1) Two (2)x100% Evaporator Blowdown Pump shall be installed; one operating and one spare in case of 1x100% Evaporative concentration system. One (1) x 100% Evaporator Blowdown Pump shall be installed per FFE train with a store stand-by Evaporator Blowdown Pump in case of 2x50% Evaporative concentration system. Blowdown pump shall be provided to transfer brine blowdown

2) Casing and impeller shall be fabricated of A890 Gr 5A

**L). Hydrocyclone Pump:**

1) One (1) per evaporator train.

2) The pump casing and impeller shall be ASTM A890 Gr. 5A or equal.

3) Evaporator train shall have a centrifugal hydrocyclone feed pump.

**M). Hydrocyclone:**

1) One (1) per evaporator train.

2) Materials shall be 6% Mo SST/Ceramic/Equivalent.

3) Evaporator shall have a hydrocyclone for automatic control of dissolved and suspended solids in the evaporator sump.

**3.02.06** Crystallizer, Crystallizer Feed Tank, Crystallizer Brine Tank & Crystallizer heat exchanger equipment:

1) Crystallizer Feed Tank and Pump-

One (1) Crystallizer Feed Tank, shall be provided for storage of evaporator effluent brine. The tank will be utilized for interim storage of brine both during normal operation and for short periods when maintenance is being performed on the crystallizer/centrifuge system. Materials of construction shall be Super Duplex 2507. The tank shall be furnished complete with Alloy C-276 agitator, level and temperature controls, and other required accessories. Feed pump shall be ASTM A 890 Gr. 5A.

2) Crystallizer Heater

One (1) forced circulation (1x120%), horizontally mounted, TEMA "C" design heat exchanger shall be furnished. Tubes to be made of Ti Gr 16, Tube sheets: Ti Gr 16, cladding on 316 SS, Shell to be made of 2205 Or 316 LSS. Head to be made of C 276.

3) Crystallizer Vapor Body

One (1) body of Alloy C 276 construction or higher grade, including de-entraining device. A cone bottom to be included. All other necessary accessories, controls, etc. shall be included. Crystallizer main circulating piping Inconel 625 or better.

4) Crystallizer Recirculation Pump

One (1), 100% duty pump constructed of ASTM A890 Gr. 5A or better shall be furnished for circulating slurry through the process. Pump type may be centrifugal or axial flow. Pump shall be furnished complete with double mechanical seals and a discharge pressure gauge.

5) Surface Condenser

One (1) surface condenser to condense crystallizer distillate shall be provided. Material of construction shall be 316L SS.

6) Anti-Foam Feed Tank and Pump

Complete feed system for injection of anti-foam to appropriate points in the process shall be included. The feed system shall include feed tank, agitator, and positive displacement metering pumps. Tank shall include a low-level alarm.

7) Caustic Feed Tank and Pump

Complete feed system for injection of caustic to appropriate points in the process shall be included. The feed system shall include feed tank, agitator, and two positive displacement metering pumps. Tank shall include low level alarm.

8) Crystallizer Distillate Tank

One (1) distillate tank shall be included, to provide positive suction head to the distillate pump. The tank shall collect both crystallizer distillate and return condensate from the crystallizer heater. Tank shall be of 316L stainless steel construction or other compatible material.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

9) Crystallizer Distillate Pump

One (1) 100% duty, centrifugal pumps shall be furnished to transfer distillate from the distillate tank to be combined with the Evaporator distillate. Should the crystallizer distillate be contaminated, it shall be discharged back to the Wastewater Storage Tank. The distillate pump casing and impeller shall be 316L SST or better.

10) Recirculation piping and Vapor duct

Recirculation Piping shall be provided in C 276 material, Vapor duct to be made of 2205.

11) Mechanical Vapour Compressor

One (1), 100% duty, centrifugal compressor shall be provided. Compressor shall have 2507 casing, 2507 impeller . Inlet guide vanes or an outlet damper valve shall be provided for flow control. Oil cooler, filter and vibration monitoring shall be included as required.

12) Dewatring System: Solids generated in the crystallizer process are dewatered in the dewatering system. Centrifuge or Belt Filter Press can be offered for dewatering salts. Material of construction for wetted part should be Hastelloy C or equal. Filter cloth can be vendor's standard material based on application.

