the near field noise levels will be measured at 1 m distance from the equipment outlines, and at a height of 1.5 m above the floor or walkways level. As per clarification about Section 4 - Clause 17.2.1 of the Master Specifications (Vol. II) regarding Noise Level Requirement, the correction for the influence of the background noise will be done, if applicable, as per procedures of ISO 3746:2010. Furthermore, the noise measurements will be carried out during the continuous operation of the Plant at base load.	Bid Specification shall prevail on the noise level. The measurement is from the outline of the equipment.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

27	1	5.5	The turbine shall be capable of accepting variation in steam temperature and pressure as per IEC-45 in case continuous over pressure is likely.	Bidder would like to clarify that over pressure operation is not envisaged for this plant and hence no pressure margin shall be provided over the design turbine inlet steam pressure. We understand that operation capability mentioned in the datasheet-A is the continuous 105% output with the rated steam pressure corresponding to VWO condition shall be 660 MW + 5%, i.e. 693 MW. Please confirm that Bidder's understanding is correct and amend the specification accordingly.	Bidders understanding is correct.
28	1	5.6	Turbine shall be suitable for two cycle shift operation	Tender requirement is not clear. Please elaborate the same.	It is clarified that the turbine is meant for base load operation.
29	1	6.1.1	The casing shall be designed for hydrostatic test pressure of at least 150% of the Design pressure.	Hydraulic pressure test not possible for Gland Seal Casings due to geometry constraint.	Bid Specification shall prevail
30	1	6.1.1	The casing shall be designed for hydrostatic test pressure of at least 150% of the Design pressure. The casings shall be free from sharp corners, sudden changes in section and other features, which may result in unnecessary stress concentration. H.P. Cylinder shall be double casing type.	As per bidder's proven practice, hydraulic test is not considered. The risk is mitigated by bidder's NDT philosophy and design. Bidder ensuring the quality of the equipments by giving reference of same unit in operation world wide. Please confirm bidder's proven practice.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
31	1	6.1.1	The casing shall be designed for hydrostatic test pressure of at least 150% of the Design pressure.	As per bidder's proven practice, hydraulic test is not considered. The risk is mitigated by bidder's NDT philosophy and design. Bidder ensuring the quality of the equipments by giving reference of same unit in operation world wide. Please confirm bidder's proven practice.	
32	1	6.1.3	The casing drains shall be provided with temperature sensing devices to ensure proper evacuation of drains.	Turbine Internal drains are controlled based on load. Before attaining 15 % internal drains remain open irrespective of Condensation and close afterwards. Accordingly temperature sensing devices are not envisaged as standard and proven practice.	Bid Specification shall prevail
33	1	6.1.4	The Steam Turbine casings shall be horizontally split at the centreline.	HP turbine casing shall be as per OEM proven design. Please confirm.	Bid Specification shall prevail
34	1	6.1.5	The LP turbine Outer casing shall be provided with a manhole on both sides of the turbine	In offered Machine, man hole is provided on Cross Over Pipes & not on LP outer casing. Please confirm that this is acceptable to MahaGenco	Will be evaluated after receipt of detailed scheme by bidder.
35	1	6.1.8	Thermocouples shall be provided on High pressure (HP) and intermediate pressure (IP) valve blocks and on HP & IP turbine cylinder top and bottom casing to indicate metal temperatures to enable evaluation of thermal stress levels.	Thermocouples will be provided as per bidder's standard practice. Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
36	1	6.1.8	Thermocouples shall be provided on High pressure (HP) and intermediate pressure (IP) valve blocks and on HP & IP turbine cylinder top and bottom casing to indicate metal temperatures to enable evaluation of thermal stress levels.	As per bidder's design thermal stress levels are monitored through startup probes provided on HP\IP turbine inner chest and loading/unloading margins are calculated internally through stress calculation. Valve block temperature measurement is not envisaged for Turbine Stress evaluation, hence not envisaged as per standard and proven practice. Please provide acceptance of bidder's standard and proven practice.	Bid Specification shall prevail
37	1	6.1.10	When jack screws are used as a means of parting contact on faces, the mating face shall be counter-bored to receive the jack screw in order to prevent subsequent scoring due to improper fit caused by marking.	As per alstom standard practice dog point jacking screw with chrome eletroplating as per ISO 4042 are used, which can ensure the scoring do not occur at parting plane (on machined surface).Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

40	1	6.1.15	The springs supports of turbine on the foundation shall be designed considering.....	We understand that the STG foundation shall be Conventional or Spring supported as decided by the bidder. Please clarify.	Specification is self-explanatory, both rigid type and spring type support are acceptable
41	1	6.2.1	Alternatively, the rotor could also be of proven welded construction. & If the HP-IP or IP-LP rotor is of welded type, only one weld is permissible between the rotors	OEM's standard & proven design is with welded rotor only. Number of welds shall be as per OEM design. Further, it shall be noted that Bidder has separate HP, IP & LP modules & there is no welding involved for HP-IP or IP-LP.. Also refer to clause 6.2.2	Bid Specification shall prevail
42	1	6.2.2	After machining and heat treating the temporary deflection shall be within the limit of clearance or 50 microns (whichever is smaller) and permanent straightness shall be assured at all operating temperatures.	As per bidder's practice, Heat stability test is not carried for welded rotors. Heat stability tests are only done on monoblock rotors which exceed a delivery weight of 32 tons when quenched in vertical position and on 5 tons when quenched in horizontal position. Rotors are made of high alloy raw material (Cr Mo W V Nb N steel) supplied by experienced suppliers, poured by ESR to reduce segregation in the forgings.	Bid Specification shall prevail
43	1	6.2.4	Critical speed of composite rotor and blade assembly shall not be within $\pm 15\%$ of operating speed.	As per bidder's design and proven practice the critical speed of the combined turbine and generator rotor shall not lie within a range of + 15% or - 10% of the operating speed of 3000 rpm. Please consider bidder's proposal.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
44	1	6.2.8	Facility for wet steam washing of turbine casings and rotors shall be provided with a tapping from nearby piping and procedure for the same shall be furnished by the bidder.	Wet steam washing system for turbines is not recommended by the bidder. Pl. refer to clause 2.1.13 also	Will be evaluated after receipt of detailed scheme by bidder.
45	1	6.2.8	Forced cooling system of turbine system shall be provided so that the turbine block can be cooled during emergency for quick access.	A system for emergency cooling will be provided as per bidder's practice. Please confirm acceptance of bidder's practice.	Specification is self-explanatory
46	1	6.3.3	LP Turbine shall have stand-alone type blades capable of sustaining -5% & +3% grid frequency variation.	LP last stage blades shall be as per OEM's standard design.	Bid Specification shall prevail
47	1	6.4.1	The exhaust hood shall be equipped with pressure relief bursting diaphragms (piercing type) designed to rupture at a specified internal pressure so as to limit the exhaust hood pressure within a safe margin. The diaphragms should be of sufficient area to pass the maximum L.P. exhaust steam plus flash steam entering the condenser.	As per bidder's design exhaust hood is equipped with pressure relief rupture disc. The rupture disc has sufficient area to allow 10% of nominal flow to pass. Please confirm acceptance of OEM design.	Specification is self-explanatory

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
48	1	6.5.2	The rotor axial position shall be maintained by a thrust bearing assembly of adequate capacity. The design of the thrust pads shall be such as to get adequate lubrication and to maintain the required film of oil at the contact surfaces at all times. Proper arrangement shall be made to maintain oil pressure under all load conditions of operation. The design shall incorporate arrangements for monitoring thrust bearing metal temperatures. Devices shall be provided for annunciation of an impending failure of the turbine thrust bearing. Additional switches shall be provided for alarm and trip of the unit in case of a thrust bearing failure.	Bidder provides axial displacement monitoring to allow for alarm and trip in case of abnormal axial displacement for whatever reason and exceeding owner's requirement. Please confirm acceptance of bidder's standard and proven practice.	Bid Specification shall prevail
49	1	6.7.3	A suitable by-pass of the Gland Steam Condenser to the exhausters shall also be provided along with desuperheater. A standby gland steam evacuation system shall also be provided. This standby system shall be used during the outage of the gland steam condenser for de superheating and to exhaust the steam to atmosphere outside the turbine building.	As per bidder's standard practice and recommendation instead of separate standby gland steam evacuation system, steam side bypass along with desuperheater arrangement shall be provided which will be used during the outage of the gland steam condenser. Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
50	1	6.9.1	(b) Mechanical position indicator to show valve open / close / travel and signal switches to indicate valve position (open or close). These signal lamps shall be mounted on valve testing panels and shall also be duplicated on the turbine generator supervisory panel.	As per bidder's standard and proven practice, valve open/close/travel position is remotely available on Operator station for monitoring. Valve Testing is carried out remotely (not vide local testing devices) and accordingly Mechanical position indicator and signal lamps are not part of bidder's standard offering. Please provide acceptance of bidder's standard and proven practice.	Specification is self-explanatory
51	1	6.9.1	The valves shall specifically include the following features: (a) Devices to trip the Generator and close all non-return and isolating valves on the extraction lines, when these stop valves are closed.	Tender requirement is not clear. Please elaborate the same.	Specification is self-explanatory
52	1	6.9.4	They shall also be fail-safe and automatic closure of valves shall take place under conditions of loss of auxiliary power, hydraulic/pneumatic pressure etc.	As per bidder's practice power assisted NRV shall closes on reverse of steam flow or in case of trip. It does not close on loss of air pressure supply, auxiliary power etc. Please confirm acceptance of bidder's standard practice.	Will be evaluated after receipt of detailed scheme by bidder.
53	1	6.9.4	Double valves shall be provided on all extraction lines.	The number of Extraction NRV will be provided as per the ASME TDP-2008 guidelines. As per that all extraction lines except to deaerator will be provided with one (1) NRV (Quick closing type) can be provided.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
54	1	6.9.4(a)	Double valves shall be provided on all extraction lines except for extraction line to LP Heater-I in Condenser neck. For extraction line to de-aerator, both the NRV's shall be power operated type.	NRVs in each extraction line will provided as per bidder's safety guidelines and standard proven practice. Please confirm acceptance of bidder's standard proven practice.	Bid Specification shall prevail
55	1	6.9.4(b)	One of these valves shall be hydraulic/pneumatic swing check/ piston lift type quick closing valves. These valves shall be operated by means of solenoid impulses. They shall be suitable for on load testing individually.	As per bidder's standard and proven practice, Onload group testing facility will be provided. Please confirm acceptance of bidder's standard proven practice.	Bid Specification shall prevail
56	1	6.9.4(c)	The material of the valves shall be compatible with the material of the piping on which the valve is mounted. However, the material shall not be inferior to the following : NRV's on CRH line and on extraction lines to HP heater : ASTM A 217 WC9 Other NRV's : ASTM A 217 WC6.	Based on pressure temperature parameters of the extraction lines, material grade WC6 for HP heaters & CRH and grade WCB for other heaters is recommendation as per bidder's proven practice. Please confirm acceptance of bidder's proven practice.	Material compatibility shall be checked during bid evaluation after reviewing the steam cycle conceived by bidder.
57	1	6.10	Vacuum breaker valve with pneumatic actuator shall be of gate type with provision of sealing.	As it is vacuum service, bidder's standard practice and suitability for vacuum service, Wafer type butterfly valve. Better sealing tightness is achieved with Wafer type butterfly valve. Please confirm acceptance of bidder's standard and proven practice.	Bid Specification shall prevail
58	1	6.11	Duplex type electro-hydraulic speed control system.....	Tender requirement is not clear. Please elaborate the same.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
59	1	6.11.1	Speed governor The speed-sensing element shall respond to small speed variations so as to keep the dead band within 0.02% of rated speed, at any power output.	We understand as per Volume V, Section 3B, Cl. No. 3.13(b), permissible speed variation to keep dead band within 0.06% of rated (Instead 0.02%). Also as per IEC-45-1 guideline, dead band is within 0.06% of rated speed.	Clause 6.11.1 (Vol III B) shall prevail.
60	1	6.11.1	The speed droop or speed regulation shall be adjustable within 2 to 8% rated speed.	As per IEC-45-1 guideline, speed regulation shall be adjustable within 3 to 8% rated speed.	Bid Specification shall prevail
61	1	6.11.3	Speed Changer The Turbine shall be provided with a speed changer to control its speed or power output within limits, locally and remotely operable from the Turbine Generator supervisory panel. The speed changer provided shall be capable of adjusting (manual/auto) the speed of the turbo set to any value in the range 95% to 105% of rated speed, to facilitate synchronising of the Generator with the bus	As per bidder's design, speed regulation and load control is part of redundant Digital Elctrohydraulic governing system and accordingly Speed changers are not applicable. Please provide acceptance of bidder's standard and proven design.	Bid Specification shall prevail
62	1	6.11.4	Load Limiting Device Turbine shall be equipped with a local/remotely operated load limiting device. The motor for the remote control of the load limiting device shall operate on D.C. power supply. A remote position indicator shall be provided for indication of the setting of the load limit on the turbine generator supervisory panel.	As per bidder's design, speed regulation and load control is part of redundant Digital Elctrohydraulic governing system and accordingly Speed changers are not applicable. Please provide acceptance of bidder's standard and proven design.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
63	1	6.12	OIL SYSTEM The Turbine set shall be provided with complete self-contained Oil Systems. The system shall supply oil for the lubrication of the Turbine and Generator bearings, for actuation of various components of governing and control system, hydraulic turning gear, seal oil etc. The Control Oil System may be separate from the Lube Oil System. The grade of oil to be used with complete specification for both Control System and Lube Oil System shall be stated along with Bid. While developing the layout, Bidder shall locate the oil tanks/coolers and route the piping in such a way that the installation becomes safe against possibility of any fire hazard and all efforts shall be made to improve layout during detail design without any price implication to the Owner. Control Fluid System (a) 2 x 100% AC motor driven Control Fluid pumps mounted vertically in Fire resistant control fluid tank supplying oil for control function viz. servomotors/actuators of control valves or for the operation of protective devices for TG set.	Fire resistance fluid shall not be provided in combine oil system. Please confirm the bidders understanding.	Specification is self-explanatory
64	1	6.12	the control oil system may be separate from lube oil system..	Please confirm bidder's understanding on acceptance of combine lube and control oil system.	Specification is self-explanatory

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
65	1	6.12.1(b)	one (1) booster pump or suitable oil injector to pressurize main oil pump suction.	Main oil pump is gear driven type hence additional booster pump is not required as per bidder's proven design. Please confirm acceptance of bidder's proven design.	Specification is self-explanatory
66	1	6.12.1(c)	an adequately sized portable pump for line testing shall be provided on permanent basis.	Bidder shall offer 1x100% Auxiliary oil pump, and One shaft driven lube oil pump and DC Emergency oil pump to provide adequate redundancy in pumps. Hence additional pump is not required as per bidder's standard and proven design. Please confirm acceptance of bidder's standard and proven practice.	Bid Specification shall prevail
67	1	6.12.1(e)	One (1) D.C. motor driven Emergency Oil Pump with drive motor and motor starter suitable for operation on 220V D.C. voltage with voltage variation from 190 V to 240 V D.C.	DC motors and voltage variation will be provided as per IEC standards. Please confirm acceptance of IEC standard.	Bid Specification shall prevail.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
68	Section-1 (Page 41 of 308)	6.12.1	OIL SYSTEM (a) One (1) Main Oil Pump driven from Turbine shaft supplying oil, for ... (b) One (1) Booster Pump ... (c) Two (2) full capacity A.C. Motor driven auxiliary oil pumps ,,, An adequate sized portable pump (d) Two full capacity jacking oil pumps ,,, (e) One (1) D.C. motor driven Emergency Oil Pump ...	OIL SYSTEM (a) Two (2) full capacity A.C. Motor driven main oil pumps ,,, (b) Two full capacity jacking oil pumps ,,, (c) One (1) D.C. motor driven Emergency Oil Pump ... [Explanation] As of the Lubrication Oil System, sufficient equipment arrangement is provided. For this purpose, instead of turbine shaft driven main oil pump, AC motor driven pump is prepared with a standby pump. Shaft driven pump system is the complex system and only a limited maker can cope with. This means it is hard in the future the maintenance of shaft driven main oil pump system as well as to achieve spare parts.	Bidder should follow as per bid specification (d) Two full capacity jacking oil pumps one of this pump shall be driven by AC motor and other one should be DC driven motor ,,, (e) One (1) D.C. motor driven Emergency Oil Pump ...
69	1	6.12.3	...The outer surfaces of all piping in the reservoir and the inner surface of the tank shall be coated with corrosion resistant paint.	As per bidder's design, offered piping is made of stainless steel material hence painting is not envisaged on stainless steal material. For the inner surface of tank, it is protected by anti corrosion WD40 coating. Please confirm acceptance of bidder's practice.	Specification is self-explanatory

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
70	1	6.12.3	It shall be provided with removable stainless steel basket strainers and at least two oil level indicators out of which one should be visible from Turbine operating floor.	As per bidder's practice, level indicator which is mounted on lube oil tank shall not be visible to operator from Turbine operating floor, however remote indication will be available on operator's stations in control room (DCS) through level transmitters. Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail
71	1	6.12.4	The Oil System for the Turbine set shall include adequate number of shell & tube type Oil Coolers.....	Bidders standard design is with plate type heat exchanger. Request you to incorporate the same as an option in technical specification.	Bid Specification shall prevail
72	1	6.12.4	Manually operated lockable type valves shall preferably be provided on the oil side of the coolers to facilitate change over from one Oil Cooler to the other without interfering with the unit operation.	We understand that requirement is for 3 way valve. Please confirm that bidders understanding is correct.	Specification is self-explanatory
73	1	6.12.5	The oil return lines from bearings shall be provided with illuminated sight fittings.	As per bidder's standard practice sight glass is used at place of illuminated sight fitting. Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail
74	1	6.12.6	Filters shall be provided at immediately upstream of all bearings and Generator seals.	As per bidder's design duplex filter is sufficient to filter oil. Hence filter immediately upstream of all bearings and Generator seals is not applicable as per bidder's standard practice. Please confirm acceptance of bidder's practice.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
75	1	6.12.7	2x100% purifier for turbine unit lube oil system and	As per bidder's standard practice and requirement , 1x100% coalescer type purifier will be provided to provide continuous and safe operation. This will be as per Bidder's standard and proven practice. Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail
76	1	6.12.7	Oil Purification Units	Please clarify if the bidder can propose the Lube oil purifier of coalescer type (Static) as per their standard practice.	Bid Specification shall prevail
77	1	8.2	...with an inlet hydraulic/ pneumatic actuated, modulating control valve, a bypass line with MO control valve , isolating valves etc.....	As per bidder's practice bypass line will be equipped with MO inching valve. Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail
78	1	8.2	...Another hydraulic/pneumatic actuated, modulating control valve shall be provided in the exhaust line from Header to condenser.....	Bidder's understanding that "exhaust line from header to condenser or any suitable location as per optimized cycle." Please confirm bidder's understanding is correct.	Bid Specification shall prevail
79	1	9.1 (a)	The minimum leakage class of HP & LP bypass system shall be Class V with full stroke operating time of the order of three (3) sec.	Employer to note that the quick opening and closing time for the HP & LP bypass system shall be of the Order of three (3) sec. however the modulating operating time of the HP & LP bypass system shall be of the order of close to 20 sec. Kindly confirm.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
80	1	9.8	Valves shall be so selected that the noise level is below 85 dB (A) at a distance of 1.0 M.	Owner to note that the noise level for the HP/LP Bypass control valve shall be relaxed to 95 dBA at a distance of 1.0 m from the equipment since the bypass operation is not a normal operating condition.	Agreed
81	1	9.8	Valves shall be so selected that the noise level is below 85 dB (A) at a distance of 1.0 M.	Employer to note that for the operation of the HP & LP Bypass system the noise level shall be allowed upto 95 dB (A) at a distance of 1.0 m since this is not a normal operating condition.	Agreed
82	1	Volume-III/ 9.8	HP/LP bypass Valves shall be so selected that the noise level is below 85 dB (A) at a distance of 1.0 M.	Noise limit of 95 dBA for HP/LP bypass valves at 1 m distance during bypass operation may please be accepted.	Agreed
83	1	10	TURBINE AND INTEGRAL PIPING DRAINS	Owner to note that for all the drains which are routed to the condenser hotwell, instead of providing separate HP & LP flash tanks, Bidder shall provide flash boxes which shall be attached to the condenser as per standard and proven practice of the Bidder. Kindly accept.	Bid Specification shall prevail
84	1	10	TURBINE AND INTEGRAL PIPING DRAINS	Keeping turbine safety in view, bidder's standard practice is only the turbine integral drain leads to condenser flashbox & external drain leads to atmospheric flash box. Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
85	Sec-I	10.2	Pg 50/308, para 2 & 3: reg. critical piping drains from MS, CRH, HRH, HP/LP Bypass	While para 2 specifies these drains to be led to HP & LP flash tanks, para 3 specifies drains from MS, HP/LP bypass to be led to unit flash tank. Bidder shall lead the drains from MS and HP bypass to atmospheric unit flash tank, while the drains from CRH, HRH & LP bypass shall be led to condenser flash tank. please confirm.	Will be evaluated after receipt of detailed scheme by bidder.
86	1	10.7	The main valve shall be suitable for throttling and the second valve shall provide complete isolation....	Regulation is not feasible as per standard operation of drain valve. Offered drains valves will be supplied with on-off type. Please confirm acceptance of bidder's request.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
87	1	11.4 11.6	INSULATION AND TEMPERATURE LIMITS The Generator stator and rotor windings inclusive of main and neutral leads, shall be provided with class F insulation but rated for class B temperature rise. The maximum permissible temperatures of different parts of the generator shall be as specified in IEC 34-1, 34-3 as applicable. The Generator shall be capable of continuous safe operation at rated output and power factor under any of the following conditions: (a) Terminal voltage variation of +_ 5% of the rated value. (b) Frequency variation within 47.5 to 51.5 Hz. (c) Absolute sum of combined voltage and frequency variation of 5%.	Bidder's shall offer proven and standard generator design. Bidder's shall furnish provenness certificate of same module running world wide. Please confirm acceptance of bidder's proven design.	Bid Specification shall prevail
88	1	11.8	ASYMMETRICAL SHORT CIRCUIT WITHSTAND The Generator shall also be capable of withstanding, without injury, any other short circuit at its terminals provided the integrated product of $(I_2)^2 \times t$ shall be upto ten (10), where "I₂" is negative sequence current and 't' is the duration of fault in seconds, and the maximum phase current is limited to a value which does not exceed the maximum phase current obtained from 3 phase fault.	The proposed generator has directly cooled rotor windings and following IEC 60034-1 standard its design meets short-time negative-sequence current capability $(I_2)^2 \times t$ of 5.5 p.u.s. Please note that according to IEC 60034-1, the value of 10 p.u.s is required for indirectly hydrogen cooled rotors. Please confirm acceptance of bidder's proven and standard design.	ASYMMETRICAL SHORT CIRCUIT WITHSTAND The Generator shall also be capable of withstanding, without injury, any other short circuit at its terminals provided the integrated product of $(I_2)^2 \times t$ shall be calculated as per IEC 600034 and value shall be equal to or more than 5.7. Refer corrigendum (II).

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
89	1	11.8.1	The Generator shall be capable of continuous safe operation with a negative sequence current upto 8% of the rated current, provided none of the phase current exceeds the rated current.	The proposed generator has directly cooled rotor windings and following IEC 60034-1 standard its design meets continuous negative-sequence current capability up to 6.4%. Please note that according to IEC 60034-1, the value of 8% is required for rotors of generators with rated power below 350MVA. Please confirm acceptance of bidder's proven and standard design.	Unbalanced Load The Generator shall be capable of continuous safe operation with a negative sequence current upto 6.6 % of the rated current, provided none of the phase current exceeds the rated current. As per IEC 600034 Refer corrigendum (II).
90	1	11.9	VOLTAGE WAVE FORM: When tested on open circuit and at rated speed and voltage, the telephone harmonic factor of the turbine-generator shall not exceed 1.5% as per IEC 60034.	According to the latest edition of IEC60034-1, section 9.11.2, the total harmonic distortion (THD) of the line-to-line generator terminal voltage will not exceed 5%, when tested on open-circuit and at rated speed and voltage. Please confirm.	1. Total Harmonic Distortion (THD) in the voltage wave form as per IEC 60034-1. 2. Voltage and Current harmonic factor of the turbine-generator shall not exceed as per IEEE 519.
91	1	11.11	CAPACITY WITH ONE GAS COOLER OUT OF SERVICE In the event of one gas cooler being out of service, the generator shall be capable of carrying at least 75 % of rated load continuously, without the permissible temperature of the machine being exceeded.	Following IEC 60034-3, the offered generator is capable of carrying 67% of rated load continuously, without the permissible temperature of the machine being exceeded. Please confirm acceptance of bidder's proven and standard design.	Bid Specification prevails.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
92	1	11.11	In the event of one gas cooler being out of service, the generator shall be capable of carrying at least 75% of rated load continuously, without the permissible temperature of the machine being exceeded.	With outage of one cooler and with 10% of tubes plugged, the generator shall be capable to deliver 2/3rd of rated output without the permissible temperature of the machine being exceeded. Please accept & confirm.	
93	1	12.2	The stator core shall be fabricated out of best quality CRGO so that losses are minimum.	Bidder's standard bases on non-grain oriented cold-rolled sheets all over the manufacturing portfolio of offering generator module. Please confirm acceptance of bidder's proven and standard design.	Refer corrigendum (II)
94	1	12.2	Magnetic screens shall be provided to reduce the end zone heating by leakage flux.	The generator casing is in natural way a magnetic shield for internal electromagnetic field generated by the stator therefore as per manufacturer proven standard, magnetic screens are not assembled. Please confirm acceptance of bidder's proven and standard design.	As a intrinsic design feature it is allowed. However bidder should give details in the offer supporting this claim.(Deviation)
95	1	12.3	Ripple springs shall be provided below the slot wedges to compensate for any future shrinkage and ensure permanent firm seating of the bars in the slot during operation.	The Bidder's proven stator slot wedging system comprises of adequately seated double-tapered convex-concave wedges with inserts under them locking stator bars in firm position in slots. Please confirm acceptance of bidder's proven and standard design.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
96	1	12.4	The seal off bushing shall be porcelain type and complete with silver plated terminal connectors.	The bushings design will meet DIN 48124 Part 2 standard. The bushings are of moulded resin-insulated type. Please confirm acceptance of bidder's proven and standard design.	Bid Specification shall prevail
97	1	12.6	The retaining rings shall be floating type, shrunk on rotor body and prevented from axial movement by snap rings/locknuts.	The generator has retaining rings of a floating type, shrunk onto rotor but prevented from axial movement by a bayonet locking system, which the standard proven product & practice. Since the generator design is proved by many units of similar design, many years in operation and since these were established on the basis of technical considerations and can not be changed. Please confirm acceptance of bidder's proven and standard design.	Bidder should furnish details of bayonet locking system in the technical offer. (Deviation)
98	1	12.7	The generator shall be provided with end-shield mounted self-aligning journal bearings.	As per bidder's standard design, the rotor is supported on two-pedestal bearings. The coupled-on slip ring shaft at the NDE is supported by a third pedestal bearing at the end of the shaft. Please confirm acceptance of bidder's proven and standard design.	Bearings mounted in the end - shield are preferred. Bidder shall provide the detail write up and proven record of the equipment offered to various customers during last 5 years.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
99	1	12.9	Hydrogen shall be circulated in the generator in closed circuit by the axial fans/compressors located on rotor shaft at either end.	The design of offered generator is with one radial-flow type fan, which circulates the hydrogen in the generator and is shrunk onto the shaft at non-driving end, just outside the active length. Bidder has proven generator design which is in operation for many years world wide, Please confirm acceptance of bidder's proven and standard design.	The specified system is preferred by owner Bidder may furnish the detailed write up along with proven record (documents) with offer to various customers during last 5 years.
100	1	12.10	The enclosure shall be natural air ventilated with intake filters to clean the cooling air and discharge filters to prevent discharge of the dust from brushes to the turbine room.	The slip rings and brush gear are cooled by a closed-circuit cooling air circulation inside their casing. The cooling air is circulated by a twin-impeller, radial-flow fan mounted on the shaft, between the two slip rings. The air passes through coolers, filters and a humidifier mounted in the upper part of the slip ring casing. Please confirm acceptance of bidder's proven and standard design.	Accepted
101	1	12.10	Provision shall be made for easy change of slip ring connection for uniform wear of slip ring.	Slip rings polarity changed is not realised in brush gear but in excitation system (off-load, manually). Please confirm acceptance of bidder's proven and standard design.	Refer corrigendum(II).
102	1	12.11	TEMPERATURE MEASUREMENTS	As per proven bidder standard, all temperature detectors would be 3-wires, single RTDs. Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
103	1	12.11	In addition to the ETD's, temperature switches shall be provided as required for alarm and interlocks.	No local temperature switches are assembled as per bidder standard proven practice. Signals from ETD's are led to control cubicles that do not include any local indicators. All signals are led to and controlled by DCS. Please confirm acceptance of bidder's standard practice.	Agreed.
104	1	12.12.2 12.12.3	The system comprises of oil tanks, defoaming chambers, vapour extractors, pumps, coolers, filters, interconnecting pipes, fittings, valves, gauges, thermometers. A Control and monitoring panel complete with annunciation shall be furnished. Damper tank for supply of oil to seal oil system under emergency condition may be considered. Seal Oil System shall have connection to turbine main oil system for make-up and also for excess return. The turbine main oil system shall also serve as a back-up to seal oil system. The H2 side oil drain shall be suitably degassed before being returned to main oil system.	Bidder's seal oil system is separated from lubrication oil system. Oil from lubrication oil system can not be used for sealing purposes. In this case a DC motor driven seal oil pump to be powered from uninterruptible power supply, which should be always available. Please confirm availability of uninterruptible power supply.	Specification is self-explanatory
105	1	12.12.3	Seal Oil System shall have connection to turbine main oil system for make-up and also for excess return. The turbine main oil system shall also serve as a back-up to seal oil system. The H2 side oil drain shall be suitably degassed before being returned to main oil system.	As per bidder's standard and proven design a separate lube oil and seal oil skid is used. Please confirm acceptance of bidder's standard and proven design.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
106	1	12.13	Two (2) full capacity refrigeration type H2 - drier with in-situ reactivation facility shall be provided. The arrangement shall be such that one drier can be taken out of service for reactivation without affecting the system performance in any way.	Single gas drier system (silica gel type). Silica gel regeneration by using hot air is provided instead of refrigeration type. Please confirm acceptance of bidder's standard practice.	Refer corrigendum-II
107	1	12.13	A manually operated vent valve shall be provided for discharging casing hydrogen to atmosphere in case of emergency to a location outside the building top.	Discharging process is automatic. Manual operation can be processed with 3 valves. Please confirm acceptance of bidder's standard practice.	Confirmed. Bidder to ensure vent out discharge casing hydrogen to atmosphere in case of emergency to a location above the building top and process is automatic and also manual provision. Refer corrigendum (II).
108	1	12.15.3.2 (a)	(ii) Thyristor convertor with 100% redundancy along with gate firing circuits	Bidder's offer will not include 100% redundancy of power converter as according to bidder's experience and philosophy it is not necessary. Bidder's standard excitation system are designed as n-1 or n-2 system (where n is a number of power converters). In such design the fault of one (in n-1 configuration) or two (in n-2 configuration) power converters does not affect the proper operation of excitation system. Bidder kindly asks for acceptance of the clarification.	corrigendum issued for N+2 system (where N is a number of power converters for rated full load capacity). Refer corrigendum (II).

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
109	1	12.15.3.2 (b)	(ii) Protection: ... Suitable lamps indication shall also be provided to indicate the defective 'thyristor'.	The each defective thyristor will be indicate as alarm signal on LCP. Bidder kindly asks for acceptance of the clarification.	Bid Specification shall prevail
110	1	12.15.3.2 ©	(iii) Gate Firing... b. It shall be able to shift the gate pulse in the time over a range of about 150 electrical degrees under a signal from the regulator.	In bidder's solution of power converters the gate pulses could be changed in range 10 to 140 electrical degrees. Bidder kindly asks for acceptance of the clarification.	Bid Specification shall prevail
111	1	12.15.3.2 ©	(iii) Gate Firing... (iv) Pulse Transformer :.... : Their amplitudes shall be depending upon the trigger characteristics, approximately (+) 3 to (+) 20 V peak against cathode.	The trigger parameters are selected according to used thyristor and his characteristics. Bidder kindly asks for acceptance of the clarification.	Bid Specification shall prevail
112	1	12.15.3.2 (e)	(i) Field Breaker : The generator field breaker shall be of DC, multi pole air break type...	Bidder's standard is that above 2000A DC field current the one pole DC breaker is used. Please confirm acceptance of bidder's standard practice.	Bid Specification shall prevail
113	1	12.15.3.2 (e)	(i) Field Breaker : ...discharge contacts.	Bidder's de-excitation system is composed of the thyristor (semiconductor switch) connecting the de-excitation non-linear resistor to the generator rotor. Bidder kindly asks for acceptance of the clarification.	Refer corrigendum(II)

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
114	1	12.15.4 ©	Load angle limiter	In bidder's Excitation System, the automatic regulator (AVR) based on the generator power diagram. In AVR there isn't the load angle limiter option, however the generator power diagram including the load angle limiter. Please confirm acceptance.	Refer corrigendum(II).
115	1	12.15.4 (g)	Rotor temperature transducer/transmitter with remote mounted indicating recorder	Bidder's standard is that standard 4...20mA signal corresponding to rotor winding temperature will be transmitted to superior station Please confirm acceptance..	Ageed.
116	1	12.15.8 (f)	There shall be provision for changing polarity of rotor magnetic field	Please clarify the requirement since the generator envisaged is a two pole generator.	Refer corrigendum (II).
117	1	Datasheet-A, 1.3,	The turbine steam temperature and operating mode	Bidder would like to clarify that over pressure operation is not envisaged for this plant and hence no pressure margin shall be provided over the design turbine inlet steam pressure. We understand that operation capability mentioned in the datasheet-A is the continuous 105% output with the rated steam pressure corresponding to VWO condition shall be 660 MW + 5%, i.e. 693 MW. Please confirm that Bidder's understanding is correct and amend the specification accordingly.	105% output required from turbine as continuous rating.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
118	1	Datasheet-A, 1.6	Operation capability (b) Continuous 100% output under over pressure operation (VWO condition i.e. TGMCR + 5%).	As per clause no. 11.2 and datasheet-A, clause no. 5.2.1, Generator rating is 660MW continuous with 0.85 p.f. lagging. Bidder requests Owner to clarify the Generator Continuous Rating to meet Operating Capability as specified in clause no. 1.6(b) i.e. TGMCR + 5%. In Bidder's opinion the Continuous Rating of Generator shall be 660 MW + 5%, i.e. 693 MW to meet the above Clause. Please confirm.	1). Overpressure requirement shall be as per IEC 45. 2). Generator over load rating shall be 660 MW +5% i.e, 693MW for testing the turbine VWO capability.
119	1	Datasheet-A 1.6	(b) Continuous 100% output under over pressure operation (VWO condition i.e. TGMCR + 5%)	We understand that VWO condition as defined by tender is, when throttle steam flow is 105% of steam flow of TMCR condition and not 105% TMCR load. Please clarify.	1). Overpressure requirement shall be as per IEC 45. 2). Generator rating shall be 660 MW with capability to overload for testing the turbine VWO capability.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
130	2	2.2 & 2.1	Required numbers of shell & tube type High Pressure Feed Water Heaters with all fittings, gauges, instruments etc.	Please note that Bidder intends to offer either twin stream i.e. 2 x 50% HP feed water heaters with medium operated 3-way bypass valves at upstream and downstream of each train of heater (the bypass line of each train shall be 50% feed water flow capacity) or single stream i.e. 1 x 100% HP feed water heaters with medium operated 3-way bypass valve at upstream and downstream of each heater (the bypass line of train shall be 100% feed water flow capacity). These media operated 3-way valves ensures quick bypassing of HP heaters in case of tube leakages. In this case, motorized isolation valves at upstream and downstream of HP heaters and in bypass line are not required. LPH-3 & LPH-4 shall have individual motorised bypass, but LPH-1 & LPH-2 being duplex type individual bypass is not possible. Bidder confirms that there are many Alstom built plants worldwide which are in successful operation with same philosophy. Please confirm that bidder's proposal is inline with specification.	2x 50% heater trains are acceptable; Rest to be taken up during bid evaluation after receipt of detailed scheme by bidder.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
131	2	2.2	Required number of shell & tube type high pressure closed feedwater heater	Although the tender P&I D(PE-189-PF-204) shows single train of HP feedwater heater, We understand that bidder has an option to provide either single train or two train of HP feedwater heater based on design optimization. Please clarify.	2x 50% heater trains are acceptable.
132	2	3.3	The maximum oxygen content of the feed water discharge from the Deaerator without chemical dosing shall not exceed 0.005 cc/litre at all loads upto and including the rated capacity.	Kindly note that the maximum oxygen content shall not exceed 0.005 cc/litre from 40% - 100% load conditon as a standard & proven practice of manufacturer. Kindly confirm.	Bid Specification shall prevail
133	2	3.5	Minimum acceptable H.P. Heater outlet temperature during Turbine low load operation shall be finalised as per Steam Generator requirement.	We understand that during start-up conditons only the deaerator pegging shall be done 1.5 ata for cold start-up and at 3.5 ata for Hot and Warm start-up. Kindly confirm. For other low load opearting conditions the final feed water temperature shall be per the optimized cycle.	Will be evaluated after recepit of detailed scheme by bidder.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
134	2	3.7	Equipment offered shall have an operating noise level as per ISO -- 85. However, noise level should not exceed 85 dB at 1 m distance.	We assume that this mentioned ISO --85 requirement about equipment noise level relates to the noise rating curve NR85. But this type of noise rating curve is actually no longer used by the noise measurement standards to characterize the noise emissions of industrial machines, or the occupational noise exposure level of the Employees. As per clarification about Section 4 - Clause 17.2.1 of the Master Specifications (Vol. II) regarding Noise Level Requirement, the relevant standard for determination of near field noise levels shall be ISO 3746:2010.	For all continuous operating equipment, 85 dBA shall be maintained; for the rest, it will be evaluated after detailed data from bidder
135	2	4.3	Design temperature Shell& tube side -As per HEI standard rounded off to next higher 10°C	As per HEI standard it is rounded off to next higher 10°F. Please check and confirm.	Agreed.
136	2	5.1.2	The lowest pressure heater may be located in the Condenser neck in case that is the standard arrangement of the manufacturer. In such a case, a separate external drain cooler may be provided instead of being integral to the heater.	Please note that low pressure heaters 1 & 2 are duplex type and located in condenser neck as per standard and proven practice of the Bidder. Since the heat balance cycle is optimised without drain cooling zone as bidder's standard practice, separate external drain cooler is not required for this LP heater in condenser neck.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
137	2	5.1.3	Bidder shall select the temperature terminal difference and the drain cooler approach of the feed heaters keeping in mind overall economy.	As per Datasheet-A cl. no. 1.6.1 & 1.6.2, limits for TTD and DCA values are furnished for Heaters. Bidder would like to clarify that TTD & DCA for heaters shall be decided by the bidder as per optimised water steam cycle and respecting requirements mentioned in HEL. Accordingly, TTD for the LP Heaters shall be upto 4 Deg.C and DCA for the heaters shall be upto 8 Deg.C. Kindly accept.	Bid Specification shall prevail
138	2	5.1.3 (a)	H.P. Heaters shall be provided with Desuperheating and drain cooling zones in addition to the condensing zone.	Bidder would like to clarify that external desuperheater may also be provided for HP heaters as per Bidder's standard and proven practice.	Specification is self-explanatory
139	2	5.1.3 (b)	L.P. Heaters shall be provided with drain cooling zone in addition to the condensing zone.	Please note that the heat balance cycle is optimised without drain cooling zone as bidder's standard practice, the drain cooling zone shall not be provided for duplex LP heater 1 & 2 and LP heater 3.	Bid Specification shall prevail
140	2	5.1.3 (c)	Heat transfer area shall be calculated considering 10% of the tubes plugged.	Please note that as a standard & proven practice of the Bidder, the heaters shall be designed for 100% TMCR with 0% MU condition without considering any tube plugging margin. Kindly accept and confirm.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
141	2	5.1.4	The H.P. Heaters shall be designed for the shut-off pressure of the Boiler Feed Pumps (at maximum speed of operation) on the tube side.	We would like to clarify following : 1) As per Tender PFD (PE-189-PF-203), Isolation valve at economiser inlet is shown and same is not required as per Bidder's standard & proven practice. 2) As per Tender PFD (PE-189-PF-203), feed control station along with necessary isolation valve at economiser inlet (downstream HP heaters) is shown which shall be located upstream of the HP Heaters (after BFPs) as per Bidder's standard & proven practice.	1). HP heater shall be designed for shut off pressure of boiler feed pumps. 2). Economiser isolation valve may be deleted. Rest will be evaluated after receipt of detailed scheme from bidder.
				3) As per IBR amendment dated March 12, 2007 to regulation 520, feed water discharge piping for feed water system without economizer inlet isolating valve can be designed based on boiler design pressure with provision of mechanical relief device, to prevent Boiler Feed Pump (BFP) shut off pressure being communicated to the piping system. 4) This will substantially reduce design pressure of the feed water piping and HP heaters and same are not required to be designed with BFP shut off head. Hence, HP heaters on tube side and feed water piping downstream feed control station shall be designed corresponding boiler economiser design pressure. Kindly accept.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
142	2	5.1.4	The H.P. Heaters shall be designed for the shut-off pressure of the Boiler Feed Pumps (at maximum speed of operation) on the tube side.	We would like to clarify following : 1) As per Tender PFD (PE-189-PF-203), Isolation valve at economiser inlet is shown and same is not required as per Bidder's standard & proven practice. 2) As per Tender PFD (PE-189-PF-203), feed control station along with necessary isolation valve at economiser inlet (downstream HP heaters) is shown which shall be located upstream of the HP Heaters (after BFPs) as per Bidder's standard & proven practice. 3) As per IBR amendment dated March 12, 2007 to regulation 520, feed water discharge piping for feed water system without economizer inlet isolating valve can be designed based on boiler design pressure with provision of mechanical relief device, to prevent Boiler Feed Pump (BFP) shut off pressure being communicated to the piping system. 4) This will substantially reduce design pressure of the feed water piping and HP heaters and same are not required to be designed with BFP shut off head. Hence, HP heaters on tube side and feed water	
143	2	5.1.4 & 5.1.6&3.2	HP Heaters shall be designed for the shut off pressure of the boiler feed pumps..	For similar supercritical power plants in the country and elsewhere in the world, the HP heater tube side is not designed for the shut off pressure of BFP, but 110% of the maximum discharge pressure at rated flow.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
144	Sec-2	5.1.4	HP Heaters to be designed on the tube side for BFP shut-off head	Feed Control Station shall be provided on the upstream side of HP heaters and there shall be no isolation valve on feed water discharge header to boiler. HP heater tubes shall be designed for the maximum pressure expected from SG side. This is in line with IBR requirement. please confirm.	
145	2	Volume-III B/ 5.1.4	The H.P. Heaters shall be designed for the shut-off pressure of the Boiler Feed Pumps (at maximum speed of operation) on the tube side.	Tube side design pressure for high pressure feed water heater shall be the maximum sustained pressure which is the sum of the maximum pressure at economiser inlet NRV (boiler terminal point), static head from the economiser inlet to the lowest elevation in piping segment, friction losses in the system. Since in supercritical plants the feed water control station is located before the HP heaters, hence complete system including HP heaters, downstream of feed control station will be designed based on maximum sustained pressure. Please confirm

147	2	Volume-III B/ 5.1.6	Each of the L.P. and H.P. Feed Heaters shall have individual motorized bypass arrangements with isolation to enable it to be taken out of service without necessitating the shut down of the Turbine Generator set.	In the Power Cycle Scheme, as an option HP heaters of 2 x 50% configuration can be provided with 3Way valve as a group bypass. In this scheme, HP heaters need not be isolated individually. Further, LP Heaters #1 & 2 shall have common bypass line as both of them are condenser neck mounted. Please confirm acceptance.	2X 50% Heater trains acceptable; rest to be taken up during bid evaluation
148	2	5.2.1	The waterbox for the high pressure heaters shall be of forged construction.	Bidder would provide Water box of formed construction (formed from the plate). Please accept.	Bid Specification shall prevail
149	2	Volume-III B/ 5.2.1	The water box for the high pressure heaters shall be of forged construction and welded to the shell.	Please consider water box constructed from boiler quality plates, welded to forged nozzle and manway.	Bid Specification shall prevail
150	2	5.2.2	The LP heater tubes shall be roller expanded into the tube plates provided with at least two grooves.	Bidder would like to clarify that grooves in the tubesheet is not required as per our design.	Bid Specification shall prevail
151	2	Volume-III B/ 5.2.3 Datasheet -A SR. No. 5.3	Seamless or welded type stainless steel (SS-304L) tubes shall be provided. Stainless steel as per SA 213 grade TP 304L for seamless (For HP Heaters) and SA 688 grade TP 304L for welded tubes (For LP Heaters).	Each HP heater shall have SA688 TP304N welded tubes. LP heaters shall have SA688 TP304 welded tubes. The 304N tubes have higher strength compared with its rivals. This reduces overall size and the weight of the equipment. This is in line with all supercritical power plant HP tubes recommendation.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
152	Vol: III-B, Sec-2	6.1	HP heater drain system - to next lower pressure heater, to deaerator and condenser.	HP heater drains shall be led to the next lower pressure heater only, while the drain from the lowest pressure HP heater shall be led to deaerator. Alternate drain from all heaters shall be led to condenser. This is in line with standard practice .please confirm.	Specification is self-explanatory
153	2	7.1.2	A horizontal, direct contact, spray-cum-tray type single de-aerating vessel mounted on a horizontal storage tank shall be provided.	Bidder proposes to provide alternatively an option of vertical type deaerator (Multiple Tower) inline with Bidder's proven design. We request customer to accept vertical deaerator and also accordingly modify provenness criteria allowing vertical deaerator.	Bid Specification shall prevail
154	2	7.1.4	The De-aerator shall be capable of de-aerating all the incoming condensate, H.P. heater drips and emergency make up water at a rate adequate to provide boiler feed to match the Steam Generator MCR requirements continuously.	No emergency make-up water is envisaged at Deaerator as it is provided at condenser hotwell. Hence please delete this requirement from this clause.	Will be evaluated after receipt of detailed scheme by bidder.
155	2	7.1.4	The deaerator shall be capable of de-aerating all the incoming condensate, HP heater drips and emergency make-up water....	As per tender document make-up is only done at Condenser hotwell and no make up is envisaged at the Deaerator. Also as per tender P&ID: PE-189-PF-203 (feedwater system), does not show any emergency make-up line to Deaerator Please clarify.	Will be evaluated after receipt of detailed scheme by bidder.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
156	2	7.1.5	The dissolved oxygen content at the discharge from Deaerator without chemical dosing shall not be more than 0.005 cc/litre in boiler feed water at all loads up to and including the rated capacity.	Kindly note that the maximum oxygen content shall not exceed 0.005 cc/litre from 40% - 100% load condition as a standard & proven practice of manufacturer. Kindly confirm.	Bid Specification shall prevail
157	2	7.1.9 (i)	Sufficient number of inspection openings/man-holes (of minimum 600 mm diameter) with suitable covers for easy cleaning, inspection and maintenance. Covers for these openings/man-holes shall be hinged type.	Bidder would like to clarify that in case of Vertical Deaerator (multiple tower) no manhole will be provided on Deaerator dome. Deaerator dome can be approachable from feed water tank itself for cleaning, inspection and maintenance.	Bid Specification shall prevail
158	2	7.2	Material of construction (c) Trays : 304 stainless steel (d) Tray supports : Stainless steel (e) Internal bolting : Stainless steel	Bidder propose MOC as follows : (c) Trays : 304 stainless steel / Carbon Steel (d) Tray supports : Stainless steel / Carbon Steel (e) Internal bolting : Stainless steel / Carbon Steel	Bid Specification shall prevail
159	2	Datasheet-A, 1.10	Terminal Temperature Difference °C - Less than 0.3°C	As per datasheet-A, cl. No 7.1.2, TTD shall be zero at all load conditions. The requirement specified for TTD is not matching with cl. no. 1.10. We understand that that the TTD for the deaerator shall be zero Deg.C at all load conditions.	Will be evaluated after receipt of detailed scheme by bidder.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
160	2	Datasheet-A, 2.1	Design Data : LP Heater Flow : 105% of design condensate flow from condensate extraction pumps without undue vibration and deleterious effects.	We understand that heaters shall be designed for 100% TMCR with 0% MU condition and this design data is a check case for heaters for operating with 105% of design condensate flow from CEP without undue vibration and deleterious effects. Please confirm.	Specification is self-explanatory
161	2	Datasheet-A, 2.2	Design Data : HP Heater Flow : 105% of the design feed water flow from BFP without undue vibration and deleterious effects	We understand that heaters shall be designed for 100% TMCR with 0% MU condition and this design data is a check case for heaters for operating with 105% of design feed water flow from BFP without undue vibration and deleterious effects. Please confirm.	Bid Specification shall prevails.
162	2	Datasheet-A, 4.3	Design temperature (shell and tube side) - As per HEI Standards rounded-off to next higher 10°C	Owner to note that the design temperature shall be as per HEI rounded-off to next higher 10 Deg. F. This is inline with the HEI guidelines. Kindly accept.	Bidder's understanding is correct; The clause is amended.
163	2	Datasheet-A, 4.4	Maximum tube side velocity : Not to exceed 2.5 m/sec.	Max tube velocity shall be as per HEI. Please confirm.	Agreed
164	2	Datasheet-A, 5.3	Tubes - Stainless steel as per SA 213 grade TP 304L for seamless (For HP Heaters) and SA 688 grade TP 304L for welded tubes (For LP Heaters).	Owner to note that the selection of tube whether seamless / welded for the HP Heaters shall be as per standard and proven practice of the Bidder. Kindly accept.	Bid Specification shall prevail

165	2	Datasheet-A, 5.4.1	TUBE SHEET LP heaters - Carbon steel as per SA 516 grade 70 or equivalent	Bidder requests Owner to provide an option of MOC for tubesheet from SA 516 Gr 70 , SA 266 grade II & SA 350 grade LF2.	Bid Specification shall prevail
166	2	Volume- IIIB/ Datasheet -A SR. No. 5.4.1 - Tube sheet Material for LP Heater	Carbon steel as per SA 516 grade 70 or equivalent	We propose Tube Sheet Material for LP heater will be Carbon steel as per SA 350 Grade LF2 or equivalent as an alternative. Kindly give the acceptance for the same.	Specification is self-explanatory
167	2	Datasheet-A, 5.4.2	TUBE SHEET HP heaters - Carbon steel as per SA 350 grade LF2 or equivalent with stainless steel cladding	Bidder requests Owner to provide an option of MOC for tubesheet from SA 516 Gr 70 , SA 266 grade II & SA 350 grade LF2.	Specification is self-explanatory
168	2	Datasheet-A, 5.6	Nozzles except HP heaters channel side - Carbon steel as per SA 106 Gr. B or equivalent for temperature less than 400°C. Suitable material for above 400°C	Bidder requests Owner to provide an option of forgings such as SA 266 grade II & SA 350 grade LF2 apart from seamless pipe SA 106 Gr B.	Specification is self-explanatory
169	2	Volume- IIIB/ Feed water Heater Datasheet -A SR. No. 5.11.2	HP Heater Bolt material - SA 193 B16 or equivalent	Bolt material of SA 193 B7 or equivalent may also be accepted as an alternative.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
170	2	Volume- IIIB/ Deaerator Datasheet -B SR. No. 1.4	Design pressure of de-aerator and feed water storage tank- 125% of maximum extraction steam pressure rounded off to next higher 0.5 kg/cm2 and full vacuum	As per OEM standard practice, design pressure of Stork type deaerator may please be accepted at 110% of the maximum extraction steam pressure obtained from various operating conditions.	Bid Specification shall prevail
171	2	Volume- IIIB/ General	Not specified	Since it is not specified, we presume that heaters are to be designed for Performance guarantee condition at 100%TMCR/0%MU.	Heaters shall be guaranteed for TMCR condition with all specified margins; hence requisite correction curves shall be applicable during demonstration test
172	3	1.1.1	2 x 50% TDBFP and 2 x 30% MDBFP	As an optional case, we propose 2 x 50% TDBFP and 1 x 50% MDBFP for better flexibility on duty point and tools and spares consideration.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
173	3	1.1.4	The pumps shall be designed for efficient and reliable operation and shall be of proven design with at least five years of satisfactory operating experience.	Owner to note that as clause no. 2.2.3, Section - 3, Volume 1 it is mentioned that the for the respective equipments mentioned under that clause, the equipment of desired capacity (as defined under the clause) should have been succesful operation an atleast One (1) plant for a period of not less than one (1) year from the date of opening of bid. However as per the caluse 1.1.4 of volume IIIB it is mentioned that the pumps shall be been in service for atleast 5 years. Bidder understands that the criteria as defined in clause 2.2.3 of volume - 1 shall remain applicable. Kindly ammend the clause of volume IIIB.	Confirmed
174	3	1.2.3	The pumps shall be designed to withstand transient condition due to load swing of the unit from full load to no load. Adequate design margins shall be provided in the pumps for turbine bypass operation.	Sizing CEPs considering turbine bypass operation will oversize the CEPs and in turn will give deteriorated performance at normal TMCR operation. Bidder requests Owner to allow three (3) pumps operation of CEP during turbine bypass operation if two pumps can not cater the spray requirement. Kindly confirm	Bid Specification shall prevail
175	3	1.4	Design capacity per pump=1.05x flow at VWO+spary...)	Please clarify the term 'spray' refers to.	Specification is self-explanatory
176	3	1.8 & 1.7	Total head at rated capacity - 10% margin on..TGVWO ,1% make up and design CWT	Please clarify the make up flow indicated as 1%	Specification is self-explanatory

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
177	3	S. No. 1.10 - CEP datasheet	NPSH required at 3% head break - Shall not be greater than 50% of NPSH available over the entire range of operation from minimum flow to pump run out flow	We propose to limit the maximum value of NPSH required as 80% of NPSH available for entire flow range. Please confirm	Bid Specification shall prevail
178	3	1.11	Design speed -6000 rpm/1500 rpm	BP speed indicated is on lower side for the TDBFP set. Please review.	Bid Specification shall prevail
179	3	S. No. 1.13 - CEP datasheet	Maximum allowable vibration at all operating condition - As per ISO 10816-1 Cl III Zone A/B	Please note that, ISO 10816-7 specifically gives instructions for the evaluation of vibration on rotodynamic pumps for industrial applications with nominal power above 1 kW. Request Owner to provide acceptance for evaluation of vibration per ISO 10816-7.	Will be evaluated after receipt of detailed scheme by bidder.
180	3	2.1.1 (l), 2.1.2(a), 5.1 4.1	Pump warm-up orifice (s) for boiler feed pump.	As per section -3, clause no 5.14.1, pump should be designed to start working without internal or external warm up arrangement. We wish to clarify in reference to the tender requirement that the Warm-up arrangement, if required, shall be provided as per pump manufacturer standard practice.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
181	3	2.1.2 (c)	Temperature sensing type seal control system for the Boiler Feed Pump complete with temperature controller, sensing elements, control valves, filters, air filter regulators, complete piping from the condensate source and suitable seal system as required by the design of the Booster Pump shaft seals.	Employer to note that complete cooling system for the mechanical seals shall not have any control valves and the fixed flow system shall be installed to ensure that the temp of the mechanical seals is well within the normal acceptable range. Also temperature controller will not be required as the colling water flow shall be decided considering the worst operating condition. Kindly accept.	Bid specification prevails
182	3	2.1.1 c / 5.9	Supply of disconnect coupling, if required for the turbine drive main feed pumps.	Flexible coupling between BFP drive Turbine and BFP may be accepted as dry flexible membrane couplings since these are simple in design and lot of accessories required for Disconnect couplings (like hydraulic pumping unit, hydraulic actuators etc.) are not applicable. Dis-engagement is by simple dismantling of spacer bolts.	Bid Specification shall prevail
183	3	2.1.1 (d)	Sole plates, pin and key blocks or other support structure and a common base plate (with foundation anchor bolts/inserts, drip lip and drain) for booster pump and gearbox, motor drive.	Employer to note that the base plates for the complete train shall be as per the standard supply of the Bidder and necessary adjustments shall be done at site during erection. Kindly accept.	Bid Specification shall prevail
184	3	2.1.1 i / 2.1.2 j / 3.1.20	Duplex type basket strainer for installation ahead of the booster pump suction	Simplex strainer or duplex strainer as per the manufacturer's standard practice.	Bid Specification shall prevail
185	3	2.1.2 (k)	Modulating type Recirculation control valves and pressure break down orifices, as necessary to pass the minimum flow required for the pump.	Bidder propsoes to provide either hydraulic or pneumatic actuator for BFO recirculation control vlaves. Kindly accept.	Specification is self-explanatory

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
186	3	2.1.1.1	Pump warm up orifice...	It will be provided as applicable to the BFP supplier.	Bid Specification shall prevail
187	Sec-3	2.1.3 (a)	Steam sources for BFP drive turbine	Only two sources have been specified, i.e. from turbine extraction (normal) and CRH (alternative), while the PID PE-189-PR-204 shows an additional alternate source from auxiliary steam. please clarify the requirement.	Clause 2.1.3(a) Section 3 shall prevail. Additional alternative source from aux steam as indicated in P& ID PE-189-PR -204 is not required.
188	3	2.1.3 a	Steam admission pipes from the following sources to the auxiliary turbine along with individual steam admission valves	Sources of steam will be from IP extraction or cold reheat as per system requirement. Steam admission shall be as per manufacturer's standard practice.	Bid Specification shall prevail
189	3	2.1.3 (c)	Gland sealing steam supply piping from main turbine gland sealing system and return piping to gland steam cooler for main steam turbine complete with all fittings, valves, necessary instrumentation and control hardwares to make the system complete in all respects.	Employer to note that the option for taking the gland seal system from upstream of drive turbine steam header shall also be allowed instead of taking the gland steam from the main turbine gland steam header as this is standard practice of the the drive turbine suppliers. Kindly accept.	Bid Specification shall prevail
190	3	3.1.3	Shut-off head shall not, however, be less than 120% and shall not be more than 130% of the head developed at pump design speed.	BFP will be selected based on hot shut-off and Shut-off head shall not be less than 120%, upper limit may be taken care by bidder as per the manufacturer's standard.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
191	3	3.1.5	The pumps shall be capable of accepting...including dry run	The pumps will be capable of accepting complete loss of water for very short duration due to incidents such as inadvertent complete closure of suction valve and brought down to rest in controlled manner from design condition with simultaneous closure of suction valve. However, Dry running shall be avoided due to possible pump damage. Closing of the suction valve during pump operation shall be avoided by interlocking logic in the plant controls.	Bid Specification shall prevail
192	3	3.1.6	Suction specific speed for BFP and booster pump must not exceed 9500 US units.	As per HIS, suction specific speed upto 11000 US units is acceptable. Please confirm acceptance.	Bid Specification shall prevail
193	3	3.1.7	The pumps shall be capable of withstanding reverse rotation...	Reverse rotation detection will be provided in the pump system.	Specification is self-explanatory
194	3	3.1.10	Pump and drive assembly shall run smooth, free from undesirable vibration, noise and leaks. Acceptable peak-to-peak vibration limits of the Hydraulic Institute Standards, USA will be applicable.	Employer to note that the vibration limits for the pump shall be as per ISO 10816-7 Zone A for preferred operating range. Kindly accept the same.	Will be evaluated after receipt of detailed scheme by bidder.
195	3	3.1.16	The pumps shall be capable of safer, proper and continuous operation at speeds upto 10% above rated speed...	Continuous operation at 110% speed is not allowable for the pump operation. Pump will trip at this speed. Also refer the specification clause 5.18.5 which calls for auxiliary turbine trip at 10% above the rated speed. Please clarify.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
196	3	3.1.17	The drive motor margin...BP-5% and BFP-10%.	Please note that the pump itself is provided with lot of margin with respect to the operating point. So we suggest for the BFP drive motor a 5% margin is adequate.	Bidder to note that there is no difference between the specification and the query bidder has posed.
197	3	3.1.18	The critical speed of the rotor assembly, in dry as well as water filled conditions shall be beyond the maximum possible running speed by at least 30%, even after considering power supply to pump drive motor at 51.5 Hz.	To be discussed. NTPC specification is asking such condition for only wet operation and also frequency variation is not asked.	Will be evaluated after receipt of detailed scheme by bidder.
198	3	3.1.18 / 5.3.2	The critical speed of the rotor assembly, in dry as well as water filled conditions shall be beyond the maximum possible running speed by at least 30%, even after considering power supply to pump drive motor at 51.5 Hz.	The critical speed of the pump rotor (only) in water filled conditions will be 30% above the pump maximum running speed. Since dry running is not expected in Super critical technology, critical speed of rotor assembly during dry condition shall be as per manufacturer's standard design.	Will be evaluated after receipt of detailed scheme by bidder.
199	3	3.1.20 5.17.3	Duplex type basket strainers shall be provided on the booster pump suction to protect the fine clearances of the pump. The screening area of the strainer shall be 4-5 times the cross-sectional area of the inlet pipe. Each pump shall be furnished with a flanged suction strainer (the duplex strainer as already specified for the Boiler Feed Pump) complete with other accessories as per requirement.	Employer to note that the Bidder shall be allowed to offer strainers of appropriate mesh size at both booster pump suction and main pump suction so as to maximize the advantage of NPSH available. Kindly accept the bidder's proposal.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
200	3	3.1.21	All the design parameters are to be met during under frequency of 47.5 Hz at grid.	As per Section-3, Datasheet-A, Cl. No. 1.8, Normally working pump(s) would be capable of meeting the 100% TG MCR requirement during an under frequency operation of 47.5 Hz. Please clarify.	Specification is self-explanatory
201	3	3.1.21	All the design parameters are to be met during under frequency condition of 47.5 hz.	The requirement is not clear .Please clarify the term 'all the design parameters'.	Specification is self-explanatory
202	Sec-3	3.1.21	Regarding BFP - 'all design parameters to be met during under frequency conditions of 47.5 Hz'	Data Sheet-A, Sr. no. 1.8 at pg 150/308 of the same section indicates the pumps to be capable of meeting 100% TGMCR during under frequency conditions of 47.5 Hz.MahaGenco to please clarify the requirement. As per normal practice followed, under frequency operation of BFPs is to be checked only for 100% MCR condition.	Specification is self-explanatory
203	3	3.1.21	All the design parameters are to be met during under frequency condition of 47.5 Hz at grid.	The boiler feed pump set shall be designed for 50Hz. However, pumps shall be suitable to meet the normal operating parameters at 47.5 Hz also.	Bid Specification shall prevail
204	3	Datasheet-A 1.6 / 3.1.23	Total combined flow of normally working two pumps shall be 105% of the total feed water flow at TG VWO, 3% MU and design condenser inlet cooling water temperature.	For supercritical applications, 1% MU is adequate and hence, we request acceptance of the same.	Bidder's understanding is correct; The clause is being amended.
205	3	3.1.23	The Boiler Feed Pump set shall be capable of continuous safe, and trouble free operation under other than normal condition, like under and over frequency (47.5 to 51.5 Hz), abnormal pressure decay in De-aerator, VWO with 3% make-up	Please clarify the design make-up quantity. it is 1% or 3% ?	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
206	3	3.1.24	Motor shall be able to accelerate the pumps from standby conditions to rated pumping conditions in less than 15 seconds after receipt of starting signal while operating either singly or in parallel with other operating pump.	Starting time of motor shall be as per manufacturer standard. Exact starting time shall be finalized during detail engineering.	Bid Specification shall prevail
207	3	3.1.25	The bidder shall demonstrate this capability by a suitable dry running test at his works and shall furnish details of this proposed test including its duration etc. in the bid.	Feed pumps for supercritical boilers are required to generate high pressures and therefore require high numbers of stages (usually 5 or 6). Such pumps are designed to accept vapour locking to the extent it would be expected to occur at site. In practice, such incidents result in the pumps being filled with a mixture of water and vapour (although the risk of such incidents is greatly reduced by modern control systems). The incidents are difficult to simulate in a controlled manner in the small closed loop of a test bed; during a works test, there would be a risk of the pump running completely dry - which would be an unrealistic situation. BFP is not designed for full dry running condition or operation under full vapour locked condition for 15 minutes. However, the offered BFP is capable of safe coasting down to rest, upon any inadvertent closure of suction valve. Adequate protections & interlocks would be built into the system to prevent dry running of the pump for extended length of	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
				time."	
208	3	3.1.25 a.&b.	Dry running test...	The pumps will be capable of accepting complete loss of water for very short duration due to incidents such as inadvertent complete closure of suction valve and brought down to rest in controlled manner from design condition with simultaneous closure of suction valve. However, Dry running shall be avoided due to possible pump damage. Closing of the suction valve during pump operation shall be avoided by interlocking logic in the plant controls.	
209	3	3.1.25 (c)	The Feed Pump shall be capable of operating under full vapour locked condition for 15 minutes (i.e. following an inadvertent closure of suction valve) and rundown to rest from this vapour locked condition without endangering the pump rotor or subsequent detrimental effect in pump overall performance. To establish above criterion, the Bidder shall necessarily submit the full backup calculation, rotor response characteristics, various internal clearances and other features, test reports for similar pumps meeting the above design condition. In order to demonstrate the above capabilities at shop, the Bidder shall furnish complete testing procedure along with the bid.	Boiler Feed Pumps are not suitable for dry running for the duration specified in the specification and hence request to remove such condition. However, dry running test in controlled manner as specified in the Vol IIIB, Annexure A "Minimum Testing Requirement" shall be conducted to demonstrate the dry running capability.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
210	3	3.1.25 (c)	The Feed Pump shall be capable of operating under full vapour locked condition for 15 minutes (i.e. following an inadvertent closure of suction valve) and rundown to rest from this vapour locked condition without endangering the pump rotor or subsequent detrimental effect in pump overall performance.	Employer to note that under the full vapour locked condition / dry running condition the pump shall be capable of operating for only 5 min as indicated by various pump manufacturers being the safe operating practice. Kindly accept.	
211	3	3.1.25 (c)	In order to demonstrate the above capabilities at shop, the Bidder shall furnish complete testing procedure along with the bid.	Shall be submitted during the execution engineering stage only. Kindly accept.	Agreed.
212	3	3.1.25 (c)	Bidder must ensure that feed pumps operation at flow beyond its maximum flow handling capability due to low system resistances shall be smooth and without any abnormal noise and vibration and without any necessity of reducing the plant load.	Kindly ammend "Bidder must ensure that feed pumps operation at flow beyond its maximum flow handling capability due to low system resistances (if envisaged by the Bidder) shall be smooth and without any abnormal noise and vibration and without any necessity of reducing the plant load."	Bid Specification shall prevail
213	3	3.1.28	In no case ,the mismatch of feed water flow through the pumps in parallel operation shall exceed 1% of average.	The minimum 5% of difference in flow will be allowed.Please refer the specification dats sheet clause 1.15,It is mentioend as 5%. Please clarify.	Bid Specification shall prevail
214	3	3.1.28	In no case, the mismatch of feed water flow through the feed pumps in parallel operation shall exceed 1% of the average.	The allowable mismatch in flows between two running pumps can go upto 5% , as per various manufacturer's feedback. Kindly allow mismatch upto 5%.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
215	3	3.2.2	There has to be two independent source of steam supply under normal and also low load operation. Both sets of steam admission valves (for normal supply and high pressure supply) shall be controlled by the Turbine governing system in a coordinated manner, to ensure a smooth change over from one source to another. Cold reheat steam will be the alternate high-pressure source of supply for these turbines.	Employer to note that all the steam sources for the BFP drive turbine shall form a common header and a control valve finally controlling the steam supply to the drive turbine shall be installed on the common header. Such control valve only is controlled by the turbine governing system. Kindly accept.	Bid specification prevails
216	3	3.3.7 & Volume-IVA/ Section-10/4.1.6	Volume-IIIB/ Section-3 Cl no 3.3.7 - "Rating of the motor shall be selected with at least 5% margin for HT motor & 10% for LT motor over the maximum power required within the range of operation." Volume-IVA/ Section-10 Cl no 4.1.6 - "Motor Name plate rating shall have at least 10% Margin over the input power requirement of the HT Driven equipment and 15% for HT Driven equipment at rated Duty Point"	As noted, there is discrepancy in the criteria for motor selection as stated in electrical section and individual equipment specifications. We propose 5% margin for HT motor and 10% margin on LT motor at design point OR run out power whichever is higher, for all equipment . Please confirm.	Bidder should follow as per Volume-IVA/ Section-10 Cl no 4.1.6 - "Motor Name plate rating shall have at least 10% Margin over the input power requirement of the HT Driven equipment and 15% for LT Driven equipment at rated Duty Point" Refer corrigendum(II).
217	3	3.3.9	The pump rotor assembly ..dry running conditions	The CEP dry running operation is not envisaged.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
218	3	5.4	The seals should be designed to have a minimum life of not less than 25,000 hours between overhauls.	Employer to note that as per clause 3.1.25 (b) of Vol III B section - 3, it is mentioned that the mechanical seal face material shall be capable of operating for atleast 20000 running hours however as per the clause 5.4 it is mentioned that the seals shall be designed to The seals should be designed to have a minimum life of not less than 25,000 hours between overhauls. We understand that the of clause 3.1.25 (b) shall prevail as a standard industry practice. Kindly confirm.	Shall be 25000 hours
219	3	5.7	The common base plate shall also accommodate the drive motor, the Booster Pump, the fluid coupling and the step up gear box as necessary.	Employer to note that the base plates for the complete train shall be as per the standard supply of the Bidder and necessary adjustments shall be done at site during erection. Kindly accept.	Bid Specification shall prevail
220	3	5.13.4	For reducing the bypass pressure to a value suitable for returning to the Deaerator, each pump shall be provided with suitable multiple stellited orifice plates of 11-13% chrome steel with companion flanges for installation in the recirculation piping and adequately designed for prolonged continuous service. Each recirculation line shall be routed independently to deaerator storage tank. An orifice, with a small pressure drop, shall be fitted in each line near the deaerator to prevent any flashing in the pipeline	Employer to note that requirement of multiple orifice plates in the recirculation line shall be decided based on the control range of the recirculation control valve. If the control range is sufficient to meet the deaerator pressure requirement then there is no need to provide such orifice. Additionally anto flash orifices with suitable pressure drop shall be provided at inlet to deaerator. Kindly accept.	Will be evaluated after recepit of detailed scheme by bidder.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
221	3	5.16.2	It shall be complete with stainless impellers, heavy duty roller up to 5 microns.	Coupling impeller MOC will be as per the standard design of manufacturer subject to approval of Owner.	Bid Specification shall prevail
222	3	5.18.3 (a)	Guarded steel oil pressure piping furnished in areas external to the reservoir in vicinity of hot turbine parts.	The oil pressure piping shall be as per standard and proven practice of the Bidder. Kindly accept.	Bid Specification shall prevail
223	3	5.18.3 (h)	Connection on oil coolers, for oil exit temperature sensor for the Owner's sensing line for automatic control of the cooling water flow.	Employer to note that necessary oil temperature control is provided on the lube oil circuit of the cooler and no control is provided on the water side of the oil cooler. Fixed flow cooling water (pre-engineered) is envisaged for the complete range of temperature control of the lube oil. Kindly accept.	Bid Specification shall prevail
224	3	5.18.3 (k)	Hand-adjustable, oil pressure reducing valves for auxiliary steam turbine and Boiler Feed-Booster Pump unit lubrication systems.	Employer to note that control valve for the lube oil header pressure control is provided however manual pressure control for the individual consumer is not envisaged as it is not a standard practice of the Bidder. Kindly accept.	Bid Specification shall prevail
225	3	5.18.4 (a)	Manual speed control shall be provided for both local and remote operation	Employer to note that manual speed control for local operation is not envisaged. Kindly accept.	Bid Specification shall prevail
226	3	5.18.5 (a)	Overspeed governor shall be independent of speed governor and shall include means for intentional tripping at speeds lower than maximum rated.	We understand that the overspeed governor shall trip the turbine at speed higher than the rated speed. Kindly confirm.	Specification is self-explanatory

