APPLICATION OF EQUIPMENT

Dry Air Blowing equipment shall be used for removing the moist air from turbine and replacing it with dry air during Erection and shutdown of turbine to prevent corrosion.

GENERAL

The dehumidifier consists of a slow rotating disc containing a highly hygroscopic substance. Filtered process air (through a colloidal filter) from the machine hall is drawn into the dehumidifier by a fan. The air then passes through the adsorption section of the rotating disc. The dried air is led into the Turbine casing.

In the regeneration section of the rotating disc, the adsorption substance which has accumulated the moisture is dried by a reverse flow of hot regeneration air also drawn from the Machine hall. The moist air is led out to the atmosphere.

As the disc rotates, there is continuous moisture removal by the adsorbent and its simultaneous regeneration takes place. After regeneration, the adsorbent is again capable of absorbing moisture. Both the cycles, adsorption of moisture and regeneration of drier wheel material takes place with separate air flows constantly so that continues drying of air takes place.

The dehumidifier is equipped with in-built filters at process air and reactivation air inlets, fans for air suction, heaters in reactivation zone with thermostat for temperature control and motors. The complete dehumidifier unit is housed in a steel cabinet. All internal electrical connections should be completely wired and only the power source need to be connected to the equipment.