13) Centrate Tank and Centrate Pump

Centrate generated from dewatering system is collected in the Centrate tank. Brine is recycled back to crystallizer process. A small amount of purge can be separated from centrate pump discharge of necessary. Material of constriction for brine wetted material shall be Hastelloy C or equal.

**3.02.07 General**

a) All equipment and material furnished by the contractor shall have an acceptable history of satisfactory reliable operation and the Contractor shall offer only proven design in successful operation in similar application at previous installations.

b) Type of equipment and material of construction for various applications in the plant shall be selected by the Contractor as per its proven practice unless specified elsewhere.

c) Contractor shall take full responsibility that all materials and components of valves, pumps, piping and other equipment and appurtenances shall be compatible with the respective fluids herein.

d) All fasteners such as nuts, bolts etc. shall be of stainless steel.

e) Equipment shall be fabricated, assembled, installed and placed in proper operating condition in full conformity with detail drawings, specifications, engineering data, instructions and recommendations of the equipment manufacturer as approved by the Employer.

f) All pressure vessels shall be tested and code-stamped conforming to ASME Section VIII, Boiler and Pressure Vessel Code. ASME Section IX certified welders shall perform welding of fabricated equipment per ASME procedures.

g) The design of equipment, arrangement of components, and routing of piping shall consider operational and maintenance accessibility of components. Equipment, piping, valves, and instruments shall be arranged so that when installed, components requiring manipulation, observation, or maintenance will be readily accessible and safe to operating and maintenance personnel.

h) The owner shall:

   i). Have full access to the equipment during manufacturing.

   ii). Be notified when manufacturing schedule is arranged, and be kept informed during manufacture of any major problems or rework that may affect delivery of the equipment as scheduled.

   iii). Be notified, should any work, fabrication, or material be supplied by a subcontractor or outside bidder, prior to release to the bidder. Engineer reserves the right of approval of any subcontractor and also the right to inspect work, fabrication or material being subcontracted at the subcontractor's location.

   iv). Each Bidder furnished equipment skid shall be assembled and shop tested as completely as possible (both mechanically and electrically) including stroking of valves. All rotating parts and shaft couplings shall be statically and dynamically balanced in the shop.

   v). Each pressure vessel shall be subjected to testing specified within ASME. Skid piping and other piping assemblies shall also be hydrostatically shop tested per ASME B31.1.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

vi). The Bidder shall notify the owner fifteen (15) working days prior to performing the following for potential owner witness or inspection:

a) Hydrostatic testing.

b) Functional testing.

vii). Coatings & Galvanizing:

a) Unless otherwise required, the Bidder's standard finish coating systems shall be applied in the shop to ferrous metal surfaces of equipment and materials. The coating system shall provide resistance to corrosion caused by weather and industrial environments. Surfaces to be primed only shall use a zinc rich primer. Surfaces shall be cleaned, prepared and coated in accordance with the coating manufacturer's instructions. Each shop fabricated vessel and tank shall be complete.

b) Stainless steel and FRP surfaces shall not be painted.

c) All exterior coating shall be epoxy black powder, no galvanized outdoors.

d) Bidder shall fully describe the proposed coating system for all Bidder supplied equipment. Equivalent coating systems by other manufacturers must be submitted for approval to the Engineer/Owner prior to fabrication of the equipment.

# SUB-SECTION-I-M8

# PIPING

## LOW PRESSURE PIPING

1.00.00 **EQUIPMENT SIZING CRITERIA**

1.01.00 All the piping systems and equipment supplied under this package shall be designed to operate without replacement and with normal maintenance for a plant service life of 30 years, and shall withstand the operating parameter fluctuations and cycling which can be normally expected during this period.

1.02.00 For all Low Pressure piping systems covered under this specification, sizing and system design shall be to the requirements of relevant codes and standard indicated. In addition to this, requirements of any statutory code as applicable shall also be taken into consideration.