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
227	3	5.18.5.f.g.h.i	Auxilairy turbine instrumentation and control..	Auxiliary turbine instrumentation and control system will be provided as per the supplier standard practise and the proven technology.	Bid Specification shall prevail
228	3	S. No. 5.18.5 BFP Protective Devices.	Bolt type over speed governor set to trip at.....	An independent dedicated Electronic Over Speed Protection Device with dedicated speed probes and with 2 out of 3 voting logic will be provided, in addition to over speed trip provided in Electronic Governor. Mechanical over speed trip device is not provided. This is in line with the standard design philosophy being followed for steam turbines of this type, size and rating.	Bid Specification shall prevail
229	3	5.19.1	The exhaust duct shall be complete with transition pieces, drain connection, relief device to open in event of vacuum failure, 500 mm square manhole, turning vanes to minimise turbulence and friction losses in the ducts and other fittings as required for safe and smooth operation of the plant.	The exhaust duct for the auxiliary drive turbine shall be as per standard supply of the equipment supplier. Internal such as turning vanes are not required as per standard supply. Kindly accept.	Bid Specification shall prevail
230	3	5.19.5 (c)	Exhaust Duct: Round exhaust ducts shall be fabricated in accordance with ASTM A-155 Grade KC-60, Class-2 or approved equal.	Employer to note that instead of providing duct works for the BFP Drive turbine exhaust, piping conforming to the requirements of ASTM A 672 Gr B 60 shall be provideed as per prevailing industry practice. Kindly accept.	ASTM A 672 shall be employed.
231	3	5.19.5 c	Round exhaust duct shall be fabricated in accordance with ASTM A 155 Gr KC-60, Class-2.	IS 2062 grade B material can also be used as an option. Please confirm	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
232	3	5.19.5 (c)	Round exhaust duct shall be fabricated in accordance with ASTM A-155 grade KC-60, class -2 or approved equal.	Please note that ASTM A-155 is withdrawn and is replaced by A-671. And bidder's recommendation for exhaust duct is A-672. Please clarify.	
233	3	5.19.5f. g., 5.19.6 g & i & 5.20.2	f. Exhaust duct shall be designed, fabricated, inspected and tested in accordance with ANSI B 31.1 g. All Welding procedure qualifications shall confirm to the requirements of ASME Boiler and pressure vessel code Section IX	The code indicated is not applicable for Low pressure exhaust duct, butterfly valve and expansion joints.	Will be evaluated after receipt of detailed scheme by bidder.
234	3	6.6	MOC of Bowl – Cast Iron	We propose to use MOC of Bowl as Carbon steel.	Bid Specification shall prevail
235	3	6.8	The Condensate Extraction Pump shaft and can length shall be based on the pump NPSH required and the Condenser Hot-Well minimum level; the later being determined based on the fluidized Condenser size, Condenser neck angle of divergence permitted, air system requirement as well as various power cycle system drainage requirement	Employer to note that the Condenser Hot-well minimum level shall be decided as per standard and proven practice of the Bidder ensuring that the NPSH _r of the condensate extraction pump and other condenser internal design requirements are full-filled. Kindly accept.	Bid Specification shall prevail
236	3	Datasheet-A, 1.4	Design capacity per pump, shall be as per the following rounded off to nearest higher 5 m ³ /hr: [1.05 x (flow at turbine vwo + sprays + sealing water) x 0.5	Please elaborate the flow related with sprays.	Specification is self-explanatory
237	3	Datasheet-A, 1.4	Design pressure of Deaerator & Feed water tank : 125 % of the maximum extraction steam pressure rounded off to next 0.5 kg/cm ² and full vacuum	Design pressure of Deaerator & Feed water tank shall be 120 % of the maximum extraction steam pressure rounded off to next 0.5 kg/cm ² and full vacuum.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
238	3	Datasheet-A, 1.6	Rated capacity of pump - Total combined flow of normally working two pump(s) shall be 105% of the total feed water flow at TG VWO, 3% Make-up and design condenser inlet cooling water temperature.....	As per Datasheet-A, clause 1.8, Total head at rated capacity - Shall include 10% margin on equipment and piping pressure drops for TGVWO, 1% Make-up and design CWT. In the referred clauses, Different make up quantities are specified for flow and head in the tender. In line with the tender stipulation, we are considering 1% make up for pump design. Please confirm.	Design Make up shall be 1 %
239	3	Datasheet-A 1.6	Total combined flow of normally working two pump(s) shall be 105% of the total feedwater flow at TG VWO, 3% Make-up .	Please clarify the design make-up quantity. it is 1% or 3% ?	
240	3	Datasheet-A, 1.7	Total dynamic Head at design capacity - (a) 125 % of deaerating feed water heater operating pressure at TG VWO (1 % makeup and design CWT)	Bidder experience indicates that 10% margin on piping pressure drop is sufficient to calculate total dynamic head of CEP. Additional margin i.e. 125% on deaerating feed water heater operating pressure is not required, as it will lead to deteriorated performance at TMCR operation and leads to adverse effect on the auxiliary power consumption. Please also note that pumps are capable to meet head & flow requirement @ 47.5 Hz frequency operation.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

251	3	Data Sheet - A 1.19	CEP suction piping and strainer shall be above ground level to avoid any trench in the ground floor of steam turbine building.	Employer to note that the location of the CEP suction stariner and the associated piping shall be as per the NPSH requirement of the CEP and as per the standard layout of the Bidder. Kindly accept.	Bid Specification shall prevail
252	3	Datasheet-A, 1.19	Maximum Vibration level at all operating conditions: VDI 2056 Group G Degree Good	VDI 2056 standard has been withdrawn, bidder proposes ISO 10816.	Agreed.
253	4	2.0 - Codes and Standards	 HEI standards or equivalent shall be followed for thermal design and IS-2825 for strength design of condenser.	Please note that strength calculation of Condenser components shall be as per HEI & ASME sec-VIII Div-1 (as referred in HEI). We have not considered IS-2825 standard for strength calculation.	Bidder's understanding is correct.
254	4	2.1	HEI standards or equivalent shall be followed for thermal design and IS-2825 for strength design of condenser.	Kindly note that the strength design of the condenser shall be as per proven and standard practice / guidelines of the manufacturer. Kindly confirm.	In place of IS 2825, ASME Section VIII may also be employed.
255	4	3.1.2	Air Extraction System: both the vacuum pumps will be operated during start up to create initial vacuum within 25 Minutes.	As per HEI, initial vacuum will be obtained within 30 minutes. Please confirm.	Bid Specification shall prevail
256	4	3.1.5	Sponge rubber ball type COLTCS with ball recirculation pump, strainer, automatic ball sorter etc.	Use of Automatic ball sorter is redundant and not required. Please note balls wear and tear is uniform. Also ball monitoring system is provided to	Confirm

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
257	4	5.4	COLTCS- A continuously operating..... Automatic ball sorter, ball collecting strainer.....	provide alarm for addition of new charge of balls when more than 10% balls have worn out. Hence automatic ball sorter is not required nor it is a general practice to provide the same. However we may provide Bucket with sieve type sorter for manual sorting of undersize balls as per general practice. Pl.confirm	Confirm
258	4	4.1	The Condenser shall be designed such that steam received from the Turbine exhaust during Turbine VWO operation with 3% make-up, all heaters in service, and Auxiliary Turbine Drive of Boiler Feed Pump engaged, can be condensed along with other heat rejections like all heater drains & vents diverted to the Condenser etc. maintaining the Condenser pressure of 77 mm of Hg (A) or lower with cooling water temperature of 33 °C with 5% of tube plugged and having a tube cleanliness factor of 90%. The cooling water temperature differential across the Condenser shall remain within 9.5 °C (during maximum thermal load).	Datasheet-A, clause no. 3.0, Design margin on heat load at TG VWO, 1% make-up and design CWT of 33 °C. = 5 % We would like to clarify following points in continuation with the reference clauses: 1) Make-up water to cycle requirement is considered as 1% in line with tender stipulation - Data sheet A. 2) The cooling water temperature differential shall be within 10°C or as optimised by bidder.	Design Make up shall be 1 %; For the rest, Bid Specification shall prevail.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
				3) As the condenser is already designed at VWO condition with 1% make-up & 90% tube cleanliness factor which is an indirect margin on TMCR operation, we do not envisage any additional margin requirement on heat load or tube plugging. This will unnecessarily increase the cost of equipment without any considerable benefit in plant performance. 4) Only LP heater drains to the condenser to be considered for condenser sizing. Bidder confirms that the above design criteria is inline with best engineering & design practices followed in India & worldwide and request you to amend the design criteria accordingly..	
259	4	4.1	Cooling water temperature of 33 degC...	It will be optimised by the bidder for the better performance. Please confirm as this is EPC contract	Cooling water temperaure shall be optimised by bidder based on the ambient data and vacuum specified.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
265	4	5.1.1	Corrosion allowance of minimum 0.8 mm on each welded side for the shell side and 3.2 mm for water boxes and tube plates shall be applied to the design thickness of each component. No corrosion allowance shall be provided on tubes.	As per 4, Datasheet-A, Corrosion allowance on ferrous parts - 3.2 mm. We understand that the corrosion allowance shall be as per clause 5.1.1 of the technical specification. Kindly confirm.	Agreed
266	4	5.1.1 - Condenser Type & Duty	The Condenser hot well should have a minimum available Volume, sufficient to contain between its "normal" and "low" levels the condensate that may be produced in the Condenser in a period of three (3) minutes under condition of maximum steam load.	The Condenser hot well should have a minimum available Volume, sufficient to contain between its "normal" and "low" levels the condensate that may be produced in the Condenser in a period of three (3) minutes at 100% TMCR/ 0% MU condition.	Specification is self-explanatory
267	4	5.1.1 - Condenser Type & Duty	C.W. butterfly valves with actuators shall be designed as per AWWA-C-504-70 or Owner approved equivalent standards. Valve material shall be suitable for duty intended.	Butterfly valves shall conform to AWWA C-504 or BS: EN: 593 or equivalent Standard of required class/rating.	Bid Specification shall prevail
268	4	5.1.2	The shell side shall be designed shall be designed from full vacuum to a minimum internal pressure of 1.08 kg/cm ² g. The shell side design temperature shall be 120 Deg C.	As per Datasheet-A, Cl. No. 9, Shell side design pressure - Turbine pressure relief self closing type disc release pressure & FV We understand that the shell side design pressure shall be corresponding to LP Turbine exhaust relief valve set pressure and the design temp shall be the saturation temperature corresponding to such set pressure.	Bid Specification shall prevail
269	4	5.1.3	The tubes shall be SS304, seamless, solid drawn type, manufactured and tested in accordance with the approved standard.	Bidder would like to clarify that the condenser tubes would be welded type of material A249 TP 304.	Clause 5.1.3 is being amended

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
270	4	5.1.3	The Condenser tube plates shall be of carbon steel conforming to ASTM A285 Gr. C. The tube plate shall preferably be welded to the shell. Tube sheets Carbon steel as per SA 516 Gr. 70.	As per Datasheet-A, cl. No. 22.4, Tube sheet shall be SA 516 Gr. 70. Kindly clarify the discrepancy in the two statements. We understand that the tube sheet shall be of SA 516 Gr 70 material.	Bidder's understanding is correct;
271	4	5.1.2	Condenser Shell And Fittings The design shall be as per ASME pressure vessel code.	Bidder clarifies that ASME pressure vessel code is not applicable for condenser. Condenser mechanical design shall be as per proven and standard practice / guidelines of the manufacturer.	Bid Specification shall prevail
272	4	5.1.5 (e)	The outer surface shall be painted with suitable paint after the surface is cleaned and degreased. Cathodic protection of water boxes and tube sheets shall be provided.	Kindly note that the cathodic protection of the tube sheet shall be as required based on the material selection of the tube sheet. Kindly confirm.	Bid Specification shall prevail
273	4	5.1.5 (i)	Adequate arrangement shall be made for removal of water box cover for tube replacement without disturbing C.W. piping. Necessary monorail, hoist block etc. shall be included.	Kindly note that incase of hinged type of water box no separate monorail and hoist block is required. Kindly confirm.	Agreed
274	4	5.2.1	AIR EVACUATION SYSTEM - VACUUM PUMPS : The design capacity of each pump shall be selected to meet both the above requirement with margin of 10%.	Design capacity of vacuum pump shall be as per HEL.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
275	4	5.2.1&2.1	Vacuum pump with design margin of 10%...	Margin over design requirement as per HEI for evacuation equipment is not recommended,as it is detrimental to turbine blades and also higher auxiliary power consumption. Also in the data sheet -A the margin is not specified. Please review.	Bid Specification shall prevail
276	4	5.2.1	It is possible to create within 25 minutes sufficient vacuum in the condenser suitable for raising the steam turbine to its full load.	The starting/rapid evacuation capacity of the vacuum pumps shall be as per HEI for Steam Surface Condenser, Cl. 6.6. Kindly confirm.	Bid Specification shall prevail
277	4	5.2.1	The design capacity of each pump shall be selected to meet both the above requirements with a margin of 10%	The capacity of the vacuum pumps shall be selected as per HEI standard.	Bid Specification shall prevail
278	4	5.2.1	Besides, the pump capacity shall also be such that at starting, with both pumps working in parallel, it is possible to create within 25 minutes sufficient vacuum in the condenser suitable for raising the steam turbine to its full speed	Since the vacuum pump capacity calculation is as per HEI (refer clarification Cl.No. 21 below), therefore the hogging capacity of pump shall also be considered as per HEI. We understand that both vacuum pumps operating in parallel shall be able to create condenser pressure upto 0.35 kg/cm2(a) in 30 minutes, inline with HEI.	Bid Specification shall prevail
279	4	5.2.1	The design capacity of each pump shall be selected to meet both the above requirements with a margin of 10%...	We understand that Vacuum Pumps capacity calculation shall be as per HEI. Please confirm	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
280	4	5.2.3	Suitable compression ratio shall be selected so that the pumps operate effectively at all conditions of operation with cooling water temperatures mentioned above.	Cooling water temperature for vacuum pump design shall be taken as 33 deg C.	Specification is self-explanatory
281	4	5.2.8	The heat exchanger shall be arranged to permit the access to tubes without disturbing the piping connection.	As per OEM's standard design vacuum Pump skid is supplied with PHE. Owner is requested to consider the same.	Agreed
282	4	Datasheet-A 2.1	Capacity of pump- As per HEI standards	We understand that Vacuum Pumps capacity calculation shall be as per HEI. Please confirm	Specification is self-explanatory
283	4	Datasheet-A 2.2	Capacity of pump during hogging- Shall be able to maintain vacuum up to 0.35 kg/cm2(a) within 25 minutes with both the vacuum pumps in operation	Since the vacuum pump capacity calculation is as per HEI (refer clarification Cl.No. 21 below), therefore the hogging capacity of pump shall also be considered as per HEI. We understand that both vacuum pumps operating in parallel shall be able to create condenser pressure upto 0.35 kg/cm2(a) in 30 minutes, inline with HEI.	Bid Specification shall prevail
284	4	Datasheet-A, 11.0	Tube gauge in air cooling zone and top two rows (steam impingement areas) - 18 BWG	Bidder would like to clarify that top two rows (impingement tubes) would be of higher thickness i.e. 21 BWG and air cooling zone would be of same thickness as condensing zone tubes i.e. 22 BWG.	Bid Specification shall prevail
285	4	Datasheet A21	Corrosion allowance on ferrous parts- 3.2 mm.	Corrosion allowance will be considered as per HEI standard.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
286	4 Pg No. 179 OF 308	Datasheet-A Cl. 2.2	Shall be able to maintain vacuum up to 0.35 kg/cm2(a) within 25 minutes with both the vacuum pumps in operation	The starting/rapid evacuation capacity of the vacuum pumps shall be as per HEI for Steam Surface Condenser, Cl. 6.6. Kindly confirm.	Bid Specification shall prevail
287	4 Pg No. 179 OF 308	Datasheet-A Cl. 6.0	As per ISO10816-1 CL II zone A/B	Shall be as per ISO10816-7 Kindly confirm the acceptance on same.	ISO 10816 agreed as basic standard; Zone to be decided during bid evaluation.
288	Sec-5	1.0	Regarding quantity of Lube Oil Purifiers	2 nos. unit purifiers and 2 nos. central lube oil purifiers have been specified. Normally, 1 no. unit lube oil purifier and 1 no. central lube oil purifier are sufficient. MahaGenco to review and clarify/confirm.	Bid Specification shall prevail
289	5	1.1.1	The unit lube oil system shall have two (2) oil purification units with all interconnecting piping, valves, fittings, supports, necessary instruments & control hardware to make the system complete in all respect	We understand that only one no. of Central Oil Purification system to be provided for the plant which consists of two (2) purifiers. Please confirm.	Bid Specification shall prevail
290	5	3.2	The capacity of each compartment of storage tank or one storage tank shall be sufficient to hold total oil in the unit oil system or 30 m3 whichever is higher.	Please note: 1.The capacity of clean & dirty oil tanks mentioned in cl.3.6 in section-5 is 150% of unit oil requirement 2. It is mentioned as 120% of unit oil requirement in datasheet-A on page 191 of 308.	Clause 3.6 shall prevail.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
291	Sec-5 Pg 193/308	Cl. 4.3,	Regarding capacity of Central Lube Oil Purifier	The capacity specified under this clause differs from cl. No. 1.1.2 of pg 185/308 of this section. The capacity of Central Lube Oil Purifier should be identical to unit lube oil purifiers, as per cl. No. 1.1.2 of pg 185/308 of this section. MahaGenco to please clarify.	Oil purifiers (2 nos unit purifiers and 2 nos central purifiers)shall be of identical and capacity as per Data sheet A, SI No. 4.3
292	Sec-5 Pg 192/308	Datasheet 2.4	Regarding capacity of clean oil transfer pump	Capacity of clean oil transfer pump specified is different from dirty oil transfer pump. Capacity of Clean Oil Transfer Pump should be equal to Central Lube Oil Purifier Capacity, i.e same as Dirty Oil Transfer Pump, for better interchangeability/redundancy, as Clean & Dirty Oil Pumps shall be interconnected at suction and discharge. please confirm.	Capacity shall be identical and adequate to transfer the entire oil from clean oil tank to main oil tank in 2 hours.
293	6	1.2	CP system shall comprise 3 x 50% condensate polisher mixed beds and one external regeneration system.	CP system we envisaged for 3 x 33.33% condensate polisher mixed beds and one external regeneration system.	Bid Specification shall prevail
294	6 Page no. 199 of 308	Clause No. 1.2,	3x50% Condensate Polisher	As an option, we propose 4x33% configuration for CPU enabling better reliability in terms of proven design, proven vessel sizing, etc. This may kindly be reviewed.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
295	6 Page no. 199 of 308 Page no. 201-3 of 309	Clause No. 1.3, Clause No. 2.13.6/7/8/10/11/13/20/21/22/23/	Regen. Vessel , meas. Tank and pumps shall be located near TG hall ...	Please clarify if the same can also be placed near DM plant. We propose combined bulk chemical storage tanks and transfer pumps, hose stations, metering tank for Neut. facilities, N-pit and Neutr. waste transfer pumps for CPU regeneration facilities and DM plant. Please confirm acceptance.	Bid Specification shall prevail
296	6	1.4	The regeneration facilities comprising of Regeneration Vessels, Measuring Tanks and Pumps shall be located in a separate place near and outside the TG building. The resins will be transferred to the Regeneration Area from the Condensate Polisher Mixed Beds and vice versa through a pipeline	We propose to locate External Regeneration facility in DM Plant area. Please clarify and confirm.	Bid Specification shall prevail
297	6	2.8	Two number recirculation pumps.....	Rinse water shall be led to the Hotwell of the condenser. In view of this the recirculation pumps will not be required. Pl. confirm.	Bid Specification shall prevail
298	6 Page no. 201, 207 of 310	Clause No. 2.13, 3.14	Based on specific regeneration technology, the Bidder may adopt deviations with reference to regeneration vessels...	Based on indicated statement, specific design criteria given in the CPU specification shall be used for guidance only. The CPU design shall be based on proven technology of OEM. Please confirm	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
299	6	2.13	External Regeneration Vessels	For optimization, we propose to use the DM Plant regeneration facilities (wherever applicable) like Acid, Alkali system, Neutralization Pit etc. for CPU regeneration also. Please clarify and confirm.	Bid Specification shall prevail
300	6	2.13.8,2.13.13	One number Hydrochloric Acid storage.....one number Alkali Storage	The acid and alkali storage facility along with N-pit can be common for CPU and DM plant. Pl.confirm.	Bid Specification shall prevail
301	6 Page no. 204 of 310	Clause No. 3.1,	The system shall be designed for 100% condensate polishing corresponding to Max. mass flow rate established with VWO condition of turbine with suitable bypass arrangement plus max. heat cycle make-up.	We understand design of CPU will not be for HP LP bypass operation where the flows/temperature are high for short transient period. Please confirm.	Bid Specification shall prevail
302	6	3.13	Vendor should offer proven technology..... Minimum 2 years in supercritical power plant	The provenness criteria shall be as per volume-1. Please confirm that for any equipment, the provenness / qualification criteria mentioned anywhere in the tender specification, other than Volume-1, is not to be considered.	Criteria as per Vol -I shall prevail
303	6	3.14	The free board in various vessels shall be Mixed Bed Polisher 100 %	Please note that CPU suppliers provide service vessels of either cylindrical type or spherical type as their standard practice. Please note that free board shall not be applicable in case spherical vessels are supplied. However, the same shall be provided if cylindrical vessels are provided. Pl.confirm.	Yes, confirmed

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
304	6	3.16	Under normal condition.....will be transferred hydraulically	Transfer of resins from exhausted vessel to regeneration area or vise versa shall be done hydraulically or hydro-pneumatically. Pl.confirm.	Bid Specification shall prevail
305	6	3.16	For regeneration, resin from the exhausted Condensate Polisher Mixed Bed will be transferred hydraulically	Please confirm if hydro-pneumatic transfer of resin is also acceptable.	Bid Specification shall prevail
306	6 Page no. 201, 207 of 310	Clause No. 2.13, 3.14	Based on specific regeneration technology, the Bidder may adopt deviations with reference to regeneration vessels...	Based on indicated statement, specific design criteria given in the CPU specification shall be used for guidance only. The CPU design shall be based on proven technology of OEM. Please confirm	Bid Specification shall prevail
307	6 Page no. 205 of 312 &	Clause No. 3.6,	Analysis of treated condensate	Total copper, Silica and chloride shall be max. 2 ppb, 10 ppb and 5 ppb respectively complying to SG & STG manufacturer's recommendation may please be allowed.	Bid Specification shall prevail
308	6 Page no. 205 of 312	Clause No. 3.7,	Under condenser tube leakage condition, the CP system....in addition to the influent contaminants under normal condition as stated above.	We could not locate influent contaminant levels in the specification. Please furnish.	Silica < 15 ppm as SiO ₂
309	6 Page no. 206 of 312	Clause No. 3.11,	The resin should be of CPU grade with uniform coeff. Less than 1.1.	Uniformity co-efficient of less than 1.1 is not available in any of CPU grade resin from Resin supplier suggested in the tender commercially. The same shall be as per resin supplier's standard.	U.C. < 1.2
310	6 Page no. 210 of 313	Clause No. 4.0,	draining the condensate polisher mixed bed to condenser hot well	We understand drain to hot well is not required since the rinse recirculation pumps are provided. Please confirm.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
311	7	1.1.4	One (1) debris filter in CW lines	CW system for this project is not a once thru system. This is a closed cycle with cooling tower. So there should not be any requirement of debris filter. Please clarify.	Bid Specification shall prevail
312	7	3.2.1a)	The cleanliness.....	The purpose of COLTCS is to minimize the fouling in condenser tubes. Maintenance of condenser vaccumm depends on number of other factors like Cooling water temp., Cooling water flow, quality of water etc. Maintaining of condenser vaccumm by only COLTCS is not correct. So this clause is not applicable for COLTCS package. Please review and confirm.	Will be evaluated after receipt of detailed scheme by bidder.
313	7	3.2.1 (b)	The pressure drop across the ball separator screens and debris filter screens during normal cleaning operation shall be minimum (it should not be more than 30 millibar).	The individual pressure drop across separator screen and debris filter screen shall not be more than 30 milibar, OR the combined pressure drop (separator screen + debris filter) shall not be more than 30 milibar. Please clarify.	Bid Specification shall prevail
314	7	3.2.1c)	In the automatic system.....	Before cleaning or washing mode, balls are collected during collection mode to avoid loss during cleaning or washing mode, however there are chances that some %age of balls (approx. 10%) may be lost in condenser water box/tubes and pipe. Please confirm that this is acceptable to MahaGenco	Will be evaluated after receipt of detailed scheme by bidder.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
315	7	3.2.1d)	The on line Condenser.....	Purpose of COLTCS is to prevent fouling and scaling. If any scale is already formed in condenser the same can't be removed by COLTCS. Maintenance of condenser back pressure/overall heat transfer co-efficient depends on number of other factors like Cooling water temp., Cooling water flow, quality of water etc. Maintaining of condenser back pressure/overall heat transfer co-efficient by only COLTCS is not correct. So this clause is not considered applicable for COLTCS package. ~~Please review and confirm~~	Will be evaluated after receipt of detailed scheme by bidder.
316	7	3.2.1e)	The quantity of cleaning.....	Ball loss shall be kept below 10%. Pl.review and confirm.	Bid Specification shall prevail
317	7	3.2.1f)	Bidder shall prove the guaranteed.....	Following three parameters shall be guaranteed for performance testing of COLTCS inline with acceptable practice followed for number of projects: 1) Ball recovery not less than 90% 2) Ball Life - Three weeks 3) Pressure drop across Ball separator - not greater than 30 millibar. Performance testing shall be done immediately after commissioning and trial run and not after twelve months of initial trial. Please review and confirm.	Bid Specification shall prevail

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
318	7	3.2.1h)	The temprature difference.....	The temprature difference between condensate and CW outlet over a period of one year depends on number of factors other than COLTCS. So this clause is not considered applicable for COLTCS package. The perf parameters as indicated above shall only be complied for COLTCS package. Please review and confirm.	Will be evaluated after receipt of detailed scheme by bidder.
319	7	3.2.1i), 3.2.1 j) & 3.2.1 k)	The owner shall conduct.....	The perf parameters as indicated above only shall be complied for COLTCS package. Please review and confirm.	Will be evaluated after receipt of detailed scheme by bidder.
320	7	3.2.2 a) & 3.2.2 b)	During the trial operation the temprature.....	The temprature difference between condensate and CW outlet over a period of one year depends on number of factors other than COLTCS. So this clause is not considered applicable for COLTCS package. The perf parameters as indicated above only shall be complied for COLTCS package. Please review and confirm.	Will be evaluated after receipt of detailed scheme by bidder.
321	7	3.2.2 c)	The performance guarantee test shall.....	The perf parameters as indicated above only shall be complied for COLTCS package. Please review and confirm.	Will be evaluated after receipt of detailed scheme by bidder.
322	Annexure-A /QAP	1	Performance test ...shut off head to 125% of rated capacity of the pump.	Performance test will be done only for the operating point. The other conditions will be extrapolated accordingly. Please confirm.	All Test/ inspection related points shall be reviewed and finalised during detailed engineering.

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
323	Annexure-A	2.1.1(b)	Casting suppliers should have established practices to ensure requirements of creep and rupture, in order to establish the adequacy of material to meet the duty requirements of long exposure to high temperatures and pressures. This data will be furnished for Owner's approval.	Bidder shall submit the available stress rupture data for customer approval.	
324	Annexure-A	2.1.1(e)	Cast enclosure shall be subjected to a hydraulic pressure test based on established practice of manufacturer unless there is a geometrical constraint for doing hydro test. Bidder to furnish their practice in this regard for Owner's approval, if feasible.	Bidder carry out hydraulic pressure tests on HP & IP Outer Casings only.	
325	Annexure-A	2.1.1(f)	Castings Hardness survey shall be carried out on the repaired area.	Bidder carry out hardness checks at random on entire casting to review the homogeneity after heat treatment since the complete casting is heat treated in furnace after weld repair. The hardness survey on representative samples of weld repairs is possible.	
326	Annexure-A	2.1.1(g)	Where stub pipes and transition pieces are welded to the main body of an enclosure the following shall be carried out: Hardness test on weld joint, HAZ and parent material	Bidder carries out a controlled stress relieving treatment for valves with transition stubs, by furnace or by local heat treatment. A hardness survey can be accepted in addition as requested.	
327	Annexure-A	2.1.1(h)	HP & IP Outer Casings Wall thickness measurement by ultrasonic for critical and highly stressed zones of the casting shall be carried out	Bidder carries out wall thickness measurement at random 20 spots for HP & IP Inner Casings only.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
328	Annexure-A	2.1.1(h)	Color matching of casting by putting two halves together or feeler gauge tightness check from outside to ensure required contact area and joint tightness shall be carried out.	Bidder carries out a color matching test for HP and IP outer casings only. Color matching or feeler gauge tightness check is technically not feasible for HP and IP Inner Casings.	
329	Annexure-A	2.1.2 (b)	Low pressure enclosure Bidder to furnish their practice regarding stress relieving of the fabricated enclosures for Owner's approval.	Bidder does not carry out any stress relieving treatment on fabricated LP-enclosures. The material is unalloyed.	
330	Annexure-A	2.1.2(c)	Bidder to furnish their standard practice regarding NDT on welds for Owner's approval, however following are minimum NDT requirements :	Can MPE/DP test be also acceptable for Butt Welds? Bidder carries out NDT on weld seams of LP-enclosures as per applicable European standard. Acceptance and test criteria will be made available to employer for information only.	
331	Annexure-A	2.1.2 (d)	Low pressure enclosure :- Bidder to furnish his proven practice for hydraulic pressure tests. If it is not their practice, the justification for not carrying out hydraulic test shall be furnished for Owner's approval.	In line with PED (Pressure Equipment directive), bidder does not carry out hydraulic pressure test on LP-enclosure.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
332	Annexure-A	2.1.3.1 (a)	Rotor forgings Fully representative tangential or radial test pieces shall be provided at each end of the body, at each shaft end and radial test piece from the trepanned core (when a core is trepanned) to determine mechanical properties including impact, brinell hardness etc. and tests for notch toughness i.e. FATT (both transition temperature and room temperature impact values)	Bidder carries out tensile and impact test on each shaft part and on each shaft end taken from a ring in tangential direction only. Radial test pieces from trepanned core and Notch toughness test (FATT) for estimation of transition temperature are carried out as type tests for initial product qualification stage only. Bidder is using material with long time experience.	
333	Annexure-A	2.1.3.1(b)	Forging suppliers should have established practices to ensure requirements of creep and rupture in order to establish the adequacy of material to meet the duty requirements of long exposure to high temperatures and pressures. This data shall be furnished for Owner's approval.	Bidder shall submit the available stress rupture data for customer approval.	
334	Annexure-A	2.1.3.1©	Heat treatment should be carried out in such a way so as to ensure minimum residual stress in the rotor. Residual stress measurement shall be carried out.	Residual stress measurement will be reasonable only for monoblock rotors. Turbine rotors are welded from single discs. Each disc will be heat treated including controlled cooling with low cooling gradient. In addition to that the welded rotor will be subjected to a heat treatment in furnace.	
335	Annexure-A	2.1.3.(d)	Rotor forgings Supplier should furnish the UT proposal, scanning plan and probe angles for clients approval	Bidder will submit the scanning plan, acceptance criteria and information about the probes and frequency for information only.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
336	Annexure-A	2.1.3.1(g)	Rotor Forgings: Thermal stability tests shall be carried out on HP and IP rotor forging to ensure the thermal stability of the rotors in service and at overspeed.	As per bidder's practice, Heat stability test is not carried for welded rotors. Heat stability tests are only done on monoblock rotors which exceed a delivery weight of 32 tons when quenched in vertical position and on 5 tons when quenched in horizontal position. Rotors are made of high alloy raw material (Cr Mo W V Nb N steel) supplied by experienced suppliers, poured by ESR to reduce segregation in the forgings	
337	Annexure-A	2.1.3.1(h), iv	Rotor forging welds Hardness survey on the welds	Required test can be performed randomly for information only.	
338	Annexure-A	2.13.2 (a)	Complete rotor Axial & radial run-outs and surface finish checks shall be carried out before and after blading and after overspeed tests. Run out examination will be carried out at blade shrouds also.	Bidder carries out axial & radial run-outs before blading and after overspeed test only. Bidder will not perform run out test on shrouds.	
339	Annexure-A	2.13.2 (b)	Complete rotor Check of clearance of rotor groove and blade at the root.	This test is not applicable to bidder's design due to the use of pretwisted blades.	
340	Annexure-A	2.1.3.2(d)	An overspeed test shall be carried out during which the rotor shall withstand an overspeed of 120% for five continuous minutes. If bidder's practice is different from as stated above, then same shall be furnished to Owner's approval. During this test, vibration measurement and analysis shall be carried out.	Bidder's practice is to do the test at 120% speed for 3 minute as per ISO Specification.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
341	Annexure-A	2.1.3.2 (e)	After blading and again after over speed testing, rotor stages with blades over 225 mm of active length are to be given standing vibration tests to determine natural frequencies in various vibration modes to ensure that the ranges are outside operating frequencies. The modes to be tested are: Bucket group tangential, wheel axial and group axial.	This is not applicable to bidder's design. All moving blades exception of the LP- last stage moving blade are designed with integral shrouds and pretwisted. Natural frequencies will be measured only on freestanding LP blades before installation on rotor.	
342	Annexure-A	2.1.3.2 (g)	Lock blade lift after the overspeed shall be checked and record for same shall be maintained.	This is not applicable because bidder's design does not use lock blade.	
343	Annexure-A	2.1.4.3	Stator and rotor blades When erosion shielded, the erosion shield and blade joint shall be radiographed	Erosion shields are not applicable to bidder's design. Bidder protects LP last stage moving blades against erosion by high frequency hardening at the inlet edges.	
344	Annexure-A	2.1.4.7	Stator and rotor blades: Natural frequencies of the LP Turbine blades shall be determined before mounting on rotors to ensure that the same are outside operating frequency range	Bidder carries out critical frequencies of blades applicable only for free standing blades without shrouds	
345	Annexure-A	2.1.4.8	Stator and rotor blades Shroud bands after punching and after rivet-ting shall be subjected to 100% DPT to ensure freedom from harmful surface defects	This is not applicable for bidder's design as shrouds are integral with blades and there are no shroud bands provided	
346	Annexure-A	2.1.4.9 (b)	Stator and rotor blades (in case of cast blades):- Rough machined and finished machined cast blades shall be subjected to MPI test	Bidder carry out MPI test on blade foil and transition zone only.	
347	Annexure-A	2.1.4.9 ©	Stator and rotor blades (in case of cast blades):- RT on blades	Bidder practice to do UT on cast blades.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
348	Annexure-A	2.1.4.9 d (I)	Stator and rotor blades (in case of cast blades):- Before starting mass productions, following technological tests shall be carried out on the first lot of 10 to 15 blades:-(i) 100% radiography and 100% MPI on blades	Bidder carries out UT & MT on all blades as per the proven inspection & test programma and same shall be submitted to customer for approval.	
349	Annexure-A	2.1.6 (a)	Casting suppliers should have established practices to ensure requirements of creep and rupture, in order to establish the adequacy of material to meet the duty requirements of long exposure to high temperatures and pressures.	Bidder shall submit the available stress rupture data for customer approval.	
350	Annexure-A	2.1.6 (d)	Stop, cotrol and bypass valve valve seat bore shall be checked for size and concentricity	Valve seat will be checked for size dimension only.	
351	Annexure-A	2.1.6 (e)	Stop, control and bypass valve: Bar stock for valve stem shall be subjected to ultrasonic examination and finish machined stem shall be subjected to magnetic particle/Dye penetrant examination.	Forged valve spindles are subjected to an US test but the MPI test on finish machined spindles is not Bidder standard. Bidder carry out a surface crack dtecton test /dye pentration test on speciial areas on valve spindles. E.g. spray coating- or hard facing areas.	
352	Annexure-A	2.1.6 (f)	Each valve body and bonnet will be hydraulic tested at minimum 1.5 times the maximum working pressure after applying temp. Correction.	Bidder carry out hydraulic pressure tests on valve body only. Suitable NDT (like UT & MPI) is performed on bonnet as per bidder's standard practice.	
353	Annexure-A	2.1.7	Cast and Forged steel components such as LP Casing, in case of cast design, inlet and extraction/exhaust connection, shaft seal covers and rings, servo motor etc.....	All parts listed under 2.1.7 will be tested as per bidder's Standards which are based on European standards.

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
354	Annexure-A	2.1.8 ©	Bar stock greater than or equal to 50mm in diameter for bolts shall be subjected to US-examination	US test on bars as required in applicable EN standard.	
355	Annexure-A	2.1.8 (b)	Finished machined bolts shall be subjected to MPI examination / DPT for surface defect examination	This is not the bidder's standard. Inadmissible defects will be found by US-test on raw material, because tests will be carried out with high test sensitivity as specified in applicable acceptance level in EN-standard, Therefore bidder do not carry out a surface crack detection test on finished bolts.	
356	Annexure-A	2.1.9	Governing and protection system equipment such as electro-hydraulic controller, hydraulic amplifier, hydraulic controller, electro hydraulic convertors, hydraulic convertors, hydraulic speed governor, trip devices etc.....	Electro-hydraulic controller, hydraulic amplifier, hydraulic controller, hydraulic convertors, hydraulic speed governor not applicable per Bidder design. Bidder uses electronic controller in place of electro hydraulic controller	
357	Annexure-A	2.1.9	Inspection of complete turbine ..prepare a checklist and submit the same for Owner's approval..	Document will be submitted for information only.	
358	Annexure-A	2.1.11(a)	Inspection of complete turbine .. His practise to carry out no load test works running tests on the steam turbine a) part of a no-load test under steam	Bidder's practice is to assemble HP & IP at the manufacturer work shop	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
359	Annexure-A	2.1.12	Generator Tests: The tests listed below shall be carried out on the generator to be supplied against this specification. If possible running trials shall be conducted for the generator,excitator and automatic voltage regulator equipment combined as a unit, on the test bed, and the bidder shall clarify indicate in his bid whether he is able to meet these requirements. (Included Clauses : 2.1.12.1,.....,2.1.12.17)	During generator manufacturing, the tests in Bidder's Standard Shop Inspection and Test Program will be conducted. It is not envisaged to conduct type tests / shop running tests since over 50 similar units are under operation which amply prove the generator design.	
360	Annexure-A	2.2.2 (a)	Cross around pipes Weld edge preparations of shop and site welds shall be checked by MPI test	For HP-loop pipes accepted but not applicable to fabricated LP-cross over pipe.	
361	Annexure-A	2.2.2 (b)	Cross around pipes butt welds shall be subjected to 100% radiographic test	For HP-loop pipes accepted, but for fabricated LP-cross over pipe, bidder's practice is to carry RT for 50% of butt welds.	
362	Annexure-A	2.2.2 ©	Cross around pipes butt welds shall be subjected to 100% magnetic particle test	Bidder's practice is to carry MPI test on 50% butt welds, 25% Fillet welds and 100% nozzle welds.	
363	Annexure-A	2.2.3 (I)	Lubricating oil pumps Main oil pump shaft shall be subjected to US-examination	No RT/UT on weld seams applicable because casing is made from cast iron.	
364	Annexure-A	2.2.3 (ii)	Lubricating oil pumps Impeller of main oil pumps shall be subjected to an overspeed test for 5 min.	Main oil is a gear type pump without impeller. Overspeed test is not applicable.	
365	Annexure-A	2.2.3 (iii)	Lubricating oil pumps pump casing should be subjected to a hydraulic pressure test at 2 times the working pressure	Oil pumps will be subjected to hydraulic pressure test with 1.5 times working pressure.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT**PRE - BID QUERIES****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
366	Annexure-A	2.2.3 (iii)	Lubricating oil pumps All pumps shall be performance tested including vibration and noise level test.	Performance test will be performed at sub suppliers work shop. Noise and vibration are type tests.	
367	Annexure-A	2.3.2	Metallic Expansion Joint: Life cycle test, meridional yield rupture test and squirm test to be carried out on a prototype/expansion bellow as per Sec. D clause 3.2 of standards of Expansion joint Manufacturer Association (EJMA). Test reports may be furnished by manufacturer for consideration and approval of Owner.	These tests shall be not done for the offered product. Instead, test reports available with the manufacturer for the same product shall be submitted for approval.	
368	Annexure-A	2.3.3	Rubber Expansion Joint: Life cycle test and burst test shall be carried out on bellows of each type, design and size. Test certificate for the same may be furnished for approval of Owner.	These tests shall be not done for the offered product. Instead, test reports available with the manufacturer for the same product shall be submitted for approval.	
369	Annexure-A	2.8	BFP + Booster Pump (In Process Tests): DPT & MPI shall be carried out on Gear, Pinion, Shaft & Wheel	Bidder request that either of DPT or MPI will suffice the inspection requirement. Hence either of DPT or MPI will be carried out on these items.	
370	Annexure-A	2.8	BFP: Other test (Final Test for BFP & Booster Pump)	Please clarify, what is other test.	

BHUSAWAL THERMAL POWER STATION 1 x 660 MW UNIT - 6 PROJECT

PRE - BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
371	Annexure-A	2.8	BFP: Thermal Shock Test shall be carried out on one Boiler Feed Pump, Metal Temperature resulting from thermal gradients and Strain Gauge Measurement shall be taken on all critical areas such as Barrel, Discharge Branch, Casing Cover, Casing Cover Stud etc. Temperature range of the test shall vary from 20 degree C to maximum operating temperature.	Thermal shock test is not a manufacturer's standard practice, hence we request Owner to withdraw this testing requirement.	
372	Annexure-A	2.8	BFP: Visual Cavitations Test on one first stage production impeller of Boiler Feed Pump shall be carried out to demonstrate absence of Cavitations at Design Speed in Cold Water. The test will establish the cavitations characteristic of one production first stage impeller to confirm that the cavity length under dynamically scaled site conditions corresponding to design point will not exceed an agreed size. This test shall be carried out at 25%, 50%, 65%, 80%, 100% and 125% of Design Flow.	Test on one first stage production impeller of Boiler Feed Pump will be carried out to demonstrate absence of Cavitations at Test Speed in Cold Water. The test will establish the cavitations characteristic of one production first stage impeller to confirm that the cavity length under dynamically scaled site conditions corresponding to design point will not exceed an agreed size. This test shall be carried out at 25%, 50%, 65%, 80%, 100% and 125% of Design Flow.

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
373	Annexure-A	2.8	BFP: Complete Strip Down of Boiler Feed Pump which under goes Performance Test, NPSH Test, Dry Run Test, Thermal Shock Test etc. shall be done in order to check problems like Internal Rubbing Damage, Excessive Wear etc. One Booster Pump shall be dismantled for visual inspection after completion of performance test and NPSH Test. For other Pumps strip down test shall be conducted only in case abnormal performance such as Excessive Vibration, High noise, high bearing temperature etc. is observed during performance test. In the lieu of testing, bidder may submit the test report of type test earlier carried out, if the type test report are not found satisfactory to the owner, then the specified tests shall be conducted per the approved performance test procedure we. In any case bidder to carry out NPSHR test on one BFP and booster pump. The above criteria are applicable to CEP as well.	It is the understanding of Bidder that if pump supplier produces the type test report of Complete Strip Down of BFP of similar model as offered for this project, then the requirement of carrying out Strip Down Test separately for this project shall be removed. Similar criteria are applicable to CEP as well.	
374	Annexure-A	2.8.3	CEP: Complete CEP Final Test	Final Test as mentioned in table on CEP Assy. is not clear. Please clarify.	
375	Annexure-A	2.8.3	CEP: DPT & MPI shall be carried out on Shaft	Bidder request that either of DPT or MPI will suffice the inspection requirement. Hence either of DPT or MPI will be carried out on these items.

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-C

S. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
1		1.1	Approval from Zonal Railways/RDSO	We request that the approval from RDSO/Zonal Railways be arranged by Owner. The Contractor will provide all the required technical information and also participate in the meetings with the authorities.	Bid specification Prevail.
2		1.1	Railway siding	Please let us know if the proposed railway siding arrangement is in line with the Zonal Railways requirement. Please let us know the remedy in case the Zonal Railways/RDSO require major modifications/changes/revision to the railway siding arrangement including but not limited to number of lines, length of lines, arrangement of lines, alignment of lines.	Minimum requirement of railway siding are given however bidder shall consider provision as per Railway norms
3		1.1	Bidder shall be responsible for obtaining approval from RDSO/Zonal railway/RITES.....	We presume our scope is limited to ensure tippler structure to conform to the latest applicable Indian / British / DIN Standards (specifically to IS 10095) and requirements of RDSO	Bid specification Prevail.
4	Page 11 of 245	2.1.12	For blending operation, imported coal shall be reclaimed by conveyor 8 with the help of necessary hopper & pay loader.	The capacity of reclaim conveyor (from the ground hopper) is considered as 30 % of CHP system capacity. Please confirm Also specify the capacity of ground hopper. Additional belt weighed is required for conveyor - 8. Please confirm.	Rated Capacity of Conv.8 shall be 450 TPH. Design Capacity of Conv.8 shall be 500 TPH. Capacity of Ground hopper shall be 150 Tonnes. Belt weigher shall be provided.
5		2..1.13	Reclaimed imported coal shall be blended with indigeneous coal on conveyor 3A or 3B	Please furnish blending ratio of indigeneous coal & imported coal has to be considered to blend imported coal with indigeneous coal on Conveyor 3A/B	Bid specification Prevail.

S. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
8		2.2	Coal storage	Three stockpiles, two(2) for indigenous & one (1) for imported coal shall be provided as per specifications and drawings but the dimensions of imported crushed coal stock piles are not given in the plotplan however crushed coal stockpile dimensions were given as 270 X 50X 11 m ³ (2 Nos). Please furnish the imported coal stockpile dimensions.	In the crushed coal stock pile dimensions shown in the plot plan i.e (270x50x11(2nos.)), Imported coal shall be stacked in some area of one of the two stock piles i.e(100 X 50x 11) m ³ as shown in the drawing
9		2.2 ; Data sheet A : Stacker cum reclaimer Sr.1.7 GA of Coal Handling Plant dwg no.PE-189- GA-120	The height of the stockpile shall be about 11m. The cross section of the stockpile shall be trapezoidal. To suit layout and requirement, 300 meters minimum As per dwg.PE-189-GA-120 the length of stockpile indicated around 270 meters. Please clarify.	We will follow layout drawing PE-189-GA-120 for stockpile length, please confirm.	Dimensions of the stockpiles shall be 270mx50mx11m.
10		2.3,	Conveyors capacity	Rated capacity of conveyors has been specified as 1500 TPH in the system description. This is very much on the higher side for 1 no 660 MW plant. Please review the requirement, otherwise the system will be oversized for the requirement and may not be economical.	Bid specification Prevail.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project
Pre - Bid Queries
Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-C

S. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
11		2.3 2.1.1	Two streams of conveyors and equipment (2x100%) with rated capacity of 1500 TPH shall be provided for coal handling system. Indigenous Coal of (-) 300 mm size and Imported Coal of (-) 50 mm size shall be received at Bhusawal T.P.S. site by box-N type wagons and shall be unloaded in any one of the two (2) Wagon Tippler Hoppers by means of Wagon Tiplers and side arm chargers.	We understand that rated capacity of coal handling system is decided based on minimum tipping rate (25 Tips/hr) of wagon tippler and BOX-N type of wagons each carrying 60T of coal. Please confirm. However, if transportation of coal shall be done by newly introduced wagons like DFC Type wagon (Net Weight of coal 108T), BOXNHL type wagon (net weight of coal 71T), BOX 25 type wagon (net weight of coal 77T), then downstream system capacity shall not be adequate and capacity shall not match with tipping rate. Please check and confirm. Also as per list of condition mentioned in RDSO norms G-33, Rev. 1 (Cl. No. 8.2) : If the client desires lesser numbers of tips, concurrence of the concerned railway authorities shall be obtained. Please refer enclosed "Annexure 1 G-33 (Rev.1) Cl. 8.2" for ready reference.	Bid specification Prevail.
12	-	2.3	SYSTEM CAPACITY Two streams of conveyors and equipment (2x100%) with rated capacity of 1500 TPH shall be provided for Coal Handling System	Based upon specified 1500 TPH Bunker Feeding Conveyor Capacity system is capable of feeding the 24 hr coal requirement within 7.5 hr only. As per latest CEA Guidelines, operating hour for Coal Handling Plant is about 14 hr per day. So, our understanding is that 2 x 800 tph streams shall be adequate meeting the CEA guidelines.	Bid specification Prevail.
13	Page 14 of 245	3.1.1	Rota Side Wagon Tippler....	Wagon Tippler in line with RDSO's G-33 Rev-1, May 2010, as approved by RDSO shall be offered. Please confirm that old design Rota Side Wagon tippler shall not be acceptable as RDSO will not accept the same.	Bid specification Prevail.
14		3.1.2	Siding	We understand that the siding Owner mentioned here refers to Mahagenco. Kindly confirm.	Confirmed

49		5.1.10	Conveyor Drive : Hydraulic drive shall be offered for all coal conveyors	Please confirm whether conventional drive can be acceptable for coal conveyors in place of hydraulic drives.	Bid specification Prevail.
50	Page 28,29 of 245 page 59 of 247	5.1.10(a)-(d), Sr. no 28,	Conveyor drive-Hydraulic drive shall be offered for all coal conveyors Annunciation- Hydraulic motor driven conveyor.	As per clause no 5.1.11,5.1.12,5.1.12 of pages from 29-35 of 245,conveyor drive is conventional type with gear box, input & output coupling. We recommend electromechanical drive for all conveyors. Please review and confirm.	Except Belt feeders and reversible belt feeders all conveyor drives shall be hydraulic.
51	Page 29 of 245	5.1.11(b),	Gearboxes shall be of same handling and completely interchangeable for all twin conveyors	Gearboxes may be interchangeable for twin conveyors by changing the internals. Please confirm acceptance.	Except Belt feeders and reversible belt feeders all conveyor drives shall be hydraulic.
52	Page 33 of 245	5.1.12(c),	Fluid coupling shall be Traction type in general. However,for highest rating scoop type can be provided, if required. As per fluid Coupling Data sheet at page no 125 of 245 at sl no 5:Scoop coupling for crusher motor.	As we understand, scoop type coupling is to be provided for crusher motor only and for all other areas fluid coupling of traction type shall be provided. Please confirm acceptance.	Bid specification Prevail.
53	Page 35 of 245	5.1.14,	All conveyor and belt feeders shall be provided with brakes	We propose to provide brakes only to the belt conveyors where the same is required to adjust difference in costing down time with its preceding and succeeding conveyors. Please confirm acceptance.	Bid specification Prevail.
54	Page 36 of 245	5.1.15,	Take up arrangement	Take up travel is considered as 2.5% of Horizontal cross section of Conv length.	As per CEMA
55		5.1.15, (f)	Takeup weight material	please confirm whether take up weight madeup of RCC is acceptable in place of cast iron or not.	Bid specification Prevail.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project
Pre - Bid Queries
Bid Specification No. DG/BSL U-6/2011/T-1 Volume-III-C

S. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
56	Page 36 of 245	5.1.16(b),	Internal belt cleaner shall be V plough type, made of mild steel and hard strips with necessary chutes shall be furnished for cleaning internal surface of belt.	Requirement of chute is not clear for the application. Please specify requirement.	Bid specification Prevail.
57		5.1.17	Beltsway switch	We will consider belt sway switches in pairs at periodic intervals of 50m instead of 30m as specified in tender specifications for all conveyors. Please confirm your acceptance	Bid specification Prevail.
58	Page 40 of 245	5.2.2,	Belt speed for belt feeder as 3.0 m/s	We understand that belt speed upto 3 m/s is applicable only for belt feeders. Please confirm.	Bid specification Prevail.
59	Page 41 of 245	5.3.1(c),	Requirement of stair case	Kindly clarify if all external staircases to be covered from FGL upto roof or only working floors are to be covered for all tall TPs near boiler bunker area upto roof.	Upto Roof
60	-	5.4.2	The Machine should be rated for continuous duty and should be able to unload all standard open broad gauge wagons (including future high sided wagons) of Indian Railways. It shall be capable of unloading either One eight-wheeler wagon or Two four Wheeler wagons at a time.	As per RSDO Guidelines G-33_Rev.-1,Wagon Payload Capacity for 1. DFC- 25 is about 82 T & unloading capacity- 2050 T/hr 2. DFC-32.5 is about 108 T unloading capacity-2700 T/hr based upon the 25 tips/hr So, we understand that coal unloading streams starting from apron feeder, conveyor upto coal stock pile shall be 2 x 3000 tph streams. Please clarify.	Bid specification Prevail.
61		5.8.4	Type of Crusher	Please confirm whether ring granulator type crusher is acceptable in place of Impactor hammer reversible type as specified in tender specifications since output size of crusher required is (-) 20 mm as per tender specifications.	Corrigendum Prevail.
62		5.8.10	All hammers shall be toothed hammer weighing maximum 30 Kg	we request customer to review hammer weight , max30 kg as specified by customer since capacity of crusher is not specified in tender specifications to check the possibility of the same.	Bid specification Prevail.

66	Page 47 of 175	5.6.2 & 6.17.4 & 5.5.3	-	a) As per this clause, the capacity of HCSD system should be 300 TPH. The fly ash collection rate considering 90% as fly ash comes out to 165 TPH. The HCSD system are recommended to be operated on continuous basis and if run it for intermittent operation then the purpose of HCSD is defeated because it will be operated for 4 to 4.5 hrs. in a shift and line has to be flushed after its operation. So, there is no point of having higher capacity HCSD system and it should be in the range of 180-185 TPH only. So, please review and clarify. b) There is a contradiction between Cl. No. 6.17.4 and HCSD evacuation time with respect to 300 TPH capacity. HCSD pump shall not run continuously as per suggested system design. Please advise.	Bid Specification Prevail
67		5.6.2	-	Total static height has been mentioned as 60 Mtrs for Head calculation of slurry Pumping. We also find that Main plant area is 206.5 Mtrs & HCSD Area is 206.5 Mtr and Ash pond area RL is also mentioned as 281 Mtrs on Page 166 of 177. Please advise static lift to be considered separately for (1) BA Slurry system (2) HCSD System indicating difference in Grade level and Dyke height.	Please refer reply to Sr.no 15

29	2	Annexure-1	Analysis of Raw water: Turbidity (NTU): 100 during non-monsoon & 10000 during monsoon	Kindly provide us the Total Suspended solids (TSS) values corresponding to the non-monsoon & monsoon period for requirement / design of clarifier system.	Bid specification prevail

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III E1**

S. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
30	2	Annexure-1	Water analysis	We note that the TDS of raw water is 870 ppm (Conductivity 1300 microS/cm). For this TDS the ion exchange type DM plant will not be an optimal solution due to high regeneration chemical requirements. It is suggested to provide RO followed by MB unit for this application considering the high TDS. Please review.	Bid specification prevail
31	2	Annexure-1	Water analysis	Please indicate the design turbidity for the clarifier. The value indicated for monsoon is too high and not applied for design.	Bid specification prevail

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III E1

S. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
32	2	Annexure-1 2.0	Analysis of Raw water: Raw water TDS: 870ppm Colloidal Silica < 1ppm Scope of supply & services: Conventional PT & DM plant (Gravity filters, ACF, SAC, Degasser, SBA, MB of 2x100% capacity)	1. For the given Raw water TDS and prescence of colloidal silica ~1ppm, Conventional DM plant (as per Tender) will not be an effective functional solution for producing DM make-up water. 2. Removal of colloidal silica requires membrane based (UF system) treatment system. 3. Also resin & chemical consumption will also be high due to high ionic load. 4. We suggest membrane based treatment plant (Reverse Osmosis (RO) with Electro DeIonisation (EDI) system) with 3x50% capacity (2working & 1 standby streams). 5. EDI has the advantage of continuous operation without any regeneration, compact, fully automatic. Also no separate regeneration is required, hence no chemical consumption for regeneration and regeneration waste generation. Owner is requested to review and change the specifiatioin to membrane based treatment plant (Reverse Osmosis (RO) with Electro DeIonisation (EDI) system), in place of the conventional plant presently specified.	Bid specification prevail

S. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
33	2	Annexure-1 7.0	TDS = 870 ppm	Cation & Anion mentioned in the Raw water analysis as 585 ppm each, therefore TDS should be around 1170 ppm. Please clarify.	Bid specification prevail
34	2	Ann. I, Clause No. 13.0, Page no. 41 of 313	Analysis of Raw Water - Turbidity	Clarifier and pre-treatment plant equipment will be designed for 100 NTU turbidity. Increased turbidity during monsoon will be considered as off design case only. Further, thickener & centrifuge will be designed based on 500 ppm inlet load at Clarifier. Please confirm.	Please refer reply to sr.no:25
35	2	Datasheet A, Clause No. 4.0 & 5.0, Page no. 46 of 313	Flash Mixer & Clariflocculator	As per clause no. 4.0, detail of Flash mixer is mentioned whereas in Clause no. 5.0 detail of Draft tube is specified. The bidder may also consider HRSCC clarifier for Removal of TSS. HRSCC will be designed for surface flow rate in clarification zone of $2.5 \text{ m}^3/\text{hr}/\text{m}^2$ and maximum residence time in clarification zone as 100 min. Please confirm acceptance.	Flash Mixer & Clariflocculator shall be considered
36	2	Datasheet A, Clause No.12.0, 16.0 & 18.0, Page no. 54, 60, 62 of 313	Dosing Pump for DM & Non-DM Stream	We suggest two (2) Different working dosing pumps for DM & Non-DM Chain for better control of dosing.	agreed, it shall be 2 nos (1 W+1S) for DM & 2 nos (1 W+1S) for Non DM

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III E2

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
1	1	2.1.11	Two (2) Self-cleaning strainers in ACW discharge header, upstream of Plate Type Heat Exchanger & Recirculation line in ACW system	Recirculation line for these pumps are not required.	Spec prevails
2	1	2.1.2	CW pumps: Concrete volute	Concrete volute is not warranted for the water quality specified. For the specified water in circulation, conventional casing material (CI) with wet pit arrangement can be used. This being EPC contract the Bidder may be allowed to select concrete volute or vertical turbine pump with metal casing.	Spec prevails
3	1	2.1.2	Concrete Volute Casing, Dry Pit Type Condenser Cooling Water Pumps	Vertical turbine pumps are suited for flow ranges between 20,00-50,000 m ³ /hr and the flow for present application falls in this range .Hence, we will be offering Vertical wet well type metallic casing CWP with Bell mouth, impeller and pump casing/diffuser construction. Such pumps have been supplied for numerous projects for 500/660/800 MW projects.Customer is requested to consider vertical wet well type metallic CWP also for this application.	Spec prevails

BHUSAVAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III E2

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
4	1	2.1.2	Concrete Volute Casing, Dry Pit Type Condenser Cooling Water Pumps	Vertical turbine pumps are suited for flow ranges between 20,00-50,000 m ³ /hr and the flow for present application falls in this range .Hence we will be offering Vertical wet well type metallic casing CWP with Bell mouth, impeller and pump casing/diffuser construction.Such pumps have been supplied for numerous projects for 500/660/800 MW projects. MahaGenco is requested to consider vertical wet well type metallic CWP also for this application.	Spec prevails
5	1	2.1.4	Independent CW & ACW return lines shall be provided for taking out hot water to NDCT	We propose that ACW return lines will be merged with CW return header and single header will be provided upto the NDCT. Please confirm.	Bid spec prevails
6	1	2.1.4	Independent ACW & CW return lines shall be provided for taking out hot water to NDCT.	Please note that ACW return line shall be connected to CW outlet pipes near condenser as per standard practise. There is no need of separate lines of CW & ACW system upto cooling tower.Pl.confirm.	Bid spec prevails
7	1	3.1.5	The design flow of ACW shall be determined based on heat load of all equipments forming power plant unit loaded up to 15% margin	Please note that design flow with 15% margin is not desired. This will increase in the size, cost and Aux power consumption of ACW pumps without any advantage. Design flow rate shall be actual flow requirement based on heat load of equipment. However margin of 10% shall be provided on the pump capacity. Pl.confirm.	Bid spec prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III E2

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
8	1	3.1.6 (b), pg 16 of 113 3.2.2 (b), pg 19 of 113 3.4.3, pg 21 of 113	Total dynamic head : A minimum of 10% margin on frictional losses assuming C = 120 on Hazen and William's Formula for design purposes based on respective pumping capacity as obtained above. Total dynamic head: A minimum of ten (10) % margin over frictional losses based on pumping capacity as obtained in (a) above. The total dynamic head of each Cycle Make-up pump shall be sized by the Bidder considering a minimum of ten (10) % margin over and above the total frictional losses based on pump capacity as guided above.	10% margin on frictional losses on actual required flow will be taken for selecting pump TDH. Please confirm the same.	Bid spec prevails
9	1	3.1.9	shall be suitably stiffened to withstand soil loads and loads due to heavy vehicles at road crossings.	Thickness of pipe shall be selected based on AWWA M11 guidelines for soil loads. At road/rail crossings pipelines shall be concrete encased to take care of loads due to heavy vehicles.	Specification is self-explanatory.
10	1	3.1.11 (C)	Each individual sump in the CW Pump house shall be designed in accordance with the recommendations specified in Hydraulic Institute/British Hydraulic Research Association/equivalent international standard and its dimensions shall be finally selected after conducting necessary sump model tests by the Bidder.	CW Pump Sump shall be designed based on manufacturer's recommendation. This shall be later verified by sump model and pump model tests as there is no specific HIS for concrete Volute pumps. HIS 9.8 is not applicable for concrete Volute pumps. Concrete volute pumps shall be as per manufacturers design. Please confirm.	Spec prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III E2

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
11	1	3.1.11 (g)	Sump gates shall be accessible from pump house overhead crane.	Screens and stop log gates to be provided at CW/ACW pump bay cannot be accessed by pump house overhead crane. Separate hoists will be provided for accessing the same. Please confirm our understanding.	Agreed.
12	1	3.2.1	Bidder shall ensure that the average temperature rise of DMCW is limited to 5.5 Deg C under all circumstances.	It may not feasible to restrict average temperature rise to 5.5 Deg C because of various coolers in SG and TG circuits of PHE. Hence, the heat exchangers shall be designed with a Terminal Temperature Difference (TTD) of 3 Deg C (max). The outlet temperature of cooling water on the secondary circuit shall in no case exceed the design outlet temperature of C.W. in condenser.	Bid spec prevails
13	1	3.2.1	 A minimum of 20 % margin shall be considered over and above the total required flow and heat load to compute the design DMCW flow and design heat load respectively in the closed circuit.	Margin shall be 20% over the design heat load only.	Agreed.
14	1	3.2.1	The required flow in this system.....A minimum of 20% margin shall be considered over and above the total required flow and heat load to compute design DMCW flow and design heat load respectively.	Please note that design flow with 20% margin on flow and 20% margin on heat load is not desired. This will increase in the size, cost and Aux power consumption of DMCW pumps, piping, PHE's etc. Design flow rate shall be actual flow requirement based on heat load of equipment. However margin of 10% shall be provided on the pump capacity.Pl.confirm.	Margin shall be 20% over the design heat load only.

BHUSAVAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III E2

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
15	1	3.2.1	The required flow in this system.....In computing the design heat load and design DMCW flow in individual system, bidder shall ensure that the average temprature rise of DMCW is limited to 5.5 degC under all circumstances.	Please note that by limiting the temperature rise to 5.5°C, DMCW flow will increase. This will cause increase in the size, cost and auxiliary power consumption of DMCW Pumps and DMCW circuit piping without any advantage to system. Hence DMCW temp rise shall be maintained as per system requirement viz. 7.6 degC for TG and 7.4 degC for SG PHE's .Pl.confirm.	Bid spec prevails
16	1	3.2.1	A minimum of 20 % margin shall be considered over and above the total required flow and heat load to compute the design DMCW flow and design heat load respectively in the closed circuit.	Margin on flow and heatload shall be as per bidders standard practice.	Margin shall be 20% over the design heat load only.
17	1	3.2.3	...All DMCW piping in the discharge of DMCW pumps shall be sized for a velocity not exceeding 2 m/sec under all circumstances.	Please allow us to consider velocity upto 2.5 m/s for piping at pump discharge.	Bid spec prevails
18	1	3.2.5	The capacity of the make up tank shall be adequate to provide a minimum of one (1) hour storage capacity in between the maximum and minimum operating levels based on the make up demand.	It is not possible to establish the make up tank capacity from the criteria specified. We propose to have a single tank of capacity 10 Cub. M for the DMCW make up. Please confirm.	Will be evaluated after recepit of detailed scheme by bidder.
19	1	3.3.2	Regarding capacity of Boiler Fill Pump - capable of filling up boiler and deaerator in one (1) hour	The capacity should be adequate to fill boiler OR deaerator in maximum TWO (2) hours (higher of the two). Please confirm.	Agreed
20	1	3.3.3	All piping in the discharge side of the BF pumps shall be sized for a velocity not exceeding 2 m/sec under any circumstances.	We request you to allow using velocity upto 2.5 m/s for pump discharge. As such this pump will be operational during start-up only.	Agreed

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III E2

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
21	1	3.4.2	The capacity to be delivered by the Cycle Make-up Pumps shall be assessed by the Bidder as per the following guideline : $Q_p = M \times [E1 \times Q_{BMCR} + E2 \times Q_{DMCW}]$ Where Q_p = Total Design Flow Rate (m³/hr) in Cycle Make Up Pumps E1 = Make-up % of Boiler Maximum Continuous Rating (BMCR) flow rate to be taken as Three (3) % (minimum). Q_{BMCR} = BMCR flow rate in m³/hr. E2 = Make-up % of total flow rate in DMCW system, shall be taken as one (3) % (minimum). Q_{DMCW} = Design DMCW flow rate in m³/hr. M = Margin over and above the required capacity to be delivered by the Cycle Make-up pumps, to be taken as five (5) % (minimum).	The capacity of cycle make-up pumps shall be assessed as per the formula indicated in this clause, however E1 i.e. Make-up % of Boiler Maximum Continuous Rating (BMCR) flow rate to be taken as one (1) % as cycle is designed for 1% only. And E2 i.e. Make-up % of total flow rate in DMCW system, shall be taken as one (1) %. Please confirm.	1%
22	1	3.4.2	Make-up % of Boiler Maximum Continuous Rating (BMCR) flow rate to be taken as Three (3) % (minimum).	For supercritical boilers boiler blowdown is not envisaged so 3 % make up is very high. Makeup shall be as per OEM's std practice.	1%
23	1	3.4.4	All piping in the discharge side of the Cycle Make-up pumps shall be sized for a velocity not exceeding 2 m/sec under any circumstances.	Velocity upto 2.5 m/s for piping at pump discharge may please be allowed.	Bid spec prevails
24	2	20	MOC for Pumps:- a) Casing-ASTM A296 Gr. CF8M b) Casing liner- ASTM A296 Gr. CF8M c) Diffuser-ASTM A296 Gr. CF8M.....	The specified ASTM code A296 does not exist. The MOC for casing, casing liner shall be to ASTM A 351 CF8M. Diffuser are not applicable as these pumps are with volute casing. Pl.confirm.	MOC for all components shall be compatible with A 351 CF8M

4	1	Power Cycle Piping-Scope of Services	4.2.7. The Contractor shall furnish separate sketches for each support, restraint, anchor, snubber, dampers etc.	The Contractor shall furnish separate sketches for each support, restraint, anchor, snubber, dampers etc. for size 65 mm NB above. For 50mm and below, only typical sketches will be furnished.	Bid Specification prevails.
5	1	Power Cycle Piping-Scope of Services	4.2.16. Drawing indicating the layout of pipe work shall be prepared in line with the flow diagrams and shall be provided as part of the Contract. Those drawings shall indicate the position of all supports, guides, restraints and anchors; all drain and vent connections and the position of all pipes. All piping systems shall be arranged to allow adequate falls in the direction of flow, except where otherwise approved by the engineer. At the points of drainage, drain pockets of ample size and approved construction shall be fitted as per details indicated in the enclosed drawings.	Piping layout drawings can not be a part of Contract because those activities can be done in detail design stage. Piping layout drawings can not indicate hanger and supports position due to lack of space. Location and type of all supports, guides, restraints and anchor will be shown in Isometrics. All steam piping systems will be arranged to allow adequate falls in the direction of flow.	Bid Specification prevails.
6	1	5.2.5	Isometric drawings of piping for flexibility analysis	There will not be any separate stress isometrics submitted. The isometrics submitted for construction will also be having the stress related data.	Bid Specification prevails.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
7	1	7.0(Annexure-I)	7.0 Extraction line from MS equalising line: From MS equalising line to auxiliary steam header	We understand that the tap off for Auxiliary steam header from MS line is required when there is no steam available for cold start-up of the plant. As unit interconnection is provided for supplying steam to and from the adjacent unit of this plant, this tapping will not be required and hence the same will not be provided.	Bid Specification prevails.
8	1	Power Cycle Piping- Design and Construction	7.1.2. The Boiler feed discharge pipe-work shall be designed for the maximum final feed water temperature and the shut-off pressure of the boiler feed pump	Boiler Feed discharge pipe line upstream of feed control station shall be designed for hot shut off head of BFP. Boiler Feed discharge pipe line downstream of feed control station shall be designed for maximum pressure expected at Steam generator (economizer) and not for BFP shut off head. Feed control station shall be located upstream of HP heaters.	Agreed.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
9	1	7.1.2 (last para)	Regarding design pressure for boiler feed discharge pipe.	Feed Control Station shall be provided on the upstream side of HP heaters and there shall be no isolation valve on feed water discharge header to boiler. Piping downstream of feed control station shall be designed for the maximum pressure expected from SG side. This is as per the standard practice followed for supercritical power plants and is in line with IBR requirement. However, the piping upstream of feed control station shall be designed for BFP hot shut-off at minimum recirculation flow. Please confirm.	Confirm
10	1	7.1.2 c	Feed water Discharge velocity : 3-6 m/s	As per the standard practice, velocity can be upto 7 m/s for feed water discharge piping.	Bid Specification prevails.
11	1	7.1.4	Pipes shall not be less than 20 mm bore unless authorised by the Engineer.	As per volume-II,Sec-4,clause no.4.1.10(b),page no-74, all vent piping shall be of 15 NB minimum,which is contradicting with this clause.kindly clarify that below 20mm bore pipe can be use or not.	Clause not applicable for vent and drains

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
12	1	Power Cycle Piping-Fabrication	7.3. Except where otherwise specified all piping shall have butt-welded connections with a minimum of flanged joints necessary for maintenance.	Except where otherwise specified, pipes of size 65 mm NB and above shall have butt-welded connections and of size 50 mm NB and below shall have socket-welded connection with a minimum of flanged joints necessary for maintenance.	Bid Specification prevails.
13	1	Power Cycle Piping-Fabrication	7.3.1. Support attachments for major piping shall be done at shop.	Support attachments for critical piping shall be done at shop.	Bid Specification prevails.
14	1	7.3.4	Mitred bends and elbows will not be accepted unless otherwise specified	For larger diameter pipes like Flash tank vent and BFPT Exhaust duct, only mitred bends shall be provided.	Bid Specification prevails.
15	1	- 7.3.8	Throughout section-1 of Volume. IIIF, 50NB piping is included in large bore piping. For Ex. Pipes of size 50 NB and above shall be shop fabricated and of size 40 NB and below shall be field run.	Pipes size 50NB and below shall be treated as small bore piping and above 50NB shall be treated as small bore piping and accordingly all the clauses of the specification are applicable. Deviation against the example mentioned: Pipe of sizes above 50NB shall be shop fabricated and sizes 50NB and below shall be field run .	Bid Specification prevails.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
16	1	Power Cycle Piping- Hangers, Supports, Anchors and Restraints	7.4.5. For Variable Spring : a) The variation in supporting effort between hot and cold condition does not exceed 25% of the load, which is higher of the operating condition and cold setting load. c) Thermal deflection between hot & cold conditions does not exceed 40 mm.	Thermal deflection limit of 40 mm for variable spring is too strict. Then Bidder would like to delete deflection limit since load variability limit has been specified as 25%.	Bid Specification prevails.
17	1	7.4.8	Owner shall provide only the main steel work or embedded plates in the concrete.	Since it is a full EPC project so we presume that these all are in bidder scope. Owner is requested to clarify his scope of supply for full plant.	Bidders understanding is correct.
18	1	7.5.1.1	Control station configuration for continuous & Intermittent requirements	Bypass for control valve stations will only be provided where ever it is necessary from process point of view. Further this requirement will not be applicable for ON-OFF type control valves	Specification is self- explanatory

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
19	1	7.5.1.1	Regarding configuration of control stations	In line with standard practice followed the following configuration is suggested: i) control valve in the bypass of main control valve is not required, except main condensate control valve. ii) motorised isolation valve shall be provided on the upstream of only low load feed control valve, i.e. high pressure service. All other control valves shall have manual isolation valve on the upstream. iii) Drain valve shall be provided at the upstream or downstream of control valve as per layout requirement. iv) motor operated inching type regulating valve is not required even for some intermittent services like CEP minimum recirculation, alternate drains of heaters etc. v) Motorised valve in the bypass of control valve need not have isolation valves on the upstream and downstream. Please confirm.	Will be evaluated after receipt of detailed scheme by bidder on a case to case basis.
20	1	7.5.1.4	All valves shall, unless otherwise approved, have ends prepared for butt-welding and the internal diameter shall be the same as the internal diameter of the pipes to be joined.	Except the control valves, All valves shall be the same internal diameter as the internal diameter of the pipes to be joined. Kindly clarify.	Agreed.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
21	1	7.5.1.9	Valves in general shall preferably be of such design as to permit repacking while in service by providing back seating arrangement duly tested during manufacture.	Control valves will not be provided with back seating arrangements as maintenance of control valves is not possible during operation.	Agreed.
22	1	7.5.1.11	Valves requiring sealing water shall be equipped with lantern ring to admit pressurised water for gland-sealing.	Garloc packing may also be used as an alternative.	Bid Specification prevails.
23	1	7.5.1.13	All regulating valves shall be designed to prevent erosion of the valve plugs and seats when the valves are operated partially opened. The valves shall have contoured plug.	Regulating valves may also have cage type of plugs depending on the valve suppliers and hence the same shall be finalised during detail engineering.	Bid Specification prevails.
24	1	Power Cycle Piping- Valves and Accessories	7.5.1.19. All valves shall be fitted with indicators so that it may be readily seen whether the valves are open or shut.	For valves NB 50mm and below, indicator is not provided because of small lift.	Agreed.
25	1	7.5.1.22	Each valve hand wheel shall be fitted with a circular nameplate of approved material indicating the valve tag number, duty or service intended and the function of the valve.	Name plate shall be of rectangular and fitted on to the valve only.	Agreed.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
26	1	7.5.1.23 4.5.1(r)	Wherever practicable, heavy valves of total weight including actuator, drive motor, integral by-pass etc. equal to or greater than 500 kg shall be provided with suitable lugs to permit direct suspension by hanger rods or direct resting on bottom support, as applicable.	No valve will be provided with any of the supporting attachment. Weight of the inline components will suitably be supported from the piping which is in turn supported from supporting arrangements. The valves having very long actuator (Approx. 2-3M) oriented in horizontal direction may have supporting arrangements for supporting the actuator only.	Bid Specification prevails.
27	1	Power Cycle Piping-Valves and Accessories	7.5.1.28. All sampling and root valves shall be of integral body bonnet type.	Optionally Sampling and root valves can be of the pressure-seal bonnet type.	Bid Specification prevails.
28	1	7.5.2.8.(a) 4.5.1.h(i)	Motor operated valves shall be fitted with both hand and motor operating gears and where a by-pass valve is provided, this also shall be provided with both hand and motor operated gear and interlock to ensure that the by-pass valve is opened before the main valves Bypass valves for larger gate valves.	Valves intended for inching duty shall not be provided with integral bypass/bypass valves. Though the main valve is of motor operated, manual bypass valve will be provided, if sufficient/required.	Bid Specification prevails.
29	1	8.1.10	Line drains from Main Steam, Hot Reheat, Cold Reheat, L.P. bypass & high pressure (above 40 kg/cm ²) extraction lines shall be provided with double isolation valves in series for each branch - each located at the two extreme ties of the line drain route. The valve near the condenser shall be motorised one. High pressure drains (above 40 kg/cm ²) shall have two valves in series and that near the condenser or flash box shall be motor operated and arranged to open and close to ensure minimum wear on one valve.	HP extraction lines shall be routed to flash tank instead of condenser with a control valve and isolation valve in the upstream of the control valve in each line placing both the valves near to the receiver (flash tank).	Bid Specification prevails.

45	2	Specification of Pipes for Different Services (piping materials)	Piping material for various services such as DM water, Instrument air and service air, clarified water, DMCW & drinking water.	Following piping material is proposed: DM water system - The SS material will be used. Inst. air & Drinking water system - IS 1239 (Gal) heavy of ERW construction will be used for sizes upto NB150 and beyond NB150 the pipe material will be IS 3589 (galvanized). The joint will be of screwed connection. Service air, Clarified water & DMCW system - IS1239 (black) heavy of ERW construction will be used for sizes upto NB150. Beyond NB150 the material will be IS 3589. The joint will be of welded connection. The fitting material will be compatible with piping material. Please confirm.	Bid Specification prevails.
46	3	3.2.1	The expansion joints will be used on C.W. Pipes at inlet and outlet of condenser and at CW pump suction to absorb relative movement between C.W. Pipes and respective equipment.	CW pumps are vertical turbine type pumps. It does not required expansion joint in suction.kindly clarify	Agreed.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
47	3	4.1.4	All flanged tees and blank flanges for tapping water supply from these pipelines to meet the necessity of Owner's other equipment are included. All materials required for the same shall be supplied.	Owner is requested to provide specific requirement for his other equipment clearly. So bidder provide the tapping for the same.	Bidder shall review the terminal points and provide as deemed necessary.
48	3	Data sheet for butterfly valves	Material of construction of body/disc	We request you to accept alternative material of fabricated steel (IS 2062) for the large butterfly valves.	Agreed.
49	4	1.1.2	(a) Design ambient temperature 45°C	Design ambient temperature should be kept at 40°C. Otherwise, there is excessive/impractical increase in Insulation Thicknesses due to introduction of thickness calculation clause as per ASTM C 680 & high ambient temperature of 45°C. The combined effect of both the stipulations will result in very high insulation thicknesses (of the order of 500-650mm in some cases), which will lead to highly congested piping layout and difficulty in pipe supporting.Pl.confirm.	Bid Specification prevails.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
50	4	1.12, pg 125 of 159	Insulation thickness shall be computed on the basis of the following data (g) Overall heat transfer coefficient and insulation thickness shall be calculated as per ASTM C-680-89	The tender specifies stringent data for selection of insulation like surface temperature- 60 deg C, Ambient temperature- 45 deg C, wind velocity- 0.25m/s> over and above this if the heat transfer coefficient and insulation thickness are calculated as per ASTM C680, this will result in very large insulation thicknesses and pose severe problems in layout of piping especially in TG Hall as found from our experience. Hence the heat transfer coefficient and insulation thickness may be allowed to be calculated as per the conventional Langmuir equations instead of ASTM C680 for the selection criteria mentioned in the tender.	Bid Specification prevails.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
51	4	1.1.2	(e) Surface Wind Velocity = 0.25m/sec	Surface Wind Velocity should be kept as, not less than, 0.5m/sec (inside TG building) & 1m/sec (outside TG building). Otherwise, there is excessive/impractical increase in Insulation Thicknesses due to computation as per ASTM C 680 & low Wind Velocity of 0.25m/sec. This combined with high ambient temperature of 45°C will result in very high insulation thicknesses (of the order of 650-700mm in some cases), which will lead to highly congested piping layout and great difficulty in pipe supporting. Pl.confirm.	Bid Specification prevails.
52	4	Thermal Insulation	3.1.1 Thermal insulating Materials -preformed bonded mineral wool sections, bonded mineral wool mattresses, loose mineral wool and lightly resin bonded glass wool shall be provided.	For piping insulation, Rockwool will be considered as an option. Glass wool is carcinogenic in nature and thus recommended not to be used.	Bid Specification prevails.
53	4	Thermal Insulation- General Information	1.1.2. Insulation thickness shall be calculated on the basis of a) Design ambient temperature: 45 DegC e) Surface wind velocity: 0.25m/sec	Insulation thickness shall be calculated on basis of a) Design ambient temperature: 40 Deg.C, b) Surface Wind velocity=1 m/s	Bid Specification prevails.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
54	4	Thermal Insulation-Materials specification	4.9. Sheathing material for all insulated surfaces, equipments, piping etc. confirming to ASTM B 209- 1060 temper H-14 or IS 737 Gr 19000 / H2, shall be provided as per following: (a) For dia of insulated surfaces of 450 mm & above and for flat surfaces:16 SWG (c) For steam generator and ESP outer casing: 16 SWG corrugated Aluminium for SG	a) We envisage 0.914 mm thick sheet, instead of 16 SWG, due to bending limitation. c) For steam generator outer casing, 1.2 mm (18 SWG) thick corrugated Aluminium sheet is envisaged, in line with clause no. 4.9. of section-4, Volume- III F	Bid Specification prevails.
55	Annexure-A	2.1.6	All strainers shall be subjected to hydrostatic test. The test pressure shall be twice the design pressure.	All strainers will be subjected to hydrostatic test. The test pressure will be 1.5 times the design pressure.	Bid Specification prevails.
56	Annexure-A	2.1.6	All steam traps shall be subjected to hydrostatic test at twice the design pressure. IBR certification shall be furnished for all steam traps.	All steam traps shall be subjected to hydrostatic test at 1.5 times the design pressure.	Bid Specification prevails.
57	Annexure-A	2.2.1	All piping, valves and specialties after installation, shall be tested hydraulically at a pressure, one half times that of the maximum attainable pressure in the system or two (2) times the design pressure whichever is higher, to check against leak tightness.	All piping, valves and specialties after installation, will be tested hydraulically at 1.5 times the design pressure.	Agreed.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III F**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
58	Annexure-A	2.2.2	All manually operated valves/gates shall be operated throughout 100% of the travel and these should function without any trouble whatsoever.	Manually operated Valves/gates will randomly checked at site.	All Test/ inspection related points shall be reviewed and finalised during detailed engineering.
59	Annexure-A	3.0	Spark Test, Adhesion Test and Material Test for primer and enameled & Coal Tar Tapes shall be as per AWWA-C-203-91.	Spark Test, Adhesion Test and Material Test for enameled & Coal Tar Tapes shall be as per AWWA-C-203-91. Request client to withdraw this testing requirement for Primer coat. Although material Certificate shall be submitted to client for primer also.	
60	Annexure-II	pg 61 of 159	MOC for fittings, fittings and valves, pipes in power cycle piping- seamless construction	It may be noted that large diameter thin walled pipes and fittings in Power Cycle piping will not be of seamless construction due to non availability in market. As per accepted industry practice Electro fusion welded pipes meeting ASTM/ ASME standards will be used for pipe sizes of Nb 550 and above, where the design pressure and temperature are such that it calls for ASME 300 class and below for wall thickness.	

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

RESPONSE TO PRE - BID QUERIES

VOLUME - III G

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III G**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
1	1	1.2.9 & 2.2	Total Six(6) air compressor (three (#) for IA Compressor and three(3) for SA system) Shall be used to cater the instrument air requirement and service air requirement of total plant except for coal handling plant , ash handling plant and coal mill reject system.	For Mill reject handling system, dedicated compressed air system for conveying / process provision shall be provided. However, instrument air for Mill reject handling system will be supplied from plant compressed air system. Please confirm.	Confirmed
2	1	2.1	Service air compressor	The requirement of service air is comparatively less. Specification calls for capacity of SA compressor same as IA compressor. So considering the above we feel that 2 nos. service air compressors are adequate. This will meet the complete station service air requirements and also provide standby capacity,	Bid specification prevail
3	1	2.3	Air dryer	The capacity of the air dryer can be the same as air compressor capacity because the capacity margins are already built into the compressor capacity	Bid specification prevail

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III G

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
4	1	2.4	Instrument and service air receiver of capacity equal to that of each compressor capacity	Capacity of receiver shall be sized as per criterion given in clause no.4.4. However minimum receiver capacity shall be 10 m3 as mentioned in cl. No. 8.2.7 of Data sheet-A. Clause 2.4 is contradictory to clause 4.4. We propose to proceed with clause 4.4. Please confirm.	Specification is self explanatory Please refer clause no.4.1.5 Cl.no:2.4 can be read as no. of instument air /service air receivers shall be equal to no. of instrument air/service
5	1	4.15	The capacity of each Air Receiver shall be determined in accordance with----- The water filled volume of each Air Receiver shall be calculated in accordance with the guidelines or 10 m3, whichever is higher.	Nominal 10 m3 capacity for each Air Receivers (IA/SA) shall be provided. Pl.confirm.	Specification is self explanatory
6	1	6.7	COMPRESSOR CASING, ROTOR AND SHAFT etc.	Material of Construction for Air Compressor & dryer shall be as per reputed manufacturer's standard product. Kindly Confirm.	Bid specification prevail
7	1		Air drying plant of capacity (1.10 times IA compressor capacity) and number equal to that of each instrument air compressor shall be installed in order to supply moisture free instrument air.	Adequate margin while arriving at main plant compressor sizing will be taken. Additional margin for ADP for IA Compressor is not required, in view of above Air drying plant shall be of matching capacity of IA compressors shall be provided. Kindly Confirm.	Bid specification prevail
8	1	6.15.1	ADP refrigerant type	HOC type may also be considered. Owner may pl review.	Bid specification prevail
9			Compressed air system	Capacity seems to be high .	Bid specification prevail

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

15	2	3.16.15	Permanent store, inflammable store	For inflammable store, wall mounted exhaust fans with fire dampers shall be provided. Fans shall be of spark proof construction and with flameproof motors. For other permanent store, wall mounted exhaust air fans (not spark proof construction) without fire damper will be provided. Motors also will not be flameproof construction.	Confirmed
16	2	3.17	Other areas, which contain PLC based control requiring air conditioning system.	1) PLCs for following areas will be kept in ground floor of TG building and will be under wet ventilation system A) PLC for Condensate Polishing System B) PLC for OLTCS and Debris filter System 2) PLCs/Microprocessor panel kept in AC Plant Room will be kept in dry ventilation. PLCs shall be suitable for expected temperature.	Bid specification prevail
17	2	4.3	Air Conditioning System with <i>Water cooled Precision type Packaged Air-Conditioners / Split Air Conditioners/Window Air Conditioners</i> and associated accessories / auxiliaries for Various Control room areas of different Auxiliary Buildings, Dining room of Canteen Building.	Air Conditioning System with <i>Air- cooled Precision type Packaged Air-Conditioners / Split Air Conditioners/Window Air Conditioners</i> and associated accessories / auxiliaries for Various Control room areas of different Auxiliary Buildings, Dining room of Canteen Building shall be provided. Pl.confirm.	Bid specification prevail

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III G

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
18	2	4.1 & 4.2	Central Chilled Water Air-conditioning system	Combined Central Chilled Water Air-conditioning plant system shall be provided for Main Power house control room areas and ESP control room areas.Pl.confirm.	Bid specification prevail
19	2	4.3 & 5.2.4	Air Conditioning System Dining room of Canteen Building Water cooled.....on the total cooling load.	Precision type air conditioners will be provided only for control room in ESP Building & Control room, office & lab area of DM Plant Building.	Bid specification prevail
20	2	5.1.1	Design for AC	The DBT for summer indicated here is quite high. For design of the air conditioning and ventilation systems it is standard practice to adopt data from nearest station of ISHRAE standard. We request you to confirm the above.	Bid specification prevail
21	2	5.1.1 of AC portion and 5.2.1 of Ventilation portion.	Design ambient Conditions	Design ambient conditions for Air Conditioning System and Ventilation system for Summer are different. Generally for design of HVAC system outdoor ambient conditions are same for AC and Ventilation. We request you to clarify the same.	The parameter indicated in 5.1.1 of AC System shall prevail for design of ventilation system.
22	2	5.2.1 (d)	These condenser water pumps VFD control buildings	We request you to allow following option also for AC system of ESP cum VFD Control building: "For PAC units of ESP cum VFD control building dedicated cooling water pumps (2x100%) and cooling towers (2x100%) shall be provided."	Agreed

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III G

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
23	2	5.2.1 a,b,c	AC equipment	For the AC of control room area in TG building, ESP building and ESP building we recommend that a common chilling plant with 3x50% chillers can be adopted. Providing 2x100% chillers individually for these areas is not economical.	Bid specification prevail
24	3	5.2.2	All AHUs shall have standby equipment for each area. Minimum total capacity shall be 2 x 100% for each area	Considering the high equipment load in Control Room and high latent load in Service Building, capacities of Air Handling Units will be high. In view of this we request you to consider following criteria for AHU selection: 1) For Control Room : N+1, Air Handling Units (where N = no. of units required for 100 % capacity, 2) For Service Building & Other areas :Minimum total capacity shall be 2 X 60%. Owner is requested to review this criteria.	Bid specification prevails
25	2	5.2.3	Chilled water system shall use de-mineralized water,.....into the chilled water expansion tank.	Make up water for AC system will be from service water tank. Water treatment for AC system will be used in case it is found this water is not suitable for the AC System.	Bid specification prevail
26	2	5.3.1 (a) & 6.3.4	Number of air washer units	Under clause 5.3.1 (a) number of air washer unit is specified as three (3) and under clause 6.3.4 number of air washer unit is specified as four (4). Please clarify.	Number of air washer units shall be considered as minimum four(4).
27	2	6.1.7	The desired pressure shall be 8.0 kg/cm2 (g)	Pressure of make-up water shall be as per system requirement.	Bid specification prevail
28	2	6.11.3	Compressors - The out door unit consists of reciprocating type compressor which is suitable to 415 V / 3 Phase supply.	Type of compressor shall be rotary/scroll or reciprocating based on Supplier standard design.	rotary/scroll compressors are also acceptable.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT
PRE -BID QUERIES from Prospective Bidders
Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III G

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
29	3	5.2.9	Air washer efficiency	Please confirm that the efficiency mentioned here is for the TG hall air washer. For unitary air washer this efficiency is not applicable.	Confirmed(90% efficiency for TG air washer) and not applicable for unitary air washer.
30	3	5.2.11	Supply air fans and/or exhaust air fans provided for ventilation of each area shall be associated with local starter panels.	All ventilation fans shall be provided with local DOL starters, viz. starters shall not be provided at respective switchgears.	Specification is self explanatory
31	3	5.2.12	All dry type transformers shall be provided with independent exhaust fans.	We shall consider Dry type transformer ventilation system as natural air ventilation "AN" in line with Volume IV-B, Section 2, Cl. 4.4. Hence, no exhaust fans will be considered.	Confirmed
32	3	Page No.-126 of 171 Clause 5.3.1b	Regarding scheme of UAF	Since capacity of UAF is below 1,00,000 CMH , we are proposing for 1 x 100% SISW centrifugal fan instead of 2 x 50 % DIDW Centrifugal fan as in the case of Air Washer.	Bid specification prevail
33	3	Page No.-133 of 171 Clause 6.1.6.1 n	Regarding MOC of Rain Protection Cowl, hoods & casing of Axial Flow Fans shall be hot dip galvanized	Rain protection cowl and hoods shall be spray galvanized / hot dip galvanized as per recommendation of fan vendor.	Bid specification prevail

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III G**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
34	Vol.-VII-A2	Drg. No. PE-189-PF-213 Issue- P2	Instrument Air -Receiver (Package specific air-receivers) of 5 m3, 2 m3 & 2 m3 (3 nos.)	Package specific Air-receiver of 5 m3 capacity shall be provided for IA distribution for various uses of power house areas, however Package specific Air-receiver of 2 m3 capacity (2 nos.) are not envisaged, as the quantity of Instrument air as required for Fuel Oil Heaters & its Pump house and Mill reject Handling system are very less and the same shall be provided from the above unit receiver. Pl.confirm.	Bid specification prevail
35	Vol.-VII-A2	Drg. No. PE-189-PF-214 Issue- P2	Service Air -Receiver (Package specific air-receivers) of 5 m3, 2 m3 (1 no. each).	As the service Air requirement is intermittent and very less in quantity, hence Package specific Air-receiver of 5 m3 & 2 m3 capacity, are not envisaged, however the total service air requirements shall be taken care from the main service air system. Pl.confirm.	Bid specification prevail

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III H

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
6		5.4.6 & 7.10.1.1 © & 7.10.2.2	Main fire detection and alarm panels in CCR, local fire alarm panels and repeater fire alarm panel in fire station shall be integrated through dual redundant optical fibre data highway connection in ring main topology. And Number of Local fire alarm panels shall be as required and as finalised during detailed engineering. And Microprocessor based fire detection and alarm panels in CCR, AHP, CHP, Fuel oil area, WTP, ESP.	Please clarify the number of fire detection and alarm panels to be integrated through dual redundant optical fibre data highway connection in ring main topology.	Specification is self explanatory
7		Notes 2 and 3	Fuel oil area	We understand that the fuel oil area referred here is the fuel oil day tank area of the proposed 660 MW plant. For existing fuel oil area, the Bidder need not consider any hydrant or monitor. Please confirm.	Bid specification prevails
8		3.8	Specification calls for Rate of rise cum fixed temperature heat detectors shall be used for Boiler burner fronts & turbine oil tanks. Heat detectors shall be analogue addressable type.	We propose to provide QBD for turbine oil tank fire protection. Please confirm.	Confirmed
9		3.12.5	NFPA/BS guideline/codes shall be followed for fire alarm system.	In addition to the mentioned codes, we propose to include the IS Code also.	Confirmed

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III H

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
10	1	3.12.7	The Cable Spreader Room and Cable Vault shall be divided into a smaller risk zones. These zones shall be separated by 120 minutes rating fire barrier walls.	We have not envisaged fire barriers within the cable vault for separation of zones.	Bid specification prevails
11		3.22	Inert gas system: Specification calls for inert gas system distribution through Deluge valve.	Deluge valve is not suitable for inert gas distribution system. Hence Bidder will propose the suitable valves. Please confirm.	During Detailed Engineering
12		5.1.22 7.6.18 Data sheet (Detectors)K.In fra red flame detector. Si.No 6	Specification calls for Dual wavelength Infrared flame detectors for boiler burner fronts and turbine oil tanks.	IR flame detector works on the radiation principle, if any welding activities performed in the boiler burner area during maintained time there will be a chances of giving false alarm, Hence Bidder will propose the QBD and ROR detector in boiler burner front and QBD in Turbine oil tanks.	Bid specification prevails
13		5.2.7	Design & construction of foundation of fire water steel storage tanks mentioned above	Since there are no separate steel storage tanks for Fire water. Fire water will be taken from raw water storage tank. Please confirm.	Confirmed

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III H

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
14		6.1.2 k)	Specification calls for For Coal Conveyors, the Medium Velocity Spray System (MVWS System) for each zone shall consist of fusible type sprinklers capable of fusing at fixed temperature mounted on a water pipe and shall cover both forward and return belts of conveyors including hoppers and feeders etc. as per TAC requirements for sprinkler system/NFPA codes.	We will consider Medium velocity spray nozzle for coal conveyer instead of fusible type sprinklers. However for the detection purpose, LHS cable and IR detector will be provided as per specification.	Bid specification prevails
15		6.1.6 c)	Specification calls for Water velocity in Fire water pipes shall be as per TAC recommendation. However, Velocity of water through pipelines at pump suction and discharge shall be limited to 1.2 m/sec to 1.5 m/sec. and 2.1 m/sec to 2.5 m/sec respectively.	However velocity for the pipes in the ring main will be considered as per TAC.	Bid specification prevails
16		6.1.6 f)	Specification call for Cut-off gate valves shall be provided for fire ring main loop	We would like to propose the butterfly valve instead of gate valve as per TAC Cl.No 7.5.11 Note 3) for ring main loop	To be taken up during detailing.
17		6.2.3	Specification calls for Satellite Fire Alarm panels shall be strategically located in different areas of the Power Plant considering zone-wise detection.	All the areas will be covered under the fire alarm panels, hence there is no requirement of satellite fire alarm panel.	Agreed.
18		7.10.2.2	Specification calls for Microprocessor based Fire Detection and Alarm Panels in CCR, AHP, CHP, Fuel Oil Area, WTP, ESP.	Number of fire alarm panels is not clear. We will provide the fire alarm panel in CHP & Main control room building and one repeater fire alarm panel in Fire station building.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - III H

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
19		7.12. B)	Specification calls for Drive Unit Power rating for the fire water pumps shall be selected such that it is equal to higher of the two conditions (i) 110% of the duty point power requirement. (ii) Motor input power required at 150% of the duty point capacity of pump.	Si.No ii) will be renamed as motor input power required at 150 % of rated capacity at a head of not less than 65 % of the rated head a per TAC.	Bid specification prevails
20		Data sheet (Detectors)K.In fra red detector Si.No 5	IR detector areas	Infra red detectors has not been mentioned in the data sheet, However the same will be considered in Coal conveyer areas.	Agreed.
21	1	Volume - III- C/5.12.2 Page - 61 of 245	The degree of protection of panel including transformer and rectifier unit shall be IP 62. In case the above degree of protection is not achieved for transformer & rectifier unit, then the transformer & rectifier unit shall be placed in SWGR/MCC room with IP-42 degree of protection.	It is not practically possible to achieve IP-62 degree of protection for transformer and rectifier enclosure as it requires constant ventilation. Hence we are left with the option of locating the rectifier and transformer at MCC/switchgear room. We propose to use a single panel for each ILMS which shall be located near ILMS equipment to reduce DC cables. Kindly confirm.	Specification is self explanatory
22		Corrigendum-I/Sr. No. 3	To be added: 5.1.32 Transformers of 220 KVA and above shall be Provided with Nitrogen Injection based Fire Protection System in addition to HVW Spray system.	As per standard industrial practice Transformer of above 220 MVA shall be provided with Nitrogen Injection based Fire Protection System in addition to HVW Spray system. Please confirm.	Nitrogen Injection based Fire Protection system shall be provided to Generator transformer, Station transformer and Unit Aux. Transformer (in addition to HVW Spray system.)

12	1	2.1.1	EHV connection for Generator transformers and station transformers at Bus Post Insulator (BPI) shall be done by switchyard contractor. Balance connection from Bus Post Insulator (BPI) to LA and then LA to bushing of Generator Transformers and Station Transformer's bushing shall be arranged by power plant EPC contractor. The connector for drop conductor to BPI shall also be arranged by power plant EPC contractor. Supply of conductor and stringing of over head conductors from Power House wall to nearest intermediate gantry of 400 kV and intermediate gantry to 400 kV switchyard gantry will be done by switchyard contractor. All 330 kV Lightning Arrestors and 400kV Bus Post Insulators including connector, intermediate gantries will be supplied & Installed including Civil foundation under this power plant EPC package. Provision of hooking arrangement at A-axis wall shall be in power plant EPC package. Installation of 330 kV LA, 400kV BPI, 400kV intermediate gantry including civil foundation, grounding etc will be under the scope of power plant EPC Bidder.	Bidder requests client to exclude High Voltage Switchyard electrical items & Structures (Towers & Gentries) from EPC Contractor's scope. In Bidder's point of view, only Civil Foundations may be retained in EPC Contractor's Scope.	Bid specification prevails.
13	1	2.1.1	Terminal Point :- All 330kV Lightning Arrestors & 400kV Bus Post Insulators including connector, intermediate gantries will be supplied & installed including Civil foundation under this power plant EPC package. Provision of hooking arrangement at A-axis wall shall be in power plant EPC package.	Our scope limited to HV Bushing of GT & ST. Supply & installation of 330kV Lightning Arrestors & 400kV Bus Post Insulators including connector, intermediate gantries & Provision of hooking arrangement at A-axis wall are excluded.	Bid specification prevails.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project**Pre - Bid Queries****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-A**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
14	Sec-1	2.1.1	EHV connection for GT and ST at BPI shall be done by switchyard contactor. Balance connection from BPI to LA and LA to bushing of GT and ST bushing shall be arranged by Plant EPC contractor. The connector for drop conductors to BPI shall also be arranged by EPC contractor. All 330kV LA and 400kV BPI including connector, intermediate gantries will be supplied and installed including civil foundation under this Power Plant EPC package.	Balance connection from BPI to LA and LA to bushing of GT and ST bushing shall be arranged by switchyard contactor as a standard practice for power evacuation system. The connector for drop conductors to BPI and all 330kV LA and 400kV BPI including connector, intermediate gantries will be supplied & installed including civil foundation by switchyard contactor as a standard practice for power evacuation system. Being a small scope this can be included in switchyard contractor scope. Pl.confirm.	Bid specification prevails.
15	Vol-IVA, Section-1	Cl. No 2.1.1, Page no 19 of 440	Intermediate 400kV Gantry	As EPC terminal point is connectors from the string line to connect the transformer bushing through BPI and LA hence the intermediate gantry (if required) shall be excluded from scope. Please confirm.	Bid specification prevails
16	1	2.1.2	The transformer yard in front of power house shall include supply and installation of all transformers, busducts, LA, BPI etc.	Bidder's understanding is that LA & BPI are part of 400kV switchyard package and need not be considered in the scope of bidder. Please confirm.	Bid specification prevails

20	1	2.1.2.f.ii	"Providing necessary out going feeders as specified in Section I of Volume IV-A"	We could not find any specific usage requirement for Owner/others. In absence of anything specific, we are not considering any feeder other than that required for our purposes (including contractual spares).	1. Key SLD showing 11 kV feeders, 2 nos. for switchyard. 2. Further LT spare feeder requirement would be decided during detailed engineering.
21	Sec-1	2.1.2 (e) and Ann.-D sr. no. 3.0	Complete cabling work..... Power Plant EPC vendor shall also provide required no. of cable trays for laying HT Cable, LT Power and Control and all other cables for interfacing with 400kV Switchyard	Required no. of Cable Trays and Cabling material(excluding Cables) from Switchyard fencing and upto Switchyard control Room/ MB and switchyard equipment will be in switchyard contractor scope. Pl.confirm.	Refer Corrigendum (II) Annex.D,Table-1
	1	2.1.2.e	Complete cabling work including inter connection between 400kV switchyard and respective control room required for interfacing with power plant and 400kV switchyard. Power plant EPC vendor shall also provide required number of cable trays for laying HT cable, LT power and control & all other cables for interfacing with 400kV switchyard. (Ref:Annexure-D)	The scope of interconnecting cable shall be between equipment where at least one end of equipment is supplied by bidder.	Refer Corrigendum (II) Annex.D,Table-1
22	1	2.1.2 (f) iii	Feeders for chimney, NDCT etc.	Please clarify whether bidder may optimize the allocation / source according to layout requirements.	Bid specification prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
23	1	0	Power Plant grounding grid is to be interconnected with existing 500 MW unit grounding grid at 4 locations. This is in scope of power plant EPC vendor.	Bidder requests Customer to indicate the Co-Ordinates of the InterConnection Points of Earth Grid in Plot Plan for Bidder's Estimation.	Interconnections to be spaced equally from transformer yard to chimney. Refer dwg.PE-189-GA-101. Interconnections shall be starting from side adjacent to existing plant earth grid. Whatever civil work required for inter connection with existing 500 MW plant grid shall be in EPC contractor scope. Refer Corrigendum (II) , vol.IV-A
24	1	2.1.2.f.v	Power Plant grounding grid is to be interconnected with existing 500 MW unit grounding grid at 4 locations. This is in scope of power plant EPC vendor.	We are considering four point connection with existing plant grid. For optimization of earthing system, we propose to consider the existing earthgrid/mat while computing the earth grid for proposed plant . If required, number of interconnections shall be increased to six in order to avail the benefit.	Proposal of bidder is not acceptable. specification prevails. Earth grid for new plant to be designed independently.
25	1	3	RANGE OF VARIATION	As per CERC Grid Code Regulation No. L-1/18/2010-CERC dated 28-04-2010 and CEA Grid Standards 2010 the Voltage Variation of 400kV Grid is +/-5% i.e. 380kV to 420kV, Frequency Variation is 49.2Hz to 50.3Hz. Bidder requests Client to verify and revise these values accordingly. The highest voltage for 400kV system is 420kV and major equipment designs will not conform to a voltage of 440kV(400kV +10%). Similarly Voltage Variation at Generator Terminals is +/-5% and it would be outside P-Q capability of Generator to meet the voltage variation of +/- 10%.	Specification prevails. Annex.A, Cl.3 is not for generator voltage or grid voltage.
26	1	3.1.1	The bidder shall submit the copies of the English version of all relevant standards during detailed Engineering.	Making copies of IS, IEC & IEEE is not legally permitted.	Refer Corrigendum-II, vol.IV-A

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
67	1	8.0	Bidder shall submit manual calculations along with ETAP calculation in support of electrical system study	Only ETAP system study will be done & manual calculations will not be submitted	Refer above point No.8
68	1	8.1	VOLTAGE REGULATION Condition Permissible voltage at motor terminal in percent of rated voltage (a) BFP Starting 75% (b) CWP Starting 80% (c) Coal mill 85%	Bidder requests client to specify the kW Rating of Motors instead of Service Designation to determine the Voltage Regulation at Starting for all motors. As Bidder is responsible for Overall Design, being an EPC Contractor, Bidder proposes the following Criteria of Voltage Regulation: Above 200kW to 1000kW - 85% Above 1000kW to 4000kW - 80% Above 4000kW - 75%	Bid specification prevails
69	1	10.1	In line with the present-day practice unitized control of the electrical system /equipment has been envisaged for the plant.	It may not be possible to maintain in all cases because of involvement of different sub vendors for packages.	Unitised control envisaged for only main plant. Refer Corrigendum (II),vol.IV-A.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project**Pre - Bid Queries****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-A**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
70	1	10.9	One Back up electrical control panel (ECP) each the unit shall also be provided in the respective control room. The back-up control panel shall be stand-alone in mosaic grid configuration consisting of Generator manual synchronizing equipments and excitation control, metering equipment, breaker control switches for GTs, 11kV, 3.3 kV & 415V Unit/station switchgear incomers, tie and outgoing non-motor feeder breakers, synchronizing selector switches, Auto-Manual, Remote-Local and other selector switches as required along with annunciation windows, indications and mimic diagram (from 400kV level to 415V level). Cooler control for Generator Transformers, Unit Auxiliary transformer, Station auxiliary transformer, Cooler control & Tap changer control for Station transformers and Unit Transformers in Remote-Manual mode shall also be provided in the Back-up Control Panel. DG shall be ON/OFF control from DDCMIS/ EDMS as well as Electrical control panel. Number of non trip and trip annunciation facia shall also be provided. All the switches and other equipments on the panel shall be suitable for mosaic titles.	Bidder requests client to exclude Back-Up Control Panel(ECP) as these increases the Control elements and reduces effective Controllability & Reliability of the System with increased Control Location elections, Cable Terminations etc. For neat and optimised Layout and ease in Erection, Operation & Maintenance Complete Control through DCS is much superior. However for Electrical Control and Synchronisation of Generator and Generator Transformer, Bidder proposes a separate Bay Control Unit with necessary Hardware, Indications, Annunciations etc.	Bid Specification prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
71	1	10.9	One Back up The back-up control panel shall be stand-alone in mosaic grid configuration consisting of Generator manual synchronizing equipment and excitation control, metering equipment, breaker control switches for GTs, 11kV, 3.3 kV & 415V Unit/station switchgear incomers, tie and outgoing non-motor feeder breakers,.....	Generator control panel shall be provided in addition to the backup control panel which shall house generator controls, metering etc.	confirmed.
72	1	10.13	In case of internal faults in the generator transformer/generator/unit transformer both turbine and generator will automatically trip. For faults external to the generator and transformer, the generator breaker will open and the turbine, generator shall operated on house load.	Bidder requests client to add GCB as an option. In such Case Faults in the generator will lead to tripping of GCB, Generator & Turbine while Generator & Unit Transformer will remain switched on through 400kV GT CB and vice versa.	Bid specification prevails
73	1	10.13	There shall also have facility to change over from station to station board as well as unit to station change with BTS Scheme.	Bidder proposes redundancy in Station System by Distribution in which Change over from Station Board to Station Board is not required. Also the BTS scheme is applicable for 11kV only. All other voltages shall have loss of voltage dead bus transfer built in Switchgears.	Bid specification prevails
74	1	12.0-c	This will be achieved by providing lightning masts on stacks, cooling towers, power house building, towers in switchyard, flood light towers etc. and connecting these with ground grid.	We have not envisaged lightning mast provision in switchyard as it is not in our scope of work.	Refer Corrigendum (II),vol.IV-A.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

87	2	1.1	21 / 420/ 3 kV, 1 phase, 275 MVA Generator Transformer: 4 nos. (3 nos. + 1no. Spare). All the transformers shall be provided with OCTC, cooling arrangements, fittings, accessories & all metering and protection devices etc. MVA rating of generator transformer, as indicated above, shall be considered as the minimum requirement for the project. Generator transformer offered by the bidder shall be sized according to the clause no. 3.0 of this section & higher rating shall be provided if required by sizing calculations.	As per current Logistics inside the factory and upto site it is possible to manufacture and transport three(3) phase Generator Transformer. Three(3) phase transformers are much more reliable, reduces complexity of Connections, reduces Auxiliary Power Consumption, occupies less space in Layout. (1) Bidder requests Customer to allow Three(3) phase Generator Transformer - One No. without any Spare as an option. (2) Bidder may be allowed to decide the MVA rating of the transformer as per Bidder's. 275MVA GT is not required as Aux Power Consumption must be deducted.	3ph GT is not acceptable, Bid Specification prevails
88	2	1.1	21 / 420/ 3 kV, 1 phase, 275 MVA Generator Transformer: 4 nos. (3 nos. + 1 no. Spare).	Bidder agrees to provide One (1) No. spare single phase generator transformer without radiator bank.	Bid Specification prevails
89	2	1.1	21/ 420/V3kV Single phase, 275MVA transformer, 4Nos. (3Nos.+1)	As per the Key SLD for Electrical System (PE-189-EL-501), three phase 825MVA Generator transformer is also acceptable. In case 3phase 825MVA transformer is considered, what is the standby requirement? The LV voltage of the Generator Transformer shall depend on the Generator Terminal voltage.	3ph GT is not acceptable, Bid Specification prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
90	2	3.2	GT shall be suitable to meet the Generator power rating of 660MW at 0.85 power factor lag without deducting the unit auxiliary power, excitation power or any other power. GT shall be sized with 10% design margin	Please refer to the clarification regarding Generator rating in Vol. III-B and clarify whether GT is to be sized for 693MW at 0.85 pf continuous. Bidder requests client to allow deduction due to Aux Power Consumption as this leads to correct sizing of Generator Transformer with respect to Voltage Regulation, Short Circuit Impedance etc.	Refer Corrigendum (II),vol.IV-A.
91	2	3.2	GT shall be suitable to meet the Generator power rating of 660MW at 0.85 power factor lag without deducting the unit auxiliary power, excitation power or any other power. GT shall be sized with 10% design margin.	We do not envisaged 10% design margin for GT sizing. Please confirm.	Refer Corrigendum (II),vol.IV-A.
92	2	3.3.4 3.5	The transformer shall be capable of operation at its rated kVA on any tap provided the voltage does not vary by more than $\pm 10\%$ of the rated voltage corresponding to the tap. The transformer shall be capable of continuous operation at rated output under the following condition: (a) Voltage variation : $\pm 10\%$ (b) Frequency variation : $\pm 5\%$ (c) Combined voltage and frequency : $\pm 10\%$ (absolute sum)	Please refer to Sl. No.20 above, Voltage variation shall be $\pm 5\%$ Also Frequency Variation is 49.2Hz to 50.3Hz.	Bid Specification prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project Pre - Bid Queries Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-A					
Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
93	2	3.5 3.7 & data sheet-A, 1.1	The transformer shall be capable of continuous operation at rated output under the following condition: (a) Voltage variation : $\pm 10\%$	As per Section 1, Annexure B, Cl.1.4, maximum voltage at 400kV is 420kV. Also, generator is suitable for 5% voltage variation. Hence, voltage variation shall be $\pm 5\%$.	Bid Specification prevails
94	2	5.31	Tap-changing gear complete with tap position indicator, operation counter etc. For OLTC gear (where specified), oil surge relay (OSL) with shut-off valve, Local control cabinet and tap changer control in ECP (RTCC) and also DDCMIS/DCS.	Bidder has considered OCTC generator transformer as per tender document and thus this clause is not applicable to GT.	Refer Corrigendum (II), vol.IV-A.
95	Sec -2	4.8.1 & Datasheet A-1.10.2	Each cooling unit shall be provided with two (2) nos. 50% capacity oil pumps and number of cooling fans. 2x50% or 6x20%	Clause 4.8.1 states about 2x 50 % radiator banks. However, clause 1.10.2 in Datasheet -A is not clear about it. We consider that 6x20% cooling configuration denotes coolers and not radiators. Kindly confirm	Refer Corrigendum (II), vol.IV-A.
96	Sec -2	4.9.2	Control panels shall be of CRCA sheet steel construction with protection class of IPW-55 for outdoor installation.	Control panels shall be of HRCA sheet steel construction may please be accepted.	Bid specification prevails
97	Vol-IVA, Section-2	Cl. No 6.1,6.2 and 6.3, Page no 106 of 440	Type test and special tests on GSUT	Valid type test and special test reports on similar rating equipment shall be furnished for approval hence no type tests/special test are considered in the offer. Please confirm.	Bid specification prevails
98	2,4,5 & 13	6.1 6.1 6.1 5.4	During manufacture and on completion, all transformers shall be subjected to the routine tests in accordance with latest IEC 60076 and its different parts.	All routine tests shall be conducted as per IEC 60076/IS 2026/Equivalent. Owner is requested to kindly confirm.	Bid specification prevails

159	6	3.5(b) DataSheet-A	SPBD	Material of enclosure shall be Al alloy grade-31000 & material for conductor shall be Al alloy grade-63401.	Refer Corrigendum (II), vol.IV-A.
160	7	1.1 & 1.2	Scope of Supply :- Minimum 10 number of 11kV Switchgears & Minimum 6 number of 3.3kV Switchgears	Kindly refer Sl. No. 1.0 & 3.0 above	Refer Corrigendum (II), vol.IV-A.
161	Vol-IVA, Section-7	Cl. No 3.1.1, Page no 253 of 440	The continuous rating of the 11/3.3kV switchgear buses and incomer breaker shall be based on the rated LV winding current of the transformer with 20% margin rounded off to the next higher standard rating.	15% margin already included in the transformer sizing and rounded off to the next higher standard rating hence the continuous rating of the 11/3.3kV switchgear buses and incomer breaker shall be based on the rated LV winding current of the transformer . Please confirm.	Bid Specification prevails.
162	Vol-IVA, Section-7	Cl. No 3.1.1, Page no 253 of 440	The continuous rating of the feeders shall be based on name plate current rating of the connected equipment with 20% margin rounded off.	The continuous rating of the feeders shall be based on name plate current rating of the connected equipment . Please confirm.	Bid Specification prevails.
163	7	3.9	Surge arrestor	LA will be suitable for 2.2pu.Please confirm the acceptance.	Bid specification prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-A

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
164	7	3.10	A margin of 5% over the short circuit current shall be applied and rounded off to the next higher standard ratings and this value shall be adopted for the breakers and switchgears.	Bidder's understanding is that the system fault level for the medium voltage is already defined (44kA for 11kV and 40kA for 3.3kV). Based on this system fault rating the circuit breaker short circuit rating shall be selected.	Bid specification prevails, minimum rating of the selection shall be as per bid specification.
165	7	3.11	The continuous rating of the 11/3.3kV switchgear buses and incomer breaker shall be based on the rated LV winding current of the transformer with 20% margin rounded off to the next higher standard rating.	10% Margin shall be adequate and we propose to consider the same inline with that of power transformers.	Bid specification prevails
166	7	4.1.1	Forced Cooling for HT Breakers (11kV & 3.3kV) & HT Switchgear is not acceptable. The nameplate rating of the Breakers and all the switchgear components shall confirm to the rating in closed cubicle of the switchgear.	Fan cooling may be required only for Station Incoming panel where the requirement is 3150A at 50 deg C.	Bid specification prevails
167	7	4.1.3	The switchgear enclosure shall conform to the degree of protection IP- 4X. The minimum thickness of CRCA sheet steel used shall be 2 mm.	We may propose Cubicle made up of riveted sheets of Alu-Zinc instead of CRCA except for front doors and end covers. Used by leading manufacturers, AluZinc is a light weight metal with increased strength and is extremely resistant to corrosion as compared to CRCA.	Refer Corrigendum (II), vol.IV-A.
168	7	4.1.6	Circuit breakers, instrument transformers, bus bars, cable compartment etc., shall be housed in separate compartments within the cubicle.	We shall consider common compartment for Cable and CT housing in HT switchgears.	Confirmed

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project**Pre - Bid Queries****Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-A**

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
169	7	4.2.1	Temperature rise	We propose temp Rise shall be as per IEC-62271-100/200 and the busbars will be Aluminium maintaining the same temp rise as per above IEC	Bid specification prevails
170	7	4.2.2	Copper busbars shall be used for bus bar current rating above 2000A, with maximum temperature rise limits same as that for aluminium bus bar.	We propose busbar & connections shall be made of Aluminium up to current rating of 3150A. However for higher current rating Busbar shall be of either Aluminium or Copper .	Bid specification prevails
171	7	4.5.2.d 5.10.3.c & d	CT accuracy 0.2S	As per CEA amendment, accuracy class of meters shall not be inferior to 1.0S accuracy class. Also, as per original CEA notification, accuracy class of CTs and VTs shall not be inferior to that of the associated meters. Hence, as per CEA notification / amendment, Class 1.0S instrument transformers and meters shall be provided. Further, since Class 1.0S CT is not defined by IS 2705 Part 2, Class 1.0 CT shall be provided. Accordingly, Class 1.0 meter shall be provided. Also note that 0.2S class CTs for smaller ratios are not available.	Refer Corrigendum (II), vol.IV-A.

1	1	1.4 Data Sheet-A:	Rated Frequency and allowable Variation - 50Hz±3%	We shall consider 50Hz±5% as mentioned in Vol IV A Section 1, page 58 of 440, Annexure A, Clause no. 3.1.b. Please confirm.	Confirmed
2	1	Data sheet - A, 2.7	Data sheet - A Temp rise	We propose the temperature rise of resistor element shall be as per IEEE 82.	Bid Specification prevails
3	2, 6 & 13	1. 3.1.4 1.22	MVA rating of the transformer, ... Transformer offered by the bidder shall be sized according to the maximum demand considering additional running of one largest standby motor with driven equipment, ...	Stand by motor loading shall be considered only when process allows the same for normal working condition of the plant. When, standby motor will be considered for transformer sizing, maximum 70% loading of stand by motor shall be considered.	Confirmed
4	2	2.1.1	For 240V AC supply :	"CBIP Manual on Transformers" shall also be referred in addition to the standards listed in the specification & the offered transformer shall be as per manufacturer standards also.	Bid Specification prevails
5	2	3.1.4	15% margin shall be considered while calculating the total load on transformer	10% of design margin over maximum consumed power shall be considered.	Bid Specification prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
6	2	3.1.4	All anticipated future loads in or around the load centres shall be taken into consideration while finalising size of L.T. Transformers.	In the absence of data on future requirements, we have not sized the transformers for future load requirements. Also We confirm that, the transformer sizing calculations will be done considering the approved mechanical load list & the same will be submitted for Owner's approval during detail engineering. Hence no other additional margin shall be considered.	Design margin takes care of future loads.
7	2	3.8	REF & Standby protection CT's shall be provided on transformer.	As we have proposed that SEF is adequate for LT Service transformer and REF shall not be envisaged, Current Transformer for SEF shall be provided.	Bid Specification prevails
8	2	4.12.3	The interior surface shall be finished with..... RAL 7032	Same Interior and exterior colour shade RAL 7032 shall also be permitted. Please confirm	Confirmed
9	Vol-IVB, Section-2	Cl. No 5.2, Page no 33 of 457	Type tests on dry type transformers	Valid type test report on similar rating equipment shall be furnished for approval hence no type tests are considered in the offer. Please confirm.	Bid Specification prevails
10	3	2.1.1	Additional Battery & Battery Charger if required shall be provided	If required, DC load requirement for other areas shall be distributed thro' DCFBs & the same shall be fed from nearest DCDBs	Bid Specification prevails. However, total DC requirements of the system should be fulfilled by the bidder.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
11	3 & 10B	2.1.1 & 3.2.1	2.2.1: (a) 220V battery sets (Plante) 3.2.1: Battery shall be Lead -Acid Plante type.	We propose to use Plante or Ni Cd batteries. Firstly, the approved vendor list allows for vendors of Ni Cd. Plante would be very specific to a vendor and would defy the logic of an EPC route for project execution. Secondly, 172 cells is indicated in Battery charger diagrammatic scheme which implies the provision of NiCd battery. Thirdly, the use of mild steel racks is indicated in Vol.V, Section 10B, which is applicable for NiCd batteries. Also, NiCd batteries are being executed in running Owner projects.	Bid specification prevails, Cl.3.2.1 stands as valid.
12	3	4.1.3	Design margin	We shall consider 10% design margin as recommended by IEEE and temperature correction factor as per manufacturer's recommendation.	Bid Specification prevails. However, total DC requirements of the system should be fulfilled by the bidder.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume-IV-B

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Resolution
13	3	4.1.3	The procedure for estimating battery capacities shall be as per guidelines stipulated in latest revision of IEEE Std. 485 for Lead acid Battery. Derating factor for prolonged float charging shall be duly taken into account, as applicable, in estimating battery capacity. While estimating battery capacities, aging margin as per relevant standard, temperature correction factor as per manufacturer's standard and a design margin of 20% shall be considered.	We propose to consider the ageing factor shall be as per IEEE-485, however, temperature correction factor shall be as per manufacturer's recommendation.	Bid Specification prevails
14	3	4.2.7	If float charger fails, it will be annunciated in the control room and stand-by float charger of the float cum boost charger will have to cut into the circuit automatically by double pole double throw switch to take over the function of float charger.	As per Cl.no. 4.2.4.b of the same specification, the float-cum-boost charger will be normally in standby mode (Auto float/charge) and will cut into the circuit automatically to take over the functions of a float charger in case of its failure. Same is contradicted in Cl.4.2.7. We have considered design as per Cl. No. 4.2.4.b	Confirmed
15	Vol-IVB, Section-3	Cl. No 6.1.1, Page no 63 of 457	Type tests on Battery and charger	Valid type test report on similar rating equipment shall be furnished for approval hence no type tests are considered in the offer. Please confirm.	Bid Specification prevails

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume V

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
10	1	4.13	In general, for temperature measurements up to 300°C, Platinum resistance temperature detectors shall be used unless the area is prone to vibration. For temperature measurement above 300°C up to 750°C, Chromel-Alumel (K) type thermocouple shall be used. For high temperature applications, noble-metal thermocouple (TC) such as Pt Rh Pt (R) type in Inconel sheathed thermowell shall be used.	For temperature measurement above 300°C only K-type T/C will be provided in Boiler and Turbine applications as per OEM's standard practice.	Specification prevails
11	1	4.15	In general, temperature transmitters shall not be used. Instead, temperature elements shall be directly connected to their respective input modules. For non-critical measurement applications (such as measurements for Boiler metal temperature and Generator winding temperature) where the measurements are not used for control/protection, Sensors may be grouped and connected to I/O modules in DCS.	Application of Temperature Transmitter in critical and non-critical temperature measurements will be as per standard & proven practice and grouping of temperature transmitters will be done in local JB's during detailed engineering.	Specification prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume V

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
12	1	4.15	In general, temperature transmitters shall not be used. Instead, temperature elements shall be directly connected to their respective input modules. For non-critical measurement applications (such as measurements for Boiler metal temperature and Generator winding temperature) where the measurements are not used for control/protection, Sensors may be grouped and connected to I/O modules in DCS.	Now days reliable temperature transmitters are available which can be used for monitoring and interlock function. This will eliminate requirement of special cables and cards at DCS end. Hence, temperature transmitters shall be used instead of connecting temperature elements directly to their respective input modules. However, in boiler area temperature elements will be directly connected except for some equipment like pulverizer lube oil / hydraulic oil, RAPH system etc. where temperature transmitters shall be used as per OEM's standard practice.	Specification prevails
13	1	4.16	In general, temperature switching function shall be configured by use of temperature elements and software configured limit value monitors instead of using conventional field mounted temperature switch.	In some equipment temperature switches shall be used as per OEM's standard practice.	Specification prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Bid Specification No. DG/BSL U-6/2011/T-1 Volume V

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
46	3A	2.11	Acoustic pyrometer type flue gas temperature measurement shall be provided to determine the average and complete temperature profile at different sections of furnace such as economizer, furnace exit zone etc. System shall be complete with required transmitters & receivers located in different zones, air purging system, monitoring terminal with required hardware, software & colour 24" TFT monitor and colour laser printer etc. The system shall be able to eliminate the effect of varying noise to obtain a high accuracy of measurement. Range shall be adequate to cover boiler operation during all regimes. Accuracy of measurement shall be better than 2%.	As per OEM standard, acoustic pyrometer shall not be provided. FEGT probe shall be used.	Specification Prevails
47	3A	2.22	Continuous air purge connections shall be provided for pressure, differential pressure and flow instruments on flue gas, flue gas/air and coal /air lines to avoid clogging.	Continuous Purging shall be considered for Flue gas pressure measurements with positive pressure where applicable and coal mill applications,. For other instruments in dusty medium, intermittent purging shall be provided.	Specification Prevails
48	3A	3.7	Complete BMS logic configuration, loading and documentation shall be permissible from common DCS engineering station.	BMS shall be proprietary control system provided by OEM, hence complete BMS logic configuration, loading and documentation permissible from common DCS shall not be recommended by OEM.	Specification Prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume V

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
49	3A	3.10.1(ix)	FMS/Flame detector testing kit.	No FMS/Flame detector testing kit is envisaged by OEM.	specification prevails
50	3A	6.4.1	O2 in Flue gas path....	O2 analyzer is the integral part of boiler. Same shall be supplied as per Boiler OEM standard practice	specification prevails
51	3A	9	Flue gas velocity measurement & Ultrasonic mass flow meter.	Please clarify, whether flue gas velocity and mass flow meter shall be two separate instruments. We understand that there shall be one instrument to measure the flue gas flow through stack. Owner to confirm our understanding.	Velocity as well as Mass Flow Measurement is required
52	3A	9	Bidder may include an air-conditioned analyzer shelter to accommodate all above analyzers and accessories & the Data acquisition station with an UPS. The optical fibre cables to the control room shall be included.	We will consider in-situ type CEMS analyzers. Hence, we understand that an air-conditioned shelter is not required and the CEMS data acquisition station may be located in the unit control room. Please Confirm.	Specification prevails.
53	3A	10	Ambient Air Quality Monitoring System	Bidder will provide AAQMS having the continuous sensor for Sox, Nox, PM10, PM2.5, CO, CO2, Ozone & Benzene only. No online measuring sensors available for the Lead (Pb), Benzo (a) Pyrene, Arsenic (As) & Nickel (Ni). These can be measured by digesting filter paper of HVS and analysis by AAS/ GC	Refer the CORRIGENDUM-II TO BID SPECIFICATION VOLUME - V CONTROL & INSTRUMENTATION Sr No 8.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume V

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
54	3A	10.4	AAQMS shall include monitoring of the following pollutant gases/parameters. (h) Lead (Pb) (i) Ammonia (NH ₃) (j) Benzene (C ₆ H ₆) (k) Benzo (a) pyrene (l) Arsenic (As) (m) Nickel (Ni)	We will not consider monitoring of these parameters in AAQMS package as their concentration in power plant surroundings is negligible. Also, we understand that online measurement of these parameters is not possible. Please review the requirement.	Specification Prevails
55	3A	10.5	AAQMS Total three (3) no's such stations shall be provided at the minimum	Please specify the exact quantity required.	Three (3) nos.
56	3A	10.5	However, during the contract implementation stage, if additional number of such monitoring locations and hence AAQMS Stations are required as per regulatory agencies requirement then the same shall be provided by the Vendor at no extra cost implication to Owner.	We have considered three (3) set of AAQMS stations and one (1) set of Meteorological Monitoring System (MMS) as specified in Tender specification. Any increase in the no. of stations will have cost implications.	Meteorological Monitoring System (MMS) not in bidder scope. Details of existing Meteorological Monitoring System shall be provided.
57	3A	10.8 (k)	Facility to interface existing plant AAQMS shall be envisaged.	Please elaborate the type of interfacing to be envisaged.	Existing AAQMS Central Monitoring system to be interfaced with the new system.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume V

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
58	3A	10.9	Technical Specification of AAQMS Equipment & Metrological sensors	We presume that one (1) set of Meteorological Monitoring System (MMS) is to be provided for monitoring of wind speed, wind direction, ambient temperature, ambient pressure, relative humidity and rain gauge. Please confirm.	Refer the CORRIGENDUM-II TO BID SPECIFICATION VOLUME - V CONTROL & INSTRUMENTATION Sr No 10.
59	3B		CONTROL & INSTRUMENTATION FOR STEAM TURBINE GENERATOR, AUXILIARIES & FEED CYCLE EQUIPMENTS	1. TG integral control system like Electro Hydraulic Governor (EHG) control, Automatic Turbine Run up System, Turbine Testing, Turbine Stress Evaluator, turning gear, Turbine Protective Trip System, Turbine Supervisory Instruments etc. shall be as per OEM's standard. Controller family of these control systems may be different from plant DCS. 2. Controls in regenerative cycle such as HP-LP bypass steam system, feed water system, condensate system, drain & vent system, heater drain system, cooling water system, pressure reducing & de-superheating system, generator auxiliaries etc. including their protection & control shall be configured in DCS Owner to note and confirm.	1) TG Integral Control System shall be DCS based. 2) Confirmed.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume V

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
60	3B	2.1	Turbine protection shall be based on triple modular redundant configuration in hardware & software meeting NFPA requirement. Configuration shall be realized with three independent trip channels.	Offered Turbine Protection is 2oo3 configuration, FireProtection is part of Turbine Protection scheme as per Bidder's standard and proven practice.	Refer the CORRIGENDUM-II TO BID SPECIFICATION VOLUME - V CONTROL & INSTRUMENTATION Sr No 11.
61	3B	2.1	Control system shall be designed meeting the criteria of high reliability and maintainability by incorporating fault tolerant hardware and software. Duplex control configuration is envisaged for Turbine EHG control and Generator mechanical protection. Duplex control configuration shall include redundant EHG valves position control modules for EHG. Two channels shall be installed in separate cabinets to avoid common failure.	Redundant Closed Loop Control for Steam Turbine will be provided as part of Integral Turbine Governing and Control System as per standard and proven practice. Accordingly separate cabinet for EHG valves position control modules in not applicable.	Specification Prevails
62	3B	2.1	Redundant EHG valve position control modules	EHG valve position control modules will be as per ALSTOM's standard proven validated practice for all the power plants globally. As per standard OEM practice, the control valve positioning module are distributed in such a way that failure of one module will result in only partial load reduction.Hence redundant EHG valve postion control modules are not envisaged.	Specification Prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume V

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
63	3B	2.1	Turbine Protection shall be based on Triple modular configuration.....	As Boiler Protection system, Burner Management System, Turbine protection system, Turbine Governing System are very much critical for the safety of the Boiler and Turbine hence OEM recommendations and implementation procedures as per their proven practice are normally followed. As per OEM proven practice - 1. Stand alone PLC based system with triple redundant controllers shall be provided for implementing Boiler protection system. 2. Burner Management System (BMS) shall be implemented in DCS. These functions shall be implemented in dedicated controllers of the DCS. 3. Stand alone PLC based system with double redundant controllers shall be provided for implementing Turbine protection system in FAIL SAFE DESIGN. 4. Turbine Governing control function shall be implemented in dedicated controllers of DCS. As per OEM practice all above loops are implemented in non SIL3 configuration.	Specification Prevails

118	10A	2.6.1	(j) For selecting Battery capacity following data to be considered : (iv) Ageing compensation factor: 1.25	Aging factor as 1 for plante battery as per IEEE and Manufacturer's recommendation may please be accepted.	Refer the CORRIGENDUM-II TO BID SPECIFICATION VOLUME - V CONTROL & INSTRUMENTATION Sr No 27.
119	10A	2.6.2. (a)	The UPS will consist of two physically separate sets of equipment streams each consisting of the following : (vi) One no. manual bypass switch	The manual bypass switch shall be provided in common bypass stream. Please confirm	Specification prevails

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume V

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
120	10A	3.9	(a) The UPS system components shall be housed in a sheet steel freestanding IP-52 enclosure with all access from the front.....	We are considering UPS enclosure with IP 41 and UPS DB with IP 52.	Specification prevails
121	10A	5.1.3	UPS Bill of Materials.	Since this is an EPC offer, BOM will not be applicable and hence need not be submitted.	Specification prevails
122	10A	Datasheet A (1.8)	Over load capacity	Please note that 300% for 4 msec shall be on Static Bypass mode as per manufacturer standard.	Specification prevails
123	10B	1.1, 5.1.4	24 V DC BATTERY & BATTERY CHARGER	Separate 24V DC system is not envisaged. 230 V AC UPS supply will be provided at one point at the panel for deriving of 24 V DC supply.	Specification prevails
124			General	We do not find any requirement of Attendance Monitoring System, we understand it is not in bidder's scope.	Attendance Monitoring System is not in bidder's scope.
125			General	We do not find any requirement of Wireless System, we understand it is not in bidder's scope. Please Confirm.	Wireless System is not in bidder's scope.

Bhusawal Thermal Power Station 1 x 660 MW Unit - 6 Project

Pre - Bid Queries

Bid Specification No. DG/BSL U-6/2011/T-1 Volume V

Sr. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
7	1	4.2	Uniformity of make and type of instruments and control components shall be followed throughout for rationalization of spares inventory, except for certain proprietary items where this requirement can not be met.	We shall try to maintain uniformity of hardware to the extent possible. However make of instruments and control systems shall be as per approved vendor list.	Confirmed.
8	1	4.4	Transmitters and electro-pneumatic positioners shall be SMART type. Each SMART equipment shall communicate in the form of analog signal 4-20 mA DC with superimposed digital signal having proven HART protocol to facilitate configuration, zero adjustment, calibration and diagnostic from remote location. All microprocessor based transmitters/analyser shall have the same type of protocol. Bidder shall provide separate HART management system along with PC and necessary software and hardware for remote calibration and diagnostic.	Transmitters supplied for Steam Turbine are HART compatible. Most of these transmitters are associated with the Protection of turbine. In view of safety and availability concern the feature of online monitoring by HART management is not allowed. Hand held HART calibrators can be used for local calibration and use of it shall be as per O&M manual.	Specification prevails
9	1	4.4	Bidder shall provide separate HART Management system alongwith PC and necessary software and hardware for remote calibration and diagnostic.	Hart management system can be integral part of DCS.	Specification prevails

26	1	3.3p	Service road along ash line	The drains along this service road will be earthen construction. Please confirm.	Refer Addendum II
27	1	3.3 (z)	HFO and LDO	As there is an interface with existing fuel oil pump house and fuel oil dyke , we request you to kindly provide with layout of fuel oil pump house and fuel oil dyke.	As there is no space available in existing pump house, new pump house shall be provided.
28	1	3.4	Scope of Work Watch tower	The number of watch towers which would be considered for this plant is five(5) in nos. Please confirm acceptance or please state the basis for deciding the number.	Watch towers to be placed at spacing of 250 mtrs (max) and at locations where the boundary wall changes direction and shall be placed around the periphery of the boundary wall.
29	1	3.4	Non plant buildings	Gate office with parking facilities & check post location are not shown in the plot plan, please provide the location & number of check post required.	Already shown in the Bid plot plan drawing (Rev P3) No. & location of check post will be decided as per functional requirement during detail engineering.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
30	1	3.4	Non plant buildings	Please clarify area required for service building, canteen, gate office, security office cum time office. Also please clarify number of watch towers required (or spacing along boundary).	For Service building refer Volume VI A section 4 clause no. 4.1 for other buildings refer plot plan & Bid specification Watch towers to be placed at spacing of 250 mtrs (max) and at locations where the boundary wall changes direction and shall be placed around the periphery of the boundary wall.
31	1	3.4	Watch tower	Please provide the no. of watch towers to be provided.	Watch towers to be placed at spacing of 250 mtrs (max) and at locations where the boundary wall changes direction and shall be placed around the periphery of the boundary wall.
32	1	3.4b	Contruction/fabrication yard	Please clarify if any permanent yard is required.	Self explanatory
33	1	3.4i	check post	Please clarify if this is part of the security office area.	No, however the number & location of check post will be decided as per functional requirement during detail engineering.
34	1	3.4m	Unloading platform	Please clarify location and specification for the same.	The no. & locations shall be as per functional requirement
35	1	3.10	"If space permits, slope (1:3) shall be provided between two different grade levels"	For better utilization of plot space and based on the soil type encountered (mostly rock), stable slope 1:2 or 1:1 may also be accepted. Under such circumstances, retaining wall shall not be provided. Please confirm.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
36	1	4.1	Power House building All floors except roofs of Turbine Hall will be cast-in-situ RCC over removable shuttering with hatchways as required.	Operating Floor and other floors may be concrete on metal deck. The slab design will be done without taking advantage of the decking sheet. Please confirm.	Bid specification prevails
	1	4.1	Power House building All floors except roofs of Turbine Hall will be cast-in-situ RCC over removable shuttering with hatchways as required.	Grating may be provided in mezzanine and other areas as required. Please confirm.	Bid specification prevails
38	1	4.1	CW channel Covered R.C.C. channel from Cooling Tower basin to CW Pump House shall be minimum 500 mm above F.G.L. and road-crossing portion shall be designed for Class 'AA' traffic.	Since trash rack, debris filter and OLTCs already in the CW system, thus we propose CW channel to be open at top. Please confirm.	Bid specification prevails
39	1	4.1	Two (2) E.O.T. Cranes (capacity shall be as specified elsewhere in this specification) will operate in the Turbine Hall for handling equipments. For rigging and positioning of the Turbo-Generator and condensers, building frame shall not be of any hindrance and temporary openings in the building claddings and cladding supporting structures shall be maintained till completion of the rigging and positioning of the condensers and TG.	Stand jack arrangement for stator lifting shall be provided. Tandem operation for stator lifting with 2 E.O.T cranes has not been envisaged. Please confirm.	Refer clarifications to queries in Volume II
40	1	4.2	Mill Buildings Floors shall be of cast-in-situ RCC over removable shuttering.	Concrete floors may be on metal deck. Please confirm.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
	1	4.2.2	Mill and bunker building	Side mill has been specified for the boiler. Typically in this arrangement, for similar boilers in the country separate staircase is not provided, access is from the boiler staircase. Please review.	Bid specification prevails
42	1	4.5a	Transfer houses/drive houses	In the transfer house or drive house cladding will be provided in areas where equipment is located and not for the entire height. Please review and confirm.	Bid specification prevails
43	1	4.5 (a)	Cladding for Transfer Points / Junction Towers	The side cladding will be provided for the junction tower upto floors where equipment is located from roof top. Remaining portion will not be cladded.	Bid specification prevails
44	1	4.5 (f)	Over boulder soling, 75 mm thick lean concrete (1:4:8) shall be spread. Final layer shall be minimum 150 mm thick RCC slab M20 with double layer reinforcement.	In our opinion the 75 mm lean concrete over the boulder soling is more than adequate. The additional 150 mm thick RCC slab of M-20 grade can be eliminated. Since the area of the stock pile is huge the cost of the RCC is very much on the higher side. Please confirm.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
45	1	4.5 (f)	Over boulder soling, 75 mm thick lean concrete (1:4:8) shall be spread. Final layer shall be minimum 150 mm thick RCC slab M20 with double layer reinforcement.	Please review the requirement for 150 mm thick RCC slab of M-20 grade in coal stockpile area.	Bid specification prevails
46	1	4.5 (h)	Design of Steel Structures	Steel structures shall be designed by working stress method as per the provisions of IS 800:1984.	Accepted
47	1	4.5 (k)	For design purpose the ground water table shall be considered at 1.00m depth below F.G.L.	As seen from the preliminary geotechnical investigation report water table varies from 4 m to 5.4 m. Hence for design purpose the ground water table shall be considered accordingly satisfying all design criteria. Please confirm.	Bid specification prevails
48	1	4.6.1 (a)	Flue shall be of M.S conforming to IS:2062,Gr -A.	As Grade-A material for plates is outdated, please confirm whether we can use Grade-Br, killed quality (E250) as per latest IS:2062-2006.	Bid specification prevails
49	1	4.6.1 (b)	Inside and outside surfaces of minishell	This clause is not applicable as we are considering stainless steel liner as per clause 4.6.1 b -vi.	Accepted
50	1	4.6.1 b, vii	Internal platforms/staircase	a) All structural steel of internal platforms and staircase will be coated with two coats of synthetic Enamel Paint.b) Handrails and gratings of platforms and staircase will be hot dip galvanized. Kindly confirm.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A**

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
51	1	4.6.1 b, xi, b	The concrete shell shall support all platforms, which in turn provide support for three independent liners.	This clause will be read as " The concrete shell shall support all platforms, which in turn provide support for one independent liner."	Accepted
52	1	4.6.1 b, xii	Thermal insulation	We are considering Rockwool insulation of density 100kg/cu.m for the thermal insulation of steel liners. Kindly confirm.	Bid specification prevails
53	1	4.6.1 ii & xi	Permissible stresses shall be as per IS:4998(part-1)-1975.	Please confirm whether allowable compressive stress in concrete shall be limited to 0.38 Fc or 0.32 Fc under DL+WL condition	Allowable compressive stress in concrete shall be limited to 0.32 Fc under DL+WL condition.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
54	1	4.6.1.8	Chimney Painting All structural steel works inside chimney such as internal platforms, stair case, ladders etc. excluding grating, flue, treads of stair shall be painted with 2 coats of zinc phosphate 2 pack epoxy primer, DFT 50 microns per coat, applied on dry surface cleaned by sand blasting & two coats of two pack Epoxy finish with micaceous iron oxide pigments having DFT 75 microns for each coat.	Generally sand blasting/shot blasting has to be done for the heavy corrosion area. The Project location/area is not coming under the heavy corrosion area category. Therefore, the surface preparation will be done by manual wire brush cleaning or any other suitable method as per Indian Standards. Pls. confirm.	All structural steel works inside chimney such as internal platforms, stair case, ladders etc. excluding grating, flue, treads of stair shall be painted with 2 coats of zinc phosphate 2 pack epoxy primer, DFT 50 microns per coat, applied on dry surface cleaned by shot blasting & two coats of two pack Epoxy finish with micaceous iron oxide pigments having DFT 75 microns for each coat.
55	1	4.6.2 (g)	Steel structures shall be designed as per IS-800	We are considering the structural steel designs as per IS:800-1984. Please confirm	Accepted
56	1	4.6.3	chimney foundation shall be in concrete grade M-25.	We would like to consider the minimum concrete grade for chimney foundation as M-25.	Accepted
57	1	4.6.3	Reinforcement shall be Fe-500 steel.	We would like to consider reinforcement steel as Fe-500 or Fe-500D depending upon market availability.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
58	1	4.6.3	Materials to be used	We are considering PPC for raft and OPC for shell. Kindly confirm.	PPC can be used for chimney raft however fly ash content shall not exceed 35% by volume
59	1	4.6.1.iX	Internal staircase shall be supported on steel frame independent of shell...	Staircase provided directly on platform, would result in large platform girders, consequently large openings in windshield, which would be zone of weaknesses in the windshield. Further platforms are placed with sliding connections in windshield, placing staircase of around 40m on platform would result in stability issues under earthquake and other dynamic conditions. Therefore it is advised that standard practice of staircase erected on brackets, supported from windshield may be followed.Pl.confirm.	Bid specification prevails
	1		Max permissible stress in "DEAD+WIND" Load case shall be $0.32 F_{ck}$, where F_{ck} is the characteristic strength of concrete.	As per the latest recommendation of Central Electricity Authority(CEA), and also as adopted by leading players in the industry , max permissible stress in "DEAD+WIND" Load case shall be taken as $0.280 F_{ck}$,where F_{ck} is the characteristic strength of concrete.Pl.confirm.	Allowable compressive stress in concrete shall be limited to $0.32 F_c$ under DL+WL condition