1.03.00 Inside diameters of piping shall be calculated for the flow requirements of various systems. The velocities for calculating the inside diameters shall be limited to the following:

a) **Water Application**

| | Pipe Size | Water Velocity in m/sec<br>Below 50 mm | 50-150 mm | 200 mm & above |
|---|---|---|---|---|
| (a) | Pump suction | ------ | 1.2-1.5 | 1.2-1.8 |
| (b) | Pump discharge and recirculation | 1.2-1.8 | 1.8-2.4 | 2.1-2.5 |
| (c) | Header | ------ | 1.5-2.4 | 2.1-2.4 |

Pipe line under gravity flow shall be restricted to a flow velocity of 1 m/sec generally. Channels under gravity flow shall be sized for a maximum flow velocity of 0.6 m/sec.

WILLIAM & HAZEN formula shall be used for calculating the friction loss in piping systems with the following "C" value:

| | | |
|---|---|---|
| (i) | Carbon steel pipe | 100 |
| (ii) | Ductile Iron. | 140 |
| (iii) | Rubber lined steel pipe | 120 |
| (iv) | Stainless steel pipe | 100 |

For calculating the required pump head for pump selection, at least 10% margin shall be taken over the pipe friction losses and static head shall be calculated from the minimum water level of the tank/ sump/ reservoir from which the pumps draw water.

(b) **Compressed Air Application**

Compressed air 15.0 m/sec.(under Average Pressure & Temp. conditions)

1.04.00 The pipes shall be sized for the worst (i.e. maximum flow, temp. and pressure values) operating conditions.

1.05.00 Based on the inside dia. so established, thickness calculation shall be made as per ANSI B 31.1 OD and thickness of pipes shall than be selected as per ANSI B 36.10/IS-1239 Heavy grade/IS-3589/ASTM-A-53/API-5L/ANSI B 36.19 as the case may be.

1.06.00 Corrosion allowance of 1.6 mm will be added to the calculated thickness being considered (except stainless steel piping).

1.07.00 Bend thinning allowance/manufacturing allowance etc. shall be as per the requirement of the design code provision.

1.08.00 High points in piping system shall be provided with vents along with valves as per the system requirement. Low points shall be provided with drains along with drain valves as per the system requirement. Drain lines shall be adequately sized so as to clear condensate in the lines. Material for drain and vent lines shall be compatible with that of the parent pipe material.

1.09.00 Material of construction for pipes carrying various fluids shall be as specified elsewhere.

1.10.00 Compressed air pipe work shall be adequately drained to prevent internal moisture accumulation and moisture traps shall be provided at strategic locations in the piping systems.

1.11.00 Depending upon the size and system pressure, joints in compressed air pipe work shall be screwed or flanged. The flange shall be welded with the parent pipe at shop and shall be hot dip galvanized before dispatch to site. Alternatively, the flanges on GI pipes may be screwed-on flanges also.

1.12.00 Threaded joints shall be provided with Teflon sealant tapes.

1.13.00 Following types of valves shall be used for the system/service indicated.

| **SYSTEM** | **TYPES OF VALVES** | | | | | |
|---|---|---|---|---|---|---|
| | Butterfly | Gate | Globe | Check | Ball | Plug |
| Water | x | x | x | x | x | |
| Air | | x | x | x | x | |
| Drains & vents | | x | x | x | | |

1.14.0 Recirculation pipes along with valves, breakdown orifices etc. shall be provided for important pumping systems as indicated in respective process and instrumentation diagrams (P&IDs). The recirculation pipe shall be sized for minimum 30%design flow of single pump operation or the recommended flow of the pump manufacturer whichever is higher.