62	1	4.7.2	Surface Protection to be provided for the entire inner face of hyperboloid shell	Since the inner surface of shell upto drift eliminator is exposed to water surface, protection will be provided upto level of drift eliminator. Please confirm acceptance.	Bid specification prevails
63	1	4.7.3.5	Bypass arrangement along with isolation valve for approximately 20% of total CW flow shall be provided.....	We have not provided any such arrangement in our past projects and also could not understand the requirement. Please clarify the purpose of CW Bypass arrangement. Also, purpose of providing horizontal base plate at the bottom of Cold water channel is not clear.	Bid specification prevails
64	1	4.7.3.5 & 4.7.3.6	By pass arrangement along with isolation valve for approx. 20% of total circulating water flow shall be provided.....	Please note that specified bypass arrangements are not required nor provided in any of the previous projects by BHEL, accordingly it is not envisaged in this project too. Please confirm	Bid specification prevails
65	1	4.7.3.5 & 4.7.3.6	By pass arrangement along with isolation valve for approx. 20% of total circulating water flow shall be provided.....	Please note that specified bypass arrangements are not required nor it is a general practice to provided the same. It is requested to delete this requirement.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
66	1	4.7.3.6	Bypass arrangement along with isolation valve for approximately 50% of total ACW pipeline to cold water basin shall be provided.....	We have not provided any such arrangement in our past projects and also could not understand the purpose. Please clarify the purpose of ACW Bypass arrangement	Bid specification prevails
67	1	4.7.4	The basin shall be designed..... The basin holding capacity shall be minimum 16 minutes between maximum and minimum water level.	Please note that as per our standard practice basin holding capacity shall be 6 minutes between maximum and minimum water level. Pl.confirm.	Bid specification prevails
68	1	4.7.4	The basin shall be designed..... The basin holding capacity shall be minimum 16 minutes between maximum and minimum water level.	Please note that as per standard practice basin holding capacity shall be 6 minutes between maximum and minimum water level. Increasing the basin holding capacity will unnecessary increase the basin size ,leading to higher cost. Pl.review and confirm.	Bid specification prevails
69	1	4.7.4	Minimum 500 mm dead storage shall be considered above invert level of basin.... The basin holding capacity shall be minimum 16 minutes between maximum and minimum water level.	A dead storage of 300mm will be provided and 12 minutes basin holding capacity as Basin holding capacity shall be adequate. Please recheck and confirm.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
70	1	4.7.10.2	Drift losses At the design point, the total water mass flow entrained in the air shall not exceed 0.01% of the mass of water circulating. In case the drift eliminator packing is to be used for achieving the specified drift loss then, the same shall be provided by the bidder. If drift eliminators are provided then the drift shall be measured at the top of the drift eliminators.	Drift eliminator is not considered in the cooling tower design thus drift testing is not applicable. Kindly confirm acceptance.	Bid specification prevails
71	1	4.7.12	Acceptance test code for water cooling towers: DIN 1947 - VDI	Please note that Performance test of Cooling Tower will be carried out as per BS 4485 or CTI ATC - 105.	Refer Corrigendum II to bid Specification
72	1	4.7.15 & 4.7.20.8	Material of Construction of Screens	There is discrepancy between the two referred Clauses about the MOC of Screens. We are considering the Screens MOC in-line with Cl. No. 4.7.15. Screens Mesh Material considered is SS 304 instead of SS 304L. Kindly confirm.	clause no. 4.7.20.18 (i) shall prevail

BHUSAVAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
73	1	4.7.17.5	Enhancement factor 1.43 is considered to take the interference effect of adjacent structures of significant dimensions into account. 10% increment shall be considered for imperfection in construction as per IS: 11504. This factor shall be increased further by 10% during foundation design in absence of model test results.	As per specification the wind enhancement factor of 1.43 shall be increase by 10% for geometric imperfections and this factor shall be increased further by 10% during foundation design in absence of model test results. We presume that for design of foundation a wind enhancement factor of 1.73 (i.e. 1.43 x 1.1 x 1.1) shall be considered. Please confirm.	Confirmed
74	1	4.7.20.7	All reinforcement steel shall be corrosion resistant steel/HCRM. The minimum reinforcement to be provided shall be as follows: HYSD bars shall be provided at a maximum spacing of 200mm in top and bottom layer along both directions.	We presume that Corrosion resistant steel shall be used only in cooling towers. Please confirm.	Accepted
75	1	4.7.2 & 4.7.20.18 9 (L)	Handling facilities at tower top	Handling facility at the tower top is not applicable for NDCT. Kindly confirm.	Bid specification prevails
76	1	4.7.20.18 (dd)	Minimum eight nos. of high intensity white flashing type aviation obstruction light at each level	We shall be considering combination of Medium Intensity and Low Intensity Aviation Warning Lights only at the top of the tower as per ICAO.	Bid specification prevails
77	1,	4.7.20.3 (E) 4.7.20.7 4.16.1	All reinforcement steel shall be corrosion resistant steel/HCRM. The minimum reinforcement to be provided shall be as follows: HYSD bars shall be provided at a maximum spacing of 200mm in top and bottom layer along both directions.	We understand that mild steel / HYSD bars shall be used for all structures and Corrosion resistant steel shall be used in cooling towers . Please confirm.	Accepted

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
78	1	4.7.20.3 (E)	All reinforcement steel shall be corrosion resistant steel/HCRM. The minimum reinforcement to be provided shall be as follows: HYSD bars shall be provided at a maximum spacing of 200mm in top and bottom layer along both directions.	We presume that Corrosion resistant steel shall be used only in cooling towers. Please confirm.	Accepted
79	1	4.7.20.7 (f)	NDCT - CW Basin design	We propose to use pressure release valves (PRV) upto 50% to counter the uplift pressure.	Bid specification prevails
80	1	4.7.22 (e)	The performance of Cooling tower shall be compared with the performance required on the basis of Performance curve for 80%, 90%, 100% & 120% of design water flow.	Please note that as per Cl. No. 7.2 of CTI Code ATC-105, NDCT performance curves applicable to 90%, 100% & 110% of design water flow shall only be required to furnish for Performance test. Hence, Performance test shall not be conducted cooling water flow of 80% & 120%. Please confirm.	Bid specification prevails
81	1	4.8.1.3	Electrical swgr room	The provision of electrical switchgear room in a particular building depends on the distribution system envisaged. It is not mandatory to provide swgr room in each pump house, for some pump house the drives can be fed from the nearby swgr rooms also. The details will be decided during detailed engineering. Please confirm.	Bid specification prevails. Please refer SLD for SWGR.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
82	1 & 2	4.9.1 (e) & 4.9	Liquid retaining structures	As per Cl. No. 4.9, Section 2, " the crack width for liquid retaining structures shall be limited to 0.1mm". All liquid retaining structures except filter water reservoir will be designed as per this clause.	All water retaining structures and other under ground structures except filtered water shall be designed with limiting crack width to 0.1 mm.
83	1	4.9.1 (e)	Filtered water reservoir shall be designed as uncracked section.	All water retaining structures and other under ground structures shall be designed with limiting crack width of 0.1 mm. Please confirm.	All water retaining structures and other under ground structures except filtered water shall be designed with limiting crack width to 0.1 mm.
84	1	4.9.4/ 4.14	Pipe/Cable Trestles And Foundations Cl. No. 4.9.4, the min clear headroom shall be 8.5 m. CL no. 4.9.4, the min clear headroom shall be 8.5 m. CL. No, 4.14 headroom clearances shall be 8.0m.	Please confirm minimum clear headroom requirement in cross-over locations.	Refer sr. No. 8 of Corrigendum no. 1 of Master specification Volume II
85	1	4.9.4	All trestles shall be provided with continuous walkway of minimum 750mm width with handrail and toe guards all along the length of the trestle along with approach ladder near roads, passageways etc.	Please review the requirement for continuous walkway of minimum 750mm width all along the length of the trestle along with approach ladder near roads, passageways etc.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
86	1 2 2	4.9.5 3.2.3/3.4 4.9	Raw water reservoir / Liquid retaining structures Storage tank structure shall be designed as per IS-3370 & considering water level at GL. No pressure relief valve arrangement shall be considered to counter uplift pressure.	For design purpose, the ground water table shall be considered as per final geotechnical report. Pressure relief valves will be provided, if required. Please confirm.	Bid specification prevails
87	1 1	4.9.5, Pg 144 of 639 2.14, Pg 241 of 639	Raw water reservoir.....storage tank will be in RCC construction Reservoir lining	Since water reservoir is of RCC construction, please clarify whether HDPE liner is required for reservoir.	HDPE lining to raw water reservoir is not required being of R.C.C construction.
88	1	4.11/4.13	CW and ACW Pump house	Based on Cl. 4.11, the said building can be both RCC and Steel framed. However, cl. No.4.13 indicates that this building shall be RCC. The CW building can be of RCC framed or combination of RCC and Steel.	Bid specification prevails
89	1	4.11	CW Forebay and Channel	We propose to use pressure release valves (PRV) upto 50% to counter the uplift pressure.	Bid specification prevails
90	1	4.16.1	All reinforcement steel shall be corrosion resistant steel/HCRM. The minimum reinforcement to be provided shall be as follows: HYSD bars shall be provided at a maximum spacing of 200mm in top and bottom layer along both directions.	We presume that Corrosion resistant steel shall be used only in cooling towers. Please confirm.	Accepted

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
91	1	4.17	Yard Drainage System Interconnection of drains with the existing/ plant water drainage system/ main outfall location	Please furnish the interfacing invert levels & coordinates of existing plant drainage system including outfall.	Required details will be provided to the successful bidder during detail engineering
92	1	4.17	DRAINAGE SYSTEM	Kindly provide the max. hourly rainfall to be considered for drain design. Also kindly provide the HFL of the area.	Bid specification prevails . For HFL refer note no. 6 of Bid Plot plan.
93	1	4.17	Yard Drainage System	It is proposed to provide brick masonry drains for depth upto 750 mm including building plinth protection drains. Drains with depth higher than 750 mm will be made of RCC. Please confirm.	Bid specification prevails
94	1	4.17	Discharge coordinate for storm water drain	Please provide the final discharge coordinates for drains.	Required details will be provided to the successful bidder during detail engineering
95	1	4.17	Drainage System: The drainage system shall be designed taking into account runoff resulting from 1 hr rainfall with a return period of 100 yrs. These values are based on the recommendations of the Indian meteorological department.	We propose to consider the rainfall intensity, derived from 50 years return period, for storm water network design as per standard industrial practice.	One hour rainfall intensity, derived from 50 years return period, as per recommendations of Indian meteorological department shall be considered for the design of storm water drainage system.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT**PRE -BID QUERIES from Prospective Bidders****Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A**

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
96	1	4.18	Sewage system	In remote areas inside the plant boundary where it is far away from the central treatment plant, it is proposed to use septic tank and upflow filter similar to the scheme mentioned in 4.18(2) of the specification. Please confirm.	Bid specification prevails
97	1	4.18	Sewage system	Where possible the gravity will be used for sewers, for long distances, sewage pumping will be adopted because the depth of sewage pipe becomes very high in case gravity only is adopted. Please confirm	Bid specification prevails
98	1	4.18	Septic tank in ash dyke area outside Plant boundary	The present scope of work outside plant boundary is limited to ash piping corridor from the plant to the ash dyke. Hence any Septic tank outside plant premises is not considered in scope. Please confirm.	Not envisaged in the Bid
99	1	4.18	Sanitary Sewerage system	Septic tank along with soak pit will be considered. Please confirm	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
100	1	4.18.1	Sewerage Transfer/Treatment System Cl. No. 4.18.1: manhole spacing shall not exceed 20m Cl. No. 3.14 (Vol. VI-B Section 7/ A), the maximum distance between manholes shall be 30m.	We shall consider maximum distance between manholes as 30 m as per Cl. No. 3.14 (Vol VI-B-Section 7/ A).	Clause no. 4.18.1 shall prevail for distance between manholes
101	1	4.18.2	Sewage Treatment Plant Cl. No. 4.18.2: Anticipated number of user may be considered as 650 for design purpose Annexure-I (Vol. VI-B Section 22): The anticipated no. user may be considered as 1500 for design purpose.	For design purpose, number of users will be considered as 200 (per day) for this proposed 1X660MW unit. Please confirm.	Clause no. 4.18.2 shall prevail for no. of users for design purpose.
102	1	clause number 4.18.2, page 163 of 639	The contractor shall make the arrangement for utilizing the treated water for gardening and plantation----	PL. clarify the location where treated water from sewage treatment plant is required to be terminated for Gardening / plantaion.	Treated sewage water is to be used for gardening and terminal points of the pipes shall be upto the farthest point of green belt within periphery of the plot.
103	1	4.18(2)	Sewage treatment for ash dyke area	Please review this requirement because in ash dyke there are no buildings in Bidder scope.	Not envisaged in the Bid
104	1	clause number 4.18.2, page 163 of 639	The contractor shall make the arrangement for utilizing the treated water for gardening and plantation----	PL. clarify the location where treated water from sewage treatment plant is required to be terminated for Gardening / plantaion.	Treated sewage water is to be used for gardening and terminal points of the pipes shall be upto the farthest point of green belt within periphery of the plot.

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
105	1	4.2	5 mm stainless steel liner plates conforming to 304M Grade, fitted without allowing any projections in coal flow path shall be provided for conical hopper portion only.	As per standard engineering practice, Coal bunkers shall be provided with 3.15 mm thick stainless steel liner in the hopper portion only. Please confirm.	Bid specification prevails
106	1	5.00	Design Documents	The Civil / Structural Analysis, Design and calculation documentations will be performed using standard software like MS-Office, MathCAD, STAADPro, SAFE, SAP, ETABS, Dyna, in-house developed templates etc.	Accepted however Dyna, in-house developed templates etc. subject to validation.
107	1		Worskhop	Please clarify capacity of crane required in workshop.	Capacity of EOT Crane shall be 10 T .
108	1		Stores	We understand that for stores separate crane is not required. Please confirm. If crane is required please indicate capacity required.	Crane not required.
109	2	3.1.a)	Area grading, Levelling & dressing (Finished ground levels shall be as mentioned in Plot Plan & area grading drawings)	Please provide contour drawing and RL of bore holes. Please provide previous grading drawing if any.	Drawings & bore holes data already provided alongwith Bid documents.

BHUSAVAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
110	2	3.1 (h)	Drain Network	We presume the terminal point of storm water drain shall be at plant boundary. Please confirm. In case it is to be drained of to near by nallah please provide us the invert level of the same. Further all necessary clearances and right of way for the same shall be in scope of Owner. Please confirm.	There will be 2 nos. of disposal points for storm water drains. The locations of the same is at bridge no. 17 & 18 of railway siding for 2 X 500 MW unit. The required data will be provided to successful bidder during detail engineering. Necessary clearances for the same shall be in scope of Bidder.
111	2	3.1.2	Live Loads	Live load considerations for CW / ACW sump and Pump house will be as per IS codal provisions.	Bid specification prevails. Refer clause no. 3.1.2.5 of volume VI A Section 2.
112	2	3.1.2.1	Live Load on roofs Cl 3.1.2.1. (a (iii)) For accessible roofs, live loads shall be considered as 1.5 KN/ m ²	However, for inaccessible roof, we propose to use live load of 0.75kN/m ² as per IS-875.	Bid specification prevails
113	2	3.1.3 (h)	Laydown area loads Lay down areas in the Turbine Hall shall be investigated for concentrated loads resulting from equipment components to be stored during erection and maintenance operation	The structure shall be designed considering laydown loads as per the actual scheme and loading data provided by equipment vendors. Please confirm.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
114	2	3.1.4 4.6.4 & 4.6.6.2	Wind loading Risk coefficient (k1) shall be considered as 1.07 for all structures. 3.1.5 Seismic	The risk coefficient as per IS875 (III) is 1.06. This shall be used for all structures other than Non plant buildings. K1 shall be 1.0 for all non-plant buildings. Please confirm.	The risk coefficient k1 shall be 1.06 as per IS: 875 (III) for all plant & non plant buildings.
115	2	3.1.7	Steam piping load Minimum intensity of steam piping load shall be 6.0 kN/Sqm for the areas at different levels through which steam piping is routed.	Steam piping loads will be considered as per actual pipe stress analysis results. Please confirm.	Bid specification prevails
116	2	3.1.11	Other loads All Power House columns adjacent to first row of Boiler columns shall be designed for an additional load of 500 kN to account for piping/cable rack loads.	No additional loads or blanket load shall be considered in addition to the actual loads based on the layout. Please confirm.	Bid specification prevails
117	2	3.40	" Whenever any structure under this contract will carry or receive additional load from the work of any other contract, the structures under this contract shall be provided with sufficient margin to carry the above load (like Mill Bay structure, Trestles etc.) details of which shall be finalized during detail engineering."	Since this is a BTG + BOP contract (full EPC), no additional loads are considered for others. However, suitable margins shall be considered during design phase to take care of engineering uncertainties.	Accepted
118	2	3.40	Design concepts 'Lifted Load' of crane shall not be considered during seismic condition.	For wind calculation, 50 % of the lifted load of Crane will be considered. Please confirm acceptance.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
119	2	3.40	Design concepts In Turbine Bay, horizontal wind girders between A-row and B-row columns must be provided below Mezzanine and Operating floor at gable ends to transmit wind load from gable columns.	The turbine building shall be designed without wind girders at gable ends.	Bid specification prevails
120	2	4.1	Power House building The roofing will be done by cast-in-situ RCC slab over permanently color coated (on exposed face) galvanized M.S. troughed metal decking of approved profile supported by steel purlins which are spanning between two adjacent roof trusses.	Insulated sandwich panel sheet shall be used in roof instead of RCC over metal deck. Please confirm.	Bid specification prevails
121	2	4.9	Liquid retaining structures All water retaining/storage structures and all underground structure requiring dry working condition shall be designed assuming liquid up to the height of wall irrespective of provision of any over flow arrangement. Use of PRV to counter uplift shall not be allowed.	Pressure relief valves may be used for liquid retaining structures. Please confirm.	Bid specification prevails
122	2	4.9	Liquid retaining structures All water retaining/storage structures and all underground structure requiring dry working condition shall be designed assuming liquid up to the height of wall irrespective of provision of any over flow arrangement. Use of PRV to counter uplift shall not be allowed.	We propose to use pressure relief valves, as required, for all liquid retaining structures.	Bid specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
123	1 & 2	4.9.1 (e) & 4.9	Liquid retaining structures	As per Cl. No. 4.9, Section 2, " the crack width for liquid retaining structures shall be limited to 0.1mm". All liquid retaining structures except filter water reservoir will be designed as per this clause.	Accepted
124	2	4.10	Power House building The roofing will be done by cast-in-situ RCC slab over permanently colour coated (on exposed face) galvanized M.S. troughed metal decking of approved profile supported by steel purlins which are spanning between two adjacent roof trusses.	As specification stipulates use of insulated metal side cladding, we would propose use of the same insulated sandwich panel in roof instead of RCC over metal deck. Any mechanical or other utilities can be placed on roof cutouts, supported on separate structural framing. ~~Please confirm.~~	Bid specification prevails
125	2	4.30	Fly ash	Sufficient amount of fly ash shall be provided free of charges by the Owner. Please confirm.	Arranging fly ash conforming to IS: 3812 is the responsibility of the bidder. However if the required quality & quantity of fly ash is available with Mahagenco the same will be supplied to bidder on chargeable basis as per Mahagenco's prevailing

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
126	2	5.5.7	"After the tanks have been erected, hydro testing shall be done. Subsequent upon hydro testing of tank, the differential settlement"	The statement appears to be incomplete. Kindly state the requirements under this clause.	The sentence shall be read as "After the tanks have been erected, hydro testing shall be done. Subsequent upon hydro testing of tank, the differential settlement noticed if any shall be rectified to the satisfaction of Engineer Incharge"
127	3	1.3	Structural steel shall conform to Grade A of IS:2062 for rolled steel members or plates up to 20 mm thickness. For plates above 20 mm thickness and welded construction, steel conforming to Grade B (Killed and normalized) of IS: 2062 shall be used except for crane girders where Grade C (Killed and normalized) (IS: 2062) steel shall be used. All structural steel plates and sections shall be of main producer of such as "SAIL" or "TATA STEEL" or "RINL" or "JINDAL" make or vendor approved by MAHAGENCO.	Structural steel of grade Q235 / Q345 as per Chinese code shall be used in addition to Indian steel. Please confirm.	Bid specification prevails
128	3	1.4/1.11	Structural steel connections Shop connections will be all welded and field connections will generally be bolted unless specified otherwise.	Welded or Bolted type of connections will be used based on requirement.	Bid specification prevails
129	3	2.44	Boundary Wall As per Clause No.3.1 of Section 1; the boundary wall shall be made of uncoursed rubble masonry. However, as per cl. 2.44(Section 4), the boundary wall is made of masonry, painted with cement -based paint over plaster.	We understand that the existing boundary wall is made of UCR and hence we propose to follow Clause No.3.1 of Section 1 for the new boundary wall.	The boundary wall shall be of UCR masonry as per clause no. 3.1 of section 1. The anticlimbing fencing, finishing of wall etc. shall be as per clause no. 2-44 of section 4 & Bid drawing.

134	4	2.4 (a)/ 2.16	Cl. 2.4: handrails and ladder pipes shall be 50 mm nominal bore MS pipes... Cl. 2.16 (a) handrails and ladder pipes shall be 50 mm nominal bore MS pipes Cl. 2.16 (h) For any other floor of powerhouse building, plant & non-plant buildings, unless otherwise indicated in the specification the post and handrails of stairs, railings, etc. shall be of 32 mm dia G.I. pipes as per IS-1239-part (I) Cl. 2.4 (b) For stairs and around all floor openings at operating floors, 1000 mm high hand railing with 32 NB (polished) stainless steel pipe shall be provided. Cl. 2.16 (d) For RCC stairs and around all floor openings at operating floors, 1000 mm high hand railing with 32 NB (polished) stainless steel pipe shall be provided. Cl. 5.1.16 (c) 40ø NB stainless steel pipe handrail for Stair in T.G. Hall area and 32ø NB medium class G.I pipe Handrail for stairs in other areas,	Kindly clarify the handrail requirements in various areas/buildings in view of the contradictions in the referred clauses.	Clause no. 2.16 of section 4 prevails for handrailing in various areas & buildings.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE -BID QUERIES from Prospective Bidders

Bid Specification No. DG/BSL U-6/2011/T-1, Volume - VI A

SR. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	Resolution
135	4	2.26	Minimum 110mm thick R.C. concrete parapet Cl. No. 2.6, 110 mm thk parapet is to be provided. Cl. No. 2.28(o): 100 mm thick concrete parapet is to be provided, Section 2; Cl. No. 6.1, 125 mm thk parapet is to be provided.	We will consider 100 mm thick, 1000 mm high RCC parapet for accessible roofs and 400 mm high 230 thk masonry parapet for non accessible roof. Please confirm.	Clause no. 2.28 (o) shall prevail for parapets.
136	4	2.37	1) PCC paving of grade M-20, 100 mm thick laid over 75 mm thick bed of dry brick aggregate shall be provided for following areas: (i) 2.0 m wide pathway all along pipe/ cable corridor	We propose to provide local paving around the pipe/ cable corridor for the accessibility to the cage ladders. Please confirm.	2.0 m wide pathway all along the pipe/cable corridor consists of 150mm thick P.C.C. of grade M-20 overlaid on 230 mm thick stone soling with interstices filled with sand by water flooding. For paving around cooling tower, volume VI A section 1
137	4	4.1.1	Landscaping: administrative area	Since no separate administration building is envisaged in the scope of work for 1x660 MW plant kindly clarify the landscaping requirement for the same .	Administration building is not included in Bidder's scope. Landscaping is not envisaged for Admin. Building.
138	5	4.11.3.3	Blasting: No blasting shall be permitted for excavation of foundation even in rocky formation, unless permitted by the MSPGCL and subject to proper licenses and permission being obtained from the authorities concerned.	Weathered rocks are observed beyond 2.5m depth. Controlled Rock Blasting shall be permitted if required for laying foundation or any other work, subject to permissions from concerned authority.	Bid specification prevails

We would like to clarify that no manual bypass valve with upstream and downstream isolation valves for spray control valve of HP turbine bypass are provided.	Bid Specification prevails
4	PE-189-PF-201		Double lead / pipe line for MS, HRH & CRH line are shown.	We understand that option of both single and double lead / pipe lines for MS, HRH & CRH are available with bidders.	Bid Specification prevails
5	PE-189-PF-201 B4 & A7		Warm-up line for HP & LP turbine bypass valves.	We would like to clarify that warm-up arrangement shall be provided if required as per manufacturer's standard practice.	Bid Specification prevails
6	Volume VII A2/ Drawing no : PE-189-PF-201		2 x 100% - HP Bypass Valves 2 x 50% - LP Bypass Valves	We propose 1 x 100% HP Bypass Valves and 2 x 50 % LP bypass valve system. Kindly confirm the acceptance for the same.	Bid Specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE-BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 "Volume-VII A2

Sr . No	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/ Stipulation	Resolutions
7	PE-189-PF-202 & 203		In PF-202 one control station is shown before LP htr 1 and one after LP htr 4.	Please clarify the purpose of two control stations. Normal practice is to provide single control station before LP heater #1.	Agreed that two control stations are not required
8	PE-189-PF-202		Dosing point shown after CPU outlet.	Dosing point should be just outlet of CPU to enable alkaline water should go to various make up and auxiliary cooling requirement.	Drawing is self- explanatory.
9	PE-189-PF-202		Common normal and emergency make up lines.	As per tender PFD there is duplication of control stations on emergency and normal make up line for better controllability and operatability we propose following, 1. Separate lines for normal (from DM plant) and emergency make up (From CST) shall be provided each having individual control station. 2. Both the emergency and normal make up lines shall directly feed to condenser and additional control station (as per tender PFD) shall not be provided.	Agreed
10	PE-189-PF-202 B5		Valve sealing, hydrazine, ammonia & sodium hydroxide dosing tapping are taken from CST discharge header.	These tapping shall be taken from CEP discharge.	Agreed
11	PE-189-PF-202 B8		Normal make-up water is shown connected from CST.	We would like to clarify that only emergency make-up shall be provided from CST and normal make-up shall be provided from DM water storage tank.	Bid Specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE-BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 "Volume-VII A2

Sr . No	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/ Stipulation	Resolutions
12	PE-189-PF-202 B9		Normal make-up control valves and emergency make-up control valve in parallel with downstream level control valve in series connected to hotwell via common pipe line.	We would like to clarify that separate lines shall be provided for normal make-up control valve from DM water storage tank to hotwell and emergency make-up control valve from CST to hotwell. No additional level control valve as shown in customer PFD is envisaged.	Will be evaluated after receipt of detailed scheme by bidder.
13	PE-189-PF-202 D3		Boiler fill pumps are connected to condensate storage tank for boiler initial and deaerator filling.	We would like to clarify that boiler fill pump shall be connected to DM water storage tank for boiler initial filling and deaerator filling.	Bid Specification prevails
14	PE-189-PF-202 D8		Separate LP heater 1 and 2 with separate LP heater 1 drain cooler.	Please note that low pressure heaters 1 & 2 are duplex type and located in condenser neck as per standard and proven practice of the Bidder. Since the heat balance cycle is optimised without drain cooling zone as bidder's standard practice, separate external drain cooler is not required for this LP heater in condenser neck.	Bid Specification prevails
15	PE-189-PF-202 D9		CEP individual minimum flow recirculation along with GSC common minimum flow recirculation line are shown.	GSC-cum-CEP common minimum flow recirculation line is sufficient for all CEP protection. No CEP individual minimum flow recirculation line is envisaged.	Bid Specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE-BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 "Volume-VII A2

Sr . No	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/ Stipulation	Resolutions
16	PE-189-PF-202 E4, F6, C5, C8		Motorised bypass ball valves with upstream and downstream manual isolation valves are shown for condensate control valve, condenser level control valve, normal make-up valve, emergency make-up valve, GSC & CEP minimum recirculation valve.	We would like to clarify that these are highly reliable control valves carefully selected with all operating conditions for the process control. As per Alstom standard practice and operation concepts, manual operation or control of the plant with motorised ball valves is detrimental to the safety of the plant and not recommended. Hence request you to delete these motorised bypass ball valves with upstream and downstream isolation valves.	Agreed
17	PE-189-PF-202 E4		Main condensate control station is 2 x 100% pneumatic control valve and 1 x 100% motorized ball valve.	We would like to clarify that condensate level control valves shall be 1 x 30% + 1 x 100% capacity pneumatic control valve for better controllability during start-up and normal operation of the plant. No motorised bypass valve is envisaged as explained above.	Bid Specification prevails
18	PE-189-PF-202 F4		Motorized bypass valve with upstream and downstream motorised isolation valves are shown for condensate polishing unit.	We would like to clarify that individual vessel isolation valves with complete CPU bypass valve shall be provided as per CPU supplier's standard practice and shall be in CPU supplier's scope. Hence no separate CPU motorized bypass valve with upstream and downstream motorised isolation valves are envisaged.	Bid Specification prevails
19	PE-189-PF-202 F7		Motorized bypass valve with upstream and downstream motorised isolation valves are shown for gland steam condenser.	As per Alstom standard and proven practice, GSC motorized bypass valve with upstream and downstream motorised isolation valves are envisaged.	Bid Specification prevails

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE-BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 "Volume-VII A2

Sr . No	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/ Stipulation	Resolutions
20	PE-189-PF-202 G8		As per tender PFD, CEP sealing and wet steam washing line are shown after GSC.	We would like to clarify that as per equipment supplier's standard practice no Cep sealing and wet steam washing is required.	CEP sealing shall be provided.
21	PE-189-PF-202 G9		As per tender PFD, control valve in tapping line from CEP discharge header for vacuum pump make-up, valve gland sealing, BFP turbine exhaust hood spray and drain cooler loop seal make-up etc.	We would like to clarify that no such control valve is envisaged for these water lines as shown in customer PFD. Also clarify that no drain cooler loop seal make-up is required.	Bid Specification prevails
22	PID no. PE-189-PF-202		Motorised valve provided at the inlet, outlet and bypass of Gland Steam Condenser	As per standard practice, Isolation valves are always kept open. Hence, motorisation of these valves is not required. Isolation and bypass for GSC shall be manual with locked open/closed facility. Please confirm.	Bid Specification prevails
23	PID no. PE-189-PF-202		Motorised valve provided at the inlet, outlet and bypass of Condensate Polishing Unit	As per standard practice , motorised valves at the inlet, outlet and bypass of CPU are provided integral with CPU package. Hence, these valves are not required on condensate discharge line.please confirm.	Bid Specification prevails
24	PID no. PE-189-PF-202		Non return valve provided in LPH-1 bypass line	As per standard practice non return valve is already provided in condensate discharge header upstream of main condensate control station. NRV indicated in LPH-1 bypass line is not needed. Please confirm.	Agreed.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE-BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 "Volume-VII A2

Sr . No	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/ Stipulation	Resolutions
25	PFD (PE-189-PF-203)		FW Control Station location	We propose FW control station to be located upstream of HP heaters	Agreed.
26	PE-189-PF-203 A1		Motorised on-off valve at economiser inlet is shown.	Employer to note that the feed check valve shall be located at the downstream of the HP heaters. However there is no requirement to provide an isolation valve at such location as per Bidder's standard & proven practice. It shall be further noted that as per IBR amendment dated March 12, 2007 to regulation 520, feed water discharge piping for feed water system without economizer inlet isolating valve can be designed. Hence request you to delete this motorised on-off valve at economiser inlet.	MOV at Economiser inlet may be deleted if the system design does not require it.
27	PE-189-PF-203 A6		Two stage attemperation system for superheaters is shown.	Bidder would like to clarify that single stage desuperheating station shall be provided as per Alstom standard and proven practice.	Bid Specification prevails
28	PE-189-PF-203 C3		Feed water regulating station at downstream of HP heater.	We would like to clarify that feed control station along with necessary isolation valve at economiser inlet (downstream HP heaters) is shown which shall be located upstream of the HP Heaters (after BFPs) as per Bidder's standard & proven practice. This will substantially reduce design pressure of the feed water piping and HP heaters and same shall be designed corresponding boiler economiser design pressure instead of BFP shut off head. Kindly accept.	Agreed.
29	PE-189-PF-203 G1		Condensate level control station upstream of deaerator is shown.	Please delete this condensate level control station upstream of deaerator as condensate level control station is already shown in PE-189-PF-202. This additional level control valve is not required.	Agreed

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE-BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 "Volume-VII A2

Sr . No	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/ Stipulation	Resolutions
30	PE-189-PF-203		1 x 100% HP Feed Heaters with individual motorised bypass & isolation valves are shown.	Please note that Bidder intends to offer either twin stream i.e. 2 x 50% HP feed water heaters with medium operated 3-way bypass valves at upstream and downstream of each train of heater (the bypass line of each train shall be 50% feed water flow capacity) or single stream i.e. 1 x 100% HP feed water heaters with medium operated 3-way bypass valve at upstream and downstream of each heater (the bypass line of train shall be 100% feed water flow capacity). These media operated 3-way valves ensures quick bypassing of HP heaters in case of tube leakages. In this case, motorized isolation valves at upstream and downstream of HP heaters and in bypass line are not required. Bidder confirms that there are many Alstom built plants worldwide which are in successful operation with same philosophy.	2 x 50 % heater trains agreed; rest to be taken up during bid evaluation.
31	PID no. PE-189-PF-203		Control station indicated near Deaerator in condensate inlet line	As per standard practice control station at this location is not required. Please confirm.	Agreed.
32	PID no. PE-189-PF-203		Arrangement of and around HP heaters	As per standard practice followed for supercritical units, all HP Heaters shall be of 2x50% capacity, arranged in 2x50% HP Heater banks provided with string bypass. Spring loaded bypass shall be provided for each heater bank.please confirm.	2 x50% heaters agreed; rest of the scheme will be evaluated during bid evaluation.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE-BID QUERIES

Bid Specification No. DG/BSL U-6/2011/T-1 "Volume-VII A2

Sr . No	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/ Stipulation	Resolutions
33	PID no. PE-189-PF-203		Location of Feed Control Station	As per standard practice followed for supercritical units, feed control station shall be located in BFP discharge line upstream of HP heaters and there shall be no isolating valve at boiler inlet. This meets IBR requirement. Please confirm.	Agreed
34	Process Flow Diagram - Feedwater System, PE-189-PI-203		Feed control station downstream of HP Heaters.	Boiler feed discharge pipe line downstream of feed control station shall be designed for maximum pressure expected from Steam generator side and not for BFP shut-off head. Feed control station shall be located upstream of HP heaters.	Agreed.
35	PE-189-PF-204		Extraction points for heaters	Location of extraction points shall be as per optimised design of bidder.	Specification is self-explanatory.
36	PE-189-PF-204		HP heaters 2 and 3 drain to deaerator	HPH3 and HPH2 emergency drain lines to condenser shall be provided. Separate emergency drain lines from these Heaters to deaerator as per tender PFD are not required and hence not envisaged. Please confirm.	Will be evaluated after receipt of detailed scheme by bidder.

BHUSAWAL THERMAL POWER STATION 1X 660 MW UNIT - 6 PROJECT

PRE-BID QUERIES

BHUSAWAL THERMAL POWER STATION 1X660MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE-BID QUERIES					
BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME -II					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	Section-2	7.14	Rainfall: 112 mm average annually	The value seems too low. Please check. Regarding the hourly maximum rainfall, please provide the reference data for the existing 2x 500 MW plant for the basic design purpose.	Please refer Pre-Bid clarification at Sr. no. 1 , Volume II and Sr. no. 95, Volume - VIA (Issued on date 07.07.2012)
2	SECTION - 3	5.0	(a) Residential accommodation to be built by the Contractor at his own expense for his employees near site.	Please inform us the location and area(m2) of the land for Contractor's accommodation and office.	This clause is deleted. Please refer Sr. no. 11 of Corrigendum -II, page 12 of 274 and will be dealt according to the Volume- I, Section-2B, clause no. 4.1.1.
3	SECTION - 3	5.0	(b) Site office, pre-assembly/storage yard to be constructed by Contractor at his own expense within plant site	Please inform us the location and area(m2) of the land for Contractor's accommodation and office.	Please refer area for Lay down space/contrsuction yard/Fabrication yard in Plot Plan for contractor's purpose.
4	SECTION - 3	5.0	5.2 Construction power at 11 kV AC +-10%, 3 Phase, 50 Hz +-5% and Construction water shall be made available at one point near the erection site by the Owner. Regarding charges, please refer Volume-I of this specification.	Please confirm if there is the limitation of consumption in Construction Power & Water.	Please refer Sr. no. 12 of Corrigendum -II, page 12 of 274 and also refer Volume -I. For limitation of consumption in Construction Power & water , Please refer Cl. No. 4.2 & 4.3, section- 2B, Volume-I.
5	4	17.1	"In case Ministry of Environment & Forest stipulates any other conditions not specified hereunder while clearing the project, same shall be complied with by the contractor"	Kindly furnish MOEF document, so that we know specific stipulation made by MOEF, for system design as per their recommendation.	The document is available on MOEF website in public domain
6	SECTION - 5	2.0	2.2 Generator Stator Lifting may be considered by either of the two options as mentioned below :	From the referred clauses, we understand the followings: 1. Tandem operation of TG hall EOT cranes are required if generator stator lifting is envisaged with turbine hall EOT cranes. 2. Capacity of each turbine hall crane shall be computed as $Y = 1.25 a/2$, if bidder opts for generator stator lifting by turbine hall cranes. Kindly confirm our understanding. Also, Mahagenco is requested to reconsider single EOT crane with genrator stator lifting option (b) since our generator stator is not recommended to lift after erection, which will save i. one TG hall EOT ii) Civil cost of TG building & other auxiliaries (Electrical).	Each crane shall have 125% of equipment weight. In case of bidder opting for option (b) mentioned in the specifications for lifting Generator Stator , two cranes shall be provided as per bid specification (Vol. III-I). Please also refer Corrigendum - VIII ..

VOLUME -II					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
7	SECTION - 8	1.4.10	It shall be demonstrated at SH and RH outlets (in case of more than one outlet) that the temperature imbalance between the outlets does not exceed	It can be met during only steady state. Doosan recommend to revise paragraph as below. It shall be demonstrated at SH and RH outlets (in case of more than one outlet) than the temperature imbalance between the outlets does not exceed 10°C under all loads.	Bid specification prevails .
8	SECTION - 8	1.4.16	(b) Maximum continuous output at generator terminals corresponding to all HP Heaters out of operation under rated steam conditions with 1% make up.	Mahagenco to clarify whether 100% TMCR output is required during all HP heater out condition.	Please refer Corrigendum - II / Sr. 30, page 18 of 274.
9	SECTION - 8	1.4.18 (Sr.. no. 191 of Pre-bid clarification issued on 07.07.2012 and Sr. no. 16 of clarification issued on 10.12.2012.	(The constant pressure operation from 0 to 35/40% of TMCR & 90% TMCR to VWO condition and sliding pressure operation from 35/40% to 90% TMCR in conjunction with the steam generator, HP-LP bypass system and Instrumentation & Control system shall be demonstrated. In sliding pressure mode of operation, during quick load increase, the idle control valve (s) must respond rapidly to pick up 20% of operating load, so that immediate increase of boiler pressure is not required. The load response capability shall be demonstrated in steps of 5%. Changeover from constant pressure mode to sliding pressure mode and vice-versa shall also be demonstrated.	1) We are considering sliding pressure operation from 40% to 90% TMCR . Please confirm our understanding. 2) These capabilities of the plant can be checked as a part of Commissioning test and hence we request you to delete the requirement of category III guarantee. We propose following operation concept as per standard and proven practice of the Bidder : 1) 0 to 40% TMCR: Constant Pressure Operation. 2) 40% TMCR to 100% TMCR: Pure Sliding Pressure Operation, with instantaneous output increase of 5% achieved through overload valve. This is in accordance to cl. no. 4.8 (d) of Grid Code (L/68(84)/2006-CERC, dtd: 14/03/2006). 3) 100% TMCR to 105% TMCR: Constant Pressure Operation through overload valve. The generating unit shall be capable of instantaneously increasing the output by 5%, limited to 105% TMCR as per cl. no. 4.8 (d) of Grid Code (L/68(84)/2006-CERC, dtd: 14/03/2006). No throttling is envisaged in sliding pressure operation.	Bid specification prevails.
10	SECTION - 8	1.4.26	(c) Cold startup/hot startup of the unit using TDBFP with motive steam from auxiliary steam header shall be demonstrated.	Bidder requests Owner to delete this Category-III guarantee as unit start-up requirement using TDBFP is not envisaged in respective specification and customer PFDs i.e. PE-189-PF-204 & PE-189-PF-205. Auxiliary steam if considered for BFP Drive turbine operation then operation of drive turbine becomes inefficient with primary source of steam and is loss of cycle heat rate. It is therefore recommended to use 2 x 30% MDBFP for starting of the plant in case of cold startup/ Hot start up. Also, as per pre-bid clarification (sl no. 187), Mahagenco has clarified TDBFP connection with auxiliary steam is not required. Hence, MAHAGENCO is requested to clarify the same.	Pl. Refer PBQ clarification no. 205, Bid specification prevails.

BHUSAWAL THERMAL POWER STATION 1X660MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE-BID QUERIES					
BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME -III A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	SECTION - 1	5.1.3	The Steam Generator unit shall be capable of operating on sliding pressure mode .The load range for sliding pressure unit operation shall be from 35% to 90% Turbine Generation Maximum Continuous Rating (TGMCR) to 90 % TGMCR and constant pressure mode between 90% TGMCR to 100% TGMCR.	1) We are considering sliding pressure operation from 40% to 90% TMCR . Plaes confirm our understanding. 2) These capabilities of the plant can be checked as a part of Commissioning test and hence we request you to delete the requirement of catagory III guarantee. We propose following operation concept as per standard and proven practice of the Bidder : 1) 0 to 40% TMCR: Constant Pressure Operation. 2) 40% TMCR to 100% TMCR: Pure Sliding Pressure Operation, with instantaneous output increase of 5% achieved through overload valve. This is in accordance to cl. no. 4.8 (d) of Grid Code (L/68(84)/2006-CERC, dtd: 14/03/2006). 3) 100% TMCR to 105% TMCR: Constant Pressure Operation through overload valve. The generating unit shall be capable of instantaneously increasing the output by 5%, limited to 105% TMCR as per cl. no. 4.8 (d) of Grid Code (L/68(84)/2006-CERC, dtd: 14/03/2006). No throttling is envisaged in sliding pressure operation.	Bid specification prevails.
2	SECTION - 1	5.16	5.16.20 Coal chutes of approved type and size shall be provided between raw coal Bunker shut off gate and inlet to the raw coal feeder and from feeder to the Mills. Height of coal chute between Bunker outlet and feeder inlet shall be adequate to prevent hot air to come up. A minimum height of 300 mm for each 75 mm water pressure shall be kept. Size of the coal chute at feeder inlet and outlet shall be minimum 900 mm. Material of chute shall be stainless steel. Coal chutes shall be provided with poke holes with 50% flanged type opening area and emptying chute to be suitable for loading trucks placed in ground floor.	Coal feeder outlet chute size will be applied minimum 600mm as per CEA regulations. In addition, to optimise coal mill performance & coal distribution coal chute design shall be applied as 600mm We have many experience applying to coal feeder outlet chute size as minimum 600mm.	Bid specification prevails.
3	SECTION - 1	5.16	5.16.23 The Bidder shall clearly describe in the proposal, the means provided to measure the coal level in the mill.	Coal level measuring is applied to tube mill. It isn't applicable to vertical spindle type mill.	Bid specification prevails .
4	SECTION - 1	DATASHEET - A	7.3 Unburnt Combustibles at Economiser outlet as % of Fly Ash to be considered for determining boiler efficiency	Please clarify whether 1.0% of fly ash is unburned heat loss(UBL) or unburned carbon in fly ash(UBC).If it means UBC, 1.0% is generally too low to meet.	Bid specification is self explanatory.

5	SECTION - 1	DATASHEET - A	10.5 RH temperature variation C (a) By burner tilting with supplementary water spray (between 60% and 100% BMCR) within $\pm 5^\circ\text{C}$ under steady state and in case of load change at the rate of 3% per minute within $\pm 10^\circ\text{C}$.	The 3%TMCR/min ramp rate with expected RH temperature variation $+15^\circ\text{C}$, -24°C are recommended for the stable operation of plant. And, the ramp rate test shall be conducted according to following conditions. 1. Ramp rates and times are based on no mills being put into or taken out of service during the ramp rate test. 2. Steady-state conditions of pressures, temperatures and flows must be established at the start of the test. 3. A dead band time due to the combustion system must be ignored to the ramp time. 4. The last part of load range must be ignored to the ramp time, because the controller will automatically reduce the the ramp rate near the final target load to reduce the variation and improve the stability.	Bid specification prevails.
6	SECTION - 1	DATASHEET - A	14.7 Material of Construction	All material and thickness of mill will be covented according to mill manufacturer's standard. Spring journal -> Hydraulic system applied.	Bid specification prevails .

VOLUME -III B

Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	1	Data Sheet -A clause no. 1.3	0.5 to 35% TMCR - Constant Pressure Operation 35 % to 90% TMCR - Sliding Pressure Operation 90% to VWO - Constant pressure operation Maximum sustained overpressure of at least 10% of the design turbine inlet steam pressure.	1) We are considering sliding pressure operation from 40% to 90% TMCR. Please confirm our understanding. 2) These capabilities of the plant can be checked as a part of Commissioning test and hence we request you to delete the requirement of category III guarantee. We propose following operation concept as per standard and proven practice of the Bidder : 1) 0 to 40% TMCR: Constant Pressure Operation. 2) 40% TMCR to 100% TMCR: Pure Sliding Pressure Operation, with instantaneous output increase of 5% achieved through overload valve. This is in accordance to cl. no. 4.8 (d) of Grid Code (L/68(84)/2006-CERC, dtd: 14/03/2006). 3) 100% TMCR to 105% TMCR: Constant Pressure Operation through overload valve. The generating unit shall be capable of instantaneously increasing the output by 5%, limited to 105% TMCR as per cl. no. 4.8 (d) of Grid Code (L/68(84)/2006-CERC, dtd: 14/03/2006). No throttling is envisaged in sliding pressure operation.	Bid specifications prevail.
2	1	12.12	Components The system comprises of oil tanks, defoaming chambers, vapour extractors, pumps, coolers, filters, interconnecting pipes, fittings, valves, gauges, thermometers. A Control and monitoring panel complete with annunciation shall be furnished. Damper tank for supply of oil to seal oil system under emergency condition may be considered.	As per Bidder's standard practice, seal oil coolers are not provided.	Bid specifications prevail.
3	1	5.2.5, Data Sheet-A	SCR : Not less than 0.48	As per Bidder's standard practice SCR not less than 0.45 shall be provided.	Bid specifications prevail.
4	1	12.11	One (1) detector in water inlet and one (1) in water outlet of each hydrogen cooler.	As per Bidder standard practice only simplex type RTDs shall be provided.	Bid specifications prevail.
5	1	12.11	One (1) detector in gas stream entering and one (1) in gas stream leaving each hydrogen cooler.	As per Bidder standard practice only simplex type RTDs shall be provided.	Bid specifications prevail.

VOLUME -III B					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
6	1	12.11	Twelve (12) detectors, four per phase and uniformly distributed around the stator, should be located at hottest possible zones between insulated coil sides in stator slots.	As per Bidder standard practice only simplex type RTDs shall be provided.	Bid specifications prevails .
7	1	12.11	Twelve (12) detectors for stator core of which six (6) shall be located in the end zones.	As per Bidder standard practice only simplex type RTDs shall be provided.	Bid specifications prevails .
8	1	12.12.3	Main Features The seal oil stream shall have three (2 x 100% AC & 1 x 100% DC motor driven) pumps one running and others standby for automatic cutting in on loss of seal oil pressure. Upon failure of both pumps, the seal oil supply shall be maintained by a 100% emergency seal oil pump (D.C. motor driven) without any interruption. There shall be individual starting/control panels for each pump and one common signalling panel. The A.C. seal oil pump shall also be connected with D.G. set to cater emergency. Seal Oil Coolers and filters shall be of 2 x 100% capacity designed for 36°C cooling water (DM quality) temperature. The piping and valve arrangement shall permit taking out any cooler/filter without affecting operation of the system. Seal Oil System shall have connection to turbine main oil system for make-up and also for excess return. The turbine main oil system shall also serve as a back-up to seal oil system. The H2 side oil drain shall be suitably degassed before being returned to main oil system. The Seal Oil system shall be supplied through two separate and independent streams - one for air side and the other for H2 side. The arrangement shall be such that even in case of failure of H2 - side stream, sealing shall be maintained by the air-side stream.	As per Bidders standard practice only one Main Seal Oil pump shall be provided.	Bid specifications prevails .
9	1	12.13	The gas system comprises a hydrogen gas circuit for cooling the stator core and rotor windings, a carbon-di-oxide scavenging system and compressed air supply. The system is required to fill the generator with hydrogen, maintain it under pressure, monitor and control gas purity, and to empty the generator of hydrogen. The design is such as to ensure safe filling/emptying by preventing formation of explosive H2 - air mixture. For filling, air is first displaced by CO2, which in turn is replaced by H2. While emptying, H2 is first displaced by CO2 before admission of air in the machine. The major system components are H2 and CO2 gas manifolds, H2 gas coolers, side stream H2 drying equipment, inter-connecting piping, fittings, valves, gauges and other instruments, control monitoring panel complete with annunciation. Hydrogen shall be circulated in the generator in closed circuit by fans fitted on the rotor shaft at either end. H2 gas is cooled by DM water heat exchangers located in the generator housing. The cooler shall be of sectionalised design such that with one cooler section out of service, the unit can carry at least three-fourth rated load continuously, without exceeding the permissible temperature limits. Hydrogen coolers shall be so designed that it is possible to meet the full load requirement of the machine with at least ten (10) percent of the tubes in each cooler plugged.	As per Bidder's standard practice hydrogen gas dryers are not provided.	Bid specifications prevails .

VOLUME -III B					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
			Two (2) full capacity refrigeration type H2 - drier with in-situ reactivation facility shall be provided. The arrangement shall be such that one drier can be taken out of service for reactivation without affecting the system performance in any way. H2 Storage and handling Unit shall be located as per the rules of Indian Explosives. H2 Purity unit, online dew point measurement equipment & Gas analyzer shall be provided. The valves in gas system shall be of special design to minimise gas leakage. Safety relief valves shall be furnished both on low and highpressure sides of the gas system. A manually operated vent valve shall be provided for discharging casing hydrogen to atmosphere in case of emergency to a location outside the building top. During the transportation, storage and also during long shut down the machine shall be kept under nitrogen atmosphere. Bidder shall bring out the requirement, if any, of Nitrogen gas. The complete nitrogen system along with the necessary nitrogen cylinders shall be furnished.		
10	1	2.1.12.9 (e)	Simulated tests on excitation and AVR circuits to demonstrate control, response, discrimination and excitation limit features.	It is not Bidder's standard practice to perform integrated tests.	Bid specifications prevail .
11	SECTION - 3	1.1	Two (2) Turbine driven pumps will be operating normally while the two electric motor driven pumps (2 x 30%) shall remain as a standby units and will come into operation automatically in case any of the working pumps fail.	We understand that, during normal operation, on failure/trip of any working TDBFP, the 2 x 30% motor driven stand-by pumps will come into operation sequentially and not simultaneously	Confirmed that on failure/trip of any working TDBFP, the 2 x 30% motor driven stand-by pumps will come into operation sequentially and not simultaneously.
12	SECTION - 3	1.2	1.2.3 The pumps shall be designed to withstand transient condition due to load swing of the unit from full load to no load. Adequate design margins shall be provided in the pumps for turbine bypass operation.	"Adequate design margins shall be provided in the pumps for turbine bypass operation", does it mean only two(2 x 50%) CEP shall be able to cater the turbine bypass requirement? or the third CEP can also be taken into service during turbine bypass?	Only two(2 x 50%) CEP shall be able to cater the turbine bypass requirement.
13	SECTION - 3	2.1	2.1.1 (d) Sole plates, pin and key blocks or other support structure and a common base plate (with foundation anchor bolts/inserts, drip lip and drain) for booster pump and gearbox, motor drive.	We understand that "motor drive" is not applicable here.	Confirmed.
14	SECTION - 3	2.1	2.1.2 (b) Balance chamber leak-off flow orifice for boiler feed pump.	Cl. no. 2.1.1 (a) for Turbine drive BFP says "Balance chamber leak-off flow orifice for boiler feed pump, if required." we understand that the Cl. no. 2.1.2 (b) as "Balance chamber leak-off flow orifice for boiler feed pump, if required"	Confirmed.

VOLUME -III B					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
15	SECTION - 3	2.1.3	(b) Exhaust ducts from the auxiliary turbines along with metallic expansion joint and butterfly valve. The exhaust duct shall be self-draining to the condenser.	In case of Drive turbine at 0m.(ground floor), the complete exhaust duct may not be self draining to condenser, in such case suitable drain arrangement along with automatic drain valve shall be provided to drain the condensate to condenser.	Agreed. Draining must be positive.
16	SECTION - 3	3.1	3.1.3 Each pump shall exhibit the same type continuously rising characteristic from rated duty point to shut-off. The pumps should be capable of parallel operation without instability at all speeds and share equal load. Shut-off head shall not, however, be less than 120% and shall not be more than 130% of the head developed at pump design point.	"...share equal load." we understand that this point is applicable only if either Two TDBFPs are operating in parallel or Two MDBFPs are operating in parallel.	Agreed.
17	SECTION - 3	3.1	3.1.5 The pumps shall be capable of accepting, without damage, any transient reduction in suction pressure including dry run condition causing cavitation and shall accept, without distress, the re-establishment of normal suction conditions following the transient, with no necessity for a pump shut down.	what is meaning of dry run condition? full dry running of BFP is not recommended by pump manufacturers.	Bid specifications prevail .
18	SECTION - 3	3.1	3.1.25 The Boiler Feed Pumps shall be capable of coasting down safely to standstill after it is tripped in the event of a sudden interruption of suction flow. The Bidder shall demonstrate this capability by a suitable dry-running test at his works and shall furnish full details of this proposed test including its duration etc in the bid.	is it required to be submitted during the bid stage?	Yes. It is required.
19	SECTION - 3	3.1	The feed pump shall be capable of a full dry running condition. The feed pumps shall have following capabilities:	Full dry running of pump is not recommended by suppliers.	Bid specifications prevail .
20	SECTION - 3	3.1	(b) The Feed Pumps shall be capable of accepting without damage transient reduction in suction pressure well below those required for freedom from cavitation and shall accept without distress, the re-establishment of normal suction conditions following the transient, with no necessity for a pump shut down.	Operation of pump with suction pressure below vapour pressure is not recommended.	Bid specifications prevail .
21	SECTION - 3	3.1	(c) The Feed Pump shall be capable of operating under full vapour locked condition for 15 minutes (i.e. following an inadvertent closure of suction valve) and rundown to rest from this vapour locked condition without endangering the pump rotor or subsequent detrimental effect in pump overall performance.	Meeting this requirement may not be possible. (to be checked with pump suppliers)	Bid specifications prevail .
22	SECTION - 3	3.1	(c) To establish above criterion, the Bidder shall necessarily submit the full backup calculation, rotor response characteristics, various internal clearances and other features, test reports for similar pumps meeting the above design condition.	as commented in the previous clause, meeting all the above conditions may not be possible	Bid specifications prevail .
23	SECTION - 3	3.1	In order to demonstrate the above capabilities at shop, the Bidder shall furnish complete testing procedure along with the bid.	we understand that this is not required during bid stage	Please refer Sr.no. 211 of PBQ clarifications dtd. 07.07.2012
24	SECTION - 3	3.2	3.2.3 Each Steam Turbine exhaust shall be separately ducted to the steam Surface Condenser, which serves the main Turbine Generator Unit. The exhaust duct shall be self draining to the Condenser.	In case BFP and the drive turbines are at ground floor, the drive turbine exhaust ducts may not be self draining to condenser, in such case suitable draining provision shall be provided to drain the exhaust duct to condenser.	Agreed. Draining must be positive.

VOLUME -III B					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
25	SECTION - 3	3.3	3.3.9 The pump rotor assembly (with guides) shall be so designed as to keep its vibration, in both wet and dry running conditions, within the safe limits as specified in relevant International Standards/Codes. (e.g. 'Good' range of VDI 2056/MIS, USA recommendations).	Pump Vibration limits shall be as per HIS	Bid specification prevails .
26	SECTION - 3	5.6	5.6.1 Each Pump set shall be provided with a complete pre ssure lubrication system of sufficient capacity for both pump and drive motor, consisting of oil pump, sump tank, water cooled oil coolers (2 x 100%, shell & tube type or plate type heat exchanger), duplex oil filter, level indicator, sight flow indicator, thermometers, relief valves, pressure regulators and necessary valves, all interconnected piping and accessories. The oil cooler tubes shall be of SS-304. The coolers shall be designed for service with de mineralized water. The oil pump shall be driven by the feed pump shaft and all parts of the system shall be mounted as an integral part of the feed pump assembly. Provision must be made to ensure continuity of oil supply even during reverse rotation of feed pump, and during low frequency operation of oil pumps.	"The oil pump shall be driven by the feed pump shaft" -we understand that this is applicable for Motor driven BFP only	Noted. Bid specification prevails.

BHUSAWAL THERMAL POWER STATION 1X660MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE-BID QUERIES					
BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME -III C					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	Vol-III C	2.1.2	Rack and pinion gates	As per referred clause, Rack & Pinion Gates in between Apron Feeder & W. T. Hopper have been proposed which is not feasible whereas in the Process flow Diagram : Coal Handling System (Dwg. No. PE-189-PF-226, P1) nothing has been shown. So please confirm whether these are required or not.	Please refer corrigendum - I Sr. no. 3
2	Vol-III C	2.1.3	Coal feed	As per referred clause, Conveyor 1A/1B shall feed to conveyor 2A/2B through chutes and rack and pinion gates whereas in the Process flow Diagram : Coal Handling System (Dwg. No. PE-189-PF-226, P1) flap gates have been shown in the discharge chute of conveyor 1A/1B. Kindly specify which one to be considered.	Please refer corrigendum - I Sr. no. 4
3	Vol-III C	2.1.16	Coal feed	As per referred clause, Conveyor 5A/5B shall feed bunkers through Travelling Trippers having one way discharge chute whereas as per the Process flow Diagram : Coal Handling System (Dwg. No. PE-189-PF-226, P1) Conv 5A/5B shall discharge either by Travelling Trippers or discharge at head pulleys in the Bunkers. We are considering the travelling Trippers (TTR-1 & TTR-2) shall be fitted with two way discharge chutes with Flap gates. Please confirm.	Bid specification prevails.
4	Vol-III C	2.1.17	Coal feed	As per referred clause, Conveyor 6A/6B shall feed bunkers through Travelling Trippers having one way discharge chute whereas as per the Process flow Diagram : Coal Handling System (Dwg. No. PE-189-PF-226, P1) Conv 6A/6B shall discharge either by Travelling Trippers or discharge at head pulleys in the Bunkers. We are considering the travelling Trippers (TTR-3 & TTR-4) shall be fitted with two way discharge chutes with Flap gates. Please confirm.	Bid specification prevails.
5	Vol-III C	2.1.18 & 2.1.21	Blending	Kindly elaborate the capacity controlling method for blending of indigenous & imported coal.	Bid specification prevails.
6	Vol. - III C	5.1.7	Idlers	We are considering idler shall be fitted with seize resistant ball bearings instead of split case type bearings. Kindly confirm.	Please refer corrigendum - II, Sr. no. 25
7	Vol. - III C	5.1.10, 5.1.11, 5.1.12, 5.1.13, Data sheet of Gear Box, Couplings.	Type of drive	Please confirm the type of drive to be used.	Please refer PBQ clarification 51 dtd.07.07.2012
8	Vol. - III C	Data Sheet-A, Note-6	Standard	As per the referred clause, power requirement and belt tensions shall be calculated as per CEMA standard whereas in Sl. no. 10 of pg no. 267 of 495 of Data Sheet B of Vol.-III- A1, section -13, it is specified that power requirement and tension calculations shall be calculated as per IS-11592. Please clarify which one (CEMA or IS) we should follow.	CEMA should be followed for power and belt tensions.
9	Vol. - III C	8.1.3	Flow path	Kindly specify which of the flow paths to be considered for arriving at the Auxiliary power Consumption for Coal Handling System.	Bidder shall indicate Auxiliary Power Consumptions for all the paths and the path having maximum power consumption shall be considered for arriving at the Auxiliary Power Consumption for Coal Handling System.

BHUSAWAL THERMAL POWER STATION 1X660MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE-BID QUERIES					
BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME -III D					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	Vol-III D	CL No. 3.1.1 & 5.4.1 ©	BA hopper volume	Bottom ash hopper volume shall be 8 hours of actual bottom ash generation at BMCR, as per data from boiler supplier. Kindly confirm.	Bid specification prevails.
2	Vol-III D	4.2.4 & DRG. No. PE-189-PI-238, P3	Flushing boxes	Flushing box with necessary arrangement below each eco-hopper shall be provided as specified in Vol-IIID, CL No. 4.2.4 , Page 25 of 175. Where Feeder ejector below each eco-hopper has been shown in DRG. No. PE-189-PI-238, P3. We understand that the scheme shown in drawing will prevail. Please confirm.	The scheme shown in DRG. No. PE-189-PI-238, P3 shall prevail.
3	Vol-III D	4.19 & 6.18.8 (d)	Flange connections on disposal piping	As per CL. No. 6.18.8 (d), Page 72 of 175, bidder to provide 10 disposal points. Hence, flange connections shall be provided on those 10 points and no other flange connection are required in HCSD system. Please confirm.	Bid specification prevails.
4	Vol-III D	5.5.1	FA extraction capacity	All 6 Nos. FA pressure conveying system may not be of same capacity as specified. Pressure conveying streams from 1st and 2nd field may be of higher capacity than that of from remaining fields. However the total FA transportation capacity for the unit will be 220 TPH which will evacuate entire ash of 8 hours shift in 6 hours as specified. Please review and confirm.	Bid specification prevails.
5	Vol-III D	4.21.17	PRV	No such automatic pressure relief valves are being installed in HCSD system and the same may be reviewed and deleted.	Agreed.

BHUSAWAL THERMAL POWER STATION 1X660MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE-BID QUERIES					
BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME -III E1					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	1	4	4.8.5 (h) Necessary toilets with basin & mirror and operator's cabins with drinking water facility.	As per tender, filtered water reservoirs to be sized to store filtered water of 24 hours requirement or 45000 m3 and 900 m3 for Non DM & DM filtered water storage tank respectively, whichever is higher. This requirement is unusual in power plant application. Kindly review the same & amend the requirement accordingly.	The query raised is not related to the clause in the specification. However, the reservoir capacities are already reviewed as 15000m³ and 900 m³ for Non DM & DM filtered water storage tank respectively.
2	1	2.2.1	Two numbers (2 x 100%) vertical wet pit type Potable water pumps for plant shall convey potable water to the potable water overhead Storage Tank to be located on the roof of TG building. Tank shall be designed for minimum 50 m3 storage.	Bidder offered the pressurized Potable water distribution system instead of gravity distribution to optimize the design load on TG building. Accordingly, Bidder provided 5 M3 capacity Potable water storage tank on TG building instead of 50 M3.	Bid specification prevails.
3	1	2.2.3	Service Water from Filtered Water Storage Tank shall be transferred to the Overhead Service water tank located on TG building roof by means of two numbers (2 x 100%) vertical wet pit type service water pumps. Tank shall be designed for minimum 150 m3 storage.	Bidder offered the pressurized service water distribution system instead of gravity distribution to optimize the design load on TG building. Accordingly, Bidder provided 10 M3 capacity service water storage tank on TG building instead of 150 M3.	Bid specification prevails.
4	1	4.5	Filtered Water Storage Tank for Non-DM shall be adequately designed for effective total capacity of one day storage, minimum 45000 m3.	Bidder provided 4 Hrs storage capacity to store the filtered water for Non-DM instead of 24 Hrs. Please confirm.	Please refer Corrigendum-VIII.
5	1	4.5	Filtered Water Storage Tank for DM shall be adequately designed for effective total capacity of one day storage, minimum 900 m3.	Bidder provided 4 Hrs storage capacity to store the filtered water for DM instead of 24 Hrs. Please confirm.	Bid specification prevails.
6	2	ANNEXURE-I	7.0 TDS ppm 870	Cation & Anion mentioned in the Raw water analysis as 585 ppm each, therefore TDS should be around 1170 ppm. Please clarify.	Annexure - I Sr. no. 7 shall prevail.
7	2	ANNEXURE-I	20.0 Total Suspended Solids ppm Not Available	Please furnish the following Raw water parameters currently mentioned as "Not Available": TSS, Carbonates, Boron, Oil&Grease.	TSS & Carbonates - Not available .Oil & Grease - Nil and boron - Less than 1 (one) ppm.
8	2	ANNEXURE-I	21.0 Carbonates as CaCO3 ppm Not Available	Please furnish the following Raw water parameters currently mentioned as "Not Available": TSS, Carbonates, Boron, Oil&Grease.	TSS & Carbonates - Not available .Oil & Grease - Nil and boron - Less than 1 (one) ppm.
9	2	ANNEXURE-I	22.0 Boron ppm Not Available	Please furnish the following Raw water parameters currently mentioned as "Not Available": TSS, Carbonates, Boron, Oil&Grease.	TSS & Carbonates - Not available .Oil & Grease - Nil and boron - Less than 1 (one) ppm.
10	2	ANNEXURE-I	23.0 Oil & Grease ppm Not Available	Please furnish the following Raw water parameters currently mentioned as "Not Available": TSS, Carbonates, Boron, Oil&Grease.	TSS & Carbonates - Not available .Oil & Grease - Nil and boron - Less than 1 (one) ppm.

VOLUME -III E1

Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
11	2	1.1	The design flow rate of Gravity filters for DM & Non DM is 50 m3/hr and 2000 m3/hr respectively.	As per the data sheet A (Clause No. 19.2.1 / Page no. 64 of 313) , Bidder considered the design capacity of the gravity filters is 1800 m3/hr & 100 M3/hr for Non-DM and DM. Please confirm.	Please refer PBQ clarification 12 dtd. 07.07.2012
12	2	3.1.5	Dosage rate of poly electrolyte : 5 ppm.	5 ppm Dosage rate of poly electrolyte is seems to be on higher side. 2 ppm is more than sufficient for Pre treatment plant applications. Please check and confirm.	Min. 2 (Two) ppm
13	2	7	Analysis of raw water : TDS - 870 ppm.	As per the tender specification, Resin based demineralization plant is envisaged. Resin based demineralization plant is not an economical option for such a high TDS i.e. 870 ppm. Please check and confirm.	Bid specification prevails.
14	3	3.4	The total time of regeneration of a complete DM Stream (Dual Media Filter, Activated Carbon Filter, Cation Exchanger, Anion Exchanger and Mixed Bed Exchanger Unit) shall not exceed four (4) hours.	As per the tender P & ID and specification for PT / DM Plant, Dual media filter is not applicable and bidder not considered the same. Please confirm.	Clause no.3.4 of the specification shall prevail.
15	3	1.0	1.1 The DM Plant capacity shall be arrived at based on bidder's basic engineering. However, a minimum net capacity of 2 x 100 m3/hr shall be provided. Under normal condition, one stream is envisaged to be kept in operation.	As per tender requirement two stream DM plant with 100 m3/hr each is envisaged. Also as per tender raw water chemistry, TDS of DM plant inlet is about 850 ppm. According to the above conditions, following are the concern for your review- 1. DM plant vessels size will be large enough which will not be techno commercial justified. 2. Since tender requires 2 DM storage tanks of 1000 m3 each & 1 CST of 850 m3. DM plant capacity seems to be on much higher side. 3. As per supercritical power plant worldwide there is no normal make up & 1% make is followed to compensate aux steam consumption & other cycle losses. Hence, 2x100 m3/hr DM plant is not suited for 1x660 MW supercritical power plant. We request Mahagenco to review our below proposals & amend the DM plant type & capacity- 1. RO-MB based DM plant with 100 m3/hr capacity, if Mahagenco requires high flow DM plant otherwise 2. Conventional DM plant (as asked in tender) of 60 m3/hr, each stream.	Bid specification prevails.
16	4	1.2.8	To reduce the Suspended Solids in the cooling water, at least 2.0 % of the total Circulating Water shall be passed through Automatic Valve less Gravity Filter Units.	As per the specification, Filtered water is envisaged as a make to the cooling tower. Hence, side stream filter is not applicable to maintain the solids load. Please check and confirm.	Bid specification prevails.
17	4	1.2.9	The redundancy in the Side Stream Filtration System shall be at least 15 % with a minimum of two (2) modules as standby. Autom atic Valve less Gravity Filters and all other accessories.	As per the data sheet A (Clause No. 2.1.1 / Page no. 216 of 313) , Bidder considered the One (1) number of standby filter (AVGF) as a redundancy instead of Two (2) numbers / 15% . Please confirm.	Bid specifiction prevails.
18	5	4.5	The treated water from OWS may be discharged in retention pit for treated water from OWS collection pit from where treated water shall be pumped finally to Ash Slurry Sump.	Mismatch with tender P & ID. As per the tender P & ID of effluent treatment system, the treated water from OWS shall be routed to in plant ash water tank. Please confirm.	There is no mismatch . The treated clear water from OWS shall be pumped in to the ash water sump and then finally to ash slurry sump through process. The sludge water shall be pumped to Ash Slurry sump.

VOLUME -III E1					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
19	5	4.5	Suspended solids in treated water : 50 mg/l max.	Mismatch with data sheet. As per the data sheet A (Clause No. c / Page no. 261 of 313) , the suspended solids in treated water not to exceed 20 ppm. Please confirm.	Please Ref. Corrigendum -II/ #16
20	Addendum-III	2.2	Raw water source : From Ozerkheda (pipe line terminal) to One Day Reservoir as indicated in the plot plan and in line with the other details like terminal points etc. indicated in the Original Tender specification.	Kindly specify the coordinate of the tapping point from the existing pipe line for 2x500 MW unit for the Raw water to be drawn from Ozerkheda Reservoir along with the flow rate of raw water to be drawn from this point for the proposed 1X660 MW TPP and the available pressure at this tapping point. Also kindly furnish the relevant geotechnical report and contour along the said pipe route.	Minimum diameter of pipe leading to 1x660MW unit from Tapping point of Ozerkheda Pipeline shall be 1600mm. Also necessary isolation arrangement / flow control valve on pipe line leading to 2x500MW shall be provided to ensure required discharge for 1x660MW. Other details are as follows: (1) Intake level of water supply pipe line from Ozerkheda dam for 2X500MW unit is 261.600 M. (2) Intake level of tapping point from Ozerkheda pipe line leading to 1X660 MW project is 204.550 M. The head available at tapping point is (261.600 - 204.550) i.e. 57.050 M. (3) Considering the top of one day reservoir at FGL, the invert level of pipe line at one day reservoir will be 213.000 M.
21	Addendum-III	2.4	The scope under this addendum covers providing and laying MS gravity pipeline of requisite diameter in the existing inlet canal from Tapi river pump house to aqueduct along with tapping and isolation arrangement for 2x500 MW project.	Kindly furnish the coordinate of the interconnection point of proposed Raw water pipeline with the existing pipeline for 2x500 MW unit. Also kindly furnish the Contour along this path.	Co-ordinate of interconnection point will be decided during detailed engineering. Approximate length of pipe to be connected is given in data sheet. The existing pipe is to be extended for connection to the proposed pipe line coming through inlet canal as per site conditions with provision of isolation valve on MS. gravity line.
22	Addendum-III	3.1 (c)	Providing and laying M.S. pipe line from existing (abandoned) Pump House to one day reservoir of 1x660 MW unit including necessary isolation wherever required renovation of Pump House and sump along with provision of required electrical and mechanical works, including providing Three pumps (2W+1S/B), valves, electrical, control and instrumentation, and appurtenances."	We understand that the modification is required to be done by the EPC contractor. Kindly furnish the GA & elevation drawing of Existing (Abandoned) Pump house indicating the High, Low & Normal water level. Also kindly furnish the high & low level of the Canal.	Please refer note # 1 of the Annexure-II- May 2013.- Layout of proposed pipe line from Tapi river water pump house to aqueduct & proposed pipe line from existing (abandoned) pump house to one day reservoir of 1x660MW and clarification at Sr. no. 5 (Letter no.1863 dtd. 03.06.2013)
23	Addendum-III	-	'L Section of Pipe line for 660 MW' and 'Plan for pipe route 660 MW'	In the L-section drawing of proposed Raw Water Pipe line along the Intake canal from Existing River Water Pump House at Tapi river to existing Aqueduct, we found that there is a steady slope from 210.4 to 206.84. There is no crossing of any river/nallah/road. However, in the drawing named 'Plan for pipe route 660 MW', few crossing has been shown. Hence, requesting you to review the same and confirm. Also kindly furnish the geotechnical report for the said path.	There is no crossing of any river/nallah along the proposed route of pipe line between existing river water pump house at Tapi River and existing aqueduct.

VOLUME -III E1					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
24	Addendum-III	-	'L Section of Pipe line for 660 MW' and 'Plan for pipe route 660 MW'	In the L-section drawing of proposed Raw Water Pipe line from Existing (Abandoned) pump house to one-day reservoir of proposed unit, we found that there are only two road crossing and one Ash pipe line crossing. However, in the drawing named 'Plan for pipe route 660 MW', crossing of 2 nos railway track, 5nos road crossing are shown. Hence, requesting you kindly review the same and confirm. Also kindly furnish the geotechnical report for the said path.	The tentative route of porposed raw water pipe line from abandoned pump house to one day reservoir is shown in the drawing shown plan view & number of crossings shall be considered accordingly. The Final route of the pipe line shall be decided during detailed engineering as per availability of space. Bidder may visit site for required details. The soil investigation along the route of pipe is in the scope of EPC bid.

BHUSAWAL THERMAL POWER STATION 1X660MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE-BID QUERIES					
BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME -III E2					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	SECTION - 1	3.1	3.1.1 (c) Each individual sump in the CW Pump house shall be designed in accordance with the recommendations specified in Hydraulic Institute/British Hydraulic Research Association/equivalent international standard and its dimensions shall be finally selected after conducting necessary sump model tests by the Bidder.	As per Vol III E2, Sec-1, Cl 2.1.1, Page 13, we understand process software (CFD) is adequate for CW/ACW sump study. Please confirm our understanding.	Clause no. 3.1.1 (c) shall prevail .
2	SECTION - 1	3.1	3.1.11(g) Adequate provision shall be made in each of the pump sump so as to facilitate insertion of isolation gates. Gates shall be fabricated from mild steel, shall be water tight type and shall preferably be of identical size/dimensions to facilitate interchangeability. Sump gates shall be accessible by the pump house overhead crane.	As per CW & ACW pump house GA drawing PE-189-GA-108, Rev P1, we undersatnd that sump gate & screen shall be handled by monorail hoist instead of CW pump house overhead crane. Please confirm our understading.	Please refer Corrigendum-VIII
3	SECTION - 1	3.2	3.2.1 The required flow in this system shall be based on the requirement of each individual connected cooler in this system with respect to flow and terminal temperature rise as encountered during maximum possible thermal load conditions. Bidder shall list out the required flow and terminal temperature rise of each cooler and the number of individual eq uipment coolers (operating/standby) in his Bid proposal. A minimum of 20 % margin shall be considered over and above the total required flo w and heat load to compute the design DMCW flow and design heat load respectively in the closed circuit. In computing the design heat load and design DMCW flow in	Our understanding on heat load margin 20% shall be 20% margin on heat duty during 100% TMCR condition with two TDBFP in operation. Please confirm.	Please refer PBQ Sr. 13 , 14 & 16 dtd. 10.02.2012. Bid specification prevails.
4	SECTION - 1	3.2	3.2.1 individual DMCW system, Bidder shall ensure that the average temperature rise of DMCW is limited to 5.5 0C under all circumstances.	We are requesting Mahagenco to allow us 6.7 deg C average temperature rise of DMCW temperature as per our standard design. Please confirm.	Bid specification prevails.
5	SECTION - 1	3.2	3.2.2(b) Total dynamic head : A minimum of ten (10) % margin over frictional losses based on pumping capacity as obtained in (a) above. Bidder shall compute the frictional losses assuming C = 120 on Hazen and William's formula for design purposes.	We understand that 10% margin will be taken on piping frictional losses only not for losses due to equipment friction. Please confirm.	Confirmed that 10% margin will be taken on piping frictional losses only.
6	SECTION - 2	DATASHEET - A	Sr. 20. (a) Casing <----- ASTM-A296 Gr. CF8M ----->	Since ASTM A296 is withdrawn & replaced by ASTM A743, we are considering ASTM A743 wherever written as ASTM A296. Please confirm.	Please refer PBQ clarification (Sr. no. 24) dtd.07.07.2012
7	SECTION - 2	DATASHEET - A	Sr. 20. (b) Casing Liner <----- ASTM-A296 Gr. CF8M ----->	Since ASTM A296 is withdrawn & replaced by ASTM A743, we are considering ASTM A743 wherever written as ASTM A296. Please confirm.	Please refer PBQ clarification (Sr. no. 24) dtd.07.07.2012

VOLUME -III E2

Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
8	SECTION - 2	DATASHEET - A	Sr. 20. (c) Diffuser <----- ASTM-A296 Gr. CF8M----->	Since ASTM A296 is withdrawn & replaced by ASTM A743, we are considering ASTM A743 wherever written as ASTM A296. Please confirm.	Please refer PBQ clarification (Sr. no. 24) dtd.07.07.2012
9	SECTION - 2	DATASHEET - A	Sr. 20. (d) Impeller <----- ASTM-A296 Gr. CF8M----->	Since ASTM A296 is withdrawn & replaced by ASTM A743, we are considering ASTM A743 wherever written as ASTM A296. Please confirm.	Please refer PBQ clarification (Sr. no. 24) dtd.07.07.2012
10	SECTION - 2	DATASHEET - A	Sr. 20. (e) Wearing Rings <----- ASTM-A296 Gr. C440 ----->	Since ASTM A296 is withdrawn & replaced by ASTM A743, we are considering ASTM A743 wherever written as ASTM A296. Please confirm.	Please refer PBQ clarification (Sr. no. 24) dtd.07.07.2012
11	SECTION - 2	DATASHEET - A	Sr.21. (f) Suction and discharge pressure Indicator Yes, along with Diaphragm Seal Yes, along with Diaphragm Seal	Diaphragm Seal is not required for passivated DM water service. Mahagenco to check & confirm.	Agreed.
12	SECTION - 3A	DATASHEET - A	18.2 Pump type Below floor discharge	As per amendment, metal casing CW pump may be used as an alternate option. Hence, we are requesting Mahagenco to provide above floor discharge pump as an option for ACW & CW pumps.	Bid specification prevails.
13	SECTION - 3B	5.1	5.1.5 The maximum closed valve head shall not be greater than 15% of the rated head including tolerance, to prevent over-pressurisation of the concrete volute.	Shut off head 15% of the rated head seems to be on lower side for this type of pump. We are requesting Mahagenco to leave this clause to bidder & the same will be decided based on pump manufacturer recommendation during detail engineering.	Please refer PBQ clarification (Sr. no. 29) dtd. 07.07.2012
14	SECTION - 3B	5.1	5.1.12 The upper limit of pump efficiency to be considered for this contract is 89%. No credit shall be given for higher efficiency values. (Not applicable in this case).	We understand this clause is not applicable for this project. Kindly confirm.	Specification is self explanatory.
15	SECTION - 3B	5.1	5.1.17(ii) 5% margin over the maximum pump shaft input power required within its operating range including the shut-off point.	As per our understanding, pump motor will be selected based on 5% margin over the maximum pump shaft input power required within its operating range including the shut-off point at 50 Hz. Please confirm.	Bid specifications prevail(Worst condition shall be considered)
16	SECTION - 3B	DATASHEET - A	: All CW Pumps with the job motor	Concrete volute pump(prototype) will not be possible for performance test at shop. Mahagenco to clarify.	Agreed.
17	SECTION - 4	4	4.4.1. The required heat load shall be computed by obtaining the summation of the maximum permissible heat loads encountered in the respective operating coolers of Boiler and TG Islands which shall be cooled by DMCW system. A minimum of 20 % margin over and above the total required heat load as obtained above shall be taken into account by the Bidder to work out the design heat load rejected by DMCW system and to be picked up by ACW system for the same.	Clarification raised as above.	Please refer PBQ clarification (Sr. no. 32) dtd. 07.07.2012
18	SECTION - 4	DATASHEET - A	5.3 However, DMCW system temperature rise not to exceed 5.50C.	Please refer clarification raised above.	Bid specification prevails.
19	SECTION - 4	DATASHEET - A	5.4 . 39 0C (Max.) Bidder to workout. However, ACW temperature rise not to exceed 5.50C	Please refer clarification raised as above.	Bid specification prevails.

BHUSAWAL THERMAL POWER STATION 1X660MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE-BID QUERIES					
BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME -III -I					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	SECTION - 1/A	4.1	4.1.1 The safe working load (Y) for E.O.T. cranes shall be computed as Y = 1.25 a	From the referred clauses, we understand the followings: 1. Tandem operation of TG hall EOT cranes are required if generator stator lifting is envisaged with turbine hall EOT cranes. 2. Capacity of each turbine hall crane shall be computed as Y = 1.25 a/2, if bidder opts for generator stator lifting by turbine hall cranes. Kindly confirm our understanding. Also, Mahagenco is requested to reconsider single EOT crane with generator stator lifting option (b) since our generator stator is not recommended to lift after erection, which will save i. one TG hall EOT ii) Civil cost of TG building & other auxiliaries (Electrical).	Each crane shall have 125% of equipment weight. In case of bidder opting for option (b) mentioned in the specifications for lifting Generator Stator , two cranes shall be provided as per bid specification (Vol. III-I). Please also refer Corrigendum - VIII ..
2	SECTION - 1/A	ANNEXURE-I	1.0 Turbine Hall - Two (2)	From the referred clauses, we understand the followings: 1. Tandem operation of TG hall EOT cranes are required if generator stator lifting is envisaged with turbine hall EOT cranes. 2. Capacity of each turbine hall crane shall be computed as Y = 1.25 a/2, if bidder opts for generator stator lifting by turbine hall cranes. Kindly confirm our understanding. Also, Mahagenco is requested to reconsider single EOT crane with generator stator lifting option (b) since our generator stator is not recommended to lift after erection, which will save i. one TG hall EOT ii) Civil cost of TG building & other auxiliaries (Electrical).	Please refer clarifications to Sr. no.1 above.
3	SECTION - 1/A	ANNEXURE-I	CW Pump House Outside: - Two (2) Semi Gantry Cranes	As per CW & ACW pump house GA drawing no. PE-189-GA-108, Rev-P1, Two nos. monorail hoist(3 ton each) are shown to handle screen & stop log gate instead of semi gantry cranes. Mahagenco is requested to clarify the requirement.	Please refer Corrigendum - VIII.
4	SECTION-3/D	ANNEXURE-I	(4) Service Water Storage Tank Vertical Cylindrical By Bidder 75 2	Since both huge volume tanks are to be located on deaerator floor, it will have major impact on TG hall structural design. Hence, Mahagenco is requested to review the tank capacity & also the location can be left to the bidder choice to meet other tender functional requirement. Also please clarify pressurized service water system is acceptable or not (without tanks).	Please refer Corrigendum - I
5	SECTION-3/D	ANNEXURE-I	(5) Potable water Storage Tank Vertical Cylindrical By Bidder 25 2	Since both huge volume tanks are to be located on deaerator floor, it will have major impact on TG hall structural design. Hence, Mahagenco is requested to review the tank capacity & also the location can be left to the bidder choice to meet other tender functional requirement. Also please clarify pressurized service water system is acceptable or not (without tanks).	Please refer Corrigendum - I

VOLUME -III -I					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
6	3/C	3.8	Two (2) Emergency make-up supply pumps located in Filtered Water pump house for Non-DM complete with electric motor drives and all other accessories as specified in this section and in the datasheet-A attached herewith.	Two (2) nos. Emergency make up supply pumps located in filter water pump house-Non DM have been mentioned in the referred clause although the same is not shown in Process Flow Diagram : Plant Water System (Dwg. No. PE-189-PF-227, P1). Kindly confirm the validity of these pumps along with its purpose.	Two (2) Emergency make-up supply pumps - Deleted.
7	4 /D	3.1	"The details of miscellaneous steel tanks.....as follows:"	Since it is not indicated in the tender specification, Bidder considered IS:2062, Gr. B as the grade of steel for DM water storage Tanks , Service Water Tank and Potable Water Tank fabrication with epoxy painting inside. Kindly confirm your acceptance.	Confirmed.

BHUSAWAL THERMAL POWER STATION 1X660MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE-BID QUERIES					
BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME -IV-A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	SECTION - 1	5.9	5.9.3 Connection of the L.T. dry type transformers to 11kV HT switchgear will be through cable and to L.V. Boards through non-segregated phase bus duct.	Please note that the requirement of NSPBD or Cable at incomer of LV board shall be decided as per current rating during detailed engineering. Customer is requested to accept the same.	Bid specification Prevails.
2	SECTION - 2	3.0	3.2 GT shall be suitable to meet the Generator power rating of 660MW at 0.85 power factor lag without deducting the unit auxiliary power, excitation power or any other power. GT shall be sized with 10% design margin.	Toshiba envisages sizing of Generator Transformer as per Clause no. 3.10 of the bid specification which states- Generator Transformer should be sized to deliver the gross unit output of the generator with turbine operation in VWO (Valve Wide Open) condition and Unit Transformers out of service. The loads of Unit Transformers will be supplied from the station bus for an extended period.	Refer CORRIGENDUM - II , S.No:18, Page No: 104 of 274
3	SECTION - 2	3.0	3.6 The transformer shall be so designed that it is capable of operation at 125% rated voltage for a period of one minute and 140% rated voltage for a period of five seconds due to sudden load throw off.	Toshiba understands that the transformer shall be so designed that it is capable of operation at 110% rated voltage continuously, 125% rated voltage for a period of one minute and 140% rated voltage for a period of five seconds due to sudden load throw off. Please confirm.	Bid specification prevails.
4	SECTION - 2	4.3	4.3.1 Off-circuit tap change (OCTC) as specified in the annexure shall be provided on the high voltage winding.	Please clarify which annexure to be referred to.	Annexure here means Data Sheet - A
5	SECTION - 2	4.7	4.7.5 In general, the arrangement shall be such as to permit removal of transformer without dismantling the bus duct /cable connection.	Please clarify on this requirement.	Bid Specification prevails.
6	SECTION - 2	4.14	4.14.1 Neutral bushing current transformers and phase bushing current transformers shall be furnished when specified in the annexure.	Please clarify which annexure to be referred to.	Refer Annexure - A, Section - 2, Page No: 113 of 440 in same volume IV-A
7	SECTION - 2	4.16.2	Impact recorder/indicator shall be provided to monitor the impact experienced by the transformer during transport.	We envisage impact recorder on returnable basis. Please confirm.	Confirmed . Pl. Refer Corrigendum -XI, Sr. No.1.
8	SECTION - 2	5.0	5.31 Tap-changing gear complete with tap position indicator, operation counter etc. For OLTC gear (where specified), oil surge relay (OSL) with shut-off valve, Local control cabinet and tap changer control in ECP (RTCC) and also DDCMIS/DCS.	We understand OLTC gear is not applicable here. Please confirm.	Confirmed. Pl. Refer Corrigendum -XI, Sr. No.2
9	SECTION - 3	3.0	3.7 IPBD (main run IPBD, Delta run, common tap-off to UT/Individual IPBD tap off to UT, Excitation Transformer Tap-off, SPVT cubicle) shall be sized considering generator voltage +/-10% voltage variation from grid source & generator source.	IPBD (main run) will be sized based on Generator output at VWO condition with 5% negative voltage variation (as mentioned in Volume-IIIB, section-1, page no 53 of 308, clause no:11.6) at generator terminal. Please confirm.	Refer Addendum -V. Sr. no.1
10	SECTION - 3	3.8	(b) 10% margin shall be considered on rating arrived at (a) above.	As mentioned in corrigendum-II, volume-IV-A, sl no:18,IPBD will be sized inline with generator transformer rating. Please confirm.	Deleted. Pl. Refer Corrigendum -XI, Sr. No.3.

VOLUME -IV-A

Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
11	SECTION - 3	4.7	4.7.2 The links shall be suitable for shorting bus conductors/enclosures of three	The mentioned drawing is not available. Please furnish the drawing.	Pl. refer Corrigendum -XI, Sr. No.4.
12	SECTION - 3	DATA SHEET - A	1.1 Rated voltage kV Generation Voltage +-10%	In view of contradiction between the mentioned clauses, we have envisaged voltage variation of generator as +/-5%. Please confirm.	Pl. refer Corrigendum -XI, Sr. No.5.
13	SECTION - 3	DATA SHEET - A	2.3 RATED CONTINUOUS CURRENT	Continuous current ratings shall be as per system calculations. Please confirm.	Pl. refer Corrigendum -XI, Sr. No.6
14	SECTION - 3	DATA SHEET - A	3.6 C.T. RATINGS	Quantity & parameters of CTs shall be finalized during detailed engineering & shall be as per Toshiba standard.	Bid specification Prevails.
15	SECTION - 3	DATA SHEET - A	5.7 OTHER RATINGS Accuracy Class Rated VA	VA rating of VT shall be finalised during detailed engineering.	Bid specification Prevails.
16	SECTION - 3	DATA SHEET - A	6.4 Voltage Ratio Generator voltage/ 220 volt	Secondary voltage of NGT shall be as per Toshiba standard.	Bid specification Prevails.
17	SECTION - 3	DATA SHEET - A	6.5 Rated Output kVA 175 for 5 min	NGT will be sized for 10 second. Accordingly rating of NGT shall be determined However continuous rating will be lesser than short time rating. Please confirm.	Bid specification Prevails.
18	SECTION - 3	DATA SHEET - A	7.3 Resistance ohms 0.212 (Tentative to be	NGR will be sized for 10 second duration. Current rating & ohmic value of the resistor will be as per actual requirement.	Bid specification Prevails.
19	SECTION - 3	DATA SHEET - A	7.5 Voltage V 220	Voltage rating of resistor shall be inline with Toshiba standard practice.	Bid specification Prevails.
20	SECTION - 4	1.0	1.2 MVA rating of the transformer, as indicated above, shall be considered as the minimum requirement for the project. HV side voltage shall change according to Generator voltage. Transformer offered by the bidder & shall be sized according to the maximum demand considering No Load Voltage Correction factor 4% while sizing of Transformer at most stringent condition plus minimum 10% margin. Bidder shall furnish sizing calculation for owners/ consultant review/approval	We have envisaged 5% margin on the operating load and 5% No Load Voltage Correction Factor over that for ST Sizing. Request to accept our proposal.	Bid specification Prevails.
21	SECTION - 4	4.3	4.3.1 On load tap changer (OLTC) as specified in the annexure shall be provided on the high voltage winding, i.e 21 kV	Please clarify which annexure to be referred to.	Annexure here means Data Sheet -A
22	SECTION - 4	4.7	4.7.6 In general, the arrangement shall be such as to permit removal of transformer without dismantling the bus duct/cable connection.	Please clarify on this requirement.	Bid specification prevails.
23	SECTION - 4	4.15	4.15.1 Neutral bushing current transformers shall be furnished when specified in the annexure.	Please clarify which annexure to be referred to.	Annexure A of section IV shall be referred for details of Neutral bushing current transformers.
24	SECTION - 4	4.17	4.17.2 Impact recorder	We have envisaged the impact recorder to be on returnable basis. Please Confirm.	Pl. Refer Corrigendum -XI, Sr. No.7
25	SECTION - 4	4.17	Impact recorder/indicator shall be provided to monitor the impact experienced by the transformer during transport.	We envisage impact recorder on returnable basis. Please confirm.	Pl. Refer Corrigendum -XI, Sr. No.7

VOLUME -IV-A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
26	SECTION - 4	DATA SHEET - A	14.0 Short-circuit impedance at 75c at principal tap 11.5% +-10% on 35 MVA base	% Impedance of the transformers shall be finalized based on System Study results carried out during detail engineering.	Bid specification Prevails.
27	SECTION - 4	DATA SHEET - A	21.3 (b). Protective creepage distance	We have envisaged the protective creepage distance to be less than or equal to 50% of the Creepage distance. Please Confirm.	This will be decided during detail engineering.
28	SECTION - 5	1	1.3 Transformer offered by the bidder shall be sized according to the maximum demand at most stringent condition plus minimum 10 % margin	We have envisaged 5% margin on the operating load and 5% No Load Voltage Correction Factor over that for ST Sizing. Request to accept our proposal.	Bid specification Prevails.
29	SECTION - 5	4.7	4.7.8 In general, the arrangement shall be such as to permit removal of transformer without dismantling the bus duct/cable connection.	We understand that the arrangement shall be such as to permit the removal of transformer only by dismantling bus duct/ cable termination.	Bid specification prevails.
30	SECTION - 5	4.16.2	4.16.2 Impact Recorder	We have envisaged the impact recorder to be on returnable basis. Request to accept our proposal.	Pl. Refer Corrigendum -XI, Sr. No.8.
31	SECTION - 5	DATA SHEET - A	21 (b). Protective Creepage distance mm/Kv Bidder to specify	We have envisaged the protective creepage distance to be less than or equal to 50% of the Creepage distance. Please Confirm.	This will be decided during detail engineering.
32	SECTION - 6	2.0	2.1 All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) and IEC except where modified and/or supplemented by this specification.	Please note that standards available as on date of bid submission shall be considered as latest version of standards. Further modification if any shall be considered with implication in all respects. Customer is requested to accept the same.	Standards available on date of bid submission shall be considered as latest version of standards.
33	SECTION - 6	3.0	3.6 Bus duct and auxiliary equipment shall be capable of withstanding the mechanical forces and thermal stresses of the short-circuit currents listed in the annexure without any damage or deterioration of material.	We understand that the annexure here means the "DataSheet-A" of Segregated Phase Bus-duct". Please confirm.	Annexure here means Data Sheet - A
34	SECTION - 6	4.2	4.2.9 Shipping length of the bus duct shall be not more than three (3) metres in length. Each shipping section shall have at least two (2) supports both for conductor in each phase and enclosure.	Please note that the shipping length of busduct shall be as per manufacturer standard. Customer is requested to accept the same.	Bid specification Prevails.
35	SECTION - 7	1	1.2 (d) 3.3 kV Bunker Switchboard	Please note that the voltage level of Bunker switchgear shall be selected as per the system requirement. Please confirm.	Pl. refer corrigendum XI, Sr. no. 9.
36	SECTION - 7	1	1.3 Additional 11kV switchgears or 3.3kV switchgears for power plant, if required shall also be included under the Scope of power plant EPC Contractor without any price implication. However, Unit rates of HT switchgear feeder shall be furnished for each type of rating.	Please note that we have considered the number of switchgears as per system requirement and the same is basis for our proposal. No additional switchgears are considered. Customer is requested to inform the same should there be any additional requirement, if any, at this stage. Addition of switchgears during detailed engineering stage shall be considered with implication in all respects.	Not acceptable. Specification is self-explanatory.
37	SECTION - 7	1	1.12 Incomer from all the Unit Transformers & Station Transformers shall be provided with Lightning Arrestor 11kV side.	Please note that there is no technical requirement for providing Lightning Arrestor on 11kV side of Unit & Station transformer. Customer is requested to revisit this requirement.	Bid specification Prevails.

VOLUME -IV-A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
38	SECTION - 7	2	2.1 All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) and IEC except where modified and/or supplemented by this specification.	Please note that standards available as on date of bid submission shall be considered as latest version of standards. Further modification if any shall be considered with implication in all respects. Please confirm.	Standards available on date of bid submission shall be considered as latest version of standards.
39	SECTION - 7	3	3.5 Switchgear ratings and quantities are detailed in the Enclosed drawings and Annexure. Equipment shall be furnished in strict accordance with the same. For indicative power distribution, scheme ""Key Single Line Diagram for Electrical systems"" Dwg. No. PE-189-EL-501 shall be referred. All the rating shown in the above drawing represents the minimum requirement only; exact rating, number and type of feeders etc. shall be decided by the bidder.	We understand that the annexure here means the "Data Sheet-A" of HT Switchgear". Please confirm.	Annexure here means Data Sheet - A
40	SECTION - 7	3.11	The continuous rating of the 11/3.3kV switchgear bus and incomer breaker shall be based on the rated LV winding current of the transformer with 20% margin rounded off to the next higher standard rating.	Please note that while arriving at MVA rating of transformer, margin is already considered and next higher standard rating is selected. So as common engineering practice the incomer breaker rating of associated switchgear shall be same as that of transformer secondary winding ampere rating. There is no need of further margin of 20% which will result in oversizing of breaker. Customer is requested to revisit this requirement.	Bid specification Prevails.
41	SECTION - 7	4.1	4.1.9 Each switchboard should be supplied with suitable d rilled foundation frame and anchor bolts from mounting the switchboard at site.	The switchgear baseframe mounting arrangement shall be as per manufacturer standard. Request to accept the same.	Bid specification Prevails.
42	SECTION - 7	4.3	(4.3.9 (a) Two (2) nos. of Trip Coils	We understand that two coils shall be provided. One Closing Coil and One Tripping coil. Please clarify whether our understanding is correct or not.	Specification is self- explanatory. Bid Specification prevails.
43	SECTION - 7	4.17	4.17.4 Wherever, the schematic diagrams indicate a definite ground at the for each switchgear, a single wire circuit thus grounded shall be run independently to the ground bus and connected thereto.	This requirement is not clear. Customer is requested to please clarify the same.	Pl. refer Corrigendum - XI, Sr. no. 10
44	SECTION - 7	4.24	An automatic 32 bit or higher micro processor based real time operated fast backed up by slow transfer scheme shall be provided for change over between unit to station sources and vis-a-vis, station to station sources (11KV & 3.3KV). All hardware pertaining to above transfers shall be mounted in Auto Bus transfer (ABT) panel. The bus transfer module shall have features such as graphical user interface, virtual test simulation, object oriented programming, on line viewing, sequence of event logging, self diagnostic features and communication port for remote communication. The ABT panel shall be indoor, simplex type construction, vertical free standing, floor mounted type, metal clad suitable for installation at 50 C ambient. Panel enclosure shall be fabricated from 2 mm thick sheet steel and the same shall be IP 52 protected. Detail write up on	Please note that fast Auto Bus Transfer shall be provided at 11kV unit and station switchgear as per specification. 3.3kV switchgears shall be provided with slow bus transfer. Please confirm.	Pl. refer Corrigendum - XI, sr. no. 11

VOLUME -IV-A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
45	SECTION - 7	4.25	Microprocessor Based Fast Bus Transfer System (BTS) shall be provided for unit to station and vis-a-vis & station-to-station supply changeover on all 11kV & 3.3 kV unit /station Switchboards.	Please note that fast Auto Bus Transfer shall be provided at 11kV unit and station switchgear as per specification. 3.3kV switchgears shall be provided with slow bus transfer. Please confirm.	Pl. refer Corrigendum - XI, sr. no. 12
46	SECTION - 7	4.26	Microprocessor Based Fast Bus Transfer System (BTS) shall be provided for unit to station and vis-a-vis & station-to-station supply changeover on all 11kV & 3.3 kV unit /station Switchboards.	Please note that fast Auto Bus Transfer shall be provided at 11kV unit and station switchgear as per specification. 3.3kV switchgears shall be provided with slow bus transfer. Please confirm.	Pl. refer Corrigendum - XI, sr. no. 13.
47	SECTION - 8	5.1	5.1.14 PCCs/PMCCs/MCCs/DBs/SVBs shall be supplied with base frames of 100mm height of structural steel sections along with all necessary mounting hardware required for bolting/welding the base frames to the foundation.	The switchgear baseframe mounting arrangement shall be as per manufacturer's standard. Customer is requested to accept the same.	Bid specification Prevails.
48	SECTION - 8	5.5	5.5.1 Switches shall be triple/double pole, air break type and designed for duties as specified in Annexure-A. Motor duty switches shall be capable of safely making and breaking the locked rotor current of the associated motor circuit.	Please note that the "duties" are not specified in "Annexure-A". Customer is requested to please provide the relevant Annexure details for the same.	Pl. refer Corrigendum - XI, sr. no. 14.
49	SECTION - 8	5.6.1	(c) Contactors for forward and reverse direction of reversible drives shall preferably be both electrically and mechanically interlocked.	Please note that as per common engineering practice, only electrical interlock is provided between the forward and reverse operation contactor and the same is widely accepted. Customer to revisit the requirement of providing Mechanical interlock.	Pl. Refer Corrigendum -XI, Sr. No.15.
50	SECTION - 8	5.10	5.10.3. (a) Class PS for differential	We understand that this clause is not applicable as the LT transformers shall not be differentially protected. Please confirm.	Pl. Refer Corrigendum -XI, Sr. No.16.
51	SECTION - 8	5.13.1	(a) All relays & timers in the protection circuit shall be flush mounted with connection from inside. They shall have transparent, dust tight covers, removable from the front. They shall have built-in testing facilities. Except small auxiliary relays and timers, all relays shall be drawout type.	Timers shall be installed and mounted inside the panel/ cubicle so there is no requirement of flush mounting. Customer is requested to accept the same.	Pl. Refer Corrigendum -XI, Sr. No.17.
52	SECTION - 8	5.13.1	(k) All DDCMIS/DCS/PLC operated motor feeders of any rating shall have ammeter & current transducer at "Y" phase.	Ammeter & current transducer at 'Y' Phase will be provided for motor rated 30 KW and above. Kindly confirm	Bid specification Prevails.
53	SECTION - 8	5.13.3	(a) Unless otherwise specified, relay shall be suitable to accept both AC/ DC supplies with range 110V to 240V with tolerance of +20%. The auxiliary power supply shall preferably be site selectable requiring no additional hardware.	Please note that tolerance shall be $\pm 10\%$ for AC and $+10\%$, -15% for DC as per specification requirement. Please confirm.	Bid specification Prevails.
54	SECTION - 8	5.16	5.16.3 Gland plates shall be minimum 4 mm thick. The gland plate and supporting arrangement for 1/C power cables shall be non-magnetic type to minimise the flow of eddy current.	We propose Gland Plates of 3 mm thickness. Kindly confirm.	Bid specification Prevails.
55	SECTION - 10	6.7	6.7.1 Motor terminal box shall be phase segregated (PSTB) type and located in accordance with Indian Standards clearing the motor base- plate/ foundation.	Phase segregated (PSTB) motor terminal box shall be provided only for HT Motors. Please confirm.	Pl. Refer Corrigendum -XI, Sr. No.18.

VOLUME -IV-A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
56	SECTION 13	1.0	1.2 MVA rating of the transformer, as indicated above, shall be considered as the minimum requirement for the project. Transformer offered by the bidder shall be sized according to the maximum demand considering additional running of one largest standby motor with driven equipment, No Load Voltage Correction factor 4% while sizing of Transformer at most stringent condition plus minimum 10 % margin	We have envisaged 5% margin on the operating load and 5% No Load Voltage Correction Factor over that for Transformer Sizing. Request to accept our proposal.	Bid specification Prevails.
57	SECTION 13	4.11	4.11.2 Wiring shall be done with flexible, 650V grade PVC wires in conduit or PVC armored cable. Minimum wire size shall be 2.5 mm ² copper. Not more than two wires shall be connected to a terminal. 10% spare terminals shall be provided.	We understand that this shall be 660 V grade. Please clarify.	Pl. Refer Corrigendum -XI, Sr. No.19

BHUSAWAL THERMAL POWER STATION 1X660MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE-BID QUERIES					
BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME -IV-B					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	SECTION - 2	3.1	3.1.4 15% margin shall be considered while calculating the total load on Transformer.	LT transformer will be sized based on operating load with 10% design margin including largest motor starting criterion. Please confirm.	Bid specification prevails.
2	SECTION - 2	3.1	3.1.7 All anticipated future loads in or around the load centres shall be taken into consideration while finalising size of L.T. Transformers.	We have not envisaged any anticipated future loads for sizing of L.T. transformers. Please confirm.	Bid specification prevails.
3	SECTION - 2	DATA SHEET	21.2 L.V. Non-segregated phase busduct	LV terminal will be suitable for cable/ NSPBD. Please confirm.	Bid specification prevails.
4	SECTION - 3	DATA SHEET - A	2.6.2 The ripple content in charger DC output Limited to 1% (rms) with or without battery	We propose ripple content in output DC as 3%. Please confirm.	Bid specification prevails.
5	SECTION - 4	4.6	(h) Current rating capacity of cables should be 110 % of full load current, after considering the derating factors.	Please note margins shall be considered for transformer & motor sizing and selection from pump capacities. Therefore, further margins on full load current is not proposed to be considered for cable sizing. Derating factors shall be considered in line with the standards while cable sizing. Request to accept our proposal.	Bid specification prevails.
6	SECTION - 5	2.0	2.2 Main plant electrical system shall be controlled and monitored from Station DDCMIS/EDMS through dedicated operator's consoles.	We understand that DDCMIS & EDMS both are same. Please confirm.	DDCMIS & EDMS are different. (Refer Cl 13.0 of section-1 of Vol IV-A for details of EDMS). Bid Specification prevails.
7	SECTION - 5	2.0	synchronizing equipments, HT Switchgear manual synchronizing equipment, governor and excitation control, metering equipment, breaker control switches for GTs, 11kV, 3.3 kV & 415V Unit / Station switchgear incomers, tie and outgoing non-motor feeder breakers, synchronizing selector switches, Auto-Manual, Remote-Local and other selector switches as required along with annunciation windows, indications and mimic diagram (from 400kV level to 415V level). Cooler control for Generator Transformers, Unit Auxiliary transformer, Station auxiliary transformer, Cooler control & Tap changer control for Station Transformers and Unit Transformers in Remote- Manual mode shall also be provided in the Back-up Control Panel. DGs shall also be control from DDCMIS/EDMS as well as Electrical control panel. OTI & WTI of GT, ST, UT, SAT and UAT shall also be repeated in Back up control panel in addition to EDMS/DDCMIS.	Coolers for Generator Transformers, Unit Transformers, Station Transformers shall be controlled from local and their control is not envisaged from ECP.	Bid specification prevails.
8	SECTION - 5	ANNEXURE - B	1.1.12 Generator Rotor second earth fault (trip) Operated	We have envisaged only single stage rotor earth fault protection. Hence alarm for the same is not envisaged.	Bid specification prevails.

VOLUME - V					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	SECTION - 1	4.0	4.15 In general, temperature transmitters shall not be used. Instead, temperature elements shall be directly connected to their respective input modules. For non-critical measurement applications (such as measurements for Boiler metal temperature and Generator winding temperature) where the measurements are not used for control/ protection, Sensors may be grouped and connected to I/O modules in DCS.	As per Bidder's proven practice, temperature transmitter shall be used for all temperature measurements of Steam Generator. Please confirm.	Bid specification prevails.
2	1	7.5.3 (b)-i	In addition to above, 20% wired input/output spare channel should be provided for each I/O modules.	Based on our past EPC experiences we feel that 10% total spare channel are sufficient & optimised design. We request Owner to reconsider their specification.	Bid specification prevails.
3	1	7.10.6(g)	At least 20 percent spare unwired terminals shall be provided for all panels/cabinets /desks /junction box etc. This shall be in addition to 20% spare wired terminals of spare IO channels and 10% wired spare modules.	As per the specification total spare terminals required are 50%(20%+20%+10%) which is very high and will increase the size of DCS System & non-optimised design. Based on our past EPC experiences we feel total 10% spare is enough. We request Owner to reconsider their specification	Bid specification prevails.
4	2	1.3.13	In addition to this redundant 24 V DC battery system is envisaged for DCS system .	Control systems can efficiently work on external UPS 230VAC supply. UPS system are very reliable & Bidder has lot of experience. Any other voltage level like 24VDC shall be derived inside the control system from AC supply. Bidder will provide UPS of sufficient capacity for this purpose. This practice is very common & is followed all over the world. Therefore 24VDC battery system is not required.	Bid specification prevails.
5	2	1.3.14(k)	Fire detection & alarm system for entire power plant.	Fire detection & alarm system is already indicated in Vol-III-H. Bidder understand that this item is repeated in this clause.	The item is not repeated in the clause. The subject clause in Section-2 denotes "SCOPE OF WORK" , whereas "Volume-III H " is detailed technical specification for Fire Detection & Alarm System .
6	2	1.3.18	Optical Time Domain Reflectometer and splicing kit for optical fiber cable testing & maintenance.	This item will be covered under C&I Lab Instruments as described in section-9 of Vol-V. Bidder understand that this item is repeated in this clause.	The item is not repeated in the clause. The subject clause in Section-2 denotes "SCOPE OF WORK" where as Optical Time Domain Reflectometer and Splicing Kit (2 nos. each) shall be supplied as per specification given in the Section- 5 Clause no. 6.20.1.
7	2	1.3.19	Bidder shall set up instrument laboratory with all necessary testing & calibrating equipments & instruments and test bench etc this shall include supply, installation & commissioning of all equipment.	As per bidder's understanding, this is C&I Laboratory Instrument package as described in cl. No. 1.3.35, page no. 76 of 718.	Section -2, clause. No. 1.3.19, specifies that Bidder has to set up Control & Instrument laboratory of adequate dimensions and facilities where all necessary testing & calibrating equipment & instruments and test bench etc as specified in Section -9 shall be supplied , installed & commissioned.

VOLUME - V					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
8	2	1.3.21	Minimum 2 (Two) numbers of hand held configurators for SMART Transmitters.	This item will be covered under C&I Lab Instruments as described in section-9 of Vol-V.	Minimum 2 (Two) numbers of hand held configurators for SMART Transmitters shall be supplied as described in Section-9 of Vol-V.
9	3A	10.4	AAQMS shall include monitoring of the following pollutant gases/parameters. However, any other gases/parameters recommended by relevant Central & State regulatory agencies during project implementation phase shall also be provided. There shall not be any cost implication for the same to Owner.	We feel it will be judicious that cost for any additional analyser shall be borne by Owner.	Bid specification prevails.
10	3A	10.8(k)	Facility to interface exiting plant AAQMS shall be envisaged.	We request to provide more detail	Existing AAQMS Central Monitoring System to be interfaced with the new system.
11	3B	6.4.7 (b)	Balance leak off Pressure	This specification requirement is not clear. Pl clarify	Bid specification prevails.
12	3B	6.4.7 (i)	Top & bottom temperature	This specification requirement is not clear. Pl clarify	It means suction & discharge.
13	3B	7.1(q)	Ejector steam pressure control station with pressure transmitters.	Vacuum pump will be applied for this project hence this is not applicable.	Noted.
14	5	5.1.7	Selected data from Owner's system & off-site plants such as Ash Handling Plant, Raw water & Pretreatment plant, Dematerialized water plant and Coal Handling Plant etc shall be displayed/historized in CCR.	Please clarify what is "Owner's System"?	The clause shall be read as " Off-site plants such as Ash Handling Plant, Raw water & Pretreatment plant, Dematerialized water plant and Coal Handling Plant etc shall be displayed/historized in CCR."
15	5	5.1.27(k)	Management Information System (MIS) (Plant View Server) - Total 40 off located all over the plant including service building, shift charge engineer's room etc.	Please refer Cl. No. 5.1.17 (page no. 310 of 718) of sec-5, Vol-V, where specified the requirement of only MIS server and MIS stations will be in owner scope. Please clarify	Bidder to supply MIS Server only which shall be capable of connecting to and serving 40 Clients.

BHUSAWAL THERMAL POWER STATION 1X660MW UNIT - 6 PROJECT					
CLARIFICATIONS TO PRE-BID QUERIES					
BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME - V I A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	SECTION- 1	2.1.3 (k)	VDI:2056 : Criteria for assessing mechanical vibrations of machines	As per latest, VDI 2056 and VDI 2060 are replaced with ISO 10816 and ISO 1940 respectively. Please replace the codes in the code list.	Refer volume -VI-A, section-2, Annexure-I, Clause no. 7.0 (Special attention)
2	SECTION- 1	2.1.3 (l)	VDI:2060 : Criteria for assessing the state of balance of rotating rigid bodies.	As per latest, VDI 2056 and VDI 2060 are replaced with ISO 10816 and ISO 1940 respectively. Please replace the codes in the code list.	Refer volume -VI-A, section-2, Annexure-I, Clause no. 7.0 (Special attention)
3	SECTION- 1	3.1 (a)	Area Grading, levelling & dressing (finished grade levels shall be as mentioned in Plot plan and Area Grading Drawings. UCR/RCC retaining wall shall be provided as per requirement to retain the soil. If space permits, slope (1:3) shall be provided between two different grade levels. However slopes shall be protected with stone pitching with cement mortar (1:4).	As per Vol-II, Section-4, Annexure-B, Sl. No-2.1.3, The maximum allowable side slope for unpaved embankment is 1:2. Please clarify the requirement.	The slope of 1:2 shall be provided between two different grade levels instead of 1:3 slope. However, the slope shall be protected with stone pitching with cement mortar (1:4) to avoid erosion of slopes.
4	SECTION- 1	4.2.2	Building roof will be of Cast-in-situ R.C.C. over permanently colour coated (on exposed face) galvanized M.S. troughed metal decking of approved profile supported on steel beams/girders and the sides will be clad with permanent colour coated sandwiched insulated metal cladding system from Tripper floor to roof. The remaining portion of the building below Tripper floor up to ground floor shall generally be unclad. However, brick cladding shall have to be provided, if required, as per TAC and any other statutory requirements.	Concrete slab on metal deck shall be provided only for feeder and tipper floor, and all other floors shall be grating / chequered plate. Roof shall be metal cladding. Please confirm.	Bid specification Prevails.
5	SECTION- 1	4.2.2	Floors shall be of cast-in-situ RCC over removable shuttering.	Concrete slab on metal deck shall be provided only for feeder and tipper floor, and all other floors shall be grating / chequered plate. Roof shall be metal cladding. Please confirm.	Bid specification Prevails.
6	SECTION- 1	4.7.5	4.7.5 The cold water from the basin shall be taken out through an opening connected to the main CW closed Channel/duct, which in turn leads to a fore-bay of the CW sump. The cold water from the basin shall flow by gravity to open approach channel leading to the fore-bay. The cold water channel shall be provided with a slide gate. Suitable handling arrangements with a monorail and a chain-operated hoist with a travelling trolley shall be provided for handling of the slide gate. In front of the outlet structure, provision shall be made for de-sludging facilities so that sediments can be withdrawn from the basin. In order to clean the cooling tower basin, sludge drain are to be provided along its perimeter with suitable sludge sump of minimum size 1.0 M x 1.0 M, from where the sludge will be taken out to sludge box/chamber outside the basin for pumping out. The size of Box	Please provide the location of the closed channel and open channel	Cold water channel including fore bay shall be closed type except maximum 5.0m portion near NDCT outlet required for operation of gates and screens.
7	SECTION- 1	4.7.17.3 (d)	(d) Loads due to temperature and shrinkage effects. Temperature effects due to solar radiation shall also be considered.	In general practice only temperature loads are considered. There is no provision for taking solar radiation effect in the loading. Please clarify.	Temperature stresses shall be considered as per Volume-VI (A), Section-II, Clause No. 3.1.6, Page 185.

VOLUME - V I A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
8	SECTION- 1	4.17	For pipe drains, concrete pipes of minimum grade Class NP2 will be used. However, for road concrete pipes of Class NP3 will be used and for rail crossing, railway norms shall be followed.	For Road Crossings NP3 class Hume Pipes shall be provided encased in PCC, instead of RCC culverts. Please confirm.	Bid specification Prevails.
9	SECTION- 1	4.17	However, for road concrete pipes of Class NP3 will be used and for rail crossing, railway norms shall be followed. R.C.C. Manholes will be provided at maximum 30m intervals along the length, at connection points and every change of alignment, gradient or diameter of pipeline. The drains shall generally be of open type RCC rectangular construction. R.C.C. drains shall be covered with perforated R.C.C. pre-cast slab (M-25) of minimum 75mm thickness with provision of openable galvanized steel grating covers at every	Please specify the minimum length of the openable galvanized steel grating cover.	Minimum length of openable galvanized steel grating cover 1.2 M shall be provided.
10	SECTION- 1	4.18	Inside surface of the drain will have smooth neat cement finish over screed concrete. Invert of the drain shall be decided in such a way that the water can easily be discharged to the recommended nearest main plant drainage system. The minimum slope of the drain shall be 1:1000 longitudinally to take care of the silting problems.	We propose the only plaster to the drain wall.	Bid specification Prevails.
11	SECTION- 1	4.20	Above the chain link a 600 mm high tensile serrated galvanized wire (HTSW) concertina made with wire diameter of 2.5mm shall be stretched to 6m and attached to two strands of galvanized HTSSW of 2.5 mm diameter by means of clips at 1m intervals. These two HTSSW strands shall be attached to the fence posts with 12 mm security fasteners.	The maximum loop spacing should be specified.	Maximum loop spacing shall be 250mm.
12	SECTION - 2	3.1.11	All Power House columns adjacent to first row of Boiler columns shall be designed for an additional load of 500 kN to account for piping/cable rack loads.	We understand 500 kN vertical loads to be applied on each column adjacent to first row of boiler column. Please clarify at what level the load to be applied. (Or the load is distributed different levels like mezzanine floor, operating floor level etc.)	Bid specification is self explanatory.
13	SECTION - 2	3.4	Ultrasonic pulse velocity tests shall be carried out for the top decks of all machine foundations including. T.G deck slab, TG foundation and TG super structure/substructures to ascertain the homogeneity of concrete. In addition, additional cubes (at the rate of one cube per 150 Cu.m of concrete subject to a minimum of six cubes) shall be taken to carry out Ultrasonic Pulse velocity (UPV) testing on the cubes, to serve as reference UPV values. Testing shall be done as per IS:13311 (Part-1). In case of any defect, the EPC Contractor shall rectify the defects suitable using cement/epoxy grout, etc.	Please clarify whether UPV testing is required for block foundations like PA fan, FD Fan, ID fan, Mill foundations.	Ultrasonic pulse velocity test shall be carried out for the top decks of all machine foundations viz. T.G. , BFP, ID fan, FD fan, PA fan mill & sub structure & superstructure of TG foundation to ascertain the homogeneity and integrity of concrete. In addition-----using cement/epoxy grout, etc.
14	SECTION - 2	4.9	All underground water retaining/conveying system structures shall have plasticiser cum waterproofing cement additives conforming to IS: 9103 of SIKKA, FOSROC make. In addition, limits on permeability as given in contact with soil shall be provided with minimum two coats of bituminous painting of grade 85/25 conforming to IS:702 @ 1.7 kg/sqm (minimum) for water/damp proofing. Storm water drains shall not be provided with bituminous paint and weep holes also shall not be provided in storm water drains.	Please clarify if bitumen paint shall be done to the surfaces in contact with soil only for " All underground water retaining/conveying system structures" except storm water drains.	Bid specification is self explanatory.

VOLUME - V I A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
15	SECTION - 2	5.2.7 (c)	Tension in piles shall not be allowed for any combination of loads.	As per general industrial practice, tension within the allowable uplift capacity of the pile should be allowed.	Bid specification Prevails.
16	SECTION - 3	1.7	1.7 Shop primer paint will be single coat of red oxide zinc- chromate primer conforms to IS-2074. The surface preparation will be done in accordance with IS: 1477 (Part I & II) Code of Practice for Finishing of Ferrous Metals in Buildings. Second coat of primer shall be applied after erection and final alignment of the erected structures. Two or more coats of synthetic enamel paint conforming to IS: 2932 of approved shade and quality shall also be applied after erection. Total Dry film thickness of the finished paint shall not be less than 110 microns.	As per Vol-II, section-4, cl. 15.4.2., the total minimum DFT is specified as 120 micron. Please clarify the requirement.	Stipulation in Clause no. 15.4.1 & 15.4.2 , Section -4 Volume -II - Master specifications shall prevail.
17	SECTION - 3	5.4	Grating flats : 5 mm	As per Cl. 5.0 of section-3, Vol-VI/A the minimum thickness of the main bearing bar shall be 4 mm. Minimum thickness of Grating flat shall be considered as 4mm. Please confirm.	All indoor gratings shall be ----- 30mm x 100 mm. The minimum thickness of the main bearing bar shall be 5 mm. All gratings shall be hot dip galvanized @ 610 gm. / sqm.
18	SECTION - 4	2.6	Masonry work facing any transformer yard up to a required height shall be fire resistant as per code/LPA requirement. Minimum thickness of firewalls shall be 345 mm for brick walls and 200 mm for concrete walls.	We understand that this 345 mm brick wall or 200 mm concrete wall.	Minimum thickness of firewalls shall be 345 mm brick wall or 200 mm concrete wall.
19	SECTION - 4	2.11 (b)	External : 20 mm thick 1:4 Sand faced cement plaster to be laid in two courses to all external surfaces.	As per Cl.No.5.1.5 of Section-4, for external and rough surfaces, 18 mm thick plastering shall be considered for power house and other building. Bidder requests to confirm the thickness of plastering (20mm or 18mm)to be provided for external surfaces of walls.	Stipulation at Clause no. 2.11(b) , Section- 4 shall prevail.
20	SECTION - 4	2.11 (e)	RCC walls : 12 mm thick 1:6 Cement: Sand Plaster	The Bidder recommends that the surface of RCC walls will be made smooth, and no need of plaster on RCC walls. Please confirm.	Bid specification prevails.
21	SECTION - 4	2.13 (b)	In non-plant buildings, solid core commercial flush doors shall be used unless otherwise mentioned.	Please clarify, whether this is solid core wooden flush door.	Type of doors & windows shall be as per doors & windows schedule given under clause No.6.1 of section-4 of Vol.VI/A.
22	SECTION - 4	2.17 (d)	All staircases shall be in structural steel unless otherwise noted.	As per Vol. VI-A, section-4, Cl. 2.4 (e) RCC staircase shall be provided for all RCC construction buildings and structural steel staircase for all structural steel buildings.Please clarify.	Volume-VI (A), Section-2.4(e) shall prevail.
23	SECTION - 4	2.20 (a)		Please clarify whether the access through lift shall be provided till roof level or machine room to be on roof level	The access through lift shall be provided till machine room to be on roof level.
24	SECTION - 4	4.1	The Technical Building is a 5-storied building (size 48M x 15M) including ground floor Building is located adjacent to the Power House Building as	Please confirm whether the bidder has any flexibility to reduce the building size without affecting the functionality of the same.	The Plan area specified under specification is minimum requirement.

VOLUME - V I A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
25	SECTION - 4	4.1 (c)	For pantry and toilet false ceiling shall be perforated aluminium stove enamel finished panels of size 600x600mm.	Please clarify whether false ceiling is required for pantry and toilet.	For Pantry and Toilet area gypsym based false ceiling shall be provided.
26	SECTION - 4	5.1.5	Plaster : Exterior & rough side : 18 mm thick with 1:6 cemen t- sand of interior brick wall mortar in two layers except where special finish provided.	As per Vol- VI-A, Section-4, Cl. 2.11 Plastering: Exterior & rough side : 20 mm thick with 1:4 cement- sand of interior brick wall mortar in two layers except where special finish provided. Interior : 12 mm thick with 1:4 cement-sand mortar Ceiling : 6 mm thick with 1:3 cement-sand mortar Please clarify the requirement.	For all external and internal plastering of all buildings, Clause no. 2.11, Section- 4 , Volume VI shall be applicable. Clauses other than this clause describing plaster shall be superseded by this clause.
27	SECTION - 4	5.1.16 (a)	All stairs shall have not more than 13 risers in one flight but in case of fire escape stairs, 15 risers may be allowed instead of 13 risers. Height of risers and width of treads shall be 180 mm (maximum) and 250 mm (minimum) respectively for fire escape stairs and 166mm (maximum) & 250mm (minimum) for general staircases. Minimum width of stairs shall be 1000mm for fire escape stairs and 1200 mm for general stairs. In general, rises shall be 150 mm.	As per Vol- VI-A, Section-4, Cl. 2.17 (b) , All stairs shall have not more than twelve (12) risers in one flight. Please clarify the requirement.	Clause no. 5.1.6 (a) shall prevail.
28	SECTION - 4	5.1.19 (a)	(a) RCC roof water tank of adequate capacity depending on the number of users for 8 hours storage shall be provided for each building.	As per Vol- VI-A, Section-4, Cl. 2.29 , Two numbers of roof water tanks (one for storing service water and another for potable water) of Polyethylene water storage tanks conforming to IS: 12701 shall be used. The tanks shall be complete with all fittings including lid, float valve, stop cock, vent pipe, etc. There is a mismatch. Please clarify.	The capacity sizing criteria and type of material of service & potable water tanks specified under these clauses are applicable only for potable water & service water distribution tanks required for the users/personnel working in the respective buildings. While finalising the capacity of these tanks the water requirement for equipment cooling, makeup of associated system, floor washing, fire fighting etc. shall be suitably considered during finalisation of service / potable water scheme. The service & potable water distribution tanks upto 5000 litre capacity shall be of polyethylene make and tanks above 5000 litres capacity shall be of R.C.C. make. The capacity & make of potable & service water storage tanks located on main plant building and other system buildings shall be as per respective specifications and as per approved scheme of service & potable water system.
29	SECTION- 1	3.3	"Rainwater harvesting scheme which is statutory requirement.....Central Ground Water Authority /Board"	Please indicate the size of Rain Water Harvesting Pond based on Central Ground Water Agency. Also kindly specify whether the pond shall be earthen or RCC with weep holes.	Bid specification is self explanatory.
30	Addendum-III		Technical Specification for Additional Sourcing Of Raw Water	We understand the right of way of the pipe route and the aquaduct and other facilities along the route is arranged by the owner.	Bid specification is self explanatory.

VOLUME - V I A

Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
31	SECTION- 1	4.4	Scope include site survey, soil investigation, site development works, complete design engineering and construction of Civil, Structural. obtain necessary various approvals from Railways, other Departments/agencies well in advance including necessary charges for permission part born by the EPC contractor	We understand that the approval from Railway and other departments are included in the scope of EPC. However, the arrangement of land (purchase of land) along the pipe route is in scope of Owner. Please confirm.	Land for routing of ash pipe lines will be made available by Mahagenco
32	SECTION- 1	3.1 (h)	Drainage network (storm water drains, oils/effluent & sewage water)	As per clarification dated 07-07-2012, the outfall of the storm water drain shall be at existing bridge no. 17, 18 (box culverts) and the necessary detail for the same shall be given to the successful bidder. We understand our scope is to make arrangement to connect the drain point with the existing culverts and existing culverts are designed to cater the drain from this plant area. Please provide the invert level of the existing culverts (basic requirement) to design the plant drainage system.	The invert level of the existing culvert at upstream end is at RL205.010M and at downstream end is at RL204.690m .The upstream side of these culverts shall be extended beyond formation width of proposed railway siding. The plant storm water shall be connected to rain water harvesting scheme pond. The excess rain water from rain water harvesting scheme shall be disposed of through the extended existing culverts. The disposal of storm water from downstream of existing culverts into Bhogavati river including required cross drainage works at road / compound wall crossings are also included in the scope of EPC bid. The invert level of final disposal point of storm water drain shall be 500mm above HFL having RL 198.2m.
33	Addendum-III	3	Scope of work.	We understand there is no work in scope of bidder from the inlet of the aqueduct up to the forebay of the existing (abandoned) pump house. Please clarify.	Cleaning and desilting of the canal stretched between the abandoned pump house and aqueduct is in the bidder's scope. Pls refer Addendum III cl. 3.1 c page 7 to 76.
34	Addendum-III	3.1.(a) Page 6 of 76	Providing and laying M.S. gravity pipe line in the inlet canal, from the existing river water pump house of MAHAGENCO located on Tapi river to aqueduct including all necessary connections for conveyance of water to the existing Raw water system with adequate slope	During site visit it was observed that the inlet canal from existing pump house to the aqueduct was full of water. Hence, provide the cross sectional details of inlet canal for estimation.	Please refer sketch attached with our letter no. 1863 dtd. 03.06.2013.
	Addendum-III	13.8 Page 37 of 76	Laying of pipe line in canal and filling around with sand upto canal top		
35	Addendum-III	3.1.(c) Page 7 of 76	The scope shall also include cleaning and desilting of approach canal to pump house and sump pump house, repairing/replacing of screens, inlet gate, inlet canal including new utilities for electrical, mechanical and ICA works for smooth operation.	We understand that the approach canal to be cleaned and desilted is stretched between the abandoned pump and aqueduct. Please confirm. Also provide the detail of approach canal/aqueduct including cross section and longitudinal section for estimation.	Please refer Bid specification and also sketch attached with our letter no. 1863 dtd. 03.06.2013.

VOLUME - V I A					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
36	Addendum-III	9.3 Page 20 of 76	The M.S. gravity pipe line from existing river water pump house to aqueduct through inlet canal shall be designed for discharge of 9000 cum/hour (considering 24 hours operation per day). While designing the above pipe line, the agency shall ensure the same discharge after existing siphon arrangement.	Please provide the GA drawing for existing (abandoned) pump house indicating levels as same are required for calculation of pump TDH. Please provide the details of existing Siphon arrangement (including GA drawing) as same is not clear from specification. Please clarify.	Please refer Note no.1 of Annexure - II and sketch attached with our letter no. 1863 dtd. 03.06.2013.
37	Addendum-III	11.3.6(g)) Page 28 of 76	Cables coming from 6.6 KV feeders & from DG & compressor house shall have to cross railway line. Adequate duct bank shall be provided for crossing railway line.	If cables are coming from Existing 2x500MW Unit feeder, There is no cable crossing of railway line as per Plot plan, thus there is no Duct bank requirement. Please clarify.	Please refer Annexure-II- Layout of proposed pipe line from Tapi river water pump house to aqueduct & proposed pipe line from existing (abandoned) pump house to one day reservoir of 1x660MW.
38	Addendum-III	11.3.8 & Key SLD) Page 28 of 76	At present spare 220V DC feeders are not available in DG & Compressor house. Two feeders which are feeding 220 V DC supply to DG board PCC & AMF panel shall be disconnected and the same shall feed 2 nos new 220V DC Sub DBs to be supplied by the bidder. Required numbers of outgoing feeders are envisaged on these Sub DBs for owner's use. But as per Key SLD 4 nos. DC Fuse DB's are indicated.	Please clarify that DG and Compressor House pertains to 2x500MW or 3x210 MW unit for estimating cable route .	DG and Compressor House pertains to 2x500MW as indicated in Annexure II-Layout of proposed pipe line from Tapi river water pump house to aqueduct & proposed pipe line from existing (abandoned) pump house to one day reservoir of 1x660MW. Sr. no. 34 in Annexure-II is DG and Compressor House .
39	Addendum-III	13.2. Page 36 of 76	---to obtain necessary various approvals from concern Departments/agencies -----	Only customer's/customer's consultants approval on design/drawings are envisaged . Any statutory approval etc. from concerned department/agencies including necessary charges are beyond the scope of . Please confirm. this tender	Bid specification prevails.
40	Addendum-III	13.7 Page 37 of 76	Diversion of existing flow of water for connection of pipe line from existing tank.	This clause is not understandable , hence it needs to be clarified.	Proposed pipeline is to be laid in abandoned canal which is parallel to the canal in use. After completion of pipeline work, end connection shall be done with existing tank near Tapi Pump House. Necessary arrangement for connections to existing tanks shall be done by the bidders.

BID SPECIFICATION No. DG/BSL U-6/2011/T-1					
VOLUME -II					
Sl. No.	Section No.	Clause No.	Bid Specification Stipulation	Bidder's Query / Stipulation	Final resolution
1	4	Annexure- D (SPECIFIC LAYOUT CONSIDERA TION)/CORRIGE NDUM-VII, S. NO. 2.0 PAGE 7 OF 34	AB -bay 36.0M, Mezzanine floor elevation : 9.0M, AB bay, BC bay floor levels at 0.0 M, 9.0M, 17.0M, 24.0M, 28.0M, 32.8M,38.0M. TDBFP Located at 17.0M Deaerator Floor - 38.0M	In line with present 660 MW projects under execution and OEM design, it is proposed to offer the optimised TG Building layout. The offered optimised layout will meet all O&M criteria. The overall project cost will unnecessarily increase if TG Building dimensions as specified in Tender Documents are retained. MahaGenco is requested to review & accept the optimised TG Building Layout. Following optimised layout dimesions of TG Building is proposed: AB-Bay-30.0M, Mezzanine floor elevation: 8.5M. AB & BC bay floor levels at 0.0 M, 8.5M,17.0M,25.5M & control tower floor elevations are at 0.0M, 8.5M,12.0M, 17.0M, 24.0M, 27.5M. TDBFP Located at 5.0M. Deaerator Floor- 25.5 M	Bid Specification and Corrigendum-VII, S. No. 2.0 Page 7 of 34 shall prevail.
2	4 PLOT PLAN (Drg. No. PE- 189-GA-101) Issue-5, Note no.4	6.1.10 Note no.4	Plot Plan 1. Concept of various mechanical and electrical equipment location and building dimesnions (including column-row spacing) as shown in Plot Plan / Floor Plan drawing are to be adhered as far as possible. Any departure from this suggestive layout is primarily not recommended. 2. Bidder to note that the relative orientations and dimensions of various facilities as well as the inter-facility clerances shown in the plant layout have been conceived by the owner/ owner's consultant keeping in view the requirement of safe and hassle-free approach for operation and maintenance, Disaster management as well as logistic convenience with the existing power plant units. Bidder shall review the layout and improve upon, if deemed necessary keeping in view the overall intent of the project.	There is mismatch in the Tender requirements as per the two clauses. It is proposed to optimise the space requirements of various plant facilities as indicated in the Tender Plot Plan layout drawing. Various facilities as shown in the Tender Plot Plan drawing are proposed to be relocated / reoriented, without effecting the requirement of operation & maintenance space. The overall project cost will unnecessarily increase if the location / orientation / dimensions of various power plant facilities as indicated in Tender Plot Plan layout are retained. MahaGenco is requested to review & accept the optimised Plot Plan Layout.	There is no mismatch in the Tender Requirement as per the two clauses. Bid specification shall prevail. Bidder shall note that the dimensions indicated in Plot Plan & Tender Documents are minimum requirements and any increase in these dimensions, if required , from the point of safe and hassle free approach for Operation & Maintenance of the equipment, shall be in the scope of the Bidder only.

Bid Specification No. DG/BSL U-6/2011/T-1					
Volume - I					
S. No	Section No.	Clause No.	Bid Specification Stipulation	Bidder's query/Stipulation	MAHAGENC O Reply
292	3	2.2.2.3	"The generator to be supplied shall be manufactured assembled and tested in the factory where generator of at least 500 MW has been manufactured in the past or is under manufacturing / assembly at factory having testing facilities of international standard acceptable to technical agency / institutions to be approved by Owner	The clause may please modified to accommodate Indian manufacturing company set up to manufacture generators for supercritical projects Accordingly we request to you to add the following at the end of the para <i>"Alternately the same can also be manufactured in Indian Manufacuring Company set up as per clause 4.2.1 of Section 1/ Volume I"</i>	Refer Corrigendum- VI
293	3	2.2.3	Provenness Criteria of LPFWH: Capacity not less than 1300 MT/hr	Please modify as below: Feed Water Low Pressure Heater of a 500 MW or higher size unit	Refer Corrigendum- VI
294	3	2.2.3	Provenness Criteria of HPFWH: Capacity not less than 800 MT/hr for each string	Please modify as below: Feed Water High Pressure Heater of a 500 MW or higher size unit	Refer Corrigendum- VI
295	3	2.2.3	Provenness Criteria of LPFWH: Feed water handling Capacity not less than 1600 MT/hr	Please modify as below: Deaerator of a 500 MW or higher size unit	Refer Corrigendum- VI

296	3	2.2.3	Provenness Criteria of HP Bypass system	The HP Bypass Valves developed by us are suitable for both 500 MW sub-critical units as well as for 660 MW supercritical sets. These valves have been tested successfully at supercritical steam parameters and flow, temperature and pressure requirements and have been working for more than 2 years in 500 MW sets in the country. We interpret that our HP Bypass valves are proven. Kindly confirm.	Bid Specifications shall prevail.
297	3	2.2.3	Feed water high pressure heaters - Capacity not less than 800 MT / hour for each string	Client to note that as per prevailing practice 2 x 50 % HP Hetaers string can be offered. Please confirm	Refer Corrigendum-VI

298	3	2.4.1	Power cycle piping The contractor / his proposed sub vendors should have designed, engineered (including static and dynamic analysis) fabricated / got fabricated AND should have experience in fabrication and welding of main steam piping	The two conditions of this clause contradict each other as the 1st condition allows fabrication by others while the 2nd condition stipulates fabrication experience also. We request you to delete the 2nd condition since fabrication is a specialised job done by fabricators/erection agencies Further We request you to add a new condition at the end of this clause In case the bidder / his sub vendor does not meet the requirements stipulated above in part or full but he is a regular piping design and engineering firm and currently carrying out the design and engineering plant units, may also be considered qualified provided he collaborates subcontracts / associates with a design firm / agency who meets the requirement of the clause above for the purpose of execution of design and engineering of power cycle piping system for this package. In such a case the bidder / its subvendors shall get the design / engineering documents as per technical specification duly vetted by his collaborator / sub contractor / associate for the part of design for which he is not qualified."	Refer Corrigendum- VI

All vent pipes and safety valves escape pipes to a level of 1 meter above SG house roof. Start-up drain and vent regulating valves with motor drives Start-up drain and vent isolating valves with motor drives All start-up vents, lowest set pressure spring loaded safety valves on Superheater outlet and Reheater outlet shall be provided with silencers shall be provided with silencers. The start-up vent lines shall be provided with one motorised isolating valve and one motorised regulating valve.	For once through supercritical boilers start-up vents are not envisaged since the boiler will be started with HP-LP bypass in operation. The vent valves provided will be used for air release purpose only during boiler filling. Hence motorised valves and silencers are not necessary. As per the bidder standard the vent pipe shall be routed to the safe location.	Bid Specification shall prevail	As per design, Safety valve and ERV at SH O/L & RH O/L are provided with Silencer to lowest set pressure only. Startup vent at SH O/L is provided with silencer, however it is not provided at RH O/L for IP steam air vent. Two motorized isolating valve shall be provided for startup vent & drain. No regulating valves are envisaged. Please confirm	This will be taken up during bid evaluation stage after revieweing the details

4	Volume-III A	1	2.3.2.10	MSSV	we understand that the bypass line referred here is small capacity bypass for equalising. Please confirm.	motorised regulating as well as isolation valve for charging shall be provided.	Motorised ON/OFF type MSSV & manual isolation valve shall be considered as per OEM practice. Please confirm	Bid Specification is self-explanatory
5	Volume-III A	1	2.5.1 (c) 13.8	Electrically operated guillotine type gas tight isolations: Before and after each regenerative air heater on both flue gas and air side Double multi louvre type isolation dampers shall be provided before and after each regenerative air heater on air side	Kindly confirm whether double multi louvre type isolation dampers can be provided on the gas side also from layout considerations.	Bid Specification shall prevail	Guillotine type dampers /gates are envisaged at a) individuals FD and PA fan outlets, b) Inlet & outlet of each ESP gas stream, c) Before & after each ID fan. d) Manual transfer dampers shall be provided at seal air fan discharge. e) Pneumatic control & isolation dampers shall be provided at Hot and Cold air duct to each mill. f) Guillotine type dampers at inlet & outlet of APHs on flue gas side & air side are not envisaged, however Bi-planar/Louver type of isolation dampers shall be provided at each air heater inlet & outlet both on the flue gas side and air side. Please confirm	Earlier response prevails.
6	Volume-III A	1	5.8.1	The outlet temperature of SH and RH shall be guaranteed to be maintained within $\pm 5^{\circ}\text{C}$ of the rated temperature condition from 60% to 100% BMCR.....	Please clarify whether the required steam temperature control range has to be considered as 60% TMCR (control load) to 100% BMCR.	50% to 100 % BMCR	As per OEM design, 60%TMCR as a lower control range point for rated SH/RH temp to be considered. Please confirm	Earlier response prevails.

7	Volume-III A	1 / 53 1 / 53 1 / 90	5.11.95.11.9 Data sheet-A. Sr.No:13.1	The Air Heater shall have peripheral duplicate A.c. The Air Heater shall have peripheral duplicate A.c. drive to be able to run the air heater at the rated RPM in the event of failure of one of the Air Heater drives. Air Heater: Rotary Regenerative, Tri-sector type or Bisector Type. Each with two peripheral AC motor drive and one independent air motor drive along with one air receiver of minimum 10 minutes capacity.	As per OEM standard centrally mounted motor. As per OEM standard centrally mounted motor drive shall be provided.	Bid Specification shall prevail	Each Air preheater is provided with 1 AC motor and 1 air motor as per OEM design. Please confirm	Earlier response prevails.
8	Volume-III A		5.12.4	Cross-connections with sufficient number of power operated dampers shall be provided such that, to the limits of their capacity, the Steam Generator may continue to operate safely following the loss of any one F.D. fan, I.D. fan or air heater (if applicable).	Cross-connection duct at FD and PA fan outlet shall not be provided due to layout constraints. However Cross connection shall be provided at ESP outlet for ID fans.	Bid Specification shall prevail	Only single stream operation (1 FD fan, 1 ID fan, 1 PA fan & 1 RAPH on the same side) is applicable as per OEM design	Earlier response prevails.

		shall be connected with matching plugs.	Rooms, SWAS Rooms, ESP Control Rooms, other areas /Control Rooms and various rooms of Technical Office Building, all as indicated in ANNEXURE-A to this section shall be through concealed cabling which may be effected by running telephone cables through PVC pipes concealed in the walls. The telephone cabling & wiring in each such rooms & areas shall be terminated to two pin sockets, to which respective telephone sets shall be connected with matching plugs.	
Additionally bidder shall consider the following as clause no. 13 in Section-5, Volume V (page 440/718). <u>SPECIAL REQUIREMENTS OF INSTRUMENTATION BASED ON ENERGY AUDIT PROGRAMME</u> 13.1 <u>INTRODUCTION</u> Measurement of important parameters which affect the input costs like coal, oil, water need to be measured and not estimated. Both receipt and consumption need to be separately monitored and reconciled through computerized system. There must not be human intervention in the measurement and recording systems of coal, fuel oil and water resources which affect the station input costs. Supply chain optimization of raw material inputs through modernization of technology needs to be taken up. Transit loss, specific fuel consumption and GCV are interlined and realistic quantification of these will only be possible if a fuel monitoring system is in place.				

CONSULTANT : PROCON ENGINEERS

The system should aim at procurement of digital instrumentation which can be seamlessly integrated into a DDCMIS. Intelligent Electronic Devices (IEDs) must be the preferred Instrumentation Systems. Information and communication system needs to be got audited for obtaining a holistic picture of its structure and efficiency.

13.2 COAL

13.2.1 Station Coal Measurement (Coal Receipt Measurement)

Fully automated pitless in motion weigh bridges with digital interface and provision for data communication to control room shall be envisaged. These must act as Intelligent Electronic Devices (IEDs) and seamlessly communicate with the overall plant automation. Besides, fully automatic rail signature at the receiving end shall have provision for acting as IEDs to communicate with the plant automation.

13.2.2 Unit Coal Measurement (Coal Consumption Measurement)

- (a) The coal entry into the boilers shall be measured. The various technologies for coal measurement are given in clause no. 13.6 of this section.
- (b) An online process (without any human intervention) which would give the online coal consumption with uncertainties of $\pm 1.0\%$ shall be envisaged and the technology for the same must be well proven and established. The conventional stacking method can be used for reconciliation of data/cross verification only and not for coal consumption measurement.
- (c) The stacking inventory procedure shall not be used for measurement of coal for declaring the station heat rate. Instead the use of fully automated, tamper-proof modern instrumentation without human intervention for on-line coal inflow and consumption shall be envisaged.
- (d) The difference in belt weighers/gravimetric feeders and receiving end coal measurements must not exceed more than 0.06 kg/kWh

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 108 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
(0.03 kg/kWh for increase in moisture from tripling to bunkering, stones weights and 0.03 kg/kWh for handling loss). (e) Based on an assessment of the different technologies the following are recommended: (i) Installation of Belt Weighers for all coal conveyors. The offered system shall monitor the time elapsed by a belt over a given bunker and which involves integration of the output of the Belt Weighers over the total bunkers of the unit in a given period of time. The bidder must come out with a viable and innovative scheme for monitoring the bunker wise coal from the belt weigher data. (ii) Microwave or Ultrasonic Bunker Level Monitoring System with digital data output, communication of data to system server or control room is required. (iii) Coal flow for the plant shall be monitored by gravimetric feeders which provide accurate and authentic coal flow measurements, in addition to belt weighers. The differences in the two are to be within 0.5%. The data from the belt weighers and the gravimetric feeder can be cross verified, calibrated and reconciled. Necessary signal exchange shall be considered by the bidder. (iv) Necessary software shall be included in the offer for online coal energy management in the plant. The software shall take input data from the various field instruments for coal receipt from various sources and coal consumption at various bunkers. (v) Computation of unit coal consumption. This is purely from the reading of the belt weigher and bunker monitoring system. This coal consumption is to be used for computation of unit and station heat rate for normal and cycling operations. In all the above instruments, the following must be considered:		

- (i) The instruments must function as Intelligent Electronic Devices (IEDs) by digitally communicating with DDCMIS/ control room through down loading of data continuously.
- (ii) The instruments must have provisions for communication of digital data.
- (iii) The instruments and the digital conversion systems must have a very high reliability in terms of SAIFI (System Average Interruption Duration Index) of 0.5 interruptions per year and SAIDI (System Average Interruption Frequency Index) of 4 hours per year.