| | |
|---|---|
| 2.00.00 | **TECHNICAL SPECIFICATION** |
| 2.01.00 | **GENERAL** |
| | Specific technical requirements of low-pressure piping, fittings, supports, valves, specialties and tanks etc. have been covered under this Sub-section. It includes details pertaining to design and material of construction for piping, fittings, valves, equipment, etc. cleaning/surface preparation application of primer and painting on over ground piping. It also includes detailed technical requirement of laying underground/buried piping including water proofing/anti corrosive protection. It also covers design, engineering, manufacturing, fabrication, technical details of piping, valves, specialties, piping hangers / supports, tanks etc. |
| 2.02.00 | **Pipes and fittings** |
| 2.02.01 | All low pressure piping systems shall be capable of withstanding the maximum pressure in the corresponding lines at the relevant temperatures. However, the minimum thickness as specified in the following clauses and or respective codes for pipes and fittings shall be adhered to. The bidder shall furnish the pipe sizing/ thickness calculation as per the criteria mentioned above under LP piping equipment sizing criteria of this Technical Specification. |
| 2.02.02 | Piping and fittings coming under the purview of IBR shall be designed satisfying the requirements of IBR as a minimum. |
| 2.02.03 | Supporting arrangement of piping systems shall be properly designed for systems where hydraulic shocks and pressure surges may arise in the system during operation. Bidder should provide necessary protective arrangement like anchor blocks/anchor bolt etc. for the safeguard of the piping systems under above mentioned conditions. The requirement will be, however, worked out by the contractor and he will submit the detailed drawings for thrust/anchor block to the Employer. External, and internal, attachments to piping shall be designed so as not to cause flattening of pipes and excessive localized bending stresses. |
| 2.02.04 | Bends, loops, off sets, expansion or flexible joints shall be used as required in order to prevent overstressing the piping system and to provide adequate flexibility. Flexibility analysis (using software packages such as Caesar-II etc.) shall be carried out for sufficiently long piping (straight run more than 300M). |
| 2.02.05 | Wherever Bidder's piping coming under this specification, terminates at an equipments or terminal point not included in this specification, the reaction and the thermal movement imposed by bidder's piping on equipment terminal point shall be within limits to be approved by the Employer. |
| 2.02.06 | The hot lines shall be supported with flexible connections to permit axial and lateral movements. Flexibility analysis shall be carried out for pipelines which have considerable straight run as indicated above and necessary loops/ expansion joint etc. shall be provided as may be necessary depending on layout. |
| 2.02.07 | Piping and fittings shall be manufactured by an approved manufacturer of repute. They should be truly cylindrical of clear internal diameter, of uniform thickness, smooth and strong, free from dents, cracks and holes and other defects. |
| 2.02.08 | For rubber lined ERW pipes, beads shall be removed. |
| 2.02.09 | Inspection holes shall be provided at suitable locations for pipes 800 Nb and above as required for periodic observations and inspection purposes. |

2.02.10 At all intersection joints, it is Contractor's responsibility to design and provide suitable reinforcements as per the applicable codes and standards.

2.02.11 For large size pipes/ducts, at high point and bends/change of direction of flow, air release valves shall be provided as dictated by the system requirement and operation philosophy & tripping conditions of pumping system. Sizing criteria for air release valves shall be generally on the basis of valve size to pipe diameter ratio of 1:8. Requirement shall be decided as per relevant code.

Transient analysis /surge analysis where ever specified and required shall be conducted in order to determine the location , number and size of the Air-Release valve on certain long distance/high volume piping systems, if applicable within the scope of work of the package.

2.03.00 **Material**

2.03.01 Alternate materials offered by Bidder against those specified. shall either be equal to or superior to those specified, The responsibility for establishing equality or superiority of the alternate materials offered rests entirely with the Bidder and any standard code required for establishing the same shall be in English language.

2.03.02 No extra credit would be given to offers containing materials superior to those specified. Likewise no extra credit would be given to offers containing pipe thickness more than specified.

2.03.03 All materials shall be new and procured directly from the manufacturers. Materials procured from traders or stockists are not acceptable.

2.03.04 All materials shall be certified by proper material test certificates. All material test certificates shall carry proper heat number or other acceptable references to enable identification of the certificate that certifies the material.

2.03.05 Material of construction for pipes carrying various fluids shall be as follows:

| Sl No | Type of Fluid | Material |
|---|---|---|
| 1. | i) Ordinary Water (Raw Water, Clarified Water, etc.)<br>ii) Equipment cooling water including Both primary & secondary circuit (DMCW pH-corrected & ACW drain water) | IS-2062 Gr.-E-250B/ASTM A-36/ASTM A-53 type 'E'Gr.B/IS-3589 Gr. 410 /IS-1239 Heavy. |
| 2. | i) Demineralised water,<br>ii)Alkaline solution (ECW system chemical dosing) | Stainless Steel to ASTM A312, Gr. 304 welded for sizes 65 mm NB and above.<br>Stainless steel to ASTM A312, Gr. 304 sch.40s seamless for sizes 50mm and below |
| 3. | i) Drinking (potable) water<br>ii)Compressed air (Instrument & service air) | ASTM A-53 type E Gr. B galvanized/ IS 1239 Gr heavy galvanized/IS 3589 Gr 410 galvanized. Galvanized shall be to IS- 4736 or equivalent. |