By this process the coal consumption will depend on the unit performance and not vice-versa.

13.3 FUEL OIL (Receipt and Consumption Monitoring)

13.3.1 Oil Receipt Measurement

The following are to be considered:

- (a) Pitless in-motion weighbridge shall be envisaged for measurement of oil in tankers.
- (b) Fully automatic ultrasonic level indicators with provision for conversion of signals into digital signals and communication through a media to DDCMIS shall be installed for all oil tanks. The digital signals must be downloadable into a data base on a continuous basis.
- (c) A fuel oil monitoring software package is to be in place for on line calculation and logging of the oil receipts, etc.

13.3.2 Oil Consumption Measurement

The following are to be considered:

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 110 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
(a) Differential pressure orifice plate or nozzle type or mass based oil flow meters with provision for continuous digital data transfer shall be installed. (b) The oil gun on-off operation data must be recorded through a time based system automatically to give a time trace of when the guns are on and when the guns are not in service. This will be useful for performance optimization group to study the operator to operator variations, coal to coal variations, variation in different seasons, etc. 13.3.3 Integrated Fuel Oil Receipt and Consumption Monitoring A Fuel Oil Monitoring software Package shall be provided. When ultrasonic level measurement for tanks is used, the software package shall calculate the oil receipts. 13.3.4 DM Water and Associated Water Systems On-line monitoring of DM water flow and unit make up with integrators shall be envisaged to control the energy efficiency as the make up is directly proportional to the steam lost from the system and affects the unit heat consumption and heat rate. Hence, it is envisaged to go in for fully automatic on line measurement of water consumption for both production and consumption measurement of raw water, DM water, soft water and drinking water. The following are to be considered for DM (De-mineralized) and associated water systems: (a) Both DM water production and DM water consumption must be separately measured and audited. (b) Installation of differential pressure orifice plate or nozzle type flow meters with digital output, communication media to relay the data to the DM control room computer and provision for downloading the data into a data base for on line monitoring of make up especially during cycling operations. On line monitoring would help in control of unit heat rate as well as give an accurate account of the chemicals consumed for DM water production.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 111 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
(c) Water Monitoring Software Package shall be provided. The package must have capability to draw inputs from the various field instruments and make an on-line continuous data base grid of the information for generation various types of information such as consumption per shift, consumption during cycling operations, operator-wise consumption, etc. to enable the performance optimization group to take control action on the areas of wastage and excessive consumption. Consumption and production shall be separately monitored.		
13.4	<u>SPECIFICATIONS OF IN-MOTION WEIGH BRIDGES</u>	
13.4.1	Particulars Of Pit-Less In-Motion Weigh Bridges	
	(a) The system is basically in-motion rail dual in-weigh sensors with analog electrical signals which are digitized and communicated to a control room through communication media where it is recorded. The record shall be in a usable format of a data base with a tie stamp.	
	(b) Accuracy : $\pm 0.5\%$ or better for individual wagon and $\pm 0.2\%$ for the entire rake.	
	(c) Power Supply : 700W	
	(d) Reliability Index : SAIDI (System Average Interruption During Index) : 48 hours / year or better SAIFI (System average interruption frequency index): 2 times / year or better.	
	Further details and latest amendments can be obtained from Research Design Standards Organization (RDSO) of Indian Railways (www.rdso.gov.in).

CONSULTANT : PROCON ENGINEERS

This refers to Volume VI A, Section 1, page 136, clause 4.7.20.18 (pp) of the bid specification. The details under Sr No (i), (ii) of the clause stand replaced as under:

(pp) The valves shall generally meet the following requirements:

(a) Butterfly Valves:

(i)	Type	:	Manually operated Double flanged Butterfly Valve
(ii)	Standard	:	AWWA C – 504/ BS: 5155
(iii)	POD (Proof of Design) Test	:	AWWA C – 504. Bidder to submit for reference.
(iv)	Operating Fluid	:	Water at 40 °C to 45 °C
(v)	Design Pressure	:	5.0 Kg./Sq.cm.
(vi)	Max. differential pressure	:	5.0 Kg./Sq.cm.
(vii)	Head loss	:	Max. 0.3 MWC
(viii)	Body	:	Cast Iron conforming to IS: 210 Grade FG 260 or Fabricated steel conforming to IS:2062/ IS:2002
(ix)	Shaft	:	Stainless Steel AISI 410
(x)	Bearing type	:	Self lubricated type
(xi)	Disc seat	:	Nitrile Rubber
(xii)	Body Seat	:	SS – 316
(xiii)	Internal Hardware	:	Stainless Steel
(xiv)	External Hardware	:	High Tensile Steel
(xv)	Fasteners	:	SS – 304 / SS – 316

(xvi)	Gland Packing	:	Teflon
(xvii)	Gaskets, Rings, etc.	:	Nitrile Rubber
(xviii)	Accessories	:	2 Nos. of 2NO + 2NC limit switches 'OPEN' & 'CLOSE.

All the butterfly valves shall be complete with graduated position indicator, arrow indicating the flow direction. The valves shall be suitable for erection in any position (Horizontal/Vertical, etc.). The operating mechanism shall be mounted directly on or supported from valve body. All the butterfly valves shall be provided with hand wheel. Butterfly valves of size 350 NB and above shall be provided with reduction gear units. Valves shall close in clockwise direction. The hand controls shall be dimensioned to guarantee an easy manoeuvre under most severe conditions. The hand controls shall be provided with locking systems to avoid the disk assuming a not desired position during operation. The pulling force required on the hand wheel-rim shall not exceed 30 Kg. when operating the valve under full flow and operating pressure. The reduction units shall be watertight, complete with lubrication and position indicator. Only one type of valve shall be provided, either cast or fabricated type. Mixing of two types of valves is not considered acceptable.

(b) Ball Valves

(i)	Standard	:	IS: 9890
(ii)	Type	:	Threaded
(iii)	Pattern and Construction	:	Full bore in single piece
(iv)	Nominal size	:	As specified elsewhere
(v)	Design pressure	:	5 Kg./sq.cm.
(vi)	Material of construction	:	Carbon Steel Valves confirms to IS: 9890

CONSULTANT : PROCON ENGINEERS

1.0 SCOPE OF WORK:

The following items & shall be executed in accordance with design criteria as stated:

- (a) Obtaining necessary approvals/permission/clearances of railway authorities before and during execution as well as after completion of railway works as per requirements of Railway department / Mahagenco /local bodies like panchayat, PWD,/or any other department required for commissioning well in advance so as to start the railway traffic in schedule time frame.
- (b) Design and Construction of ROB within Railway Boundary with launching scheme including footpath and wearing coat.
- (c) Design and Construction of ROB viaduct in non-railway and railway area including wearing coat.
- (d) Design and Construction of ROB approach ramps including required earthwork, GSB, WBM and BT works etc.
- (e) Design and Construction of Anti-crash Barrier for entire ROB, friction slab for approaches as required.
- (f) Drainage arrangement for entire ROB including GI spouts, down take pipes, water collection chambers of 450 x 600 size near piers and abutments, RCC-NP3, 450 mm dia pipe connection from collection chambers to road side drain or Nalla.
- (g) RCC pier protection in viaduct portion on either side in Non-Railway and Railway area.
- (h) Painting to entire ROB structure including approach ramp and staircases by waterproof cement paint.
- (i) Maintenance of existing slip/service roads during construction till completion of work.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 138 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
(j) Any other works not specified but required for completion of scheme. (k) Providing suitable and required ducts / conducts / openings / boxes / slots etc. for electrical and streetlight installations in Bridge concrete structure at appropriate location as per electrical installation scheme. (l) Designing of electrical and street lighting system/circuitry for entire work and obtaining necessary approval from the Maharashtra State Power Transmission Company Ltd /Electrical Inspector as required. (m) Construction of roadside drains along the diversion road. (n) Providing and fixing aluminium cat-eye-stud as required. (o) Providing and fixing cautionary / warning signboards / information signboard. (p) Providing and laying thermoplastic road marking material as per Specification. (q) Construction of diversion road as per required section provided. General Details of Work to Be Executed Under Total Contract 1.1 <u>WIDTH AND CROSS SECTION:</u> Width of the Road Over Bridge and the requirements of carriageway shall be as per requirement. 1.1.1 <u>LENGTH OF BRIDGE :</u> (a) Railway Bridge Portion : Two span of 20 to 25 M Total length of Bridge in Railway portion is approximately 50 M. (b) Non-Railway Bridge Portion : 10 spans of 25.00M each i.e. @ 250.00 meters.		

Total length of viaduct in Non-Railway portion is 250.00 M.

1.1.2 APPROACHES:

- (a) Solid ramp on both ends with gradient 1:30
- (b) Diversion cum service road with drain approximate: 950 M

1.1.2.1 Carriage Width:

- (a) In Railway Portion : 5.5M + 1.5M footpaths on both Sides + 0.50M anticrash barriers on both sides +125 mm parapet both side
Total width =9.75 M
- (b) In non Railway Portion : 5.5M + 0.5M anticrash barriers on both sides
Total width=6.5 M

1.1.3 LENGTH OF ROB AND VIADUCT:

The contractor's proposal shall provide the length of the Road Over Bridge, viaduct and approaches strictly as per standard specifications / drawings to suit the requirements of minimum horizontal i.e. clear span and vertical clearance i.e. rail top to soffit of superstructure as indicated for Railway Bridge portion and viaduct as per specified gradient not steeper than required specifications for Railway portion is obligatory. The contractor shall provide the Road Over Bridge to confirm to these requirements and including properly designed vertical and horizontal curves for a design speed of 80 km/h (Summit curve in the central portion and valley curve on either ends). Valley curves are to be provided at either ends of the Road Over Bridge. In the inner half portion of the valley curve-retaining structure shall be continued. In the outer half portion of the valley curve, crash barrier shall be provided upto the point where height of fill is more than 10 cms above the existing road level.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 140 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

1.1.4

CAMBER AND SUPER ELEVATION:

Minimum camber to be provided to the carriageway shall be 2.5%. Super elevation where required shall be as per actual design (subject to a maximum of 4% if super elevation needs to be provided in structural portion).

1.1.5

TRAFFIC DIVERSION:

The contractor may adopt a suitable scheme of construction, which shall be got approved from Railway Authorities, Traffic (Police) Department. The responsibility of obtaining the permissions for scheme to be adopted from concerned authorities e.g. Railways, Traffic (Police) shall be that of the contractor. No extra cost will be paid on account of such diversion.

In situ staging for construction of superstructure is not permitted over the Railway span. End launching or any other method (acceptable to Railway) shall only be permitted. Precast RCC shuttering slab for PSC girder is not permitted.

1.1.6

Programme of construction of railway bridge portion shall be arranged in such a way that it is complete in the shortest time period.

1.1.7

Interim support at minor bridges/CD works on the existing road shall not be allowed for construction superstructure.

1.2

SITE CLEARANCE / SETTING OUT:

1.2.1

Making out the center line of the ROB and various components and complete lining out with masonry and concrete pillars for proper lines and levels with precision theodolite survey including constructing theodolite stations, bench marks etc., as directed. This includes all the allied works like clearing the road side line removing and stacking of the existing kerb stones, obstructing bushes, trees etc. The surveying instrument used on the works shall be modern electronic equipment.

1.2.2

Providing all documentation such as audio/video cassettes or CDs/photographs, record drawings etc.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 141 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

1.3

FOUNDATION :

1.3.1

Open Foundation – In case of open foundation, taking foundations through all strata upto required foundation level including embedment as per specification/design criteria. Rock levels/line as per Geo-tech report.

1.3.2

Pile Foundation – In case of pile foundations providing MS liners of (i) 8mm thick for the Railway bridge portion (foundation covering span over the railway boundary) and (ii) 6mm thick for rest of the foundation including coal tar epoxy anticorrosive paint of zinc rich epoxy primer and two coats of coal tar epoxy paint (total dry film thickness = 50 + 80 + 80 = 210 micron) to the mild steel liners on surface in contact with earth. The bottom shoe of liner of 12 mm thick shall attain minimum height provided and placed in position prior to driving 8mm / 6mm thick MS liner. These MS liners are to be provided up to top of rock or refusal level as approved by the Engineer.

1.3.3

Load test on pile (Initial) – Providing and casting test pile and carrying out load test as per design criteria for initial load test. **Only by STATIC method of testing.**

1.3.4

Load test on pile (Routine) – Carrying out routine load test on pile conforming to design criteria. Only STATIC method of testing shall be adopted.

Pile Cap – Providing RCC pile cap : The top of the pile caps shall be atleast 0.5m below ground level.

1.3.5

The foundation level/depth for pile foundation of structures for bridge portion shall be as per design data.

1.4

SUBSTRUCTURE:

Providing sub structure of piers, abutments, returns etc., as per design criteria with suitable RCC caps.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 142 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

1.5

SUPER STRUCTURE:

Providing superstructure and decking shall be conforming to the design criteria suitable for roadway particulars footpaths, central median etc. as shown in the departmental drawings. Only prestressed concrete superstructures are allowed. Steel and composite superstructures are not allowed. For Railway portion only precast prestressed girders are allowed as per GAD approved by Railways.

1.6

RAILING, KERBS, BEARINGS, EXPANSION JOINTS, WEARING COAT ETC.:

1.6.1

Providing necessary bearings, pedestals for bearings, expansion joints water spouts, mastic layer on the deck wearing coat, road kerbs, anti crash barriers etc., as per design criteria. Anti crash barrier for the ROB & viaduct portion shall be as per section indicated in MORTH Specification of concrete grade of deck slab. For approaches same section shall be provided with suitable friction slab, design with suitable length & keys. The design shall be approved by the Engineer.

1.6.2

Drainage:

Providing minimum 150mm GI water spouts CIMS grating and 150mm GI runner pipes and down take pipes at each pier and abutment location. The GI pipes shall be painted with oil paint in three coats. Chambers shall be provided at the pier and abutment locations and 150 mm dia down take pipes to connect to these chambers. These chambers shall be connected by 300 mm dia. NP-3 Class RCC pipes to take the collected water upto near by nallah or adjoining existing drain as directed by Engineer.

1.7

APPROACHES

Providing approach structures as follows:

1.7.1

Providing vertical retaining structure with outer face in plumb for embankment of approaches in ramps at either ends of ROB proper comprising RCC retaining wall resting on strata of required bearing capacity and as per provisions of design criteria. Providing granular filling

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 143 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

in RCC retaining wall as per specifications and as approved by the Engineer including CC kerb drains of 250mm wide adjacent to crash barrier and intermediate down take arrangement.

1.7.2 Providing Rubble filling behind the abutment and returns for 0.6m width. The height of rubble filling shall be up to the bottom of rubble matt/crust.

1.7.3 Providing Rubble matt of 900mm thickness, below the road crust between the returns for a length of 4 m on either sides of the ROB.

1.7.4 The details of the crust for solid approach ramp of ROB and approach Road from the end of solid Ramp to the junction point on either side is as under:

(a)

Granular Sub base

:

150 mm thick.

(b)

WBM with stone screening with grade I metal layer compacted by vibratory roller

:

150 mm (Two layers each 75mm thick)

(c)

WBM with stone screening with grade II metal layer compacted by vibratory roller

:

150 mm (Two layers each 75 mm thick)

(d)

Bituminous Bound macadam 75mm thick with 250 Kg/100 sqm vibratory roller including tack coat @ 5kg per 10 Sq.m. of bitumen grade 60/70.

:

75mm thick Bituminous Bound macadam (Bitumen grade 60/70)

(e)

Bituminous Macadam 50mm thick with 60/70 grade With 5% bitumen with vibratory roller including tack coat @ 5kg. per 10sqm. of asphalt

:

50mm (Bitumen grade 60/70)

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 144 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

grade 60/70.

(f) Asphalting concrete : 15mm thick Asphalting concrete
15mm thick with 6.5% (Asphalt grade of 60/70).
Bitumen with vibratory
roller including tack coat
@ 5kg. per 10 sqm. of
asphalt grade 60/70.

1.7.5 Providing wearing coat over the bridge superstructure as follows:

(a) Dense Bituminous : 50 mm average thickness
Macadam as per job mix (Asphalt Grade 60/70)
design with minimum 5%
bitumen by wt. including
tack coat @ 5Kg per
10sqm.with vibratory
roller

(b) Mastic Asphalt : 15 mm thick (Grade 10/20)

Profile correction for camber, super elevation and vertical curve shall be provided in deck, itself.

1.7.6 All known overhead utility services if any like electric poles & lines, the telephone poles & lines and known underground service pipe lines, cables etc., falling in the alignment of ROB proper, solid ramp, approach Road shall be shifted by contractor at appropriate locations.

1.7.7 Cross Drainage:

Providing cross drainage in drawing if required and as directed by the Engineer.

1.7.8 SOIL INVESTIGATION:

Soil investigation shall be carried out as required for designing and to confirm the soil investigation report attached and as directed by Engineer in charge.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 145 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

1.8

WIDENING – ROAD WIDENING FOR TRAFFIC DIVERSION:

1.9

ANTICORROSIVE TREATMENT, PAINTING, FIXTURES ETC.

1.9.1

Painting/ Anticorrosive Treatment

Providing protective painting to the concrete surface for foundation by bituminous paint and the substructure and superstructure etc., shall be painted with three coats of water proof cement paint. Median verge shall be painted with three coats of oil paint as approved by the Engineer.

1.9.2

Fixtures

Fixing the fittings and fixtures, instrumentation as may be supplied by the corporation and railways at specified location on bridge structure for certain amenities such as lighting arrangement on ROB and providing items as per design criteria.

1.10

PIER PROTECTION, ROADSIDE KERBS:

1.10.1

Providing pier protection to all the piers as directed by Engineer by constructing RCC pardi of 25 cm thick (M-20) finished with cement plaster in CM 1:4 to exposed faces around piers for a height of 1.25m above G.L. with a gap of one meter between pier and pardi filling the gap with moorum inside and 150mm rubble soling over laid by PCC of M-15 grade of 100 mm thick. The vertical reinforcement of 16mm dia at 200mm center to center and 10mm dia. at 200mm center to center as distribution steel shall be provided on the outer face and nominal steel on inner face 10 mm dia. at 200 mm. at center to center both ways in the RCC pardi. Providing foundation for pardi of minimum size 0.45m x 0.50m in M-15 over rubble soling of 0.15m Pier protection is required only to RCC pier column.

1.10.2

Providing and fixing continuous precast **RCC kerbs stones in cement concrete M-20 of size 1000mm x 300mm x 600mm embedded 300 mm in ground along the bridge adjacent** to the solid ramp portion on both sides upto the end of ramp @ 300 mm clear distance from R.E. Walls with 150 mm dia drainage spouts @ 2000 mm c/c including oil painting of approved colour and shade by Engineer.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 146 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

These kerb stones shall be provided on roadside parallel to the retaining wall or reinforced earth structure to protect it from damages and to channelize the traffic running on side roads.

1.11 LABORATORY:

1.11.1 Providing and maintaining an adequately equipped field laboratory as required for site control on the quality of material and the works. It shall have adequate area for the entire equipment and working as directed by the Engineer.

1.11.2 The field laboratory of adequate floor area shall be located on the site as shown or as directed and approved by the Engineer. It shall be provided with all amenities like water supply, electric supply etc.

1.12 BLASTING OF ROCK:

Blasting of Rock/Boulder etc., is not permitted. Only chiseling should be resorted to.

1.13 DOCUMENTATION:

Providing documentation such as videocassettes, CDs, photographs as built drawings etc., as specified in the tender. All drawings shall be on Auto CAD of latest version.

1.14 CONSTRUCTION PHASING:

The contractor has to prepare detailed work plan with his bid which shall take into account, the traffic position, milestones specified in the tender, and availability of men, material, machinery and shuttering material with him. He has to indicate how he intends to divert the traffic during construction.

1.15 Waterproof cement based paint shall be provided to the finish surface of the Road Over Bridge, viaduct and approaches as approved by the Engineer.

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 147 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

1.16

AESTHETICS:

Aesthetics aspects like smooth profile of soffit, precast fascia, geometric profile, grooves, crash barriers etc., which may lead to enhance overall look of bridge and area is desirable. Precast RCC Fascia of minimum M-25 grade with minimum 80 mm thick and 1500 depth below RTL with necessary grooves / pattern shall be provided if proposed by the contractor for viaduct portion to match the overall aesthetics of the bridge.

1.17

Thermoplastic road marking – Yellow and white continuous lane marking at 3 locations per lane carriage as directed by the Engineer for entire length of the work including markings for junction developments as approved by the Engineer.

1.18

Sign, caution, informatory board, and hazard markers of Retro reflective type as approved by the Engineer.

1.19

Cat-eyes as approved by Engineer.

1.20

ROB – BRIDGE WITHIN RAILWAY BOUNDARY

All the structural designs for all components including foundations substructures, Bearings, Expansion Joints, Superstructures, Railway/ Crash barriers, Footpaths, Stair cases etc., shall have to be got approved by the contractor from the Railway authorities. Nothing extra will be paid on this account to the contractor.

2.0

DESIGN CRITERIA FOR FLYOVER/ ROB

2.1

SPECIFICATIONS FOR DESIGN AND CODES TO BE FOLLOWED :

2.1.1

The design of structural components shall conform to the criteria laid down in the latest editions of the following codes of Practice and Standard specifications published up to the last date of receipt of tender and subject to the departures stipulated.

2.1.1.1

Standard Specifications and Codes of Practice for Road Bridges. :

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 150 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

2.1.1.8

For items not covered by any of the above Standards and Specifications, Sound Engineering practice and provisions relevant Codes of other nation shall be referred.

2.1.1.9

In case of ROB/RUBs involving the bridges over/under railways, the relevant provisions of railway codes/railway authorities shall supercede the provisions in this criteria in the portion of bridge where these are applicable.

2.2

DESCRIPTION OF WORK AND OBLIGATORY PROVISIONS

2.2.1

Alignment and Location :-

Alignment and location of the FLYOVER/ROB shall be as shown in the Departmental drawings.

2.2.2

The Length Of Flyover/Rob And Viaduct :-

The length of the FLYOVER/ROB and via-duct shall satisfy the following criteria.

(a)

Maximum height at abutment location shall not be more than those shown in departmental drawing.

(b)

Longitudinal gradient shall not be steeper than those shown in departmental drawings.

(c)

Restrictions on terminal points if specially mentioned in departmental drawings.

(d)

Any other criteria shown on the departmental drawings / supplementary data.

(e)

Overall length of bridge proper i.e. FLYOVER/ROB and Viaduct shall not be less than the length shown in departmental drawing.

(f)

The minimum vertical and horizontal clearances under the Railway Bridge Portion shall not be less than those shown in drawing.

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 151 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

2.2.3

Road level on the flyover/rob and roadway particulars:

(a)

Roadway particulars and carriageway widths shall be as per relevant drawing.

(b)

The vertical geometry of the finished surface of deck slab and wearing course shall be in the form of a smooth curve where change in gradient occurs. The design of curves shall be got approved from the Engineer. The design of curves shall comply relevant IRC Codes / Guidelines. The design speed on curve shall be as stipulated in **Design Data**.

2.2.4

Supplementary data for design shall be as per Design Data.

2.3

DESIGN LOADS: -

2.3.1

Live loads :

2.3.1.1

The bridge shall be designed for Loading(classAA) as per IRC: 6-2000. During construction a construction load of 300kg/sqm shall be considered. The Bridge shall also be designed for Service Loads as specified in Design Data.

2.3.1.2

For Railway portion – As per IRC:6-2000 Or as approved by Railway Authority whichever produces worst effect.

2.3.2

Wind Forces:-

Wind forces shall be considered for the design.

2.3.2.1

Temperature-Range :-

For calculation of thermal forces effect of 'E' value of concrete should be taken as 50 % of the instantaneous value so as to account for effects of creep on thermal strains.

2.3.2.2

Earth Pressure:

The abutment shall also be designed to be safe for a back fill with dry density of soil 1.8 t/cum, saturated density 2.00 t/cum, $f = 30^\circ$ and $C = 0$.

2.4 FOUNDATIONS :

2.4.1 Piers/ Abutments:

2.4.1.1 The details of the borings with levels & their locations are in the drawing/tender document for general guidance of the bidder only. The contractor shall have to take borings by double tube boring machine at the final location of each pier and abutment prior to the commencement of the work to ascertain the rock levels/quality at the location of the foundations and this shall form part of the contract and no payments will be made by the Department for boring, soil sampling and testing etc.

2.4.2 Ramp/Retaining Walls :-

2.4.2.1 The solid ramp portion of the Flyover/Road Over Bridge shall be a retaining structure. The retaining structure resting on strata other than rock shall not be accepted, unless they are of R.C.C. wall. The foundation of retaining structure shall be rested at least 1.0 metre below the ground level on strata other than rock.

2.4.2.2 For foundation of Retaining structure if design requires to increase SBC at foundation level by any soil stabilization method or any type of additional foundation arrangement, treatment etc is required, the same shall be included in the tendered amount. No payment will be made separately for the same.

2.4.3 Pile Foundations:

2.4.3.1 Minimum embedment into rock and S.B.C. of the strata shall be considered as follows

Sr. No.	Type of strata	Min. Embedment in rock	S.B.C. of rock
(a)	Hard rock	1.5 x diameter of pile	400 t/m ²

		1.0 x diameter of pile	300 t/m ²
(b)	Soft rock	3.0 x diameter of pile	250 t/m ²
		2.0 x diameter of pile	200 t/m ²
		1.5 x diameter of pile	150 t/m ²

The values of S.B.C. given above consider the effect of embedment in rock and global behavior of the pile and hence friction resistant of pile shall not be further added.

2.4.3.2 Only end bearing bored cast in situ piles drilled with rotary rig or regular tripod rigs will be accepted.. Design with single row of piles per Substructure shall not be accepted. Annular piles filled or not filled shall not be accepted.

2.4.3.3 Minimum 6mm thick permanent M.S. Liner for piles shall be provided, for piles up to top of rock. For Railway bridge portion the minimum thickness of permanent M.S. Liner for piles shall be as per the requirements of railway codes/authorities.

2.5 SUBSTRUCTURE:

2.5.1 For continuous spans, pier with fixed bearing shall be designed to take all the horizontal forces

2.5.2 The thickness of counter-fort shall not be less than 400 mm and that of any other element shall not be less than 300 mm.

2.5.3 Dead man anchors or friction slabs shall not be accepted behind abutment for relieving moments

2.5.4 Scope for accessibility for inspection and arrangement for lifting of the superstructure for future replacement of bearings shall be provided for in the design of substructure. The positions of jacks shall be distinctly marked on the drawing and also on the structure.

2.5.5 The height of pedestals shall be limited to 500 mm and shall not be less than 300mm.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 154 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

2.6

SUPERSTRUCTURE:

2.6.1

Deck slab thickness shall not be less than 300 mm and not less than 200 mm at tip of cantilever, irrespective of the provisions elsewhere.. The slab shall be checked for punching shear. The cantilever projection of slab in transverse direction shall not be more than 1.8m.

2.6.2

In case of voided slab structure, analysis & design shall be based on the provisions of B.S-5400. The minimum thickness of concrete around the void of deck shall be 300 mm.

2.6.3

Minimum thickness of intermediate diaphragm where provided shall be 300 mm and that of end diaphragm shall be 500 mm for the cast in situ work. Manholes shall kept at a spacing not more than 150m with arrangement for access inside the box.

2.6.4

In the absence of rigorous analysis for torsional and distorsional moments and forces due to warping torsion at ends, the design live load moments and shear force in the longitudinal direction shall be increased by 20% and transverse reinforcement by 5%.

2.6.5

For pre-stressed Superstructure with box girders, the cross diaphragms shall be minimum one each at supports and at each abrupt change in soffit geometry.

2.6.6

The provision for imparting 20% of design prestress at a future date shall be made in the deck and suitable anchorages, bulkheads, deviator blocks etc. shall be constructed for the purpose. Arrangement for external prestressing shall be got approved.

2.6.7

In addition to post tensioning as per I.R.C. codes, precast segmental construction as well as pre-tensioned construction are also permitted as per B.S.:5400.

2.7

BEARINGS BELOW SUPERSTRUCTURE :

2.7.1

Type of bearings shall be permitted: - POT PTFE.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 155 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

2.7.2	The bearings shall be easily accessible for inspection.
2.7.3	Scope for lifting the superstructure for future replacement of bearings shall be provided for in the design of bearing.
2.8	<u>EXPANSION JOINTS:</u>
2.8.1	Expansion joints shall conform to MORT&H specifications. The detailed working drawing for the joint shall be in conformity with overall geometry of deck. Geometrical profile shall be achieved by adjusting the dimensions of superstructure.
2.8.2	The expansion joints should generally be spaced at not less than 100 m. except in case of unavoidable circumstances.
2.9	<u>CRASH BARRIERS :</u> Anti crash barriers having a typical cross section as shown in Departmental Drg shall be provided for FLYOVERS/ROBs with footpaths / without footpaths.
2.10	<u>WATER SPOUTS:</u> Water spouts as per MOST Type design No.SD/303 shall be provided. However, the dia of pipe shall be 150 mm. Waterspout shall be connected to runner pipe of suitable diameter (Minimum 150 mm) on either side of roadway and taken down by down take pipes of suitable diameter at approved locations.
2.11	<u>WEARING COAT :</u> A wearing coat of uniform thickness shall be provided for riding surface. The configuration of wearing coat shall be as per the Design Data .
2.12	<u>ANTICORROSIVE TREATMENT:-</u>

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 156 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
Anti-corrosive protective paint as mentioned below and approved by the Engineer shall be provided. This paint shall be got tested from the approved laboratory and shall be of approved quality, colour and shade. The protective coating shall consist of: 2.12.1 Mild steel liner to piles: One coat of Zinc-rich Epoxy Primer and two coats of coal tar epoxy.(Total dry film thickness 50 + 80 + 80 = 210 microns) 2.12.2 Reinforcement steel shall be cleaned with sand blasting before placing in position. 2.12.3 Part of substructure exposed to atmosphere - Water proof cement based paint of approved quality and colour in three coats. 2.12.4 Part of substructure in contact with earth upto GL – one coat of primer and two coats of coal tar epoxy. 2.12.5 The superstructure shall be treated with following protective coatings. (a) <u>Parapets/ Railings / Crash Barriers</u> Waterproof cement based paint of approved quality and colour in three coats. (b) <u>Deck/Girder/box and inside of RCC/PSC Box</u> Waterproof cement based paint in three coats of approved quality and colour. (c) <u>Steel Structures</u> The anti – corrosive protective paint shall be provided as approved by Railways. 2.13 <u>LOAD TEST :</u> 2.13.1 In case a structure or a component of structures proposed by the contractor, in the opinion of the Engineer is of unusual nature, then the Engineer shall		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 157 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
	have the right to call upon the contractor to carryout model testing and/or load testing of the structure or component to prove its suitability. The cost of such test shall be borne by the contractor only.	
2.13.2	Any defect noticed in the structure or any damage done to the bridge at the time of testing, which affects or is likely to affect the strength of the bridge shall be rectified by contractor at his own cost by remedial measures or replacement as approved by the Engineer.	
2.13.3	The test shall be carried out in the presence of Engineer.	
2.14	<u>DOCUMENTATION, INSTRUMENTATION :</u>	
	The following items shall be deemed to be included in the tendered cost.	
2.14.1	All final drawings and Microfilms and Compact Discs of all approved drawings and “as built” drawings and calculations shall be supplied by the Contractor free of cost.	
2.14.2	Three DVD of 180-minute duration each of the bridge covering the different phases of construction from start to finish shall be supplied by the Contractor free of cost.	
2.14.3	A “Maintenance Manual” describing access arrangements, important obligatory precautions from the point of view of structural safety, and procedure for minor and major repairs of each component of the bridge, renewals of finishes and periodical treatments shall be supplied by the Contractor free of cost.	
2.14.4	A “Quality Assurance Manual” covering all aspects of designs and drawings, mix-designs, materials, testing, soil and rock properties, statistical quality control, etc. shall be prepared by the Contractor free of cost well before starting the work.	
2.14.5	A “Construction manual” covering various aspects of construction methods, difficulties faced and how they were overcome during execution etc. shall be supplied by the contractor free of cost at the time of finalization of work.	

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 158 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
2.14.6	The Contractor shall install fixtures and fastenings provided by the Department for housing any instrumentation that may be useful for the Employer at his cost.	
2.14.7	Fixing arrangement for internal and external lighting shall be got approved from competent authority and executed.	
2.15	<u>PROCEDURE FOR CHECKING DETAILED CALCULATIONS WORKING DRAWINGS:</u>	
2.15.1	Within one month of the receipt of work order, the contractor shall submit a program of submission of designs. The program of submission of designs of various components should be consistent with the program of work prepared by the contractor and approved by the Engineer.	
2.15.2	The consultant shall have the latest official version of the software being used for design and same shall be made available for scrutiny of design to the Engineer if demanded.	
2.15.3	Detailed calculations and working drawings of all the component parts of the Bridge shall be submitted well in advanced of the execution, in accordance with the above program. Two sets of such design calculations and Three sets of drawings accompanied by complete information and sufficient data shall be submitted to the Engineer for checking the design calculations. The designs and drawings for various component parts shall be submitted progressively. If computer is used for design or analysis, the contractor shall submit with design, the detailed description of method of analysis with explanatory notes and manually done sample calculations for adequate number of typical cases & soft copy. The Computer Program as submitted will be further tested by comparison with solutions of worked examples. The Contractor should submit along with his tender note giving his design approach and construction scheme conforming to the basic requirements which should be approved by the authorities while awarding the work so as to avoid the possibility of major changes being required in the design at a later date.	
2.15.4	Drawings and designs shall be in metric units. Calculations shall be neat and clear and supplemented by full explanatory notes and sketches

	wherever required. The drawings of initial submissions and final approval shall be stenciled and in 420 mm x 297 mm size only. It is entirely the responsibility of the contractor to submit the design in a good time to enable the Engineer to approve them in time. No claim shall be granted on account of late approval to the design and consequent delay in the execution. Schedule of reinforcement and rate reinforcement Per Cum. Of Concrete quantity (and also percentage with respect to gross cross sectional area of the component) should also be shown on each drawing.	
2.15.5	Nine sets of approved working drawings along with one soft copy in the form of Compact Disk and four sets of approved designs calculations shall then be supplied by the Contractor which will be formally authenticated by the Engineer. These drawings shall be submitted in the plastic folders for each set and calculations in plastic files & bags.	
2.15.6	After completion of each stage of work, three sets of records plans based on the work as actually executed on site, shall be supplied by the Contractor, to the Engineer.	
2.15.7	Approval to drawings and designs and design calculations by the Engineer shall not in any way relieve the Contractor of his responsibility for their correctness and soundness, structural stability and safety of the structure.	
2.15.8	The approved drawings and the design calculations of the bridge shall be the property of the Employer.	
2.15.9	The Contractor’s designer or consultant shall attend all the design review meetings conducted by Employer Personnel from time to time, without any extra cost.	
2.15.10	For the Railway Bridge portion the structural designs and drawings with Temporary Arrangement Drawing for launching Scheme along with supporting designs and calculations shall have to be proof checked by approved structural consultants approved by Railways and further approval by the concerned Railways Authorities with out any extra cost.

SPECIFICATIONS

The General Technical Specifications comprise of the "Specifications for Road and Bridge Works" (Fourth Revision – August 2001) by Ministry of Surface Transport Roads Wing, Government of India and Published by the Indian Roads Congress, New Delhi, Specifications for Road & Bridge Work (Fourth revision – 2001) of M.O.R.T & H and Indian Railway Standard Code of Practice for plain, Reinforced and pre-stressed concrete for General Bridge construction (Concrete Bridge Code), second revision 1997 issued by Ministry of Railways, which are not reproduced here. The contractors shall obtain their copies of the specifications directly from IRC and Railways.

Full text of all modifications, amendments and additions to MOST Specifications are reproduced here below and will override or supplement the respective provisions of MOST specifications.

SECTION 100

GENERAL

105.1 Scope of Work

107.1

The work to be carried out under the Contract shall consist of the various items as generally described in the tender document under the heading Scope of Work

SECTION 107

CONTRACT DRAWINGS

Sub-Section 107.2

The drawings provided in the tender are the drawings showing proposal of the Employer. Since the offers are invited on the basis of contractor's own design, the drawings submitted by the contractor along with his tender shall be treated as contract drawings subject to conditions laid down in the contract. The Contractor

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 163 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

should visualize the nature and type at work contemplated and ensure that price quoted by him have due consideration of qualitative and quantitative variations, as may be found at the site and complexities of work involved during actual execution/construction

Sub-Section 107.3

The contractor shall submit a programme of submission of designs as per the stipulations made in the design criteria. The program of submission of designs of various components shall be consistent with the programme of work prepared by the contractor and approved by the Employer.

Detailed design calculations and working drawings of all the component of the bridge including launching scheme shall be submitted well in advance of execution, in accordance with the above programme. Three sets of such design calculations and drawings accompanied by complete information and sufficient data shall be submitted to the Engineer after getting the same proof checked by approved structural consultant approved by Railways for checking. The designs and drawings shall be submitted progressively. If computer is used for design or analysis, the contractor shall submit with design, the detailed description of method of analysis with explanatory notes and manually done sample calculations for adequate number of typical cases. The Computer Programme as submitted will be tested by comparison with solutions as worked examples.

Drawings and designs shall be in metric units. Calculations shall be neat and clear and supplemental by full explanatory notes and sketches wherever required. The drawings of initial submission and final approval shall be stenciled and in A-1 size only.

If during the scrutiny of detailed design calculations and drawings including temporary arrangements for launching, any changes therein are found necessary in the opinion of Engineer, they shall be incorporated without altering the Lump-sum price quoted. It will be entirely the responsibility of the contractor to submit properly prepared designs and drawings in good time to enable the competent authority to approve them in time.

Schedule of reinforcement and the rate of reinforcement per cum of concrete quantity (and also percentage with respect to gross cross sectional area of the component) should also be shown on each drawing.

CONSULTANT : PROCON ENGINEERS

Eight sets at approved working drawing including one set on reproduction tracing film and 4 sets at approved design calculations shall then supplied by the contractor which will be formally authenticated by the Engineer (5 copies of drawings and one set of design calculations for field officers, one set to be returned to the contractor and three to be retained by Engineer). These drawings shall be submitted in approved plastic folders and calculations in approved plastic files free of cost.

Sub-Section 107.4

After completion of each stage of work, 3 sets of record plans and one set of final design calculations based on the work actually executed including one soft copy on CD compatible to window 98, office 2000 & AutoCAD 2000I or 2002, shall be supplied by the contractor to the Engineer / MSPGCL as directed.

Approval to drawings and designs by the Engineer shall not in any way relieve the contractor of his responsibility for the correctness, soundness, stability and safety of the structure.

The approved drawings and design calculations of the bridge shall be the property of the Employer.

SECTION 110**PUBLIC UTILITIES****Sub-Section 110.1**

Drawings showing the affected services like electric lines, telephone lines, water pipes, sewers, oil pipelines, cables, gas ducts etc. owned by various authorities including Public Undertakings and Local Authorities are indicated on the drawings. The contractors alternative proposal shall be such that the shifting of utilities is not required. If during the course of execution such utilities are encountered then the contractor shall shift the utilities and will be reimbursed as per the estimate prepared by the concerned department and approved by Employer. The work shall be carried out under the supervision of the concerned department. In case in the opinion of the Engineer it is not possible to divert the

utilities, the Contractor shall make necessary modifications in the structure at no extra cost to the Employer.

SECTION 112

ARRANGEMENT FOR TRAFFIC DURING CONSTRUCTION

Sub-Section 112.7

The Contractor shall have to prepare a detailed traffic diversion plan as per the requirement of traffic authorities. The Contractor shall have to carry out the modifications in the traffic diversion plan at various stages of work as required. The Contractor will have to maintain liaison with the traffic police and Railways authorities so as to ensure smooth flow of traffic at all stages of the work without causing inconvenience to the traffic.

Traffic Rotary - The Contractor shall provide traffic rotary showing traffic direction made up of four blinkers mounted on M.S. Frame of 50 × 50 × 6 m size 250 Hz frequency electrically operated at both ends of the cordoned area to help and guidance of the road use. Necessary arrangement for supply of electricity shall be made by the contractor.

Road delineator - Road delineators as per IRC- 79 and as per relevant drawings and as directed by Engineer shall be fixed at suitable intervals to have a suitable guidance to the road users at the night time to follow the passage. Delineators shall be fixed firmly in the ground. Also red flags, cat eye reflectors shall be fixed on the barricades. Alternate arrangement shall also be kept ready in case of failure of electricity.

SECTION 809

KERBS, CRASH BARRIERS

Concrete crash barriers, curbs, medians shall be laid preferably with machine.

SECTION 1000

REINFORCEMENT

**Sub-Section 1009.3****Reinforcement /Untensioned Steel**

- (a) Cutting, bending of all reinforcement shall be allowed with bar bending machine and also by manually. But heating shall not be permitted.
- (b) All reinforcement steel shall be HYSD.

SECTION 1100**PILE FOUNDATIONS****Sub-Section 1102.**

Add following to the specifications

- (a) Only large diameter bored cast in situ piles constructed using of hydraulically operated rotary drilling machines similar to Bauer B.G. Series piling machines will be preferred, other kind of machine for boring shall also be permitted. Regular tripod rigs also shall be allowed.
- (b) The liner to piles shall be of mild steel conformity to IS 226/IS 2062 weldable quality. The methodology and equipment for providing M.S. Liner shall be got approved. The liner shall be fabricated truly in cylindrical shape with inner dia equal to diameter of pile. The bottom shoe of liner of 12 mm thick shall attain minimum height provided and placed in position prior to driving 6 mm thick M.S. Liner. The M.S. Liner shall be painted with one coat of Zinc rich primer and two coats of Coal for epoxy. Care shall be taken that the shape of liner does not change while driving.

SECTION 1500**FORM WORK****Sub-Section 1502**

The form work used shall be made preferably of marine ply wood properly stiffened, such as DOKA /PERI type form work

**Sub-Section 1510.1**

The form for piers shall be provided such that concreting of piers from 0.5m below ground upto pier cap bottom shall be done for full height in one pour without any construction joint. Form Work shall be properly designed. The formwork shall be such that it either requires no supports or supports do not protrude outside permissible working area and provided within the carriageway.

For pier cap also the shuttering shall be such that it is possible to erect it as a single piece with the help of crane in very short time. It also shall be supported only from the already constructed pier below it.

SECTION 1700**STRUCTURAL CONCRETE**

The work shall consist of forming and placing of concrete. All concrete preferably shall be ready mixed concrete except for railway portion. For railway portion necessary approval to use of RMC from the railway authorities shall have to be sought by the contractor if he proposes so.

SECTION 1702**Materials**

No creek sand shall be allowed in concreting. Only crushed sand and or river sand from approved source shall be allowed. The suspicious aggregates shall be dealt in accordance with IS 2386 (part VII) for alkali aggregate reactivity.

SECTION 1705**ADMIXTURES**

Calcium/Chloride shall not be used, Air entraining, agents workability aids retarding agents may be used if permitted by the Engineer.

SECTION 1707

**EQUIPMENT**

The Equipment for production, Transportation and compaction of concrete shall be as under

- (a) For Production of concrete
 - (i) Deleted
 - (ii) For all concrete work – batching and mixing Plant fully automatic with electronic controls or Mini mobile batching plant with adequate capacity as approved by the Engineer. Ready Mixed Concrete if RMC is used.
- (b) For concrete Transportation – Transit truck, mixer, concrete distributor booms, tremies, cranes etc if RMC is used.
- (c) Weigh - Batching for concrete mixed at site is compulsory if RMC is not used.

SECTION 2000**BEARINGS**

The bearings shall be only Pot PTFE with cast steel plates. The bearings shall be procured only from manufactures approved by MSPGCL/MOST.

SECTION 2300**SUPERSTRUCTURE**

Only following type of superstructure shall be allowed.

Superstructure with precast / prefabricated /cast in situ elements in pre/post tensioned Box/ Voided Slab/ Prestressed girders with cast-in-situ slabs for obligatory and not obligatory spans.

RCC Superstructure is not permitted.

For Railway portion superstructure shall be provided as approved by Railway authority.

SECTION 2309

Protective Coating to the faces of superstructure shall be as per design criteria and scope of work

SECTION 2600**EXPANSION JOINTS**

The Expansion Joints shall be strip seal /modular strip seal as per requirement and shall conform to latest MOST specifications and shall be procured only from manufactures approved by MSPGCL/ MOST.

3.0 SPECIFICATIONS FOR BITUMINOUS BOUND MACADAM (BBM)

Item: Providing and laying 50/75 millimetre thick bituminous bound macadam road surface including supplying all materials, preparing the existing road surface, spreading 40 mm. stone metal layers, heating and spraying the bitumen, spreading 12 mm. size chips compacting with vibratory roller etc. complete.

- (a) Including picking of existing W.B.M./W.M.M. surface.
- (b) Including applying tack coat at the rate of 50 Kg/100 Sqm. on existing bitumen surface.

3.1 GENERAL

The work consists of supply of materials and labour required for providing and laying bituminous bound macadam surface for compacted thickness of 50/75 mm. This item includes preparing the existing road surface to receive the bituminous bound macadam course i.e. picking the existing W.B.M./W.M.M. surface or application of tack coat on existing B.T. surface spreading of 40 mm size metal layer in required thickness with compaction with vibratory roller heating and spraying bitumen with sprayer etc. spreading key aggregates 12 mm chips and final compaction with vibratory

roller etc. complete and finishing in accordance with the requirement in close conformity with grades lines, cross sections and thickness as per approved drawings etc. complete.

3.2 DIVERSIONS

Temporary diversions shall be constructed and maintained by the contractor at his own cost. Diversion shall be watered if dust is likely to blow onto the road being bituminised.

3.3 MATERIALS

3.3.1 Aggregates

The aggregates for providing B.B.M. surface shall comply with specification Nos. Rd-41 for 40 mm. and 12 mm. size metal, and shall normally comply with the following regarding size and quantity of aggregates and grade and quantities of bitumen.

Description	Rate of application for 100 sqmt.			
	75 mm.		50 mm.	
	On asphalt surface	On W.B.M. surface	On asphalt surface	On W.B.M. surface
(a) 40 m. size crusher broken metal	9.00 cum	9.00 cum	6.00 cum	6.00 cum
(b) 12 mm. size chips.	1.8 cum	1.8 cum	1.2 cum	1.2 cum
(c) Bitumen for grouting I.S. Grade	200 kg.	200 kg.	175 kg.	175 kg.
S 35 with 30/40 penetration or S 65 with 60/70				

penetration				
(d) Tack coat for existing bituminous surface	50 kg.	--	50 kg.	--

3.3.2 Bitumen

The bitumen shall be paving bitumen of suitable penetration grade within the range S 35 to S 65 & A 35 to 65 (30/40 to 60/70) as per Indian Standard Specification for "Paving bitumen" IS: 73-1992.

3.4 PREPARING THE BASE

Any pothole in the existing bituminous road surface and broken edges shall be patched well in advance and the surface shall be brought to correct level and camber with additional metal and bitumen as required which will be paid separately. Before starting the work the bituminous surface shall be swept clean of all the dirt, mud cakes, animal droppings other loose foreign material.

If so required by the Engineer, the contractor shall keep the side width & nearby diversion watered to prevent dust from blowing over the surface to be bituminised.

Existing W.B.M./W.M.M. surface shall be picked for and surface loosened for a depth of 2.5 cm. and the picked surface shall be brought approximately to the correct camber and section. Edge line shall be correctly marked by dog belling the surface to form a continuous notch.

There shall always be sufficient length of prepared surface ahead of the bituminous surfacing operations as directed by the Engineer to keep these operations continuous.

3.5 TACK COAT ON BITUMEN SURFACE

Applying tack coat for existing B.T. surface only at the rate of 50 Kg./100 m² as per specification No. Rd-47.3.3.

3.6 PICKING OF EXISTING W.B.M./W.M.M. SURFACE

Picking of existing W.B.M. surface for receiving Bituminous Bound Macadam as per Rd-33.

3.7 SPREADING AND COMPACTION.
3.7.1 Spreading of 40 mm. Size metal

40 mm. size metal shall be spread only at the specified rate of 9 cubic meter/6 cubic meter per 100 square meter of area so as to form a layer over the width of road with correct camber/super-elevation as required. Any foreign matter, organic matter, dust, grass etc. shall be removed immediately. The sections shall be checked with camber board and straight edge batten etc. Any irregularities shall be made good by adding aggregates in case of depressions and removing aggregates from high spots checked with camber board and straight edge batten etc. Any irregularities shall be made good by adding aggregates in case of depressions and removing aggregates from high spots.

3.7.2 Compaction of 40 mm. Size metal.

The surface of 40 mm. size metal layer after bringing it to necessary grades and sections shall be rolled with the use of vibratory roller. Rolling shall commence from the edges and progress towards center longitudinally except on super elevated portion where it shall progress from the lower to upper edge parallel to the centerline of pavement. When the roller has passed over the whole area any high spots or depressions, which become apparent shall be corrected by removing or adding aggregates. The rolling shall then be continued till the entire surface has been rolled to desired compaction such that there is no crushing of aggregates and all roller marks have been eliminated. Each pass of roller shall uniformly overlap not less than one third of the track made in the preceding pass.

3.8 APPLICATION OF BITUMEN.

Bitumen of I.S. grade S. 35 or S. 65 supplied for the work shall be heated to temperature of 177⁰ Celsius to 191⁰ Celsius (350⁰ F. to 375⁰ F.) in a bitumen boiler and temperature shall be maintained at the time of actual application.

The hot bitumen shall be applied through a pressure sprayer on the road surface uniformly at the rate of 200 Kg./100 Sqmt. or 175 Kg./100 Sqmt. The road surface shall be divided into suitable rectangles marked by chalk so as to ensure correct rate of application of the bitumen.

3.9 KEY AGGREGATES

On completion of bitumen application, 12 mm size key aggregate shall be spread immediately at a uniform rate of 1.8 cubic meter/1.2 cubic meter per 100 square meter of area when entire surface is in hot condition. Brooms shall be used to ensure even, distribution of key aggregates.

3.10 FINAL COMPACTION

Immediately after spraying of bitumen and spreading of key aggregates, the surface shall be rolled with a vibratory roller to obtain full compaction and to force the blindage of key aggregates into the interstices of the coarse aggregate. The rolling shall continue till the asphalt surface hardens and key aggregates stop moving under roller.

3.11 SURFACE FINISH AND QUALITY CONTROL.

The surface finish shall confirm to requirements of clause 902 of specification for Road and Bridges by Ministry of Surface Transport. Quality Control Test and their frequencies shall be as per table below.

Sr. No.	Test	Frequency
(a)	Quality of binder.	Two samples per lot to be subjected to all or some test as directed by the Engineer.
(b)	Aggregate Impact Value.	One test per 200 cubic meter of aggregate.
(c)	Flakiness Index and Elongation Index.	One test per 200 cubic meter of aggregate.

(d)	Stripping value	Initially one set of three representative specimen for each source of supply, subsequently when warranted by changes in the quality of aggregate.
(e)	Water absorption of aggregates.	Initially one set of three representative specimen for each source of supply, subsequently when warranted by changes in the quality of aggregate.
(f)	Aggregate grading.	One test per 100 cubic meter of aggregate.
(g)	Temperature of binder at application.	At regular close intervals.
(h)	Rate of spread of binder.	One test per 500 square meter of area.

3.12 ITEM TO INCLUDE

3.12.1 Diversions unless separately provided in the tender.

3.12.2 Preparing the road surface.

3.12.3 Applying tack coat on existing B.T. or Picking the existing W.B.M./W.M.M. surface.

3.12.4 Supplying, spreading and compaction of 40 mm size aggregates.

3.12.5 Supplying, heating and spraying bitumen.

3.12.6 Supplying, spreading and compaction of 12 mm size chips.

3.12.7 All labour, materials, including bitumen and aggregates, use of tools, plants and equipment for completing the item satisfactorily.

4.0 SPECIFICATIONS FOR RETRO-REFLECTIVE SHEETING

4.1 GENERAL REQUIREMENTS

The retro-reflective sheeting used on the sign shall consist of the white or coloured sheeting having a smooth outer surface, which has the property of retro-reflection over its entire surface. It shall be weather – resistant and show colourfastness. It shall be new and unused and shall show no evidence of cracking scaling, pitting, blistering, edge lifting or curling and shall have negligible shrinkage or expansion. A certificate having tested the sheeting for these properties in an unprotected outdoor exposure (stating retained reflection of 80%) facing the sun for three year and its having passed these tests shall be obtained from a reputed independent test laboratory, by the manufacturer of the sheeting of the sheeting and the same should be submitted while taking up the actual work.

The retro reflective sheeting shall be of wide-angle prismatic lens type of ASTM Type-IX.

4.2 The retro reflective sheeting shall be of wide angle Prismatic lens type, consisting of cube corner lenses and pressure sensitive adhesive and should be applied to the sign substrate at room temp 18°C, transparent, waterproof of plastic having smooth surface. The coefficient of retro reflective as determined in accordance with STM standard E-810 shall give the minimum values as indicated in table given below.

TABLE – 1

**Minimum coefficient of Retro-reflection for retro-reflective sheeting
Prismatic lens type candelas / lux / sq.m)**

Observation Angle (in deg.)	Entrance Angle (in deg.)	White	Yellow	Green	Red	Blue
0.1	-4	660	500	66	130	30
0.1	+30	370	280	37	74	17

0.2	-4	380	285	38	76	17
0.2	+30	215	162	22	43	10
0.5	-4	240	180	24	48	11
0.5	+30	135	100	14	27	6
1.0	-4	60	60	8	16	3.6
1.0	+30	45	34	4.5	9	2

When totally wet, the sheeting shall not show less than 90% of the values of retro reflectance indicated in Table 100-1. At the end of 7 years, the sheeting shall retain at least 75% of the original retro reflectance.

4.3 MESSAGES / BORDERS

The messages (legends, letters, numerals etc.) and borders of cautionary / regulatory signboards shall be screen – printed, Screen – printing shall be processed and finished with materials and in a manner specified by the sheeting manufacturer and shall be bonded with the sheeting in the manner specified by the manufacturer. The message (Legends, letters, numerals etc.) and borders of information signs, shall be of cut letters made in transparent overlay film pasted over the base sheeting with pressure sensitive adhesive or as instructed by the manufactures or as directed by the Engineer.

4.4 For screen-printed transparent coloured areas on white sheeting the coefficient of retro-reflection shall not be less than the values of corresponding colours in Tables.

4.5 Cut-out message and borders, wherever used, shall be made in transparent film applied on base sheeting with pressure sensitive adhesive with the coefficient of retro reflection shall not be less than the valued of corresponding colour in Tables-1. For background colour of the sign the coefficient of retro reflection shall not be less than the specified in table no. 1 for the respective colours.

4.6 COLOUR

Colour shall be as specified and shall conform to the requirements of table II. Conformance to colour requirements shall be determined spectrophotometrically in accordance with STM E 1164, with instruments utilizing either 45/0 or 0/45 illumination/viewing conditions or tolerances as described in ASTM E 1164 for retro-reflective materials.

Article I. Table-II

								Reflectance Limit (y)		
Colour	X	y	x	y	x	y	x	y	Min	Max
White	.30	.3	.35	.35	.33	.37	.28	.32	40.0	
Yellow	.48	.42	.54	.45	.46	.53	.42	.48	24.0	45.0
Red	.69	.31	.59	.31	.56	.34	.65	.34	3	15
Blue	0.7	.17	.15	.22	.21	.16	.13	.03	1.0	10.0
Green	.03	.39	.16	.36	.28	.44	.20	.79	3.0	9.0

The four piers of chromaticity co-ordinates determine the acceptable colour in terms of CIE 1931 standard colorimetric system measured with standard illumination source D65 – these colures are equivalent to those listed in ASTM D4956 using source C.

The colour shall be durable and uniform in acceptable value when viewed in daylight or under Normal headlights at night.

4.7 ADHESIVES

The sheeting/firm shall have a pressure sensitive adhesive of the aggressive tack type requiring no heat, solvent or other preparation for adhesion to a smooth clean surface. The adhesive shall be protected by an easily removable liner (removable by peeling without soaking in water or other solvent) and shall be suitable for the type material of the base plate such that it shall not be possible to remove the sheeting from the sign base in one piece by use of sharp instrument. The adhesive shall form a durable bond to

smooth, corrosion and weather resistant surface of the base plate. In case of pressure sensitive adhesive sheeting, the sheeting shall be applied in accordance with the manufacturer's specifications reflective sheeting. If the surface is rough, approved surface primer may be used. After cleaning metal shall not be handled, except by suitable or clean canvas gloves, between all cleaning and preparation operation and application of reflective sheeting / primer. There shall be no opportunity for metal to come in contact with grease, oil or other contaminants prior to the applications of retro-reflective sheeting.

- 4.8 Complete sheets of the materials shall be used on the signs except where it is unavoidable, at splices; sheeting with pressure sensitive adhesives shall be overlapped not less than 5 mm. When screen-printing with transparent colours is proposed, only but jointing shall be used. The material shall cover the sign surface evenly and shall be free from twists, cracks and folds. The transparent overlay film in which cutout messages have been made shall be bounded with sheeting in the manner specified by the manufacturer.

4.9 **WARRANTY AND DURABILITY**

The contractor shall obtain from the manufacturer a seven year pre-qualification warranty for satisfactory field performance including stipulated retro-reflectance of the retro-reflective sheeting of Prismatic lens type and that of transparent film before taking up actual work. In addition, a seven year warranty for satisfactory in field performance of the finished signs with retro-reflective sheeting of Prismatic lens type, inclusive of the screen printed or cut-out letters/legends, transparent film and their bonding to the retro-reflective sheeting shall be obtained before taking up actual work. The contractor / supplier shall also furnish a certification that the signs and materials supplied against the assigned work meets all the stipulated requirements and carry the stipulated warranty.

Warranties should be given in original and should have legal jurisdiction in India. Warranties given by power of attorney holders will not be acceptable.

Processed and applied in accordance with recommended procedures, the reflective material shall be weather resistant and following, cleaning, shall show no appreciable discoloration, cracking, blistering or dimensional change and shall not have less than 50 per cent of the specified minimum

PRE-QUALIFICATION WARRANTY

This is to certify that Micro-prismatic Retro-reflective Sheeting of ASTM type-IX supplied by ABC to M/s XYZ for Retro Reflective signboards as mentioned above will conform to published specifications. ABC and M/s XYZ the sign fabricators, jointly and severally agree to repair or replace at their option, warranted Retro reflective signboard fabricated by M/s XYZ, from Micro-prismatic Retro-reflective Sheeting of ASTM type – IX and supplied to you by M/s. XYZ, provided:

- 1) The sign is ineffective for its intended purpose when viewed from a moving vehicle under normal day and night driving conditions by a driver with a normal vision, and
- 2) The coefficient of retro-reflection at the end of 7 years is less than 75% of values as specified in the following table:

Observation Angle (in deg.)	Entrance Angle (in Deg.)	White	Yellow	Green	Red	Blue
0.1	-4	660	500	66	130	30
0.1	+30	370	280	37	74	17

4.10 ARRANGEMENT FOR TRAFFIC:

The contractor shall at all times carry out work on the road in manner creating least interference to the flow of traffic while consistent with the satisfactory execution of the same. The contractor shall in accordance with directions of Engineer provide and maintain, during execution a clear passage for traffic along part of the existing carriageway or along a temporary diversion as directed if it is found necessary. When the traffic can be allowed on the roadside berms without much inconvenience to the traffic or impediment to the work, this shall be provided by the contractor at his own cost.

4.10.1 Traffic safety and control:

The contractor shall take all necessary measure for the safety of traffic during construction and provide, erect and maintain such barricades, including signs, marking, flags, lights and flagmen as may be required by Engineer for information and protection of traffic approaching or passing through the section of pavement under improvement. The sign set up shall be of approved design and of refractory type, temporary warning lamps shall be installed at the barricades during the hours of darkness and kept light at all times, during these hours.

4.10.2 Maintenance of diversion and traffic control devices:

Signs, lights, barricades and other traffic control devices as well as the riding surface of diversions shall be maintained in satisfactory condition till such time they are required by the Engineer. The temporary travelled way shall be kept free of dust by frequent application of water if necessary.

4.11 PRECAUTIONS WHILE WORKING IN THE VICINITY OF TRACK:

4.11.1 When the work is required to be done along or near existing railway track, the contractor(s) shall take steps as are necessary for the safety of the track labour working at site. He / They will also be required to make Programme of his/their work so as not to interfere with the movement of trains. No extra payment shall be allowed for these precautions and also for crossing track/tracks required during execution of the work. It should be ensured

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 182 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
that the ballast of the railway track(s) is not spoiled or mixed with earth or disturbed.		
4.11.2	In addition to the precautions taken by the contractor for the safety of the track and labour, it may be necessary to post flagmen in some locations as an additional safety measure. The contractor(s) shall be fully responsible for any damage to or trespass caused by his/their men to surrounding structure, MSPGCL bears no liability whatsoever on this account.	
4.11.3	Instruction given by Railway Authority regarding safety shall be strictly followed during execution of work.	
4.12	<u>SAFETY PRECAUTIONS :</u>	
4.12.1	The Contractor/s shall at all times adopt such safe methods to work as will ensure safety of structure, equipment and labour. If at any time the MSPGCL finds the safety arrangements unsafe, the contractor/s shall take immediate corrective action as directed by the MSPGCL in the matter. This shall in no way absolve the contractor/s of his/their sole responsibility to adopt safe working methods.	
4.12.2	The Contractor/s shall design and execute temporary works such as formwork and supports, so as to ensure absolute safety of contractor/s personnel as well as Consultant/MSPGCL staff and personnel engaged on the work. The Contractor/s should indemnify the MSPGCL against damages and injury to workmen. MSPGCL reserves the right to enforce safety regulations on the contractor/s and recover any cost, which may be incurred for the purpose.	
4.12.3	Whenever a lorry or any other form of road transport is required to ply along or in the vicinity of a running line or any other railway track where railway Engines or trains are scheduled to move, the contractor shall inform the Engineer in writing of such requirement specifying the locations and the duration of time over which such specified road vehicles have to operate in the area (for loading, leading or unloading of earth, ballast or any other material, plant or equipment) without any obstruction or dislocation to the running of trains. The contractor also should furnish the particulars of vehicles and the name and photograph of drivers and attendants retained for each legal to enable the engineer to issue necessary along the holder to

operate the vehicles, with such restrictions regarding the durations and / or locations as are considered necessary. Such permit shall be returned to the engineer as soon as the work for which it is issued is over.		
4.12.4	The contractor shall execute a bond undertaking to ply to road vehicles in a safe and satisfactory manner and strictly in accordance with the stipulations and other conditions specified by the engineer and to engage and retain only the permit holder to be the contractor agent in charge of the vehicles, while driving or a rest. The person in charge of the vehicles in the attendant shall at all times be vigilant and on the look out for signals from the look out men, flagmen or other personnel available at site with a view to stop for regulate the road movement so as to ensure adequate margin of safety for the timely passage of an approaching train or railway engine, without any delay or detention.	
4.12.5	The contractor shall also be bound by the provision of this agreement, to ply the road vehicles only with adequate margin of safety, well clear of the fixed structure profile of infringement, as stipulated in the rules made under the Indian Railway Act and to seek and be guided by the signal and other directions of any lookout men for other personnel retained for the purpose of ensuring safety, and to ensure care and vigilance while turning, reversing or moving the road vehicle in any other manner, at an inclination to the running railway track or the siding, as the case may be.	
4.12.6	The contractor also undertakes to make good at his own cost any inconvenience, loss, damage, or other expenses caused to or incurred by the railway administration and to pay such amount as determined by the engineer to be recoverable from the contractor as penalty or damage for any omission, negligence, careless, oversight or accidents on the part of any of the contractor's agents, drivers or attendant or any person to whom the services of the holder of the permit (issued by the Engineer) has been lent other wise made accessible or available.	
4.12.7	Any breach of these conditions by the contractor and/or his agent affecting the safety of movements of trains, engines or other rolling stock of the Railway shall constitute a breach of contract by the contractor entailing liability for termination of contract for default on the part of the contractor.	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 184 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
4.12.8	The Tenderer/s will be permitted to make use of the level crossing for crossing the track after observing the standard railway safety precaution. If such precautions are not taken these will be enforced by the railway by adequate arrangements and the cost thereof shall be recovered from the contractor.	
4.12.9	The contractor/s shall inspect the proposed site of work and acquaint himself / themselves with site conditions working hours storing spaces for materials, approach road / pathway available etc. and all relevant items connected with the execution of work. No. claim shall be entertained from contractor/s and shall make his own arrangements for approach/approach roads from out side railway land and contractor will bear entire expenses such as road taxes payment on right of way etc. to outsiders.	
4.13	<u>PROTECTION AT THE WORKS SITE :</u>	
4.13.1	On Railway track where the train traffic will be operational during the execution of the contract work, the protection of the works site as considered appropriate and adequate shall be arranged by the contractor at his own cost.	
4.13.2	Notwithstanding the aforementioned protection at the works site provided by the Engineer's representative, the contractor shall be responsible for providing appropriate and adequate system for warning the contractor's workmen about the train traffic on or in the vicinity of the site of work. The decision of the Engineer's representative whether the facilities provided by the contractor in this regard are appropriate and adequate or not, shall be final and conclusive. In case of non-following of instruction issued by Railway/MSPGCL by the third party quality audit agency, the MSPGCL shall have the right to terminate the agency and direct the contractor to appoint another agency duly approved by the Railway.	
4.14	<u>WORKS DURING BLOCK PERIOD</u> For excavation nearer to the Railway track proper shoring and strutting shall be used, shoring and strutting arrangement shall be approved by the Railways.	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 185 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

4.15	Incase of any accident during construction due to which the Railway undergone monetary or structural losses, it is the responsibility of the contractor to bear such losses. Any assessment made by the Railway shall be binding on the contractor.
4.16	Supervision of the works within the Railway boundary shall be done by the Railway as well. Any instructions given by the Railways regarding the works shall be binding on the contractor. Contractor shall arrange for the necessary conveyance for the officers of Railways for the supervision/inspection of the portion of works within the Railway boundary.
4.17	Precast concrete panel for shuttering below the deck slab is not permitted for the works within the Railway boundary. Necessary removable shuttering shall be provided by the contractor. Arrangements for shuttering for deck slab shall be planned and designed by the contractor by providing sleeve holes into the web of the girder.
4.18	<u>BLOCK DURING LAUNCHING & ANY OTHER ACTIVITY :</u>
4.18.1	It is the responsibility of contractor to arrange necessary blocks from Railways during launching operation or any other activity requiring blocks. Necessary assistance however shall be provided by MSPGCL. The necessary charges payable to Railways in this regard as required and demanded by Railway authority shall be borne by the Contractor.
4.18.2	The contractor shall ensure that block period sanctioned is not violated. The contractor shall be liable for penalty for each block bursting for an amount if claimed by Railways towards bursting of block. So, also, prolongation of caution order than the agreed programme will be liable for penalty if claimed by the Railways. Any expenditure on this account shall have to be borne by the Contractor.

5.0

**SPECIFICATION FOR ELECTRIFICATION OF ROAD OVER BRIDGE
(SPECIFICATION FOR THE ELECTRICAL WORK)**

5.1

THE FOLLOWING WORK SHALL BE CARRIED OUT BY THE CONTRACTOR.

5.1.1

415 Volts Feeder Pillar:

Feeder Pillar panel rated for 415 Volts, 3 phase, 4 wire, 50 HZ, supply, pedestal/bracket mounting, cubical type weather proof, suitable for outdoor installation, complete with double door, canopy arrangement and including civil foundation. Internal painting shall be milky white, external Opaline green. Sheet steel enclosure shall be fabricated out of 14 SWG thick sheet. Suitable gland plates and stud type terminations shall be provided at top/bottom for entry and exit of following cables.

Incoming - 3 1/2C x 50 sqmm.

Outgoing - 4C x 16 sqmm.

The feeder pillar shall be mounted over a suitable civil foundation with a clear height of 500 mm from finished ground level. Rate quoted shall included associated civil works.

5.1.2

Feeder Pillar - 1&2

Incoming feeder shall have 1 No.4 pole, 40 Amps MCB with shunt release, 1 No. core balance CT with earth leakage relay setting range from 0.5 - 2 amps, 3 Nos. current transformers - ring type ratio 25/5 Amps, 15VA, accuracy class-1, 1 No. Ammeter with Selector Switch - digital type, 1 No. Voltmeter ith selector switch - digital type, 1 No.25 Amps, 3 pole AC - 3 duty contactor, 1 No.16A time switch with running reserve time 100 Hrs. MDS - Legrand make, type - MaxiRex Qt (24 Hrs)-49754. 3 Nos. cuttent transformers - ring type ratio 25/5 Amps, 15VA accuracy class - 1 for KWH meter. Provision for mounting 1 No.KWH meter and 3 Nos. CT's in a separate sealable compartment.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 187 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
	Outgoing feeder consisting of 1 No.25 Amps, 4 pole MCB, 3 Nos.20 Amps TPN MCB's, 2 Nos. 20 Amps TPN MCB as spare, 2 Nos. On/Off push buttons.	
5.1.3	Luminaire	
	Street Light Luminaire complete with polyester filled copper wound ballast, electronic ignitor, capacitor, mains connector and earthing terminal. Luminaire to be provided with 1x250 Watts HP Mercury Vapour Lamp. Philips make-Type CRP 330/250W or equivalent.	
5.1.4	Octagonal Poles	
	Poles with 9M mounting height galvanized octagonal pole (of fixture from road level) with double and decorative brackets as per Deg.No.E&PBU-SL-WR-015-00IR. Poles to be fixed on Median verge only.	
5.1.5	M.S.Sleeve	
	MS Sleeve of 160mm ID and 1000mm height provided with base plate 12mm thick 400mm square MS plate suitably anchored to the crash barrier.	
	Note :	
	The light poles shall be inserted in to MS sleeves and suitable anchored with fasteners. The lighting poles shall have a 75mm diameter opening at sides to receive the cables from its associated junction box through a inclined rigid PVC pipe. An earth strip of 25x3mm GI – 150mm length shall be provided for each pole as shown in the drawing. 4 core cables for street light poles shall be terminated with loop in and loop out facilities/termination proper. Generally the spacing between poles to be maintained at 25 mtrs. and quality of poles are indicative and may marginally vary depending on site conditions.	
5.1.6	Junction Box / Light Controls Mcb Box	
	Weather proof junction box for road lighting luminaries for road above flyover mounted/embedded into crash guard /concrete pedestal, fabricated out of 14 SWG sheet steel consisting of one number 6 way terminal suitable

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
	for entry/exit of upto 4x16 sqmm. AI Conductor Cable and 1 No. 20 Amps DP MCB and earth terminal with suitable termination / looping in and looping out of its associated phases and neutral conductors.	
5.1.7	1.1 KV Grade Pvc Insulated Armoured Aluminium Conductor Cables And Terminations. Supply and laying 1100 volts grade, PVC insulated aluminium conductor, steel wire armoured power cable. The cable shall be laid indoor/outdoor. The rate shall include laying as per specification. Brick sand backfilling etc., for outdoor laying. Cable shall be clamped at regular intervals using clamps and fasterers. (Length of the cable indicated is approximate. Exact length of the cable shall be ascertained as per the site condition before supplying the same to site.) 3 1/2 x 50 sqmm – incoming cable, 4 x 16 sqmm (These cables shall be run through 75mm dia PVC pipes laid in crash battier.	
5.1.8	Codes & Standards The design manufacture, testing and supply of the cables under this specification shall comply with the latest revisions including amendments of the following standards. (a) IS : 7098-I - XLPE insulated heavy duty cables for working voltages upto 1100 volts. (b) IS : 3961-II - Recommended current ratings for cables. (c) IS : 8130 - Conductors for insulated cables. (d) IS : 5831 - XLPE insulation and outer sheath of electric cables. (e) IS : 7098-I - Test Procedures for cables. (f) IS : 10418 - Specification for drums for electric cables. (g) IS : 3975 - Mild steel wire, strips, and tapes for armouring of cables.	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 189 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

5.1.9

Technical Requirements:

5.1.9.1

All XLPE Aluminium / Copper Power Cables shall be 1100 volts grade, multi core constructed as IS : 7098 Part-I of 1988 as follows :

(A)

Standard Aluminium / Copper conductor in case of 10 sq.mm and above and solid conductor in case of 10 sq.mm and below.

(b)

All Aluminium / Copper XLPE cables insulation shall be of high grade Cross-linked Polyethylene from insulation for extrusion process.

(c)

Cores laid-up.

(d)

The inner sheath should be bounded over with termo-plastic material for protection against mechanical and electrical damage.

(e)

Armouring should be provided over the inner sheath to guard against mechanical damage. Armouring should be galvanized steel wires or galvanized steel strips. (In single core cables used in A.C system armouring should be non-magnetic hard aluminium Wires / Strips.

(f)

The outer sheath should be specially formulated heat resistant black PVC compound conforming to the requirement of type ST2 of IS : 5831-1984 extruded to form the outer sheath.

5.1.10

Conductor shall be of electrolytic Aluminium / Copper conforming to IS : 8130 and are compact circular or compact shaped.

5.1.10.1

Insulation shall be of XLPE type as per latest IS general purpose insulation for maximum rated conductor temperature 70 degree centigrade.

5.1.10.2

In inner sheath laid up core shall be bounded over with thermoplastic material for protection against mechanical and electrical damage.

5.1.10.3

Insulation, inner sheath and outer sheath shall be applied by extrusion and lapping up process only.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 190 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

5.1.10.4 Armouring shall be of galvanized steel wire / flat.

5.1.10.5 Repaired cables shall not be used.

5.1.10.6 Current ratings of the cables shall be as per IS : 3961.

5.1.11 XLPE Cables:

 The XLPE insulated cables shall conform to latest revision as read along with this specifications.

 The Conductor shall be stranded Aluminium / Copper circular / sector shaped and compacted.

 In multi core cables the core shall be identified by red, yellow, blue and black colouring of insulation.

 The XLPE insulated 1100 volts grade power cables shall conform to latest IS and shall be suitable for a steady conductor temperature of 70 degree centigrade.

 The conductor shall be stranded Aluminium / Copper as called for in the Schedule of Quantities.

 The outer sheath shall be as per the requirement of type ST-2 of IS:5831 of 1984.

5.1.12 Supply and Laying Of Cables

 The cables shall be suitable for laying in racks, ducts, trenches, conduits and underground buried installation with uncontrolled back fill and chances of flooding by water.

 Progressive automatic in line sequential marking of the length of cables in meters at every one meter shall be provided on the outer sheath of all cables. Cables shall be supplied in non returnable wooden drums as per IS : 10418.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.		Page 191 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1		
	CORRIGENDUM - I		
	Both ends of the cables shall be properly sealed with PVC / Rubber caps so as to eliminate ingress of water during transportation, storage and erection.		
5.1.13	Test and Test Reports		
	Cables shall be subjected to type tests, acceptance tests and routine tests as per 7098 Part-I. Four (4) copies of all test reports shall be submitted for approval to the Engineer.		
5.1.14	Drawings and Data		
	The contractor shall furnish technical particulars of cables type, make and catalogue for the approval of Engineer.		
5.1.15	The product should be coded as per IS – 7098 Part-I and the codes shall be as follows:		
	Aluminium Conductor	A	
	XLPE Insulation	2X	
	Steel round wire armour	W	
	Steel strip armour	F	
	Steel Double round wire armour	WW	
	Steel Double strip armour	FF	
	Non-magnetic (A1) round wire armour	Wa	
	Non-magnetic (A1) strip armour	Fa	
	PVC outer sheath	Y	
5.1.16	End Termination		
	Cable and terminations for 1.1 KV grade PVC insulated armoured heavy duty aluminium conductor cables complete with double compression type brass cable glands, crimping type aluminium lugs, necessary insulation type etc., complete in all respects.		
5.1.17	Installation of MV Cables		
5.1.17.1	General		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 192 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
(A) MV Cables shall be inspected prior to laying, laid tested and commissioned in accordance with drawings, specifications, relevant Indian Standards Specifications and cable Manufacturer's instruction. The Cable shall be delivered at site in original drums with manufacturer's name drum No. length and size of cable clearly written on the drum. (b) The recommendations of the cable manufacturers with regard to jointing and sealing shall be strictly followed. 5.1.17.2 Inspection (a) All cables shall be inspected upon receipt at site and checked for any damage during transit. (b) While selecting cable routes, corrosive soils, ground surrounding sewage effluent etc., shall be avoided; where this is not feasible, special precautions as decided by the Engineer-in-charge, shall be taken. Street lighting and Service line to each area have separate route. 5.1.17.3 Proximity to communicate Cables Power and communication cables shall as far as possible cross at right angles. Where power cables are laid in proximity to communication cables the horizontal and vertical clearances shall not normally be less than 60 cms. 5.1.17.4 Laying Methods (a) Cables shall be laid direct in ground, in pipes/closed ducts, in open ducts or on surface depending on environmental and site conditions. (b) During the preliminary stages of laying the cables, consideration should be given to proper location of the joint position so that when the cables are actually laid the joints are made in the most suitable places. As far as possible water logged locations, carriage ways, pavements, proximity to telephone cables, gas of water mains, inaccessible places, ducts pipes racks etc., shall be avoided for joint position.		

5.1.17.5 Laying direct in ground

General

This method shall be adopted where the route is through open country, along roads/lanes etc., and where no frequent excavations are encountered and where re-excavations is easily possible without affecting other services.

5.1.17.6 Trenching

Width of Trench

The width of the trench shall first be determined on the following basis :

- (a) The minimum width of trench for laying single cable shall be 35 cm.
- (b) Where more than one cable is to be laid in the same trench in horizontal formation, the width of trench shall be increased such that the inter-axial spacing between the cables, except where otherwise specified shall be atleast 20 cm.
- (c) There shall be a clearance of atleast 15 cm. between axis of the end cables and the sides of the trench.

5.1.17.7 Depth of Trench

The depth of the trench shall be determined on the following basis

- (a) Where cables are laid in single tier formation, the total depth of trench shall not be less than 75 cm for cables upto 1.1 KV and 1.20 m for cables above 1.1 KV.
- (b) When more than one tier of cables is unavoidable and vertical formation of laying is adopted, depth of trench in above shall be increased by 30 cm. for each additional tier to be formed.

5.1.17.8 Laying of Cables in Trench

- (a) At the time of issue of cable for laying the cores shall be tested for continuity and insulation resistance.
- (b) When the cable has been properly straightened, the cores are tested for continuity and insulation resistance and the cable is then measured. The ends of all lead sheathed cables shall be sealed with solder immediately. In case of PVC cables suitable moisture seal tape shall be used for this purpose.
- (c)
 - (i) Cable laid in trenches in a single tier formation shall have a covering of clean dry sand of not less than 17 cms above the base cushion of sand before the protective cover is laid.
 - (ii) In the case of vertical multi-tier formation after the first cable has been laid, a sand cushion of 30 cms shall be provided over the initial bed before the second tier is laid. If additional tiers are formed, each of the subsequent tiers also shall have a sand cushion of 30 cms. as stated above. The top most cable shall have a final sand covering not less than 17 cms. before the protective cover is laid.
- (d) At the time of original installation, approximately 3m of surplus cable shall be left on each end of the cable and on each side of underground joints (straight through/Tee/Termination) and at entries and places as may be decided by the Engineer. The surplus cable shall be left in the form of a loop. Where there are long runs of cable length, loose cable may be left at suitable intervals as specified by the Engineer.
- (e) Unless otherwise specified, the cables shall be protected by second class bricks of not less than 20cm x 10cm x 10cm (nominal size) protection covers placed on top of the sand, (bricks to be laid breadth wise) for the full length of the cable to the satisfaction of the Architect/Consultant. Where more than one cable is to be laid in the same trench, this protective covering shall cover all the cables and project atleast 5cm. over the sides of the end cables.

5.1.17.9 Back Filling

- (a) The trenches shall be then back filled with excavated earth free from stones or other sharp edges debris and shall be rammed and water, if necessary, in successive layers not exceeding 30 cm. Unless otherwise specified, a crown of earth not less than 50 mm in the center and tapering towards the sides of the trench shall be left to allow for hazard to vehicular traffic. The temporary reinstatements of roadways should be inspected at regular intervals, particularly during the wet weather, and any settlement should be made good by further filling as may be required. After the subsidence has ceased, trenches cut through roadways or other paved areas shall be restored to the same density and material as the surrounding area and repaved to the satisfaction of the Engineer.
- (b) Where road cutting, excavation in lawns kerb stones displaced etc., the same shall be repaired and made good except turfing/asphalting to the satisfaction of the Engineer and all surplus earth or rock removed to places as specified.

5.1.17.10 Route Marker

- (a) Route Marker shall be provided along straight runs of the cables at locations approved by the Engineer and generally at intervals not exceeding 100m. Markers shall also be provided to identify change in the direction of the cable route and also for location of every underground joint.
- (b) Route Markers shall be made out of 100mm x 100mm x 5mm GI/Aluminium plate, welded or bolted on to 35mm x 35mm x 6mm angle iron 60cm long. Such plates marker shall be mounted parallel to and 0.5m or so away from the edge of the trench.
- (c) The word 'cable' and other details such as voltage grading size etc., as furnished by the Engineer shall be inscribed on the marker.

5.1.17.11 Laying in Pipes/Closed Ducts

- (a) In locations such as road crossing, entry to buildings, on poles in paved areas etc., cable shall be laid in pipes or closed ducts.
- (b) Stone ware pipes, GI, CI or Spun reinforced concrete pipes shall be used for such purposes. In the case of new construction, pipes as required shall be laid along with the Civil works and jointed as per the instructions of the Engineer. The size of the pipe shall be decided by the Engineer and shall not be less than 10cm in diameter for a single cable and not less than 15cm for more than one cable.

These pipes shall be laid directly in ground without any special bed except for SW pipe which shall be laid over 10cm thick cement concrete 1 : 3 : 6 (1 cement : 3 coarse sand : 6 graded stone aggregate of 40mm nominal size) bed. No sand cushioning or tiles need be used in such situations. Unless otherwise specified, the top surface of pipes shall be at a minimum depth of 1m from the ground level when laid under roads, pavements etc., where steel pipes are employed for protection of single core cables feeding AC load, the pipe should be large enough to contain both cables in the case of single phase system and all cables in the case of polyphase system.

- (c) Pipes for cable entries to the building shall slope downwards from the building and suitably to prevent entry of water inside the building. Further, the mouth of the pipes at the building end shall be suitably sealed to avoid entry of water.
- (d) All chases and passage necessary for the laying of service cable connections to buildings shall be cut as required and made good to the original finish and to the satisfaction of the Engineer.
- (e) Cable grips/draw wires and winches etc., may be employed for drawing cables through pipes/closed ducts etc.

5.1.17.12 Laying of Open Ducts

- (a) Open ducts with suitable removable covers shall be preferred in sub stations, switch rooms, plant rooms, workshop etc.
- (b) The cable ducts should be of suitable dimensions so that the cables can be conveniently laid. If necessary, cables may be fixed with clamps on the walls of the such or taken in troughs in duct. The duct should be covered with removable slabs or chequered plates.
- (c) Ducts may be filled with dry sand after the cable is laid and covered as above or finished with cement plaster specially in high voltage applications.
- (d) Splices or joints of any type shall not be permitted inside the ducts.
- (e) As far as possible laying of cables with different voltage ratings in the same duct shall be avoided.
- (f) Where considered necessary, hooks or racks shall be provided for supporting the cables in masonry/concrete cable ducts, cable troughs. Otherwise cables shall be laid direct in the trench or trough etc. While deciding the layout of cables in such ducts, care should be exercised to ensure that unnecessary crossing of cables is avoided.

5.1.17.13 Laying on Surface

- (a) The cables may be laid in troughs or brackets at regular intervals or directly cleated to wall/ceiling. When laid over bracket supports, the cables shall be clamped to prevent undue sag.
- (b) Cable clamps shall be made from materials such as mild steel, porcelain, wood, aluminium etc., in case of single core cables the clamps shall be non-magnetic materials. A suitable non-corrosive packing shall be used for clamping unarmoured cables, to prevent damage to the cable sheath.

5.1.17.14 Cable Identification Tags

Wherever more than one cable is laid/run side by side, marker tags as approved, inscribed with cable identification details shall be permanently attached to all the cables in the manholes/open ducts etc. These shall also be attached to various cables laid direct in ground at suitable intervals as directed by the Engineer before trenches are filled up.

5.1.17.15 Jointing

- (a) Jointing work shall be carried out only by a licensed/experienced cable jointer.
- (b) At the preliminary stages of laying a cable, a proper jointing position should be selected.
- (c) Sufficient surplus cable shall be left on each side of joints as mentioned in clause 3.5.3.4.
- (d) Joints shall be staggered by 2 to 3 m when two or more cables are laid together in the same trench.
- (e) Jointing materials and accessories like conductors ferrules, solder, flux, insulating and protective tapes, filling compound, jointing boxes etc., of right quality and correct sizes, conforming to relevant Indian Standards, wherever they exist, shall be used. The design of the joint box and the composition of the filling compound shall be such as to provide an effective sealing against entry of moisture in addition to affording proper electrical characteristics to joints. Where special type of splicing connector kits or epoxy resin spliced joints are specified materials approved for such application shall be used and instructions of the manufacturer/supplier of such materials shall be strictly followed.
- (f) Insulation resistance of cables to be jointed shall be measured with 500 volts megger upto 1.1 KV grade and with 2,500/5,000 volts megger for cable of higher voltage. Unless the insulation resistance values are satisfactory, jointing shall not be done.

- (g) Cores of the cables must be properly identified before jointing.
- (h) Where a cable is to be jointed with the existing cable, the sequence should be so arranged as to avoid crossing of cores while jointing.

5.1.17.16 Jointing Procedure

- (a) While it would be best to follow strictly the instructions for jointing furnished by the manufacturers/suppliers of cable and joint boxes.
- (b) All outdoor jointing of PVC cable shall be done using best quality of compound and jointing materials. For indoor termination of PVC cables, joints with compression type glands shall be preferred.

5.1.17.17 Testing

- (a) All cables before laying shall be tested with a 500 volts megger for 1.1 KV grade or with a 2,500/5,000 volts megger for cables of higher voltages. The cable cores shall be tested for continuity, absence of cross phasing, insulation resistance to earth/sheath/armour and insulation resistance between conductors.
- (b) All cables shall be subjected to above mentioned tests during laying, before covering the cables by protective covers and back filling and also before the jointing operations.
- (c) In the absence of facilities for pressure testing, it is sufficient to test for one minute with 1,000 volts megger for cables for 1.1 KV grade with 2,500/5,000 volts megger for cables of higher voltages.

5.1.17.18 Completion Plan and Completion Certificate

The work shall be carried out in accordance with the drawings enclosed with the tender and also in accordance with the modifications thereto from time to time approved by the Engineer.

- (a) Layout of cable work.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 200 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

(b)

Length, size, type and grade of cables.

(c)

Method of laying i.e. direct in ground in pipes etc.

(d)

Location of each joint with jointing method followed.

(e)

Route marker and joint marker with respect to permanent land marks available at site.

(f)

Name of work, job number, accepted tender reference, date of completion, names of division and sub-division, names of contractor with their signature and scale of drawing.

5.1.18

Earthing

Earthing shall be as per IS:3043 standards for earthing of feeder pillar, street lighting poles, interconnections between earth electrodes. The rates to be quoted shall include all necessary clamps, saddles, hardware, fixing arrangements excavation, as required. 25 x 3mm GI flat. GI pipe type earth electrodes as per IS:3043 standards, complete with excavation, civil works, funnel, cast iron cover earth pit makers etc.

Note :

25x3mm GI flat along the side of the road above flyover shall be embedded in crash battier by the electrical contractor during the civil works.

5.1.19

Lighting Protection

Supply & fixing of GI pipe earth station conforming full to IS:3043, complete with brick masonry chamber, GI cover, water funnel etc.

Supply and running 40x6 GI strip as lightning conductor lead, clamped to structure.

Supply & installation of Air termination rod with 5 Nos. 10mm. dia solid copper spikes mounted on copper ball with 25 dia. long copper tube mounted on base plate with necessary clamp bolts, grouting etc., complete.

	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
5.1.20	The contractor shall carryout and completes the said work under this contract in every respect in conformity with the current rules and regulations of the local electrical authority, the Indian Standard Institution with the directions of and to the satisfaction of the Engineer-in-charge. The contractor shall furnish all the labour and install all materials, appliances, equipment necessary for the completion and testing of the whole electrical installation as specified herein and shown on the drawings. This also includes any material, appliances, equipment not specifically mentioned herein or noted on the drawings as being furnished or installed but which are necessary and customary to make complete installation in all respect as shown on the drawings or described in specification herein properly connected with electrical installation such as excavation of trenches and back filling, cutting / drilling and grouting for fixing of fixtures, equipment etc., further all the liaison work with the Supply Authorities for obtaining electrical load sanction, obtaining the released order from supply authority for release of supply and other bodies like compliances, drawings etc., shall be done by the contractor without any extra cost. No separate amount towards the same will be paid by the MSPGCL.	
5.1.21	Contractor has to submit detailed drawing to the Engineer-in-charge for approval before commencement of work. All the drawings to be prepared in AutoCAD (Latest release only).	
5.1.22	Further the contractor has to liaise with the supply authority for getting the load sanctions and release of L.T. supply to the premises and to individual owners. The MSPGCL will assist the contractor for giving the necessary dates for filling the form. The contractor shall be solely responsible for submission of application along with all necessary documents to supply authority. Further he shall be responsible for follow up the application and getting the release of the supply to lighting. The necessary cost involved for the said work is to be included in the cost of the work. No separate payments will be made by the clients towards the same.	
5.1.23	The contractor shall also be responsible for getting approvals from the various bodies such as Supply Authority, Electrical Inspector, PWD, MSEB, Government of Maharashtra and any other statutory bodies. The cost involved for getting the necessary approvals is to be included in the cost of	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 202 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
the overall work. No separate payment towards the same will be paid to the contractor. The owner will reimburse the official fees paid by the contractor to the various departments. The contractor will have to submit the original copies of the bills / challans and copy of the receipt of the payment made to the various departments.		
5.1.24	The contractor will have to carry out the entire electrical works to the satisfaction of the Engineer-in-charge. The brief description of the work is as follows :	
5.1.24.1	Main Cabling The Contractor will have to lay the LT XLPE armoured cables from the feeder pillar to street light poles, junction boxes, lighting fixtures etc. Before laying this cable the contractor will have to do necessary voltage drop calculations for each size of the cables and get it approved from Engineer-in-charge. The termination of the cables will be carried out using good quality heavy duty brass double compression glands of approved makes and heavy duty tinned copper crimping lugs. The cost of all the cables will be included in the scope of the contract. After laying of the cables all the cables will have to be neatly dressed using necessary clamps. The cable identification tags shall be provided at both ends and at every 15-20 meters.	
5.1.24.2	Feeder pillar : The Feeder Pillar for the said work is to be supplied by the contractor. The feeder pillar will be out door duty fabricated using minimum 14 SWG white CRCA sheets and the same shall be double door type and rain canopy fixed on top. The feeder pillar will under go the seven tank painting process. It will be painted using powder coated granule finish Siemens gray PAL 7032 colour shade Busbars used for the same will be tinned copper & with colour code heat shrinkable sleeve only, a separate compartment with necessary sealing arrangements for the energy meter. The Feeder Pillar shall have bottom cable entry and top copper bus bar chamber. The Feeder Pillar shall be installed on the concrete pedestal of minimum 500mm high from the finished road level. The contractor will have to submit the necessary drawings in detail to the Engineer-in-charge for his approval before fabrication work started. All the cost towards the supply, installation, testing and commissioning including all necessary civil work will be borne	

by the contractor. Before the Feeder Pillar dispatched to the site the same shall be inspected and tested at the manufacturing tests before the final commissioning.

- (a) Before erecting the Feeder Pillar at site, a thorough inspection shall be done by the Contractor and reported to the Engineer if any difficulties are envisaged for erection. Thereafter, an erection sketch shall be prepared, indicating the dimensions and the clearances between the Boards. A similar marking will also be made at site.
- (b) Feeder Pillar shall be tested for mechanical endurance. After checking wiring and cable connections the entire boards, shall be erected in places indicated and marked on the plan. All touching up work of points shall then be done and foundation bolts grouted. All necessary holes and civil works shall be done as per directions. The Feeder Pillar after duly testing shall be put to commission for trial.

5.1.24.3 Lighting fixtures :

All the fixtures shall be of good quality and of approved lighting make only. All the fixtures shall be provided with high frequency electronic ballast's. All the fixture shall be installed as per the G.I.pipe or G.I. pipe suspension using ball and socket and necessary G.I. hardware. The fittings shall be installed either on wall or ceiling mounted. The sample of each fitting should be submitted to Engineer-in-charge for approval prior to procurement of the fixtures.

5.1.24.4 Earthing system:

Prior to starting the earthing work the contractor will have to submit the detail earthing calculations for the approval of Engineer-in-charge. 2 nos. earthing with plate type of earthing to be provided for the feeder pillar. 1 No. pipe earthing system approach to Road Over Bridge to Kamptee side and 1 No. pipe earthing system approaches to Road Over Bridge to Bhandara side and necessary earth wire to be provided to earth street light poles. 1 No. pipe earthing system to be provided to high mast lighting tower. The earthing results should be less than 1.0 Ohms for grid. From earth pit to the feeder pillar, high mast tower and upto first street light pole 25 x 6 hot-dipped G.I. Strip is to be used.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 204 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

5.1.24.5 Earth Electrodes In Earth Pits

Plate electrodes of Copper shall be 600 x 600 x 6mm thick and 600 x 600 x 12mm thick for GI unless otherwise specified.

5.1.24.6 Earth Bus and Earth Continuity Conductor

(a) Earth bus is a copper strip or flat of specified size interconnecting all earth electrodes.

(b) Switchgears and Power Distribution Board's shall be earthed by a copper flat strip/Hot dipped Galvanized Iron strip wire.

(c) Panels, fused DBs and motors upto 30 KW rating shall be earthed by a continuity conductor, as specified. Minimum size of continuity conductor shall be 25 x 3mm bare copper strip, soft drawn.

(d) Road Lighting Poles shall be earthed with GI wire.

5.1.24.7 Earth Bus Station:

Earth Bus Station shall be provided to facilitate tapping of earth continuity conductor from earth bus/grid very conveniently it will comprise of a 400 mm long 50 x 6 mm bare copper strips / flat fixed with raw plugs / bolts securely on wall / column above floor level. Spacers of 20 mm to 25 mm shall be provided to keep the flat away from wall and facilitate connections of earth conductor for which 6 mm dia holes 8 to 10 numbers are provided with proper size proper size brass nuts, bolts and washers. Earth bus shall be connected to it.

5.1.24.8 Resistance to earth:

The contractor shall measure the resistance of the individual earthing pit and report to the Engineer-in-charge. The contractor will make after due consultation with Engineer-in-charge, No. of earth pits, such that, the overall resistance in the earth mat does not exceed 1.0 Ohm.

5.1.24.9 Earthing Station

Plate Electrode Earthing:

Earthing electrode shall consist of a tinned copper plate not less than 600 x 600 x 12 mm G.I. as called for in the drawings. The plate electrode shall be buried as far as practicable below permanent moisture level but in any case not less than 3 mtrs. below ground level. Wherever possible earth electrode shall be located as near the water tap, water drain or a down take pipe as possible. Earth electrodes shall not be installed in proximity to a metal fence. It shall be kept clear of the buildings foundations and in no case shall it be nearer than 1 meter from the outdoor face of the wall. The earth plate shall be set vertically and surrounded with 150 mm thick layer of charcoal dust and salt mixture. 20 mm G.I. pipe shall run from the top edge of the plate to the ground level. The top of the pipe shall be provided with a funnel and a mesh for watering the earth through earth. The main earth conductors shall be connected to the electrode just below the funnel, with proper terminal lugs and checks nuts. The funnel over the G.I. pipe and earth connections houses 300 mm wide and 300 mm deep. The masonry chamber shall be provided with a cast iron cover resting cover a C.I. frame embedded in masonry.

5.1.24.10 Guarantee:

At the cost of the work and before issue of final certificate of virtual completion by the Engineer-in-charge, the contractor shall finish a written guarantee indemnifying the owner against defective material and workmanship for a period of one year after completion. The contractor shall hold himself fully responsible of reinstallation or replace free of cost to the MSPGCL.

5.1.24.11 Completion Certificate:

On completion of the Electrical Installation a Certificate shall be furnished by the contractor, counter signed by a Licensed Supervisor, under whose direct supervision the installation was carried out. This certificate shall be in the prescribed form as required by the local supply authority. The

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 206 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

contractor shall be responsible for getting the Electrical Installation inspected and approved by the Local Authorities concerned.

5.1.24.12 Test to be called for approval purpose:

- (a) The tenderer/bidder shall carryout in presence of Engineer’s Representative all tests. Such tests shall be carried out at the manufacturers or at works of the bidder.
- (b) The tenderer shall forward all the relevant copies of tests so performed in for the record of the Engineer-in-charge.
- (c) The tenderer shall give clear 15 days prior intimation in writing for all such tests to be carried out at relevant place of manufacture, works, sub-works etc. The cost incidental to such tests being carried out shall be borne by the tenderer. However, the expenditure for Engineer’s Representative making such visits for inspection only is borne by the Contractor.

5.2 GENERAL CONDITIONS OF SUPPLY OF ELECTRICAL EQUIPMENTS

5.2.1 The tenderer/bidder shall submit all technical data and catalogues of all relevant manufacturers he wishes to supply in his offer. However the supply and selection of materials and makes shall comply with the standards and approvals set herein only. If any deviations are noted, they shall be listed separately. The tenderer at his own discretion may list out any such reasons on quality/specifications/technical data for deviating from the approved makes. These shall then be appropriately considered. However all such deviations shall only be made by the bidder as alternate to the makes and materials specified If these are not indicated then the tenderer’s offer is likely to be rejected in to.

5.2.2 All tests to be performed prior to supply shall be indicated clearly by the tenderer. It is generally expected that all type and routine tests for all equipment required to be supplied under this tender shall complied to, however if the tenderer wishes to deviate for certain reasons all such reasons should be clearly brought out in the offer, specifically all tests shall be called for noted in this section.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 207 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
5.2.3	The successful tenderer before placing the orders or before supplying shall seek clearance in a meeting with the Engineer the final list of supply of materials at the time of signing of the contract by the Engineer and the successful tenderer/bidder. The successful bidder/tenderer shall then strictly adhere to these approved lists of makes and materials and proceed to supply the same. If any deviation and/or for any unforeseen reasons the makes or materials are to be altered, the successful tenderer shall obtain the proposal from Engineer in charge in writing and then only be may proceed to supply.	
5.2.4	The successful tenderer shall be entirely responsible for Guarantee of every equipment supplied performing in a continuous manner and mode acceptable to the Engineer.	
5.2.5	The successful tenderer shall submit minimum eight sets of all equipment, maintenance manuals, test certificates, guarantee of equipment etc., to the owner at the time of supply.

5.3	<u>SAFETY MEASURES:</u>	
5.3.1	Scaffolds:	
	Suitable scaffolds shall be provided for workmen for all works that cannot be safely done from the ground, or from solid construction, except such period work as can be done safely from ladders. When a ladder is used, it shall be of rigid construction made either of good quality wood or steel. The steps shall have minimum width of 450mm and a maximum rise of 300mm. Suitable hand holds of good quality wood or steel shall be	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 208 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	
	provided and the ladder shall be given an inclination not steeper than ¼ to 1 (1/4 horizontal and 1 vertical).	
5.3.2	Scaffolding or staging more than 4 meters above the ground floor, swing or suspended from an overhead support or erected with stationary support shall have a guard rail properly attached, bolted braced and otherwise secured atleast one meter high above staging and extending along the entire length of the outside and ends thereof with only such openings as may necessary for the delivery of materials. Such scaffolding or staging shall be so fastened to prevent it from swaying from the building structure.	
5.3.3	Working platforms gangways and stairways shallbe so constructed that they do not sag unduly or if more than 4 meters above ground level or floor level they shall be closely bordered, have adequate width and be suitable fenced.	
5.3.4	Every opening in a working platform shall be provided with suitable means to prevent falls of persons or materials by providing suitable fencing or railing.	
5.3.5	Whenever there are open excavations in ground, they shall be fenced of by suitable railing and danger signals installed at night so as to prevent persons slipping into the excavations.	
5.3.6	Safe means of access shall be provided to all working places, Every ladder shall be securely fixed. No portable single ladder shall be over 9 meters in length; width between side rails in rung ladder, shall in no case be less than 290mm for ladders upto and including 3 meters in length. For longer ladders this width shall be increased atleast 20mm for each additional meter of length.	
5.3.7	Adequate precautions shall be taken to prevent danger from electrical equipment. No material or any of the sites of work shall be so stacked or placed as to cause danger or inconvenience to any person or the public.	
5.3.8	Other safety measures:	
5.3.8.1	All personnel of contractor working within site shall be provided with safety helmets. All welders shall wear welding goggles while doing	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 209 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

welding work and all metal workers shall be provided with safety gloves. Persons employed on metal cutting and grinding shall wear safety glasses.

5.4 ELECTRIC SUPPLY AND MSEDCL CONNECTION:

Contractor shall arrange to provide electric supply from MSEDCL including required power meters. The necessary meter & connection charges and deposit to MSEDCL shall be paid by the contractor and the same will be reimbursed by MSPGCL on producing the MSEDCL receipts certified by the PMC.

5.5 HANDING OVER OF STREET LIGHTING SYSTEM:

Contractor shall hand over the entire lighting system erected for the project to the Executive Engineer (Electrical), after its completion and made operational through PMC / Engineer. An undertaking in prescribed format along with its enclosures in triplicate shall have to be given by the contractor within fifteen (15) days of its certification of its completion from PMC/Engineer. The contractor shall be responsible for handing over all installations of street lighting arrangement. The necessary co-operation if required will be extended by the Engineer and client.

5.6 DECLARATION:

I/ We hereby declare that I / We have read and understand the scope of the work for electrification and the detail technical specifications. I / We hereby declare that our offer also include all the materials required to complete the said job as per the requirements spelt out in the said Tender. I / We shall not claim any extra amount for completing the said work. Further we will supply and install all the material as required to complete the said work as per the entire satisfaction of the Engineer-in-charge and approving authorities for electrification work.

6.0 TRAFFIC SAFETY MEASURES
6.1 TRAFFIC SAFETY MEASURES DURING CONSTRUCTION AND MAINTENANCE OF ROADS AND BRIDGES WHERE TRAFFIC IS TO BE PASSED OVER A DIVERSION

Providing Traffic Safety Measures on DIVERSION During Construction / Reconstruction of BRIDGE / C. D. WORKS comprising of Road Traffic Sign Boards and devices as per detailed design, drawing, specification and as directed by Engineer.

The Contractor will have to provide the traffic safety arrangements as per detailed drawing before allowing traffic on the diversion. The traffic safety arrangements will have to be got approved from Engineer by the Contractor before taking any construction activities for Bridge / C. D. Works.

The Engineer shall get himself satisfied about the traffic safety arrangement provided on the work site before commissioning of Diversion and a certificate to that effect shall be recorded.

6.1.1 The Sign No. 1 the board display the message “GO SLOW – WORK IN PROGRESS’ shall be placed at a distance of 120 m. away from the point where the Diversion begins. The signboard shall be of size 1.0 m x 1.0 m. having Red Background and messages in white colour.

6.1.2 The Sign No. 2 “SPEED LIMIT (20)” shall be placed at a distance of 100 m. away from the point where the Diversion begins. The board shall be of size 60 cm. Dia. having white background and Red Border and the numerals shall be in black colour as per IRC:67-1977. Distance between Sign No. 1 and Sign No. 2 shall be minimum 20 m.

6.1.3 Speed Breakers / Humps shall be provided and marked with black and white colour in checkered pattern in accordance with IRC:99-1988. Speed breaker shall be provided at a distance of at least 20 m. away from the point where diversion begins.

6.1.4 The Sign No. 3 – The cautionary signboard indicating “SPEED BREAKER” shall be placed on either side of the speed breaker at a distance of at least 40

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 211 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

m. away from the Speed Breaker. The cautionary board shall be of an equilateral triangle of size 90 cm. having white colour background, retro-reflective border in red colour and non-reflective symbol in black colour. The definition plate shall be of size 60 cm. x 20 cm. having retro-reflective white colour background and message with non reflective black colour as per IRC:99-1988.

Retro-reflective “CAT – EYE” (Aluminium) shall also be provided on either side of the speed breaker as shown in the drawing.

6.1.5 The Sign No. 4 – DIVERSION board shall be placed at the point of detour. The signboard shall be of size 0.90 m x 0.60 m having red background and white retro-reflective messages.

6.1.6 Road marking for guiding the traffic (centerline / edge line marking) approaching the traffic where diversion begins shall be provided on the pavement with pavement marking paint in white colour as per IRC:35-1970.

Retro-reflective Cat – Eye made of aluminium body shall be placed along centerline marking before speed breakers as shown in the drawing. Sand filled plastic cones mounted with Retro-reflective Arrow Hazard Marker sign shall be placed as indicated in the drawing. Plastic cone shall be 73 cm. in height having 39 cm. square / hexagonal base.

6.1.7 Retro-reflective Strong Inviolable Stand Type Barrier painted black and having white Retro-reflective Strips for closer of traffic shall be placed on to cover the entire width of carriageway including shoulders as per drawing. The barricades shall be opened for the use of construction machinery only in the presence of responsible field person of the department. The Barricades shall not be removed unless the permission is given by the responsible officer of the rank not less than Resident Engineer. The Barricade shall have two plates of size 1.30 m x 0.20 m. painted Black and shall have White Retro-reflective Strips and mounted on angle Iron Stand of 1.0 m. height.

6.1.8 Yellow light flasher shall be kept lit from sunset to sunrise, three nos. at the point of detour and two nos. at barriers on both sides as indicated in the drawing.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 212 of 247
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	CORRIGENDUM - I	

6.1.9 Informatory sign board indicating name of work, Amount of Contract, Completion period, Defect Liability period, Name of Contractor with Telephone No., Name of Executive Engineer with Telephone No. shall be provided between sign board No. 4 and the barricade. The sign board shall be having Blue Stove Enamel Paint background and white messages retro-reflective as per IRC:67-1977.

6.1.10 The sign No. 5 “RESTRICTION ENDS” sign shall be placed at 200 m. beyond the edge of work area. The size of sign plate shall be 60 cm. dia having white background retro-reflective and black band of non-reflective.

The Signs, Lights, Barricades and other traffic control devices shall be well maintained, till such time the traffic is commissioned on the New Bridge / C.D. Work. The size, shape and colour of all the sign and caution boards shall be as mentioned above as per detailed drawings in accordance with the relevant I.R.C. specifications and as per Ministry of Surface Transport’s Specifications.

6.2 TRAFFIC SAFETY MEASURES DURING RECONSTRUCTION OF CROSS DRAINAGE STRUCTURES WHERE TRAFFIC CAN BE PASSED OVER PART WIDTH

Providing Traffic Safety Measures on road during RECONSTRUCTION OF CROSS DRAINAGE STRUCTURES in part width, comprising of traffic signboards and devices as per detailed design, drawing and specification as directed by Engineer.

This includes providing traffic safety arrangements required for traffic control within the vicinity of work site before actual start of the widening of the C.D. Work. The Contractor will have to provide the traffic safety arrangements as per the detailed drawing before starting the dismantling the existing structure. The traffic safety arrangements will have to be got approved from the Engineer by the Contractor before taking any construction activity for the C.D. work.

The Engineer shall get himself satisfied about the traffic safety arrangement provided on the work site before allowing Contractor to dismantle the existing structure and certificate to get effects shall be recorded in the Measurement Book.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 213 of 247

	CORRIGENDUM - I	
6.2.1	The Sign No. 1 the board display the message “GO SLOW – WORK IN PROGRESS’ shall be placed at a distance of 120 m. away from the point of detour and shall be of size 1.0 m. x 1.0 m. having red background and messages in white colour.	
6.2.2	The Sign No. 2 “SPEED LIMIT (20)” shall be placed at a distance of 100 m. away from the point of detour. The boards will be of size 60 cm. dia. having white background and red border and the numerals shall be in black colour as per IRC:67-1977. Distance between Sign No. 1 and Sign No. 2 shall be minimum 20 m.	
6.2.3	Speed Breakers / Humps shall be provided and marked with black and white colour in checkered pattern and stop line 20 cm. wide with letters “STOP” painted white on the pavement in accordance with IRC:99-1988 and IRC:35. Speed breakers shall be provided at a distance of minimum 20 m. away from the point of detour and line indicating “STOP” shall be exactly on the point of detour.	
6.2.4	The Sign No. 3 – The cautionary signboard indicating “SPEED BREAKER” shall be placed on either side of the speed breaker at a distance of at least 40 m. away from the speed breaker. The cautionary board shall be of an equilateral triangle of size 90 cm. having white colour background, Retro-reflective border in red colour and non-reflective symbol in black colour. The definition plate shall be of size 60 cm. x 20 cm. having retro-reflective white colour background and message with non reflective black colour as per IRC:99-1988. Retro-reflective “CAT – EYE” (Aluminium) shall also be provided on either side of the speed breaker as shown in the drawing.	
6.2.5	The Sign No. 4 – STOP sign with definition plate indicating “ONE WAY TRAFFIC” shall be placed at the point of detour. The STOP sign shall be octagonal in shape of size 90 cm having red background and message in white colour as per IRC:67-1977.	
6.2.6	Road marking for guiding the traffic (centerline / edge marking) approaching the work area shall be provided on the pavement with pavement marking paint in white colour as per IRC:35-1970 as shown in the drawing.	

Retro-reflective Cat – Eye made of aluminium body shall be placed along centerline marking before speed breakers as shown in the drawing. Sand filled plastic cones mounted with Retro-reflective Arrow Hazard Marker sign shall be placed as indicated in the drawing. Plastic cone shall be 73 cm. in height having 39 cm. square / hexagonal base.

- 6.2.7 Retro-reflective Strong Inviolable Stand Type Barrier painted black and having white Retro-reflective Strips shall be placed at either ends of the widening area in half width of the carriageway edge of the formation. The barricades shall not be removed unless the permission is given by the responsible officer of the rank not less than Resident Engineer. The Barricade shall have two plates of size 1.30 m x 0.20 m. painted black and shall have White Retro-reflective Strips and mounted on Angle Iron Stand of 1.0 m. height.
- 6.2.8 Retro-reflective Hazard Marker shall be provided on opposite side of work area at both the ends of parapet wall of cross drainage structure. The size of sign plate shall be 30 cm. x 90 cm. painted with black colour and yellow retro-reflective strips as per IRC:79-1981
- 6.2.9 Yellow light flasher shall be kept lit from sunset to sunrise, 2 Nos. along the white painted line and 3 Nos. at barriers on both sides as indicated in the drawing.
- 6.2.10 Informatory sign board indicating name of work, Amount of Contract, Completion period, Defect Liability period, Name of Contractor with Telephone No., Name of Executive Engineer with Telephone No. shall be provided between sign board No. 4 and the barricade. The sign board shall be having Blue Stove Enamel Paint background and white messages retro-reflective as per IRC:67-1977.
- 6.2.11 The sign No. 5 “RESTRICTION ENDS” sign shall be placed at 200 m. beyond the edge of work area. The size of sign plate shall be 60 cm. dia having white background retro-reflective and black band of non reflective.

The Signs, Lights, Barricades and other traffic control devices shall be well maintained, till such time that the traffic is commissioned on the new C.D. Work. The size, shape and colour of all the sign and caution boards shall be as mentioned above

Data Sheet –B of Transport Air Compressor in Ash Handling System (Sec-14, Sr no: 3.14) is amended as under:

<u>SR.NO.</u>	<u>ITEM</u>	<u>UNIT</u>	
1.0	Designation		
2.0	Numbers offered		
3.0	Type of compressor		
4.0	Make and model number		
5.0	Testing standard		
6.0	Number of stages		
7.0	Capacity FAD	m ³ /min	
8.0	Type of suction and discharge valve		
9.0	Suction pressure	Kg/cm ² (g)	
10.0	Discharge pressure	Kg/cm ² (g)	
11.0	Suction temperature each stage	°C	
12.0	Discharge temperature each stage	°C	
13.0	Selected compressor speed	rpm	
14.0	BKW		
15.0	Recommended maximum speed		
16.0	BKW at recommended maximum speed		
17.0	Volumetric efficiency		
18.0	Load/unload setting	Kg/cm ² (g)	
19.0	Auto start stop setting	Kg/cm ² (g)

<u>SR.NO.</u>	<u>ITEM</u>	<u>UNIT</u>	
20.0	Motor make, rating and speed		
21.0	Lube oil type and consumption for each compressor		
22.0	Lube oil pump driven by compressor motor		
23.0	Type and make of bearings		
24.0	Painting		
25.0	Cooling water requirement		
25.1	Flow rate	m ³ /hr	
25.2	Inlet and minimum outlet pressure	Kg/cm ²	
25.3	Inlet and maximum outlet temperature	°C	
26.0	Intake filter type		
26.1	Filter element		
26.2	Rated capacity		
26.3	Efficiency		
26.4	Type and Number of steps		
26.5	Method Employed in case of constant speed type		
27.0	Weight of Entire unit mounted on common base frame	Kg. apx.	
28.0	Overall dimensions of common base frame L x W x H	mm	
29.0	Single largest component to be lifted during maintenance		
30.0	Discharge flange- final stage size/standard / rating

1.0

INTRODUCTION

1.1

This section presents the system description, scope of work, basic design criteria and performance requirements of the additional sourcing of Raw Water for the 1 x 660 MW Bhusawal expansion project.

2.0

SYSTEM DESCRIPTION

2.1

The main source of Raw Water for plant make up is Ozerkheda reservoir belonging to Irrigation Department, located about 20 km from plant site.

2.2

At present, the Line from Ozerkheda reservoir is being built to cater to the requirement of 2 x500 MW units, together with the projected requirement for the 1 x 660 MW unit.

2.3

MAHAGENCO also have their own pump house on Tapi River which is used to serve through a canal, the existing 2x210MW units as well as the 2x500 MW units currently under execution. For the proposed 1x660MW unit also MAHAGENCO intends to use the Tapi River water as an additional source. It has been decided to go for a dedicated pipeline from the existing pump house on Tapi River to the plant site.

2.4

The distance from the existing river water pump house to the 1 x 660 MW unit (Unit # 6) is approximately 3 km. The proposed pipe line from Tapi river water pump house shall join the line coming from Ozerkheda near one day reservoir for 1 x 660 MW. The scope under this addendum covers the two numbers of intake water pumps and connecting pipework from river water pump house to the one day reservoir for 1 x 660 MW. The isolation arrangement shall be near to one day reservoir within plant boundary of 1x660 MW unit.

2.5

Five (5) pumps are presently installed in River Water Pump House out of which one pump is not operational owing to mechanical faults. This non operational pump is to be replaced by one of the new pumps. Further, space for installing one additional pump is also available in the pump house. Thus, two (2) pumps (1W+1S/B) can be accommodated in the pump house for catering to the requirement of 1x660 MW unit. However, this needs to be independently verified by the bidder.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 4 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	ADDENDUM- I	

2.6

This river water will be transported to the power plant site by cross country M.S. pipe line and stored in the raw water reservoir in the plant

2.7

The layout of River water Pump House and the proposed scheme is as per the enclosed sketch (Drg. PE-189-ME-SK-1043).

3.0

SCOPE OF WORK

3.1

The scope of work shall include design, manufacture / fabrication, inspection, testing, packing & forwarding, transportation, delivery, erection, commissioning & performance test at site of raw water system (including carrying out soil investigation, excavation and backfilling of the soil, providing requisite thrust blocks wherever applicable etc) from the existing river water pump house of MAHAGENCO located on Tapi river to the one day reservoir of 1 x 660 MW unit, including all electrical, control and instrumentation.

3.2

The scope inter-alia shall include the dismantling of one of the existing pumps in order to make way for the new pump.

3.3

The layout of the existing pump house as well as the indicative routing of the cross-country piping is shown in the attached sketches ; However, the bidder shall independently carryout the site survey and determine the detailed scope.

3.4

The major scope of work under this specification are Two (2) vertical pump sets (1W+1S/B), One (1) M.S. cross country piping (partly buried and partly above ground), valves and related electrical and instrumentation. The pumps and piping specification is as per Datasheet-A enclosed. However, any item not specifically mentioned but deemed necessary by the Bidder for making the system completely reliable and efficient shall also be included.

3.5

Providing and laying M.S. pipeline of commercial quality Fe-410 grade conforming to IS 3589, aligning proper line and level as per site requirement.

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 5 of 54

	ADDENDUM- I	

3.6

PIPING VALVES AND SPECIALTIES

(a)

Motorized butterfly valves at pump discharge with associated actuator.

(b)

Manually operated butterfly valve and non-return valve at the interconnection point near One Day reservoir for 1x660 MW unit

(c)

Rubber expansion joints at pump discharge.

(d)

Double kinetic air valves and accessories at pump discharge.

(e)

Drain arrangement with isolation gate valve at pump discharge. All drains shall be header routed.

(f)

Pressure gauge and pressure switch with isolation globe valves at pump discharge and pressure gauge at common header.

(g)

Pipe supports and associated civil/structural works as required including all temporary frames for transport.

(h)

Electro -Magnetic Flow meter with integrator on pipe line

(i)

Expansion joints to be provided at an interval of 300m for above ground portion of pipe line.

3.7

The raw water intake channel at existing pump house located in the Tapi River shall be provided with level indicators and level switches with protection interlocks for associated pumps. All pumps drawing suction from the raw water intake channel and shall be protected against operation under low suction condition. Annunciation for abnormal conditions levels (low and high) in the raw water pumps shall be annunciated in the control panel. The MCC for pumps providing power supply to the pumps shall be provided in the adjoining room of the raw water intake pump house.

3.8

The raw water intake pump set shall be supplied with the following accessories, as applicable.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 6 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	ADDENDUM- I	
(a) Heavy duty couplings of approved design to connect the pump shaft directly with the motor shaft. (b) Sets of base plates, support plates, grounding pads, thrust blocks, lifting lugs, eye bolts, nuts etc for each pump and motor set. (c) Slip on type drilled steel counter flanges of proper rating to suit the discharge flange of each pump set. All the counter flanges shall be complete with requisite number of bolts, nuts and gaskets etc. (d) Thrust pads, if required, for pump discharge head complete with all necessary fixing and bolting arrangement, fasteners etc. (e) One (1) pressure indicator with isolating cocks at the discharge side of each pump, two (2) additional stubs with isolating root valves for pressure tapings and two (2) thermowells for temperature tappings at the discharge side of each pump for performance testing. Thrust bearing shall be furnished with thermometer, temperature switch for high temperature annunciation and oil level gauge. Thrust bearing temperature indicator shall be hooked-up to the PLC. (f) All internal/integral piping with valves, fittings and instruments for lubrication, cooling and sealing, if applicable, shall preferably be tapped off from respective pump discharge. (g) Pump using 6.6 kV drive shall be equipped with vibration measuring and temperature measuring probes for pump and motor bearing with adequate annunciation / interlock function. The vibration measurement, Start/Stop and necessary interlocks shall be hooked-up to PLC.		
4.0 <u>TERMINAL POINT :</u> 4.1 River water pipeline shall be connected to tap off line from supply pipe coming from Ozerkheda reservoir within the plant boundary and near the one day reservoir of 1x660 MW plant.		

5.0 SPECIFIC DESIGN CRITERIA

- 5.1 In case the pumps/ motors need external cooling, the bidder shall consider the same and include in the proposal.
- 5.2 The design shall take into account the effect of internal/external pressure, thermal expansion, self weight of piping, support reactions, surge and water hammer, earthquake and wind effects at site, corrosion and erosion etc. and any other effects dictated by good engineering practices.
- 5.3 Pipelines shall be laid underground or in tunnels as far as possible. Wherever it is not possible, pipelines shall be laid over ground on the R.C.C. saddle supports with M.S. clamping.
- 5.4 The raw water pipe line and pumping system sizing shall be based on Sixteen (16) hours operation per day for a quantity equivalent to 110 % of the plant make up water requirement arrived at by considering a cycle of concentration of five (5). The capacity of the each pump shall be equivalent to 110% of quantity requirement for plant makeup considering Cycle of concentration (C.O.C) of five (5). The number of pumps shall be Two (2) (1W+1 S/B).
- 5.5 Bidder shall carry out surge analysis for determining the thickness of the cross country piping with provision of additional 1.5 mm thickness for corrosion allowance.
- 5.6 Sizes of pipe line shall be selected such that the velocity of fluid in pipes does not exceed the range of 1.5 – 1.7 m/s.
- 5.7 The pipe network shall be provided with air release valves at high points and drain valves at the lower points. Air valve should be placed at least every 500 meters.
- 5.8 Pipeline passing under or through equipment foundations or walls of buildings or any other inaccessible structure shall be provided with steel encasing pipes for easy insertion and removal.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 8 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	ADDENDUM- I	
5.9	The over ground piping, wherever required, shall have a minimum vertical clearance of 0.9 metres above finished ground level and 8.5 meters above road level in plant working area.	
5.10	Valves provided on the over-ground pipe network shall be provided with steel structural platforms and access ladders.	
5.11	C/C distance between two supports shall not be more than 6.0 m.	
5.12	All the buried pipelines shall be laid with a nominal slope towards the drain point.	
5.13	In case of the buried pipe lines, the top of the pipeline shall be minimum 1200 mm below the finished ground level.	
5.14	Isolation /control valves, drain valves, air release valve provided on the buried pipe network shall be housed in suitably sized covered valve pit and the valve pits shall be of self draining type. Air release valves shall be provided at the highest points of each sector of the pipeline and drainage valves shall be provided at the lowest points of each sector of the pipeline.	
5.15	Wherever the buried pipelines are crossing the roads and tracks, they shall be suitably encased with mild steel pipes or reinforced concrete casing pipes of NP3 class or as required as per statutory norms, whichever stringent. Permissions for crossing (Road/Railway track etc.) shall be obtained by the bidder from the concerned department.	
5.16	Mechanical cleaning and anticorrosive protection of underground MS pipelines shall conform to IS: 10221 - 1982. The anticorrosive protection of pipelines shall consist of the following activities in sequence: (a) Application of one coat of coal tar primer (b) Application of one coat of coal tar enamel (c) One wrap of fibre glass tissue (d) Application of one coat of coal tar enamel	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 9 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	ADDENDUM- I	
(e) One layer of fibre glass tissue impregnated in coal tar enamel. (f) Application of the final coat of a water-resistant white wash 5.17 Alternatively, Coal tar based anticorrosion tape as per IS :15337 - 2003 shall be provided for protection of underground mild steel pipelines. The thickness of tapes shall be 3 mm up to pipe diameter DN 300 mm and 4 mm above pipe diameter DN 300 mm. 5.18 <u>INTERNAL PAINTING TO PIPELINE</u> Food-grade epoxy coating, minimum 250 micron thick, shall be imparted to the internal surface of M.S. pipeline. Surface preparation of internal surface shall be made as per clause no. 5.21. Resin and hardener shall be mixed in standard proportions and the mix shall be applied as primer to the internal surface within ‘open time’ of the resin hardener mix. When the primer is “touch dry”, two (2) top coats shall be applied to a total thickness of 250 micron. 5.19 <u>LAYING BURIED PIPELINES</u> 5.19.1 All buried pipelines shall be laid with earth cover sufficient to avoid damage from pressure of vibration caused by the surface traffic. Minimum earth covering over the pipe shall be 1200 mm from the finished ground levels. For laying of buried pipelines earth work in excavation, back filling and acceptance of trenches etc. shall be as per IS: 5822-1994, IS: 3114-1994 and IS: 12288-1987. 5.19.2 The trench shall be so dug that the pipe line can be laid to the required alignment and at the required depth, proper levelling of the excavated surfaces is an essential requirement. 5.19.3 The bottom of the trench shall be levelled by sand layer for a minimum thickness of 150 mm. 5.19.4 If the depth of excavation is more, proper protection for side walls shall be provided till the pipe levelling is completed.		

- 5.19.5 The entire pipe trenches bottom shall be covered with local sand bed of 150 mm thick layer.
- 5.19.6 After laying the pipelines, 150 mm thick layer of local sand shall be provided all around the pipe.
- 5.19.7 Precautions shall be taken at all the times to prevent damage to the coating and wrapping in the pipe lines and appurtenances as applicable by workmen or trespassers during laying or at any other time. Pipe handling slung and any blocking used in handling or storing the pipes must be well padded to avoid damage to pipe and its coating.
- 5.19.8 After laying a pipeline on skids it shall be thoroughly cleaned, inspected for any damage to the protective coating. Satisfactory repair work shall be performed while the pipe is suspended above the trench.
- 5.19.9 After the pipes are erected and tested, the back filling of the trenches shall be done with loose soil free from stones, bricks and metallic pieces in layers and shall be well rammed and compacted.
- 5.19.10 The underground pipelines shall be provided with pipe markers at regular interval for proper identification.
- 5.19.11 The coating system for under ground piping based upon the soil resistivity may be selected on the following basis:

	SOIL RESISTIVITY	CORROSIVITY	COAL TAR COATINGS	WRAPPING TAPES
(a)	≤ 1000 ohm-cm	Extremely corrosive	3 coats and 3 wraps	3 layers of tape
(b)	> 1000 ohm-cm	Corrosive & non-corrosive	2 coats and 2 wraps	2 layers of tape

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 11 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	ADDENDUM- I	

5.20

PROTECTION FOR ABOVE GROUND PIPING

5.20.1

The coating shall consist of two coats of synthetic enamel painting over a coat of primer, as per relevant standard and manufacturer’s specification.

5.20.2

The two ends of each length of pipe shall be left bare of primer coating for a distance of 150 mm from the end to facilitate field welding and subsequent field coating.

5.20.3

The supply, application, characteristics of materials and testing requirements shall be strictly as per relevant IS.

5.21

SURFACE PREPARATION

5.21.1

Pipe surfaces to be provided with underground protection shall be cleaned by shot blasting. The cleaning shall be so carried out that the piping surface is free from mill scale, rust, oil, welding scale and other foreign materials. Primer shall be applied immediately after shot blasting to prevent rust forming. Superficial rust formed shall be removed by wire brushing or by the use of emery paper. If the rust formation is heavy, re-blasting may be necessary. Around field joints, the pipe surfaces may be cleaned by wire brushing prior to the application of anti-corrosive protection

5.22

PRIMER COAT

5.22.1

The primer shall be compatible with the grade of enamel used. It shall be thoroughly mixed before using by stirring or by rocking the drum to provide uniformity of material. The primer coat shall be applied over a thoroughly clean and dry surface within three (3) hours of the cleaning operation, and shall be applied preferably immediately with a uniform thickness on the entire surface of the piping using appropriate quantity per unit area of surface as recommended by the manufacturer. The primer coating shall be free of bubbles, globules, drips and runs. Pipes having a longitudinal seam shall be carefully examined to determine that all excess primer has been brushed out of each side of the welding seam. The primer shall be thoroughly dry before the enamel is applied. If

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 12 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	ADDENDUM- I	

ready-made tapes are used, then primer, as suggested by the manufacturer, shall be used.

5.22.2 Freshly-primed pipe shall be handled carefully to prevent damage. The damaged area shall be re-primed before applying enamel/wrapping tapes.

6.0 PERFORMANCE REQUIREMENTS

6.1 Performance requirements for all the pump(s) shall be as specified in datasheet-A enclosed.

6.2 Pump(s) shall preferably be designed to have the best efficiency at the specified duty point. Further, the pump(s) shall be suitable for continuous operation at any point within its range of operation as specified in datasheet-A enclosed.

6.3 Pump(s) shall have continuously rising head-capacity characteristics, with maximum head at pump discharge shut-off, to enable parallel operation

6.4 Under all circumstances, the `range of operation' of the pump(s) shall exclude any unstable operating zone of the head-capacity curve.

7.0 ELECTRICAL

7.1 The existing 6.6 kV switch gear & Power and control cables in Tapi River Pump house are 40 years old and they shall be replaced. The entire replacement of 6.6 kV switch gear and cables and all associated work shall be done by the EPC contractor. The scope of above work is generally given below. The EPC contractor is expected to visit the site to make the assessment of the quantum of work as the entire activities are included in the scope of EPC contractor.

7.2 **Broad Scope Shall Be As Follows:**

7.2.1 Disconnection of existing power and control cables, bus section wise connected to 12.5 MVA transformers, 6.6 KV switch gears, motors & control panels etc.

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 13 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	ADDENDUM- I	
7.2.2	Removal of these cables from Trays, trenches, underground locations & transport & storing them at suggested location.	
7.2.3	Removal of existing switchgear panels bus section wise and transport & storing them at suggested location.	
7.2.4	Civil modification such as modifications of frames, trenches etc. as required for installation of new switch gear, cables & control panel etc.	
7.2.5	Design, engineering, manufacturing, testing at works, Insurance supply to site, unloading, checking, storage, erecting / installation at site testing & commissioning and putting into successful commercial operation of the following electrical equipments. (a) 6.6 kV, 50 Hz, 3 phase, 1250A, 40KA VCB switch gear #1 & #2 as per key single line diagram no PE-189-EL-SK-5007/P0 attached here with. (b) Two (2) new pumps with squirrel cage motors (c) Two (2) control panels for Two (2) new pumps	
7.2.6	11/ 6.35 kV XLPE armoured cables & control cables for :- (a) Connection between 12.5 MVA transformer no. 1 to incomer of 6.6 kV switchgear #1. (b) Connection between 12.5 MVA transformer no. 2 to incomer of 6.6 kV switch gear #2. (c) Connection between 6.6 kV switchgear #1 & 2. (d) Connection to all existing 6.6 kV motors. (e) Connection to two (2) new 6.6 kV motors. (f) Connection to Two (2) 6.6 kV/ 433 V 500 KVA existing transformers. (g) Connection to new control panel.	

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 14 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	ADDENDUM- I	
(h) Any other as required 7.2.7 Grounding for the entire system 7.2.8 All electrical system studies such as short circuit levels, voltage drops, grounding, relay setting & relay coordination, all sizing calculations etc & preparation & submission of all necessary document and drawings for approvals & then with approved AS BUILT STATUS. 7.2.9 Any other activity required for completion of the project on EPC Basis. 7.3 <u>LOCAL CONTROL PANEL</u> 7.3.1 Degree of protection - IP 54 or better totally enclosed type 7.3.2 Mounting - Floor mounted, Free standing, dead front assemblies. 7.3.3 Base plates - steel channel / Angle with anti vibration mounting & stainless steel kick plates. 7.3.4 Construction - Sheet steel Minimum 2 mm thickness. 7.3.5 Door - Rear Door with concealed Type hinges & Pad locking arrangement. Door shall be grounded by copper braid. All doors & removable covers shall be provided with neoprene rubber gaskets all around and sufficiently strong. 7.3.6 Height - panel height shall match with existing panels. Working height of panels shall be limited between 750 mm & 1800 mm. 7.3.7 Control transformers / space Heater - two (2) (1*100% stand by) per panel. 7.4 All electrical equipments and systems shall comply with the Volume II, Volume IV A, Volume IV B and relevant drawings of Bid specification.		

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 15 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	ADDENDUM- I	

8.0

CONTROL AND INSTRUMENTATION

A programmable logic control (PLC) shall be considered for the monitoring and control of the proposed raw water pumps. For detailed requirement of Control and Instrumentation system, Volume –V shall be referred to.

9.0

CIVIL

9.1

The bidder shall visit the site to acquaint himself regarding all site features and scope & extent of Civil/Structural works to be carried out for this purpose to amalgamate with the new facilities in consultation with Owner/owner’s consultant.

9.2

Scope includes site survey, soil investigation, site development works, complete design engineering and construction of Civil, Structural works and to obtain necessary various approvals from concern Departments/agencies well in advance including necessary charges.

9.3

For crossing of the pipe lines with nallahs, rivers, canals etc, pipe shall be laid over RCC supports and bottom of pipe shall be kept at 0.5 m above H.F.L.

9.4

Providing and Laying pipe line including their supports and foundations, thrust blocks etc wherever required including earth mat/lightening protection.

9.5

Thrust blocks shall be provided to resist the thrust load from pipelines considering the test pressure in the pipelines at bends/tees etc.

9.6

Backfilling, around foundations and bottom of pipes, thrust blocks etc shall be carried out with approved material in layers not exceeding 30 cm thickness and each layer shall be compacted to 90% standard proctor density for cohesive soil and to 75% of relative density for non- cohesive soils.

9.7

For detailed civil specification, refer volume VI-B.

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.	Page 16 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1	
	ADDENDUM- I	

10.0

TESTING

10.1

THICKNESS

10.1.1

The thickness of the pipe coating shall be measured either by elcometer or by coating thickness gauge.

10.2

BOND

10.2.1

Bond test shall be carried out by cutting 25 mm square at three locations of the coating on a sample test specimen to qualify the procedure. Coating shall be pulled out by lifting one corner of the square. For a good coating, the section shall not peel off easily.

10.2.2

The coating on the pipe shall be carried out only after satisfactory completion of the qualifying test.

10.2.3

In case of doubt regarding the quality of coating, bond test shall be carried out on any location of the pipe to the satisfaction of the Owner.

10.3

FIELD ADHESION TEST FOR WRAPPING TAPES

10.3.1

Adhesion test shall be made to determine the proper bond between the tape and primed pipe. The temperature of the tape and pipe to be tested shall be between 10 and 27 °C. If the temperature is outside this range, hot or cold water shall be poured over the test area until this temperature range is attained. A test area shall be selected by the inspector where the tape is smooth for 15 cm in the longitudinal direction of the tape. Two knife cuts that are 15 cm long and 5 cm apart shall be made through the tape. A flat blade shall be used to pry up 5 cm of the fabric. This 5 cm flap of fabric shall be grasped firmly in one hand and shall be pulled with a quick motion in the direction of the remaining 10 cm of the 15 cm knife cut.

10.3.2

The adhesion is satisfactory if the tape tears at the point of stripping or the fabric strips from the underlying coal tar component, leaving exposed not more than 10% of the primer or metal.

10.4 HOLIDAY TEST

10.4.1 On completion of coating/wrapping, the quality of the coating shall be tested using efficient high voltage holiday detectors, operating at a voltage high enough to jump an air gap, the length of which is equal to the thickness of the coating/wrapping. All holidays found shall be repaired and the repairs shall be retested with the holiday detector to ensure that adequate repairs have been made.

10.4.2 The suggested test voltage shall be as follows:

$$V = 1250 (t)^{1/2} \text{ where}$$

V - voltage in volts,
t - coating thickness in mils (1 mil = 0.001 in.)

10.5 CERTIFICATES

The CONTRACTOR shall furnish certificates of all the materials purchased by him and also complete instructions from the manufacturer regarding the storage, preparation and application of the coating materials.

11.0 SPARES AND CONSUMABLES AND LUBRICANTS

Bidder shall consider identical mandatory spares for all mechanical, electrical and instrumentation items in line with Volume- II, Section-9 and include in the scope.

Similarly, all consumables and lubricants till COD of the unit shall be included in the scope.

Further, bidder shall offer recommended spares for Three (3) year operation as specified under Volume- I .

HT SWITCHGEAR (6.6 kV)

DATA SHEET - A

<u>SR NO.</u>	<u>ITEM</u>	<u>UNITS</u>	
1.0	<u>SWITCHGEAR</u>		6.6 kV
1.1	<u>GENERAL</u>		
(a)	Type		Metal-clad, draw out
(b)	Service		Indoor
(c)	Enclosure		IP – 4X
1.2	<u>SYSTEM</u>		
(a)	Rated Voltage	kV rms	6.6 ± 10%
(b)	Phase		Three (3)
(c)	Rated Frequency	Hz	50 Hz ± 5%
(d)	System grounding		Non effectively earthed through resistance
1.3	<u>DESIGN AMBIENT TEMPERATURE</u>	°C	50
1.4	Rated Current inside the cubicle and at design ambient temperature of 50°C		
(a)	Bus bar		1250A
(b)	Circuit breaker		1250A

<u>SR NO.</u>	<u>ITEM</u>	<u>UNITS</u>		
1.5	<u>SHORT CIRCUIT RATING</u>			
(a)	Rated short time withstand current	kA	40 kA	
(b)	Duration		3 Sec	
(c)	Rated peak withstand current	kA	100 kA	
1.6	<u>INSULATION LEVEL</u>			
(a)	Rated lightning impulse withstand voltage	kV	As per IEC	
(b)	Rated one minute power frequency withstand voltage	kV	As per IEC	
1.7	<u>AC/DC POWER SUPPLY</u>			
(a)	Control voltage	V	110 V DC	
(b)	Service voltage	V	240V ± 10%, 1 Ph, 50 Hz ± 5%	
2.0	<u>CIRCUIT BREAKER</u>			
2.1	Duty Cycle		0 - 3' - CO - 3' – CO	
2.2	<u>BREAKING CURRENT</u>			
(a)	A.C. Symmetrical	kA	40 kA	
(b)	A.C. Asymmetrical		As per IEC	
2.3	Making Current	kA	100 kA p	
2.4	<u>OPERATION TIME</u>			
(a)	Opening time (ms)		Not more than 60

<u>H.V. POWER CABLE (6.6 kV)</u> <u>DATA SHEET - A</u>			
<u>SR. NO.</u>	<u>ITEM</u>		
1.0	<u>6.6 kV POWER CABLE FOR NON EFFECTIVELY EARTHED SYSTEM</u>		
1.1	11kV /6.35 grade 90° C continuous rating under normal condition and 250° C rating under short circuit condition heavy duty XLPE power cable suitable for use in non-effectively earthed (UE) system conforming to following requirement and in line with IS-7098, IS-8130, IS-5831 & IS-3975, manufactured by Triple Extrusion Dry Cure(CCV) process using pressurized Nitrogen		
1.1.1	Conductor		Stranded and compacted circular aluminium conductor of grade H2 & class 2 for all sizes, generally conforming to IS:8130
1.1.2	Conductor Screen		Extruded semi-conducting compound
1.1.3	Insulation		Extruded cross linked polyethylene (XLPE) conforming to IS7098 (Part-2)
1.1.4	Insulation Screen		Extruded semi-conducting compound in combination with a layer of lapped copper tape of thickness is not less than 0.1mm.
1.1.5	Core Identification		By coloured strips applied on (For three core cables) cores or by numerals.

CONSULTANT : PROCON ENGINEERS

	MAHARASHTRA STATE POWER GENERATION CO. LTD.		Page 29 of 54
	BID SPECIFICATION NO.: DG/BSL U-6/2011/T-1		
	ADDENDUM- I		
SR. NO.	ITEM		
1.1.6	Inner Sheath		Extruded HRPVC/FRLS compound conforming to type ST2 of IS: 5831 for three core cables. Single core cables shall also have inner sheath. Filler material shall also be of type ST2 PVC.
1.1.7	Armour		Galvanised single round steel wire armour for twin and multicore cables
			Non-magnetic hard drawn aluminum single round wire conforming to H4 of IS-8130 latest for single core cables.
1.1.8	Overall Sheath		Extruded FRLSH HRPVC compound conforming to type ST2 of IS: 5831.
1.1.9	Drum		Steel Drum

<u>CONTROL CABLE</u> <u>DATA SHEET - A</u>			
<u>SR. NO.</u>	<u>ITEM</u>		
1.0	<u>CONTROL CABLES</u>		
1.1	Rating : 1.1 kV grade 85° C continuous rating under normal condition and 160°C under short circuit condition rating HRPVC Control cable (YWY) conforming to following requirement and in line with IS:1554, IS:8130, IS:5831 and IS:3975.		
1.1.1	Conductor		Stranded, non-compacted & circular, high conductivity annealed plain copper, generally conforming to IS: 8130.
1.1.2	Insulation		Extruded HRPVC type-C compound conforming to IS: 5831. The minimum volume resistivity of insulation shall be 3.5 x 10 ¹⁴ ohm-cm at 27°C and 3.5 X 10 ¹¹ OHM-CM at 85°C.
1.1.3	Core Identification		By color coding and numbering at interval of 100mm or less.
1.1.4	Inner Sheath		Extruded HRPVC compound conforming to type ST2 FRLS of IS: 5831 for multicore cables. Single core cables shall have no inner sheath. Filler shall be of same material as of inner sheath i.e. ST2.

DATA SHEET - C**DRAWINGS, DATA, CURVES AND INFORMATION REQUIRED:****1.0 DRAWINGS/DATA****1.1 Drawings/Data**

- (a) Determination of pump head and capacity as per guidelines of this specification.
- (b) General arrangement drawings showing the principal dimensions, weight and location of the suction and discharge connections of the pumps offered. Details of lubrication and sealing arrangement shall be included.
- (c) Outline drawings of the pump showing the various dimensions, suction and discharge locations.

1.2 Anticipated performance curves showing the following characteristics:

- (a) Capacity Vs Head
- (b) Capacity Vs Power & Efficiency
- (c) Capacity Vs Submergence
- (d) Capacity Vs NPSH requirement

1.3 A write-up describing clearly the procedure for installing the pump with its column pipe - piece by piece and also for overhauling the pump in a like manner. A diagram showing the required pump house crane hook lift above the pump operating floor has also to be furnished.

CONSULTANT : PROCON ENGINEERS

**DATA SHEET – C****DRAWINGS, DATA, INFORMATION & MANUALS REQUIRED:**

- 1.0** Final versions of all the documents, furnished during the bid.
- 2.0** A complete list of all piping systems and corresponding materials included in the scope of work.
- 3.0** A complete list of all valves with their quantities and ratings.
- 4.0** Detailed layout of the cross- country piping from Tapi river water pump house upto the interconnection point.
- 5.0** Manufacturer's catalogue indicating complete range of available size and rating of pipes, fittings, valves and specialties.
- 6.0** General Arrangement and Sectional drawings with data on weight and material of construction for each category of Expansion Joints with control rod assemblies.
- 7.0** Outline drawings and Cross Sectional drawings indicating principal dimensions and weights of equipment, size and location of various nozzles, connections, nozzle sizes and foundation arrangement.
- 8.0** Detail drawings including fabrication drawings of all shop fabricated piping system indicating design parameters and complete bill of material (Relevant Standards and grades to be indicated) and information/data pertaining to the hydrostatic and non-destructive test requirements to be submitted progressively.
- 9.0** Detail dimensioned drawing of each valve, specialties, indicating tag no., pressure rating, manufacturing standard, the bill of materials and hydrostatic test pressures. The drawing shall include the end preparation details and shall indicate the position of the hand wheel/operator. Technical particulars of motor operators wherever applicable shall also be indicated.

4.0 Construction of the Contract:

4.1 ⁴We are a foreign national firm having been incorporated by virtue and under the Laws of _____⁵ and do hereby confirm that:

- We have studied all the extent laws in India in connection with execution of Engineering and Construction contracts, employment of labour, taxation including the Income Tax Act etc. and shall abide with the same and other laws which may come into force during the performance of the contract.
- We have studied the Clause 35.3, Section – 1, Volume – I and have noted that in the event of acceptance of our bid, you shall award three contracts as stipulated therein. We also accept that all these three contracts shall have cross-fall-breach clause to the effect that breach of any contract shall be considered as breach of remaining contracts.
- ⁶We propose M/s. _____ as our assignee for execution of Second and/or Third Contract (strike out whichever is

34343442_____

⁴ Applicable for Offshore bidders only, Indian Bidders to strike out this portion till marked @@.

⁵ Insert the name of the country where the bidder is registered.

⁶ Insert only if applicable

not applicable) and enclose their unequivocal consent to work as your independent contractor on the terms and conditions offered/accepted by us. We also confirm that the proposed assignee has capacity and experience to perform the contract to your entire satisfaction. However, if the proposed assignee is not acceptable to you, we shall propose alternate assignee or perform the contract(s) proposed to be assigned by ourselves. We also confirm that the assigned contracts shall also contain cross-fall-breach clause to the effect that any breach of the contract(s) by assignee may be considered as the breach of the remaining contracts including the first contract and vice-a-versa.@@

⁷ We are Indian Bidder and do hereby confirm that:

- i) We have studied all the extent laws in connection with execution of Engineering and Construction contracts, employment of labour, taxation including the Income Tax Act etc. and shall abide with the same and other laws which may come into force during the performance of the contract.
- ii) We have studied the Clause 35.2, Section – 1, Volume – I and have noted that in the event of acceptance of our bid, you shall award three contracts as stipulated therein. We also accept that all these three contracts shall have cross-fall-breach clause to the effect that breach of any contract shall be considered as breach of remaining contracts.§§

5.0 We have understood that deviation in essential terms and conditions as mentioned under Clause 28.4, Section -1, Volume – I of the bid specification shall render our bid to be non-responsive. We confirm that we have not taken any deviation, directly or indirectly, explicitly or implicitly to these terms and conditions. If any such deviation is observed in the bid, the same shall deem to be unconditionally withdrawn by us without any financial implication to the owner.