2.03.06 In water lines, pipes upto 150mm Nb shall conform to ANSI B36.10/ASTM-A-53, Type-E Gr.B /IS:1239 Gr. Heavy and minimum selected thickness shall not be less than IS:1239 Grade Heavy except for demineralised water, drinking water and condensate spill lines.

| | |
|---|---|
| 2.03.07 | Pipes of above 150mm Nb shall be to AWWA-C200/ANSI B 36.10/ASTM A-53/IS 3589 Gr.410. Pipe to be fabricated by the bidder shall be rolled and butt welded from plates conforming to ASTM A-53 type 'E' Gr. B/IS 2062 Gr.E-250B/ASTM-A-36. However, larger pipes, i.e. 1000mm Nb and above shall be made from plates conforming to ASTM A 36/IS 2062 Gr.E-250B and shall meet the requirements of AWWA-M-11 (for deflection & buckling criteria considering water filled pipe as well as vacuum condition that may prevail during transient/surge conditions, truck-load, rail-load and weight density for compacted soil or any other load as the case may be). |
| 2.03.08 | In demineralised water service, the pipes upto 50 Nb shall be of stainless steel ASTM A 312, Gr. 304 sch. 40 Seamless. The size for these pipes shall be to ANSI B 36.19. These shall be socket welded. The material for pipe from 65mm NB upto and including 400 NB shall be to ASTM A 312, Gr. 304 (welded). In no case the thickness of fittings shall be less than parent pipe thickness.<br><br>Bidder/Contractor shall note that pipes offered as per a particular code shall conform to that code in all respects i.e. Dimension, tolerances, manufacturing methods, material, heat treatment, testing requirements, etc. unless otherwise mentioned elsewhere in the specification. |
| 2.03.09 | Instrument air, Plant (service) air lines and Drinking water lines shall be to ASTM A 53 type E grade B/ANSI B 36. 10/IS 3589, Gr. 410 / IS: 1239 Heavy (in case thickness calculated is more than gr. Heavy, ANSI B 36.10 Schedule numbers shall be followed) and galvanized to IS 4736 or any equivalent internationally reputed standard. The material of the pipes shall be to ASTM A 53 type 'E' Gr. B / IS: 3589, Gr. 410 / IS: 1239 Gr. Heavy. The fittings shall be of either same as parent material or malleable iron to IS-1879 (galvanized). |
| 2.03.10 | Spiral welded pipes as per API-5L/IS-3589 are also acceptable for pipe of size above 150 NB. However minimum thickness of the pipes shall be as elaborated in above clauses. |
| 2.03.11 | Condensate lines shall be to ASTM A 106 Gr. B and dimension to ANSI B 36.10 schedule "standard" as minimum to be maintained. |
| 2.03.12 | If carbon steel plates of thickness more than 12 mm are used for manufacture of pipes, fittings and other appurtenances, then the same shall be control-cooled or normalized as the case may be following the guidelines of the governing code. |
| 2.04.00 | **Field routed pipes:** |
| 2.04.01 | Pipe lines of NB 50 size and below are regarded as field run piping. It is Bidder's responsibility to plan suitable layouts for these system insitu. Bidder shall prepare drawings indicating the layout of field run pipe work. These drawings shall be approved by Project Manager to the installation of the field run pipe work. Based on these approved layouts the Bidder shall prepare the BOQ of field run-pipes and submit to Employer for approval. |
| 2.05.00 | **Slope/Drains and Vents** |
| 2.05.01 | Suitable slope shall be provided for all pipelines towards drain points. It is Bidder responsibility to identify the requirements of drains and vents, and supply the necessary pipe work, valves, fittings, hangers and supports etc. As per the system requirement low points in the pipelines shall be provided with suitable draining arrangement and high points shall be provided with vent connections where air or gas pockets may occur. Vent for use during hydrostatic test shall be plugged after the completion of the test. Vent shall not be less than 15mm size. Drains shall be provided at low points and at pockets in piping such that complete drainage of all systems is possible. Drain shall not be less than 15mm for line size up to 150mm, not less than 20mm up to 300mm and not less than 25mm for 350mm to 600mm pipes and not less than 50mm for 600mm and above pipes. |

2.05.02 Air piping shall be sloped so that any part of the system can be drained through the shut-off drain valve or drain plugs.