6.0 We confirm and accept that you are not bound to accept the Lowest evaluated Bid or the Lowest Price Bid or any other bid you may receive.

7.0 The work completion period offered by us and the inputs required from the owner for the same are submitted as Schedule – 6 and Guaranteed Technical Particulars as Schedule – 7. We also accept your right to the bid offering lowest completion period on time preference basis. We also confirm that if our bid is

35353542_____

⁷ Applicable for Indian bidders. Offshore bidders to strike out this provision till §§

Form for Deed of Joint Undertaking

[To be executed by the collaborator of the Equipment and the Indian Manufacturer of the equipment on Non-Judicial Stamp Paper of INR 200/- [(refer Clause No. 4.2.4, Section – I, Volume – I of the bid specification)]

DEED OF JOINT UNDERTAKING

The DEED OF JOINT UNDERTAKING executed this _____day of _____Two thousand _____ by:

M/s. _____, a company incorporated under the provisions of _____ act of _____(country)_____ having its Registered Office at _____ (hereinafter referred to and called as the “the Collaborator SG”, which expression shall include its successors, administrators, executors and permitted assigns).

And

M/s. _____, a company incorporated under the provisions of Indian Company’s Act 1956 having its registered office at _____ (hereinafter referred to and called as “the Indian Manufacturer SG”, which expression shall include its successors, administrators, executors and permitted assigns) or “the Contractor”.

in favour of Maharashtra State Power Generation Company Ltd., a Government of Maharashtra Enterprise incorporated under the Provisions of Indian Companies Act, 1956, having its Registered Office at 2nd Floor, Prakashgad, Prof. Anant Kanekar Marg, Bandra (East), Mumbai - 400 051, INDIA (hereinafter referred to as either “MAHAGENCO” or “ the Owner” which expression include its successors, administrators, executors and assigns).

WHEREAS, the owner has invited Bids for design, engineering, manufacture, supply, transportation to site, installation, testing, commissioning and conductance of guarantee tests for the Power Plant comprising of Supercritical Steam Generator including its all Auxiliaries (SG), Supercritical Steam Turbine including its all Auxiliaries (ST) & Generator Set including its all Auxiliaries (GS), Balance of the Plant Equipment and Civil Works for its Bhusawal Thermal Power Station 1x660 MW Unit - 6 Project (hereinafter referred to as “Plant”) against its Bid Specification No. : DG/BSL U-6/2011/T-1 vide its Invitation of Bids No. _____ dated _____.

AND WHEREAS Clause 4.2.4, Section – 1, Volume – I of the bid specification stipulates that the Indian manufacturer of sub-critical equipment who meets the experience criteria stipulated therein can be considered as the Qualified Manufacturer of Supercritical Steam Generator including its all Auxiliaries (SG) provided he has a valid ongoing collaboration and technology transfer agreement including license to manufacture and supply of Supercritical Steam Generator including its all Auxiliaries (SG) covering the type, size and rating specified with a manufacturer of the respective equipment (the collaborator SG) who satisfies the experience criterion stipulated under Clause No. 4.2.1 and furnishes a Deed of Joint Undertaking executed by the Indian Manufacturer SG and the collaborator SG.

AND WHEREAS against Owner's aforesaid Invitation for Bids (IFB), M/s. _____ (the bidder) has submitted the bid proposal in consortium with M/s. _____ and M/s. _____ which includes supply of Supercritical Steam Generator including its all Auxiliaries (SG) covering the type, size and rating specified manufactured at the works of the Collaborator SG, the Indian Manufacturer SG and their sub-vendors as per the drawings, specifications, Quality plans etc. approved by the collaborator SG.

AND WHEREAS the Indian Manufacturer SG satisfies the experience criterion stipulated under Clause No. 4.2.4 Section – I, volume – I of the bid specification for Steam Generator and has a valid ongoing collaboration and technology transfer agreement including license to manufacture and supply supercritical Steam Generator covering the type, size and rating specified with the Collaborator SG who satisfies the experience criterion stipulated under Clause 4.2.1, Section – I, volume – I of the bid specification

AND WHEREAS the Indian Manufacturer SG and the Collaborator SG are required to jointly execute and furnish along with the bid an irrevocable Deed of Joint Undertaking and be jointly and severally responsible and bound unto the Owner for the successful performance of the equipment fully meeting the stipulated technical requirements, and Guaranteed parameters and characteristics as per bid specification, in the event, the Bid is accepted by the Owner resulting into a Contract/Contracts.

AND FURTHER WHEREAS the Indian Manufacturer SG and the Collaborator SG are required to jointly execute and furnish along with the bid an irrevocable Deed of Joint Undertaking and be jointly and severally responsible and bound unto the Owner for the successful performance of the Contract with regard to implementation of the Phased Manufacturing Program and transfer of technology in accordance with the bid specification, in the event, the Bid is accepted by the Owner resulting into a Contract/Contracts.

NOW THEREFORE, THIS DEED WITNESSETH AS UNDER:

1. That in consideration of the award of the Contract(s) by the Owner to the Contractor, we the Collaborator SG and the Indian Manufacturer SG do hereby declare and undertake that we shall be jointly and severally responsible to the Owner for the execution and successful performance of the equipment and achievements of all guaranteed parameters as specified under the said Contract(s) to the satisfaction for the Owner.
2. In case of any breach of the Contract(s) committed by the Contractor, we the ~~Indian Manufacturer SG and~~ Collaborator SG do hereby undertake, declare and confirm that we shall be fully responsible for the successful performance of complete equipment, including its satisfactory performance and achievement of all guaranteed parameters as specified in the Contract and undertake to carry out all obligations and responsibilities under this Deed of Joint Undertaking including the technical guarantees for the complete equipment in order to discharge the Contractor's obligations and responsibilities stipulated in the Contract. Further, if the Owner sustains any loss or damage on account of any breach of the Contract(s) related to the equipment, we the Indian Manufacturer SG and the Collaborator SG jointly and severally undertake to promptly indemnify and pay such losses/ damages caused to the Owner on its written demand without any demur, reservation, contest or protest in any manner whatsoever. Determination of losses/ damages shall be in line with provisions on Limitation of Liability of the said Contract(s).

The liability of the Collaborator SG hereunder shall, however, be limited to an amount calculated at the rate of 221 Million for each number of equipment to be supplied by the Contractor. This is without prejudice to any right of Owner against the Contractor under the Contract and all guarantees.

Without prejudice to the joint and several obligations of the Contractor and the Collaborator SG hereunder, the analysis/ investigations of the non-performance of the equipment manufactured by the Contractor may initially be carried out by the Contractor within a period of 15 days from the date of reference of the problem by the Owner, before the Owner approaches the Collaborator SG for any such analysis/ investigation. It shall not be necessary or obligatory for the Owner to first proceed against the Contractor before proceeding against the Collaborator SG (with respect to obligations and responsibilities of the collaborator covered under this Deed of Joint Undertaking). Nor any extension of time or any relaxation given by the Owner to the contractor shall prejudice any

right of Owner under this Deed of Joint Undertaking to proceed against Indian Manufacturer SG and the Collaborator SG and the Contractor.

- 3 Without prejudice to the generality of the undertaking in para '1' above. The manner of achieving the objectives set forth in para '1' above shall be as follows:
 - a) We, the Collaborator SG shall be specifically responsible for complete engineering, preparation of all designs, design calculations, design documents / drawings and manufacturing drawings for all the equipment; selection of their auxiliaries and interfacing / integration of all equipment with their auxiliaries so as to ensure satisfactory, reliable, safe and trouble free performance of all equipment as well as the performance meeting all stipulated technical requirements as well as all guaranteed parameters specified in the Contract (s).
 - b) We, the Collaborator SG shall extend our quality surveillance / supervision / quality control to the Contractor during manufacture, erection, commissioning and performance testing, both at Contractor's works and / or at Owner's project site. Without prejudice to the overall responsibilities of the Collaborator SG for successful commissioning and performance of the equipment, the Collaborator SG shall depute their technical experts from time to time to the works of the Indian Manufacturer SG / Owner's project site, as mutually agreed upon between the owner and the Contractor in accordance with the stipulations of the Contract(s).
 - c) We, the Collaborator SG will supply equipment / components manufactured at our works or at our vendor's works as per requirements / schedule specified in the Contracts.
 - d) We, the Collaborator SG will be fully responsible for the quality of manufacture of all equipment / main assemblies / components for incorporation in the equipment. For the items to be manufactured by the Indian Manufacturer SG at his / or his vendor's works as per design of the Collaborator SG, the Collaborator SG shall ensure completeness and correctness of the design, data, document and information in every detail provided to the Indian Manufacturer SG which would result in the same quality of equipment as if manufactured at the works of the Collaborator SG and shall meet approval / acceptance of the Collaborator SG.
 - e) The Indian Manufacturer SG shall be responsible to manufacture portion of the equipment which are to be manufactured at its works or its vendor's works as per the design of the Collaborator SG and to the quality acceptance

level of the Collaborator SG (to be finalized before Notification of Award). Further, the Indian Manufacturer SG shall erect, commission and carry out the guarantee tests of all the equipment in accordance with the advice, procedure and guidance of the Collaborator SG. In case, there is any need to modify the design / drawings / procedure in certain areas, the Indian Manufacturer SG shall seek specific approval of the Collaborator SG before proceeding further.

- f) In the event any problem is encountered during design, manufacture, erection, testing and commissioning or if the Indian Manufacturer SG fails to demonstrate during the guarantee tests that the equipment meet the guaranteed parameters and demonstration parameters as specified in the contract, the Collaborator SG shall promptly provide all technical assistance / services / support to analyze and suggest corrective measures / modifications to the equipments / systems of all the equipment under the Contract(s) directly to the Owner and the Contractor/ Indian Manufacturer SG and the Collaborator SG shall promptly carry out all corrective measures and modifications (as suggested by the Collaborator SG and agreed by the Owner) for each of their respective equipment / systems supplied by them at their own expense. Thereafter, the Contractor/ Indian Manufacturer SG and the Collaborator SG shall demonstrate the successful performance of the equipment meeting the guaranteed parameters as stipulated under the contract.
4. We the Indian Manufacturer SG and the Collaborator SG do hereby declare and undertake that we shall be jointly and severally responsible to the Owner for the successful implementation of the Phased Manufacturing Program as specified in the said Contract(s).
5. We, the Indian Manufacturer SG and the Collaborator SG do jointly hereby undertake, declare and confirm that we shall be fully responsible for indigenizing the manufacturing of supercritical Steam Generator sets in India in a phased manner in accordance with the Phased Manufacturing Program specified in the said Contract(s).
6. We, the Indian Manufacturer SG and the Collaborator SG do jointly hereby undertake, declare and confirm that we shall be fully responsible for ensuring that transfer of the technological know - how for equipment (of the type, size and rating specified in the Contract (s) in the form of complete transfer of design dossier, design software's, drawings and documentation and quality system manuals is transferred to the Indian Manufacturer as per the Contract(s).

7. We, the Indian Manufacturer SG and the Collaborator SG do further undertake, declare and confirm that we shall be fully responsible for imparting relevant training to the personnel of the Indian Manufacturer SG as part of the technology transfer agreement between the Indian Manufacturer and the Collaborator SG.
8. We, the Indian Manufacturer SG and the Collaborator SG do hereby undertake and confirm that this Deed of Joint Undertaking shall be initially valid till ninety (90) days beyond the schedule date of completion of the defect liability period of the all the equipment or completion of the Phased Manufacturing Program under the Contract (s), whichever occurs later. In case of delay in completion of the defect liability period under the contract(s) or delay in the completion of the Phased Manufacturing Program beyond the aforesaid period, the validity of this Deed of Joint Undertaking shall be extended by such period of delay. However, this Deed of Joint Undertaking shall terminate at the latest 27 months from the scheduled end of defect liability period of the unit of 660MW under the contract. We, the Indian Manufacturer SG and the Collaborator SG do further undertake and confirm that this Deed of Joint Undertaking shall be irrevocable and shall not be revoked till its validity. We further agree that this Deed of Joint Undertaking shall be without any prejudice to the various liabilities of the Contractor including contract performance security as well as other obligations of the Contractor in terms of the Contract(s).
9. In case of award, in addition to the Contract Performance Securities to be furnished by the Contractor, the Indian Manufacturer and the Collaborator SG shall furnish as security on demand Performance Bank Guarantee(s) in favour of the Owner as per provision of the bid specification for each of the contract(s) awarded to the Bidder/Contractor. The value of each such Bank Guarantee shall be equal to one-half percent (0.5%) of the total Contract Price of the Contract(s) (an equivalent absolute amount to be specified at the time of award of Contract) and it shall be guarantee towards the faithful performance/compliance of this Deed of Joint Undertaking in accordance with the terms and conditions specified herein. The bank guarantee shall be unconditional, irrevocable and initially valid till ninety (90) days beyond the scheduled date of completion of the defect liability period of the equipment / component covered under the Contract(s) or completion of the Phased Manufacturing Program under the Contract(s) whichever occurs later. In case of completion of the defect liability period under the Contract(s) or delay in the completion of the Phased Manufacturing Program beyond the aforesaid period, the validity of this Deed of Joint Undertaking shall be extended by such period of delay. However, this bank guarantee shall terminate at the latest 27 months from the scheduled end of defect liability

period of the equipment. The guarantee amount shall be promptly paid to the Owner on demand without any demur, reservation, protest or contest.

10. Any dispute that may arise between the Owner and the Contractor in connection with this Deed of Joint Undertaking shall be finally settled as per the arbitration procedure/rules mentioned in the Contract Documents. Any dispute that may arise between the Owner and the Collaborator SG in connection with this Deed of Joint Undertaking shall be finally settled by reference to Arbitration in accordance with the United Nations Commission on International Trade Law (UNCITRAL) Arbitration Rules of 1976. The Arbitral Tribunal shall consist of three members and shall be appointed in accordance with the said Rules. The appointing authority for the Third Arbitrator shall be the President, International Chamber of Commerce, Paris. The language to be used in arbitral proceedings shall be English. The venue of arbitration shall be Singapore. The award made in such arbitration shall be final and binding and shall be enforceable in any court of competent jurisdiction.

11. This deed of undertaking shall be construed and interpreted in accordance with the Laws of India.

12. That this Deed of joint undertaking shall be operative from the effective date of the Contract.

IN WITNESS WHEREOF, the Collaborator SG and the Indian Manufacturer through their authorized representatives have executed these presents and affixed common seal of their respective companies on the day, month and year first mentioned above.

Form for Deed of Joint Undertaking

[To be executed by the collaborator and the Indian Manufacturer for Steam Turbine & Generator on **Non-Judicial Stamp Paper of INR 200/-** [(refer Clause No. 4.2.4, Section - I, Volume - I of the bid specification)]

--

DEED OF JOINT UNDERTAKING

The DEED OF JOINT UNDERTAKING executed this _____ day of _____ Two Thousand _____ by:

M/s. _____, a company incorporated under the provisions of _____ act of (country) having its Registered Office at _____ (hereinafter referred to and called as the "the Collaborator ST & GS" which expression shall include its successors, administrators, executors and permitted assigns).

And

M/s. _____, a company incorporated under the provisions of Indian Company's Act 1956 having its registered office at _____ (hereinafter referred to and called as "the Indian Manufacturer ST & GS" or "Contractor", which expression shall include its successors, administrators, executors and permitted assigns).

in favour of Maharashtra State Power Generation Company Ltd., a Government of Maharashtra Enterprise incorporated under the Provisions of Indian Companies Act, 1956, having its Registered Office at 2nd Floor, Prakashgad, Prof. Anant Kanekar Marg, Bandra (East), Mumbai - 400 051, INDIA (hereinafter referred to as either "MAHAGENCO" or "the Owner" which expression include its successors, administrators, executors and assigns).

WHEREAS, the Owner has invited Bids for design, engineering, manufacture, supply, transportation to site, installation, testing, commissioning and conductance of guarantee tests for the Power Plant comprising of Supercritical Steam Generator including its all Auxiliaries (SG), Supercritical Steam Turbine including its all

Auxiliaries (ST) & Generator Set including its all Auxiliaries (GS), Balance of the Plant Equipment and Civil Works for its Bhusawal Thermal Power Station 1x660 MW Unit - 6 Project (hereinafter referred to as "Plant") against its Bid Specification No. : DG/BSL U-6/2011/T-1 vide its Invitation of Bids No. _____ dated_____.

AND WHEREAS Clause 4.2.4, Section - 1, Volume - I of the bid specification stipulates that the Indian manufacturer of sub-critical equipment who meets the experience criteria stipulated therein can be considered as the Qualified Manufacturer of Supercritical Steam Turbine including its all Auxiliaries (ST) & Generating Set including its Auxiliaries (GS) provided he has a valid ongoing collaboration and technology transfer agreement including license to manufacture and supply of Supercritical Steam Turbine including its all Auxiliaries (ST) & Generating Set including its Auxiliaries (GS) covering the type, size and rating specified with a manufacturer of the respective equipment (the collaborator ST & GS) who satisfies the experience criterion stipulated under Clause No. 4.2.1 and furnishes a Deed of Joint Undertaking executed by the Indian Manufacturer ST & GS and the Collaborator ST & GS.

AND WHEREAS against owner's aforesaid Invitation for Bids (IFB), M/s. _____ (the bidder) has submitted the bid proposal which includes supply of Supercritical Steam Turbine including its all Auxiliaries (ST) covering the type, size and rating specified manufactured at the works of the Collaborator ST, the Indian Manufacturer ST & GS and their sub-vendors as per the drawings, specifications, Quality plans etc. approved by the collaborator ST & GS.

AND WHEREAS the Indian Manufacturer ST & GS satisfies the experience criterion stipulated under Clause No. 4.2.4 Section - I, volume - I of the bid specification for Steam Turbine & Generating Set and has a valid ongoing collaboration and technology transfer agreement including license to manufacture and supply supercritical Steam Turbine & Generator Set covering the type, size and rating specified with the Collaborator ST & GS who satisfies the experience criterion stipulated under Clause 4.2.1, Section - I, volume - I of the bid specification

AND WHEREAS the Collaborator ST & GS shall indemnify the Indian Manufacturer ST & GS with respect to patent infringement claims pertaining to the Steam Turbine and Generator Set of Type, size and rating specified and offered, as per the provisions of the said collaboration and technology transfer agreement.

AND WHEREAS the Indian Manufacturer ST & GS and the Collaborator ST & GS are required to jointly execute and furnish along with the bid an irrevocable Deed of Joint Undertaking and be jointly and severally responsible and bound unto the Owner for the successful performance of the Steam Turbine Generator Set including the auxiliaries specified in Annexure-I (hereinafter referred to as "Equipment") fully meeting the stipulated technical requirements, and Guaranteed parameters and characteristics as per Contract documents, in the event, the Bid is accepted by the Owner resulting into Contracts.

AND FURTHER WHEREAS the Indian Manufacturer ST & GS and the Collaborator ST & GS are required to jointly execute and furnish along with the bid an irrevocable Deed of Joint Undertaking and bound unto the Owner for the successful performance of the Contract with regard to transfer of technology in accordance with the Clause No. 6 hereunder and the Indian Manufacturer ST & GS is responsible for implementation of Phased Manufacturing Program in accordance with the bid specification , in the event, the Bid is accepted by the Owner resulting into a Contract/Contracts.

NOW THEREFORE, THIS DEED WITNESSETH AS UNDER:

1. That in consideration of the award of the Contract(s) by the Owner to the Contractor, we the Indian Manufacturer ST & GS and Collaborator ST & GS do hereby declare and undertake that we shall be jointly and severally responsible to the Owner for the execution and successful performance of the Equipment and achievements of all guaranteed parameters as specified under the said Contract(s).
2. In case of any breach of the Contract(s) committed by the Contractor, we the ~~Indian Manufacturer ST & GS and~~ Collaborator ST & GS do hereby undertake, declare and confirm that we shall be fully responsible for the successful performance of complete Equipment, including its satisfactory performance and achievement of all technical guaranteed parameters of the Equipment as specified in the Contract and undertake to carry out all obligations and responsibilities under this Deed of Joint Undertaking including the technical guarantees for the complete Equipment in order to discharge the Contractor's obligations and responsibilities stipulated in the Contract. Further, if the Owner sustains any loss or damage on account of any breach of the Contract(s) related to the Equipment we the Indian Manufacturer ST & GS and the Collaborator ST & GS jointly and severally undertake to promptly indemnify and pay such losses/ damages caused to the Owner on its written demand without any demur,

reservation, contest or protest in any manner whatsoever, subject to failure on the part of the Indian Manufacturer ST & GS and the Collaborator ST & GS to rectify such breach.

Except in case of criminal negligence or willful misconduct, the Collaborator ST & GS shall not be liable to the Owner, whether in contract, tort, or otherwise, for any indirect or consequential loss or damage, loss of profit, cost of capital, cost of replacement power or increased cost of operation, provided that this exclusion shall not apply to any obligation of the Contractor to pay Liquidated Damages to the Owner.

The aggregate liability of the Collaborator to the Owner hereunder shall not exceed the US\$ 50 Million or the value of services and components supplied by the Collaborator ST & GS to the Indian Manufacturer ST & GS for Bhusawal TPS 1x660MW Unit-6 Project whichever is higher.

This is without prejudice to any right of the Owner against the Contractor under the Contract and all guarantees.

Without prejudice to the joint and several obligations of the Contractor and the Collaborator ST & GS hereunder, the analysis/ investigations of the non-performance of the Equipment manufactured by the Contractor may initially be carried out by the Contractor within a period of 15 days from the date of reference of the problem by the Owner, before the Owner approaches the Collaborator ST & GS for any such analysis/ investigation. It shall not be necessary or obligatory for the Owner to first proceed against the Contractor before proceeding against the Collaborator ST & GS (with respect to obligations and responsibilities of the Collaborator covered under this Deed of Joint Undertaking). Nor any extension of time or any relaxation given by the Owner to the Contractor shall prejudice any right of Owner under this Deed of Joint Undertaking to proceed against Indian Manufacturer ST & GS and the Collaborator ST & GS and the Contractor.

3. Without prejudice to the generality of the undertaking in para '1' above. The manner of achieving the objectives set forth in para '1' above shall be as follows:
 - a) We, the Collaborator ST & GS shall be specifically responsible for complete engineering, preparation of all designs, design calculations,

design documents / drawings and manufacturing drawings for the Equipment; selection of their auxiliaries and interfacing / integration of Equipment with their auxiliaries so as to ensure satisfactory, reliable, safe and trouble free performance of Equipment as well as meeting all stipulated technical requirements and guaranteed parameters specified in the Contract(s).

- b) We, the Collaborator ST & GS shall extend our quality surveillance / supervision / quality control to the Contractor during manufacture, erection, commissioning and performance testing, both at Contractor's works and / or at Owner's project site. Without prejudice to the overall responsibilities of the Collaborator ST & GS for successful commissioning and performance of the Equipment, the Collaborator ST & GS shall depute their technical experts from time to time to the works of the Indian Manufacturer ST & GS / Owner's project site, as mutually agreed upon between the Owner and the Contractor in accordance with the stipulations of the Contract(s).
- c) We, the Collaborator ST & GS will supply equipment / components manufactured at our works or at our vendor's works as per requirements / schedule specified in the Contracts.
- d) We, the Collaborator ST & GS will be fully responsible for the quality of manufacture of all equipments / main assemblies / components for incorporation in the Equipment. For the items to be manufactured by the Indian Manufacturer ST & GS at his / or his vendor's works as per design of the Collaborator ST & GS, the Collaborator ST & GS shall ensure completeness and correctness of the design, data, document and information in every detail provided to the Indian Manufacturer ST & GS which would result in the same quality of equipment as if manufactured at the works of the Collaborator ST & GS and shall meet approval / acceptance of the Collaborator ST & GS.
- e) The Indian Manufacturer ST & GS shall be responsible to manufacture portion of the Equipment which are to be manufactured at its works or its vendor's works as per the design of the Collaborator ST & GS and to the quality acceptance level of the Collaborator ST & GS (to be finalized before Notification of Award). Further, the Indian Manufacturer ST & GS shall erect, commission and carry out the guarantee tests of all the Equipment

in accordance with the advice, procedure and guidance of the Collaborator ST & GS. In case, there is any need to modify the design / drawings / procedure in certain areas, the Indian Manufacturer ST & GS shall seek specific approval of the Collaborator ST & GS before proceeding further.

- f) In the event any problem is encountered during design, manufacture, erection, testing and commissioning or if the Indian Manufacturer ST & GS fails to demonstrate during the guarantee tests that the Equipment meet the guaranteed parameters and demonstration parameters as specified in the contract, the Collaborator ST & GS shall promptly provide all technical assistance / services / support to analyze and suggest corrective measures / modifications to the equipment / systems of all the Equipment under the Contract(s) directly to the Owner and the Contractor/ Indian Manufacturer ST & GS and the Collaborator ST & GS shall promptly carry out all corrective measures and modifications (as suggested by the Collaborator ST & GS and agreed by the Owner) for each of their respective equipment / systems supplied by them at their own expense. Thereafter, the Contractor/ Indian Manufacturer ST & GS and the Collaborator ST & GS shall demonstrate the successful performance of the Equipment meeting the guaranteed parameters as stipulated under the contract.
4. We the Indian Manufacturer ST & GS do hereby declare and undertake that we shall be responsible to the Owner for the successful implementation of the Phased Manufacturing Program as specified in the said Contract(s).
5. We, the Indian Manufacturer ST & GS do hereby-undertake, declare and confirm that we shall be fully responsible for indigenizing the manufacturing of supercritical Steam Turbine Generator sets in India in a phased manner in accordance with the Phased Manufacturing Program specified in the said Contract(s).
6. We, the Indian Manufacturer ST & GS and the Collaborator ST & GS do jointly hereby undertake, declare and confirm that we shall be fully responsible for ensuring a valid technology transfer agreement including license to manufacture and supply in India between the Manufacturer ST & GS and the Collaborator ST & GS covering the type, size and rating of the Equipment specified, valid minimum up to the end of the defect liability period of the

Contract. The technology transfer agreement necessarily covers transfer of the technological know-how for Equipment in the form of complete transfer of design dossier, design software's, drawings and documentation and quality system manuals.

7. We, the Indian Manufacturer ST & GS and the Collaborator ST & GS do further undertake, declare and confirm that we shall be fully responsible for imparting relevant training to the personnel of the Indian Manufacturer ST & GS as part of the technology transfer agreement between the Indian Manufacturer and the Collaborator ST & GS.
8. We, the Indian Manufacturer ST & GS and the Collaborator ST & GS do hereby undertake and confirm that this Deed of Joint Undertaking shall be initially valid till ninety (90) days beyond the scheduled date of completion of the defect liability period of the Equipment under the Contract (s). In case of delay in completion of the defect liability period under the contract(s) beyond the aforesaid period, the validity of this Deed of Joint Undertaking shall stand extended by such period of delay. However, this Deed of Joint Undertaking shall terminate at the latest 24 months from the scheduled end of defect liability period of the unit of 660MW under the contract. We, the Indian Manufacturer ST & GS and the Collaborator ST & GS do further undertake and confirm that this Deed of Joint Undertaking shall be irrevocable and shall not be revoked till expiry of its validity. We further agree that this Deed of Joint Undertaking shall be without any prejudice to the various liabilities of the Contractor including contract performance security as well as other obligations of the Contractor in terms of the Contract(s).
9. In case of award, in addition to the Contract Performance Securities to be furnished by the Contractor/the Indian Manufacturer, the Collaborator ST & GS shall furnish as security on demand Performance Bank Guarantee(s) in favour of the Owner as per provision of the bid specification. The value of such Bank Guarantee shall be equal to one-half percent (0.5%) of the total Contract Price of all the Contract(s) (an equivalent absolute amount to be specified at the time of award of Contract) awarded against this bid specification and it shall be guarantee towards the faithful performance/compliance of this Deed of Joint Undertaking in accordance with the terms and conditions specified herein. The bank guarantee shall be unconditional, irrevocable and initially valid till ninety (90) days beyond the scheduled date of completion of the defect liability period of the Equipment covered under the Contract(s). In case of completion of the

defect liability period under the Contract(s) beyond the aforesaid period, the validity of this Deed of Joint Undertaking shall be extended by such period of delay. However, this bank guarantee shall terminate at the latest 24 months from the scheduled end of defect liability period of the Equipment. The guarantee amount shall be promptly paid to the Owner on demand without any demur, reservation, protest or contest.

10. Any dispute that may arise between the Owner and the Contractor in connection with this Deed of Joint Undertaking shall be finally settled as per the arbitration procedure/rules mentioned in the Contract Documents. Any dispute that may arise between the Owner and the Collaborator ST & GS in connection with this Deed of Joint Undertaking shall be finally settled by reference to Arbitration in accordance with the United Nations Commission on International Trade Law (UNCITRAL) Arbitration Rules of 1976. The Arbitral Tribunal shall consist of three members and shall be appointed in accordance with the said Rules. The appointing authority for the Third Arbitrator shall be the President of the International Chamber of Commerce, Paris. The language to be used in arbitral proceedings shall be English. The venue of arbitration shall be Singapore. The award made in such arbitration shall be final and binding and shall be enforceable in any court of competent jurisdiction.
11. This Deed of Joint Undertaking shall be construed and interpreted in accordance with the Laws of India.
12. This Deed of Joint Undertaking shall be operative from the effective date of the Contract.
13. This Deed of Joint Undertaking shall form an integral part of the Contracts.

IN WITNESS WHEREOF, the Collaborator ST & GS and the Indian Manufacturer through their authorized representatives have executed these presents and affixed common seal of their respective companies on the day, month and year first mentioned above.

The Proforma for Consortium Agreement, at page No. 99, Section I, Volume-I of the bid specification is modified as under:

Annexure - VI

Proforma for Consortium Agreement

(Refer Clause No. 4.1 (b), Section - 1, Volume - I. To be submitted on non-judicial stamp paper of INR. 200/-)

CONSORTIUM AGREEMENT

The CONSORTIUM AGREEMENT executed this ____ day of ____ Two thousand ____ by:

M/s. _____, a company incorporated under the provisions of _____ act of (country) having its Registered Office at _____ (hereinafter referred to and called the "the qualified manufacturer ~~†SG/†G ST~~ /GS/ **The EPC Contractor**", which expression shall include its successors, administrators, executors and permitted assigns) who shall be acting as "the leader of consortium" for the purpose of this agreement and bidding for which this consortium is formed.

And

M/s. _____, a company incorporated under the provisions of _____ act of (country) having its Registered Office at _____ (hereinafter referred to and called the "the qualified manufacturer ~~†SG/†G ST~~ /GS/ **The EPC Contractor**", which expression shall include its successors, administrators, executors and permitted assigns).

And

M/s. _____, a company incorporated under the provisions of _____ act of (country) having its Registered Office at _____ (hereinafter referred to and called the "the qualified manufacturer ~~†SG/†G ST~~ /GS/ **The EPC Contractor**", which expression shall include its successors, administrators, executors and permitted assigns).

And

M/s. _____, a company incorporated under the provisions of _____ act of (country) having its Registered Office at _____ (hereinafter referred to and called the "the qualified manufacturer ~~†SG/†G ST~~ /GS/ **The EPC Contractor**", which expression shall include its successors, administrators, executors and permitted assigns).

And hereinafter, above parties are collectively referred to and called as the parties.

WHEREAS, Maharashtra State Power Generation Co. Ltd. (MAHAGENCO), a 100% owned enterprise of Govt. of Maharashtra, India registered under and by virtue of Indian Companies Act 1956 and having its registered office at 2nd Floor, 'Prakashgad', Prof. Anant Kanekar Marg, Bandra (East), Mumbai (hereinafter referred to and call as the "Owner"), has invited Bids for design, engineering, manufacture, supply, transportation to site, installation, testing, commissioning and conductance of guarantee tests and all Civil Construction and Architectural Works required for its Bhusawal Thermal Power Station 1x660 MW Unit - 6 Project which comprises apart from other equipment, the Supercritical Steam Generator including its all Auxiliaries (SG), Supercritical Steam Turbine including its all Auxiliaries (ST) and Generator Set including its all Auxiliaries (GS) (hereinafter referred to as "Plant") against its Bid Specification No. : DG/1x660MW BSL U-6/~~MP~~/T-1 vide its Invitation of Bids No. _____ dated _____.

AND WHEREAS in terms of the Qualifying Requirements of the Bid Specification Stipulated under Clause No. 4.1 (b), a bid from consortium of Qualified Manufacturer of SG or ~~TG as defined thereunder (as a leader of consortium) in consortium with Qualified Manufacturer(s) of TG and GS or SG & GS respectively~~ Qualified Manufacturer of ST, Qualified Manufacturer of GS *and An Engineering, Procurement & Construction (EPC) Contractor as defined thereunder is acceptable

AND WHEREAS the parties believe that they individually meet the qualifying requirements stipulated in the bid specification for their respective equipment which and hence they can bid as the consortium.

AND WHEREAS the parties have indicated / expressed their willingness to co-operate with each other in respect of preparing and submitting jointly to owner bid for the Project and in the event of contract (hereinafter referred to as the "CONTRACT") being awarded to the parties by owner, the Parties agree to carry out the execution of the Contract and jointly & severally share the responsibility in accordance with the said Contract if awarded.

NOW THIS INDENTURE WITNESSTH AS UNDER:

1.0 Purpose of the Agreement:

All above "Parties" hereby agree to form a consortium to jointly bid for the project under a single bid and in the event of the said single bid submitted by the parties being accepted by the owner, to enter into the Contract and to execute the same to the satisfaction of Tender Specifications. The Parties shall co-operate with each other in order to secure the successful bidding for the Project and thereafter upon its acceptance by owner to execute it successfully.

FURTHER the Parties are desirous of entering into a Consortium for the execution of the Project and to determine, fix and define between them the respective interests, scope of responsibilities and liabilities in connection with the whole execution of their part for the **said Project.**

2.0 Consortium:

The Parties agree to form a consortium for the purposes of undertaking the Bidding Process and if the Bid is successful, for implementing the Project.

Each Party shall Co-operate with the other Party to the fullest extent possible to ensure that all filings made with, and communications to the owner are complete, accurate in all respect and made within the prescribed time limits.

3.0 Lead Member:

The lead member of the consortium i.e. M/s. _____ is authorised to take all actions on behalf of the all the members of the consortium that may be necessary or required in connection with or incidental to the Consortium's Pre-Qualification and Bid, including but not limited to:

- i. Signing and submission of all applications and other documents and written communications;
- ii. Participating in 'Bidders' and other conferences and providing information or responses to the owner;
- iii. Representing the Consortium in all matters before the owner;
- iv. Submission of the Bid;
- v. Signing and execution of all contracts and undertakings consequent to acceptance of the Bid by the owner;
- vi. To incur liabilities and receive instruction for and on behalf of the Consortium;
- vii. To take all the action for entire execution of the Contract and

† accept payments on behalf of the Consortium from the Owner. All the Members further agree and irrevocably accept that the Leader Member shall be authorized to accept payments from the Owner and upon making the payments to the Lead Member after due recoveries, if any, the owner shall have discharged himself in full from all its liabilities to the consortium.

OR

† submit invoices of the Individual Members of the Consortium duly certified, to enable the Owner to make payments to the Individual member after due recoveries, if any. All the Members further agree and irrevocably accept that upon making payments to the members of Consortium as above, the Owner shall have discharged himself in full from all his liabilities to the consortium.

viii. To do any other act or deed in relation to or incidental to submission of the Bid, execution and implementation of the Contract on behalf of the Consortium.

Communication to and from the Lead Partner shall be binding on all the members of the consortium.

4.0 Securities Towards Contract:

In the event of award of the contract by the owner to the consortium, the lead member shall submit the contract performance security amounting to 10% of the contract price and other members of the consortium shall submit on Demand Bank guarantee amounting to 1.5% of the contract price to the owner.

5.0 Division of Responsibilities towards the Contract:

In the event of award of the contract by the owner, the Division of responsibilities of among the parties shall be as under:³

M/s. _____ :

M/s. _____ :

M/s. _____ :

M/s. _____ :

Notwithstanding anything contained above, all the members of the consortium shall be jointly and severally responsible to the owner for the performance of the contract in full.

6.0 Assignment:

Neither party to this agreement is entitled to sell or sub-let or assign or otherwise transfer any of its rights and/or obligations from or in relation to this agreement to any third party, without the prior consent of the other party and further mandatory written consent from the owner

7.0 Liability:

The Parties shall be responsible for completion of their respective scope of work and for the costs and expenses incurred in connection with the execution of the said scope of work. The project schedule for the respective scope of work shall be in tune with the master project schedule. However, each party will co-operate /give its fullest support to other party, if either party make written request for the same.

Each Party shall bear the Pre-approved costs and expenses incurred by any of the party for the bid preparation and follow up on contract until the contract is awarded to the CONSORTIUM by MAHAGENCO.

38383860_____

³ The division of responsibility shall be such that entire scope of work as stipulated in bid specification is invariably covered. Any missing scope shall deemed to be included in the scope of the lead member of the consortium.

The parties shall be jointly & severally responsible for the execution of the contract. It is clarified that the Members of the Consortium shall remain jointly and severally liable to the Owner, irrespective of whether the entire payment is made to the leader of the Consortium, or whether payment is made directly to individual Members of the Consortium.

8.0 Project Organisation:

All parties should jointly formalize a project organization chart for the execution of the entire project specifying the personnel to be employed for the project with their respective roles & responsibilities and with the respective schedule.

9.0 Authorities of the Parties and their Representatives:

The contractual responsibilities of the parties to each other, on any particular project opportunity, shall be defined by separate written agreement applicable to each such project. By executing this agreement, the Parties shall be deemed independent entities, and neither party authorizes the other to act as its agent or representative, except to the extent set forth herein. Under no circumstances shall the employees of one party be deemed to be the employees of the other party.

Each party shall indemnify and hold harmless the other from and against any and all damages, costs or expenses (including attorney's fees) arising from any representation, action, or undertaking by the indemnifying party which exceeds or is outside of the scope of this agreement.

Each party has appointed / nominated the following individual as its principal representative and will advise the other party, in writing, of any limitations on the authority of the said principal representative. The representative of the parties shall be :

For M/s. (Name of the Company) : (Name of the representative)

For M/s. (Name of the Company) : (Name of the representative)

For M/s. (Name of the Company) : (Name of the representative)

For M/s. (Name of the Company) : (Name of the representative)

Each party may change its representatives so appointed/nominated above at any point of time however a written communication in this regard will be made to other parties and the owner within a period of thirty days from the date of such changes.

10.0 Duration of the Agreement:

This agreement shall cease to exist at an earlier of the following:

- i) The bid by the consortium is disqualified by the owner.
- ii) The owner awards the contract to some other entity.
- iii) The owner abandons the project.

- iv) Either Party is declared as insolvent or gets wound up by a Court of competent jurisdiction.
- v) Any change in the law which would render execution or implementation of **agreement illegal / impossible.**

11.0 Confidentiality:

- a) All the documents / drawings / technical data and any other information regarding this work shall be treated as top Confidential and should not be used for any other purpose not related to execution of work under this Pre-bid Agreement.
- b) Each party agrees to keep the information confidential shared with it in respect of the Project by the other Party, and not to divulge the same to any third party in subsequent discussions, negotiations, etc. or any other agency in the interest of securing the Project. The parties shall enter into a non-disclosure / confidentiality agreement to this effect separately.

12.0 Indemnities:

- a) Each Party shall indemnify and hold harmless the other party against any and all damages, costs, losses or claims incurred by or made against the other party arising from:
 - i) Any breach, non-observance or failure by the either Party or their servants, agents or subcontractors to carry out and perform its responsibilities;
 - ii) Any negligent act or omission of the either Party or their servants, agents or subcontractors committed during the performance of its obligations.
- b) The Parties shall indemnify and hold harmless the Owner against any financial liability towards any demand from statutory authorities towards deduction of Withholding Tax and/or Interest thereon and authorise the Owner to deduct such amounts from the bills payable and/or enforce the securities available with the Owner and pay the same to the respective Tax Authorities. The Parties shall also indemnify the Owner from any costs towards defense of suits/proceedings brought against the Owner in this regard.

13.0 Force Majeure:

No Party will be responsible for non-performance of any or all of their obligations under this Agreement if such non-performance is due to reasons beyond the reasonable control of the Parties. "Force Majeure" situations are also included in the expression "beyond the reasonable control of the Parties" including, but not, restricted to acts of god, declared or undeclared war, riots, civil wars, fires, floods, epidemics, strikes, freight embargoes, expropriation by Government authorities, rebellion, sabotage, abrupt change political / economical situations, depreciation of currency.

14.0 Amendments:

Any amendments to this Agreement shall be only in writing and such writings shall be signed by the authorized representatives of both the Parties.

15.0 Notices:

All notices and communications which are signed by the Authorized Signatories of either party shall be sent by registered post A.D to the following addresses of the Parties:

M/s. (Name of the Company)

(Address).

16.0 Dispute Resolution:

If any disputes, differences or controversies (collectively a dispute) arise between the Parties in respect of this agreement or the subject matter or interpretation hereof or in respect of any connected matters, then any party may deliver to the other party a notice of dispute in writing adequately identifying and providing details of the dispute (the "Notice of Dispute"). The authorized representative of the parties shall co-operate, in good faith, to attempt to amicably resolve the dispute. If any party believes that such representatives cannot resolve the dispute, such Party may invoke the further dispute resolution procedures of this clause No.15.

All disputes and differences, arising out of or in connection with this Agreement be attempted to be resolved mutually through negotiations between the Parties failing which the same shall be referred to arbitration. The provisions of Arbitration & Conciliation Act 1996 shall be applicable to such arbitration proceedings. The provisions of this clause No.15 shall survive the expiration of this Agreement.

17.0 Jurisdiction and Governing Law:

Incidental to arbitration as hereinabove mentioned, this Agreement shall be governed by the Indian laws and will be subject to the jurisdiction of the Courts in Mumbai, having jurisdiction to entertain the dispute.

18.0 Miscellaneous:

- A. Neither this Agreement nor any interest herein shall be assigned, in whole or in part, by either party hereto to any third party (is) without the prior written consent of the other party.
- B. Each party represents that it has corporate power and authority to under respective governing laws enter into and to perform the obligations set forth in this agreement.
- C. This 'Agreement' constitutes the entire understanding and agreement of the parties with respect to the subject matter hereon and supersedes all prior representations and agreements, oral or written. This Agreement may be modified only upon written instrument executed by the authorized representative of each party.
- D. This Agreement shall not constitute, create or in any way be interpreted to create a joint venture, partnership or formal business organization of any kind among above parties and is applicable and valid only for the sole purpose and the intent expressed as above. The members of the Consortium shall otherwise be free to carry on their independent business of commercial activities for their own respective benefits under their own respective names and styles. This Consortium Agreement is limited in its operation to the specified Project named ... (Name of the Project)

19.0 Notwithstanding anything contained hereinabove, all the provisions of this agreement shall be consistent with the provisions of the bid specification No. DG/BSL U-6/2011/T-1 and/or contract if any awarded by the owner to the consortium. In case of any provisions of this agreement are contradicting to the provisions of the bid specification and/or contract awarded by the owner to the consortium, the provisions of bid specification and/or contract shall prevail over those of agreement.

In witness thereof the parties hereto have set & subscribed their respective hands to this memorandum of Understanding at Mumbai on the day, month and year first herein written above:

Proforma for Break-up of Prices

(to be submitted in electronic form on line by uploading the *.pdf file)

BREAK UP OF PRICES OF MANDATORY SPARES

The Break up of prices of Mandatory Spare as indicated at 1.2 and 1.4 of Price Schedule is as under:

Sr. No.	Item Description	Unit of Measure	Quantity	Rate/Unit		
				INR	FC1	FC2
Indigenously Manufactured Spares						
Total						
Imported Spares to be directly despatched to the site						
				FOB		
				CFR		
				FOB		
				CFR		
Total				FOB		
				CFR		

Note: The description and quantity of mandatory spare shall be as stipulated in the Volume - II of the bid specification and shall be same as indicated in techno-commercial bid.

Following Proforma for Bank Guarantee against Phased Manufacturing Program is being included in the Bid Specification as Schedule-8D

Schedule - 8 (D)

Proforma for Bank Guarantee against Phased Manufacturing Program

(To be submitted on the Stamp Paper of requisite money value purchased in the name of the guarantor bank)

BANK GUARANTEE

In consideration of the Maharashtra State Power Generation Co. Ltd. (Mahagenco), a company incorporated in India, registered under the Companies Act, 1956 and having its registered office at 2nd Floor, Prakashgad, Plot No. G9, Prof. Anant Kanekar Marg, Bandra (East), Mumbai – 400 051, India (hereinafter referred to as “the Owner”), which expression shall, unless repugnant to the context or meaning thereof include its administrators, successors and assigns having awarded to M/s.....(Contractor’s Name)....with its Registered /Head Office at.....(hereinafter referred to as the ‘Contractor’ which expression shall unless repugnant to the context or meaning thereof, include its successors administrators, executors and assigns), a Contract by issue of Letter of Award No.....dated.....and the same having been unequivocally accepted by the contractor, resulting into a Contract bearing No.....dated.....valued at.....for and the Contractor having agreed to provide a Performance Guarantee for the faithful Completion of Phased Manufacturing Program for an amount equivalent to 5% (five percent) of the contract price in. to the Owner.

We.....(Name & Address of the Bank).....having its Head Office at.....(hereinafter referred to as the ‘Bank, which expression shall, unless repugnant to the context or meaning thereof, include its successors, administrators, executors and assigns) do hereby guarantee and undertake to pay the Owner, on demand any and all monies payable by the Contractor to the extent of Rs.....(equivalent to 5% of the total contract price) as aforesaid at any time during the validity of this Bank Guarantee without any demur, reservation, contest, recourse of protest and/or without any reference to the Contractor. Any such demand made by the Owner on the Bank shall be conclusive and binding notwithstanding any difference between the Owner and the Contractor or any dispute pending before any Court, Tribunal, Arbitrator or any other authority. The Bank undertakes not to revoke this Guarantee during its

currency without previous consent of the Owner and further agrees that the Guarantee herein contained shall be enforceable till six months after expiry of its validity.

The Owner shall have the fullest liberty, without affecting in any way the liability of the Bank under this Guarantee, from time to time to extend the time for performance of the Contract by the Contractor. The Owner shall have the fullest liberty, without affecting this Guarantee, to postpone from time to time the exercise of any powers vested in them or of any right which they might have against the Contractor, and to exercise the same at any time in any manner, and either to enforce or to forbear to enforce any covenants, contained or implied, in the Contract between the Owner and the Contractor or any other course or remedy or security available to the Owner. The Bank shall not be released of its obligations under these presents by any exercise by the Owner of its liberty with reference to the matters aforesaid or any of them or by reason of any other act or forbearance or other acts of omission or commission on the part of the Owner or any other indulgence shown by the Owner or by any other matter or thing whatsoever which under law would, but for this provision, have the effect of relieving the Bank. The Bank also agrees that the Owner at its option shall be entitled to enforce this Guarantee against the Bank as a principal debtor, in the first instance without proceeding against the Contractor and notwithstanding any security or other guarantee that the Owner may have in relation to the Contractor's liabilities.

We shall extend the validity of this Bank Guarantee for the further period of six months, one month prior to its present validity period at the request of the Owner. We further agree that non-extension of the guarantee as above shall be sufficient ground for encashment of the same by the Owner.

Notwithstanding anything contained above:

- i) Guarantor's liabilities under this guarantee shall not exceed ⁶_____.
- ii) This Bank Guarantee valid up to ⁷_____.
- iii) The guarantor is liable to pay the guaranteed amount or any part thereof under this bank guarantee only and only if the owner serve upon us a written claim or demand on or before _____ .

Following Proforma for Bank Guarantee against Advance payment is being included in the Bid Specification as Schedule-(8E)

Schedule-8(E)

PROFORMA OF BANK GUARANTEE FOR ADVANCE

(to be submitted on the Stamp Paper of requisite money value purchased in the name of the guarantor bank)

Bank Guarantee No..... & date
(For Rs)

Issue date:

Expiry date:

Claim period:

Name & Address of the Bank

To,

Maharashtra State Power Generation Co. Ltd.,
'Prakashgad', 3rd floor,
Bandra (East),
MUMBAI-400 051

Dear Sirs,

In consideration of Maharashtra State Power Generation Co. Ltd., Mumbai (hereinafter referred to as the Owner, which expression shall unless repugnant to the context or meaning thereof, include all successors, administrators and assigns) having awarded to M/s..... with its Registered/Head Office at (hereinafter referred to as 'Contractor' which expression shall unless repugnant to the context or meaning thereof, include its successors, administrators, executors, and assigns) a contract by issue of Owner's Letter of Award No. dtd. with the contract price of Rs. for(scope of work) (hereinafter called the 'Contract') and the Owner having agreed to make an advance payment to the Contractor for performance of the above contract amounting to Rs. (Rs. only) as an advance against Bank Guarantee to be furnished by the Contractor.

We (Name of the Bank).....having its Office at(address of the Bank)..... (hereinafter referred to as the 'Bank' which expression shall unless repugnant to the context or meaning thereof, include its successors, administrators, executors and assigns) do hereby guarantee and undertake to pay to the Owner immediately on demand, any or all amounts payable by the Contractor to the extent of Rs. (Rupees) at any time up to without any demur, reservation, recourse, contest or protest and/or without any reference to the Contractor. Any such demand made by the Owner on the Bank shall be conclusive and binding notwithstanding any difference between the Owner and the Contractor or any dispute pending before any Court, Tribunal, Arbitrators or any other authority. We agree that the Guarantee herein contained shall be irrevocable and shall continue to be enforceable till the Owner discharges this Guarantee.

The Owner shall have the fullest liberty without affecting in any way the liability of the Bank under this Guarantee from time to time to vary the advance or to extend the time for performance of the contract by the Contractor. The Owner shall have the fullest liberty without affecting this Guarantee, to postpone from time to time the exercise of any powers vested in them or of any right which they might have against the Contractor, and to exercise the same at any time in any manner and either to enforce or to forebear to enforce any covenants contained or implied in the Contract between the Owner and the Contractor or any other course or remedy or security available to the Owner. The Bank shall not be released of its obligations under this presents by any exercise by the Owner of its liberty with reference to matters aforesaid or any of them or by reason of any other act or forbearance or other acts of omission or commission on the part of the Owner or any other indulgence shown by the Owner or by any other matter or thing whatsoever which under law would, but for this provision, have the effect of relieving the Bank.

The Bank also agrees that the Owner at its option shall be entitled to enforce this Guarantee against the Bank as a Principal debtor, in the first instance without proceeding against the Contractor and notwithstanding any security or other Guarantee that the Owner may have in relation to the Contractor's liabilities

We shall extend the validity of this Bank Guarantee for the further period of six months, one month prior to its present validity period at the request of the Owner. We further agree that non-extension of the guarantee as above shall be sufficient ground for encashment of the same by the Owner.

Notwithstanding anything contained above –

- i) Our liabilities under this guarantee shall not exceed Rs. ----- .
- ii) This Bank Guarantee valid up to ----- .
- iii) We are liable to pay the guaranteed amount or any part thereof under this bank guarantee only and only if you (MahaGenco) serve upon us a written claim or demand on or before ----- .

In witness whereof We _____ Bank Limited have executed this on this the _____ day of -----.

ANNEXURE - I

Transformer Protector Based on Dynamic Pressure rise (Explosion Preventor) Protection System

Supply, Installation, Testing and commissioning of Explosion and Fire Prevention System for Transformer including Main Tank, On Load Tap Changer, Oil Cable Boxes and Oil Bushing Cable Boxes.

The transformer shall be equipped with, Explosion and Fire Prevention System for Transformer including Main tank, On Load Tap Changer, Oil Cable Boxes and Oil Bushing Cable Boxes. The system shall be complete in all aspects to perform the required functions and shall include not only of the transformer main tank explosion prevention and fire protection but also of the On-load tap changers, Oil bushing Cable boxes and Oil cable boxes, as applicable for transformers, using the principle of a Fast Depressurization System as mentioned in the NFPA Codes 850 & 851, Edition 2010. The system shall include a Nitrogen injection to evacuate the explosive gases in a remote area, after an incident occurs. The depressurization process shall operate mechanically, without need of any actuator.

For Power transformers having the Oil filtration or filter units for the OLTC or cable Box, the same should be completely isolated from the OLTC/OCB during insert gas injection. The system shall ensure a complete protection for the transformer main tank, On load tap changer, Oil bushing cable boxes, Oil cable Boxes, as applicable for transformers, from any explosion in case of occurrence of internal short-circuits.

The principle of operation shall be such that in the event of high intensity fault resulting to excessive energy or dielectric oil over pressure, the system shall initiate the depressurization process within milliseconds after the fault occurrence. The depressurization shall be performed thanks to the first dynamic pressure peak of the shock wave, activating the depressurization set. After depressurization, nitrogen flow shall forbid the self -inflammable gases contact with the air (oxygen). However, nitrogen injection process shall operate only with the presence of the following signals.

- The activation of any of the integrated rupture disk explosion detector confirming the over pressure state and the beginning of the depressurization process and;

- The activation of any of the electrical protection signal, confirming the electrical fault of the protected transformer.

The system operation shall be properly coordinated with the required input to avoid mal-operation and malfunction of the total system. Activation of only one signal among the conditions stated in above paragraph shall prevent the operation of nitrogen injection process and shall only generate remote annunciation/signal at the control room. Only at the presence of both signals shall the electrical actuator triggers the nitrogen injection process.

The nitrogen injection function shall:

- Start after a period of time but before the maintenance team open the transformer;
- Immediately stop the explosive and flammable gas production (hydrogen, methane, acetylene etc.);
- Evacuate the explosive hydrogen stocked in the tank upper parts;
- Replace the generated explosive and inflammable gases by a nitrogen atmosphere inside the vessel;
- Avoid air oil contact by slightly pressurizing the transformer with the nitrogen gas;
- Limit the damage caused by temperature gradient in the metal parts;
- Completely cool down the transformer by injecting nitrogen at the required time (normally 45 minutes) to bring the short circuit parts temperature down below the oil flash point.

The design of the nitrogen injection process shall also include manual activation of the nitrogen in the event that the DC power supply source for the transformer protector system fails.

All alarm signals associated with the transformer protector system i.e. AC, DC power supply failure, nitrogen cylinder low pressure alarm, system actuation audible alarm, etc. shall be sent to the control room at the control board annunciator system.

The depressurization system of the offered system shall be activated by the first dynamic pressure peak of the shock wave, avoiding transformer

explosion before static pressure increases and should not be dependent on the activating signals from the Transformer accessories for prevention.

The design of the Transformer, On Load Tap Changer, Oil Cable Boxes and Oil Bushing Cable Boxes system shall be such that in maintaining the power transformer, the system can be isolated without affecting any of its components. All accessories necessary for this purpose shall be included in the scope of supply for the Transformer, On Load tap Changer, Oil Cable Boxes and Oil Bushing Cable Boxes System.

If required in the Technical Data Sheet of the transformer, the explosion and fire prevention shall be backed with Nitrogen Fire Extinguishing system. The principle shall consist of injecting nitrogen at the transformer base to extinguish fire.

Just like Explosion and Fire Prevention System, injection of nitrogen can be activated only in the presence of the following signals:

- The activation of any Linear Heat Detector (LHD) confirming the occurrence of fire and
- The activation of any of the electrical protection signal, confirming the electrical fault of the protected transformer.

The system operation of the backup system shall be properly coordinated with the required input to avoid mal-operation and mal-function of the backup system. Activation of only one signal among the two mentioned below:

- The activation of the LHD confirming the occurrence of fire; and
- The activation of any of the electrical protection signal, confirming the electrical fault of the protected transformer.

shall prevent the operation of nitrogen injection process and shall only generate remote annunciation/signal at the control room. Only at the presence of both signals shall the electrical actuator trigger the nitrogen injection process.

LHD for the backup system shall be located at the appropriate location in the tank, OLTC, Oil cables Boxes and Oil Bushing Cable Boxes, as applicable.

The design of the whole system shall be submitted to the Owner for review and approval before any manufacturing has to be done for the Transformer Explosion Prevention and Fire Prevention System.

The whole system shall be installed and tested by the Transformer Manufacturer or Contractor under the supervision of Equipment manufacturer and shall be commissioned by the Equipment manufacturer.

Contractor or Transformer manufacturer should ensure that the necessary provisions to adapt this system are considered in the Transformer design.

Also, pipes, valves, cables, Oil gas separation tank and other accessories which is deemed necessary for completion of the installation of system are in the scope of Transformer manufacturer or Contractor.

The OEM of the offered equipment should have design and field experience of the similar system at least for the period of 5 years. Activation / experience certificate issued by the users evidencing this should be submitted in their bid.

This is considered to be critical equipment which needs to respond at appropriate time and well design for each transformer. Further, failure of this system at the time of need reflect in huge loss to the user. Contractor shall be exclusively responsible for any mishap in this regard and shall replenish the equipment without any additional cost to Mahagenco. Confirmation on this should be submitted by the bidder from the OEM at the time of submission of this tender.

An official test certificate from recognized and independent high voltage laboratory shall be provided by the supplier. Transformer, On load Tap Changer, Oil cable Boxes and Oil Bushing cable Boxes Explosion and Fire Prevention System be designed as per recommendation given in the National Fire Protection Association for Fast Depressurization system.

ANNEXURE - II

13.0 SPECIAL REQUIREMENTS OF INSTRUMENTATION BASED ON ENERGY AUDIT PROGRAMME

13.1 INTRODUCTION

Measurement of important parameters which affect the input costs like coal, oil, water need to be measured and not estimated. Both receipt and consumption need to be separately monitored and reconciled through computerized system. There must not be human intervention in the measurement and recording systems of coal, fuel oil and water resources which affect the station input costs. Supply chain optimization of raw material inputs through modernization of technology needs to be taken up. Transit loss, specific fuel consumption and GCV are interlined and realistic quantification of these will only be possible if a fuel monitoring system is in place.

The system should aim at procurement of digital instrumentation which can be seamlessly integrated into a DDCMIS. Intelligent Electronic Devices (IEDs) must be the preferred Instrumentation Systems. Information and communication system needs to be got audited for obtaining a holistic picture of its structure and efficiency.

13.2 COAL

13.2.1 Unit Coal Measurement (Coal Consumption Measurement)

- (a) The coal entry into the boilers shall be measured. The various technologies for coal measurement are given elsewhere in this section.
- (b) An online process (without any human intervention) which would give the online coal consumption with uncertainties of $\pm 1.0\%$ shall be envisaged and the technology for the same must be well proven and established. The conventional stacking method can be used for reconciliation of data/cross verification only and not for coal consumption measurement.
- (c) The stacking inventory procedure shall not be used for measurement of coal for declaring the station heat rate. Instead the use of fully automated, tamper-proof modern instrumentation without human intervention for on-line coal inflow and consumption shall be envisaged.

- (d) The difference in belt weighers/gravimetric feeders and receiving end coal measurements must not exceed more than 0.06 kg/kWh (0.03 kg/kWh for increase in moisture from tripling to bunkering, stones weights and 0.03 kg/kWh for handling loss).
- (e) Based on an assessment of the different technologies the following are recommended:
 - (i) Installation of Belt Weighers for all coal conveyors. The offered system shall monitor the time elapsed by a belt over a given bunker and which involves integration of the output of the Belt Weighers over the total bunkers of the unit in a given period of time. The bidder must come out with a viable and innovative scheme for monitoring the bunker wise coal from the belt weigher data.
 - (ii) Microwave or Ultrasonic Bunker Level Monitoring System with digital data output, communication of data to system server or control room is required.
 - (iii) Coal flow for the plant shall be monitored by gravimetric feeders which provide accurate and authentic coal flow measurements, in addition to belt weighers. The differences in the two are to be within 0.5%. The data from the belt weighers and the gravimetric feeder can be cross verified, calibrated and reconciled. Necessary signal exchange shall be considered by the bidder.
 - (iv) Necessary software shall be included in the offer for online coal energy management in the plant. The software shall take input data from the various field instruments for coal receipt from various sources and coal consumption at various bunkers.
 - (v) Computation of unit coal consumption. This is purely from the reading of the belt weigher and bunker monitoring system. This coal consumption is to be used for computation of unit and station heat rate for normal and cycling operations.

In all the above instruments, the following must be considered:

- (i) The instruments must function as Intelligent Electronic Devices (IEDs) by digitally communicating with DDCMIS/ control room through down loading of data continuously.

(ii) The instruments must have provisions for communication of digital data.

(iii) The instruments and the digital conversion systems must have a very high reliability in terms of SAIFI (System Average Interruption Duration Index) of 0.5 interruptions per year and SAIDI (System Average Interruption Frequency Index) of 4 hours per year.

By this process the coal consumption will depend on the unit performance and not vice-versa.

13.3 FUEL OIL (Receipt and Consumption Monitoring)

13.3.1 Oil Receipt Measurement

The following are to be considered:

- (a) Fully automatic ultrasonic level indicators with provision for conversion of signals into digital signals and communication through a media to DDCMIS shall be installed for all oil tanks. The digital signals must be downloadable into a data base on a continuous basis.
- (b) A fuel oil monitoring software package is to be in place for on line calculation and logging of the oil receipts, etc.

13.3.2 Oil Consumption Measurement

The following are to be considered:

- (a) Differential pressure orifice plate or nozzle type or mass based oil flow meters with provision for continuous digital data transfer shall be installed.
- (b) The oil gun on-off operation data must be recorded through a time based system automatically to give a time trace of when the guns are on and when the guns are not in service. This will be useful for performance optimization group to study the operator to operator variations, coal to coal variations, variation in different seasons, etc.

13.3.3 Integrated Fuel Oil Receipt and Consumption Monitoring

A Fuel Oil Monitoring software Package shall be provided. When ultrasonic level measurement for tanks is used, the software package shall calculate the oil receipts.

13.3.4 DM Water and Associated Water Systems

On-line monitoring of DM water flow and unit make up with integrators shall be envisaged to control the energy efficiency as the make-up is directly proportional to the steam lost from the system and affects the unit heat consumption and heat rate. Hence, it is envisaged to go in for fully automatic on line measurement of water consumption for both production and consumption measurement of raw water, DM water, soft water and drinking water.

The following are to be considered for DM (De-mineralized) and associated water systems:

- (a) Both DM water production and DM water consumption must be separately measured and audited.
- (b) Installation of differential pressure orifice plate or nozzle type flow meters with digital output, communication media to relay the data to the DM control room computer and provision for downloading the data into a data base for on line monitoring of make-up especially during cycling operations. On line monitoring would help in control of unit heat rate as well as give an accurate account of the chemicals consumed for DM water production.
- (c) Water Monitoring Software Package shall be provided. The package must have capability to draw inputs from the various field instruments and make an on-line continuous data base grid of the information for generation various types of information such as consumption per shift, consumption during cycling operations, operator-wise consumption, etc. to enable the performance optimization group to take control action on the areas of wastage and

excessive consumption. Consumption and production shall be separately monitored.

13.4 METHODS OF MEASUREMENT OF COAL USED IN THE BOILERS

- (a) Belts weightment at the entrance of the raw coal bunkers.
- (b) Bunker level calibration and flow measurement based on bunker level.

- (c) Volumetric measurement based on raw coal feeder speed.
- (d) Volumetric measurement based on pulverized coal feeder speed.
- (e) Gravimetric measurement at outlet of raw coal feeder.
- (f) Pressure drop across pulverized coal pipe leading to the burner through fixed geometry devices.
- (g) (Variable orifice dampers.
- (h) Dirty pitot tube measurement in the coal pipe leading to the burner.
- (i) Passive Electrostatic Sensors
- (j) Screw-in Microware Sensor.
- (k) Passive Acoustic Sensors
- (l) Laser through beam or retro reflex sensors
- (m) Calibration of mills as a function of their power input.

13.5 SPECIFICATIONS OF BELT WEIGHER

13.5.1 Particulars Of Belt Weighers

- (n) Micro Processor based electronic belt weighers with communication facility to continuously transmit the data to a control room as well as local reading.
 - (i) Type : Electronic, Multi-idler type
 - (ii) Location : Refer mechanical specification of Coal Handling Plant
 - (iii) Belt Speed : Refer mechanical specification of Coal Handling Plant
- (o) Coal Properties and Capacity
 - (i) Bulk density : Refer mechanical specification of Coal Handling Plant
 - (ii) Capacity : Refer mechanical specification of Coal Handling Plant

(p) Duty Conditions

(i) Moisture : Refer mechanical specification of Coal Handling Plant

(ii) Dust : Refer mechanical specification of Coal Handling Plant

(iii) Rain and high RH : Refer mechanical specification of Coal Handling Plant

(q) Accuracy : $\pm 0.25\%$ or better of actual flow rate (dynamic). Weigh idler deflection less than 0.025 mm at full load.

(r) Reliability Index : SAIDI (System Average Interruption During Index) : 48 hours/year or better
SAIFI (System average interruption frequency index): 2 times/year or better.

(s) Overload Capacity : Up to 25% with 100% overload protection

(t) Capacity range of accuracy : 0 to 100%

(u) Electronic Components : Electronic digitiliser / monitors, cable, totalizer, sub- totalizer, tacho generator, printer, transmission of the impulse of flow rate as well as total quantity conveyed to control room through communication media. Fully digital with microprocessor and battery back-up memory.

(v) Mode of weightment primary sensors : Super precision stainless steel strain gauge load cell applied in tension for highly accurate load measurement.

Hermetically enclosed measuring device, compact designed, suitable for all customary belt widths.

- Speed measurement: Brushless digital tachometer provides accurate measurement of speed.
- (w) Outputs : Electronic signals to control room and to local instrument display.
- Status Annunciator for set points.
- (x) Printout weigh, total and error reports : Provision for zero setting on empty belt and further calibration. Special electronic calibration facility for frequent calibration checks without handling standard weights.
- (y) Special trunion bushes to absorb normal shocks and transverse forces.
- (z) Fully automatic tare and span calibration.
- (aa) Self-checking diagnostics for fault indications.

ANNEXURE - III

In addition to above, following points shall also be considered while designing the underground L.D. Pipe Lines.

- (a) The design ground table at 1.0m below finished ground level shall be considered for design of pipes.
- (b) The suitability of local soils for structural backfill around pipes shall be established by conducting laboratory / field tests and suitable modulus of soil reactions of corresponding backfill soil for submerged condition shall be considered while designing the pipes.
- (c) Backfilling of pipes shall be done with non-expensive soils only. If the natural soils are having medium to high expensive characteristics, the same shall be replaced by suitable non-expensive soil for backfilling around pipes.
- (d) If soils having medium to high plasticity i.e. having liquid limit more than 50% is to be used for backfilling around pipes; in such cases the modulus of soil reaction shall be considered as 'O' while designing the pipe i.e. no strength of such soils shall be considered for design of underground pipes.
- (e) To ensure quality control for backfilling work of pipeline at site, Field Quality Plans for quality of filling soil & bedding materials, construction activities like laying of bedding layer / backfilling layers, optimum moisture content of back soil, type of compaction equipment, method of compaction, relative degree of compaction etc. including laboratory & field tests to be conducted prepared during execution of work shall be prepared & got approved from Owner / Consultant and work shall be carried out strictly in accordance with approved Field Quality Plans.
- (f) The micro grading of nearby area of pipe corridor shall be carried out such that no storm water will flow towards pipe corridor area and accordingly storm water drainage arrangement of areas around pipe corridor shall be provided.
- (g) Adequate numbers of thrust blocks, anchors, etc. shall be provided as per requirement to prevent displacement, uplift movement of underground pipes.

- (h) Transient analysis of CW / ACW pipelines shall be carried out from recognized institute and locations of air release valves, etc. shall be decided accordingly and the details shall be submitted to Owner / Consultant for review / information.
- (i) The procedure for hydro testing of pipes shall be prepared and got approved from Owner / Consultant and hydro testing of pipes shall be carried out in accordance with approved procedures.

ANNEXURE - IV

Design Specification for Dimensions of Natural Draft Cooling Tower

(This paragraph shall be considered before last paragraph of Clause No. 4.7.20.2 – Size and shape, Page no. 108, Section -1, Volume-VI A)

The following method shall be used to evaluate the minimum height required for Natural Draft Cooling Tower (NDCT).

- 1.0 Design shall be in confirmation with BS: 4485. Air properties published by BS would be used for evaluation.
- 2.0 Performance number KaV/L
 - (a) Demand / Required KaV/L shall be calculated using Tchebycheff's integration method described in CTI: ATC-105/ BS: 4485.
 - (b) Supply KaV/L
 - (i) Fill KaV/L shall be calculated using Fill Manufacturer's curve for given L/G. Designer shall submit Fill characteristic curve along with sizing calculations.*
 - (ii) Fill KaV/L shall constitute at least 90% of total KaV/L of tower.
 - (c) Supply KaV/L shall be more than 'Or' equal to design KaV/L.

3.0 Draught Loss Calculations

Losses in air path will be calculated using the formulae:

$$H = \sum_{1}^n h_x = \sum_{1}^n k_x \rho \times \frac{V_x^2}{2} \dots \dots \frac{N}{m^2}$$

Where H=Total Draught. Loss .in. mmwc

..... .h=Draught. Loss. in. particular. zone. in. mmwc

.....K=Empherical. Coefficient. in. that. zone.

.....K1 =5.0.... for.. air. inlet. (including. rain. below. fill)

.....K2. for.. fill=As. per. Manufacturer. data*

.....K3 = 1.5....for. Water. Spray. above. Fill

.....K4.. for. Drift. Eliminator....=As. per. Manufacturer. Data

.....K5 = 1.0....for.. Stack. Top

.....ρ = Air.Density.in.that.zone.in.kg/cu.m

.....V = Air. Velocity.in. m/sec

4.0 Minimum required tower height shall be calculated using BS: 4485 formulae.

* -- If published curves are available in literature, conservative among them would be considered for evaluation.

ANNEXURE - V

The Specifications for Painting of Steel Structures Pertaining to Civil Works

Structural Steel which is encased in concrete or galvanized shall not be painted. All other steel members of buildings & structures shall be provided with suitable painting as Protective coating against corrosion considering the exposure to the atmosphere pollution conditions.

For sheltered steel structures, where sides of the structures are not fully covered such as deaerator floor, bunker building, etc. both exterior & interior steel structures shall be considered as exposed to non-polluted inland atmosphere condition.

For other steel structures exterior structures shall be considered as exposed to non-polluted inland atmosphere condition and interior structures shall be considered as normally dry condition.

- (a) The painting scheme for steel structures exposed to non-polluted inland atmosphere condition shall be provided in line with Clause No. 2.28(aa), Section-4, Vol.-VI-A as below:
 - i. Minimum total 75 micron DFT of Inorganic zinc primer composed of 85% zinc (by volume) shall be applied in two coats over blast cleaned surfaces of the structure. One coat of primer minimum 35 micron DFT shall be applied as shop primer paint and second coat of primer shall be applied after erection and final alignment of the erected structures.
 - ii. Minimum total 125 microns DFT of polyamide epoxy paint composed of 77% solids (by volume) shall be applied in three coats as intermediate and finishing coat.
 - iii. Minimum 50 micron DFT of Aliphatic polyurethane composed of 56% solids (by volume) shall be applied as top finishing coat.
- (b) The painting scheme for steel structures exposed to normally dry condition shall be provided in line with Clause No. 2.28(aa) , Section-4, Vol.VI-A as below:

CORRIGENDUM - XV

- (i) Minimum total 75 micron DFT of Inorganic zinc primer composed of 85% zinc (by volume) shall be applied over blast cleaned surfaces of the structure. One coat of primer of minimum 35 micron DFT shall be applied as shop primer paint and second coat of primer shall be applied after erection & final alignment of the erected structures.
- (ii) Minimum total 150 micron DFT of polyamide epoxy paint composed of 77% solids (by volume) shall be applied in three coats as finishing coat over primer coat.
- (c) The painting scheme for all internal steel doors, ventilators, louvers, rolling shutters, etc. shall be provided in line with clause No. 1.7 of Section - 3 of Vol.-VI-A as below:
 - (i) Shop primer paint shall be single coat of red oxide / zinc chromate primer conforming to IS-2074 shall be applied after surface preparation in accordance with IS-1477 (Part-I& II). Second coat of primer shall be applied after erection and final alignment of the structure.
 - (ii) Two coats of synthetic enamel paint conforming to IS: 2932 of approved shade and quality shall be applied after erection on primer coat.
 - (iii) Total dry film thickness of finished paint shall not be less than 110 microns.
- (d) The painting specifications for steel structures pertaining to chimney, cooling tower, structures exposed to chemical fumes, etc., shall be as per painting specifications given under relevant Sections of Vol.-VI-A.
- (e) The painting specifications of E&M equipment, structural steel of Boiler & ESP shall be as per corresponding E&M bid specifications.