2.06.00 **Pipe Joints**

In general all water lines 65mm NB and above, are to be joined generally by butt welding except the locations where valves/fittings are to be installed with flanged connections and 50mm and below by socket welding unless mentioned otherwise specifically. All air lines shall be of screwed connection and rubber lined pipes of flanged connections.

2.06.01 **Screwed Joints**

(a) Threading of pipes shall be carried out after bending, heat treatment etc. If not possible, threading may be done prior to these operations but proper care should be taken to protect them from damage. Threads shall be to ANSI B 2.1 (taper) NPT/IS: 554 unless specified otherwise.

(b) Galvanized pipe shall generally be joined by screwing into sockets. The exposed threaded portion on the outside of the pipes shall be given a zinc silicate coating. Galvanized pipes shall not be field joined by welding for protection of Galvanising Zinc layer. Screwed ends of GI pipes shall be thoroughly cleaned and painted with a mixture of red and white lead before jointing. For galvanized pipe sizes above 150 mm NB, screw & socket jointing as per ASTM-A-865 shall be employed for both pipe-to-pipe and pipe-to-fitting jointing. For pipe to fitting connection since no direct threading can be done on the fittings (supplied as per ASTM-A-234 Gr. WPB and ANSI B-16.9) necessary straight pipe lengths acting as match pieces shall be welded to the fitting at both ends and subsequently the free ends of the straight lengths shall be threaded as per ASTM A-865 for jointing with main pipe. Once welding of fittings with match pieces and threading of free ends of match pieces are over, the entire fabricated piece shall be galvanized, or in case match pipes and fittings are already galvanized before the above mentioned fabrication then suitable application of Zinc-Silicate paste adequately at the welded surface (both in side & out side) after welding with zinc rich electrode, along with the nascent threaded metal portions at both free ends given the same application of Zinc Silicate paste. Alternatively flanged jointing may be employed for pipe sizes 100 NB and above. However, the bidder shall ensure the galvanized pipe joints do not fail during hydro test.

(c) Teflon tapes shall be used to seal out screwed joints and shall be applied to the male threads only. Threaded parts shall be wiped clean of oil or grease with appropriate solvent if necessary and allowing proper time for drying before applying the sealant. Pipe ends shall be reamed and all chips shall be removed. Screwed flanges shall be attached by screwing the pipe through the flange and the pipe and flange shall be refaced accurately.

(d) For pipe sizes from 350 mm NB to 550 mm NB (including 350 NB & 550 NB) the GI pipes shall be of flanged connection. However, the pipes after welding of flanges shall be completely galvanized. Any site welding done on galvanized pipes shall be done with zinc-rich special electrodes and the welded surfaces whether inside or outside shall be coated with zinc-silicate paste. Seal welding of flanges with zinc-rich electrode will be permitted only when any flange is leak-prone during hydro testing.

(e) For pipe sizes 600 mm NB and above, the GI pipes shall be of welded connection (with zinc-rich special electrodes) followed by application of zinc silicate coating at welded surfaces both inside and outside the pipe, except for the last blank/blind flange, or, equipment connection where application of zinc-silicate paste after welding cannot be done due to inaccessibility of the inside welded surface and where galvanic protection has been impaired due to welding of pipe-to-pipe joint. Thus the last erection joint shall be flanged joint.

2.06.02 **Welded Joints**

(a) For making up welded joints (butt weld or socket weld) the welding shall be performed by manual shielded metal arc process in accordance with the requirements specified elsewhere in the spec. Any welder employed for carrying butt welding shall be qualified as per ASME section IX for the type of joints he is going to weld. Jointing by butt weld, or socket weld shall depend upon the respective piping material specifications.

2.06.03 **Flanged Joints**

(a) Flanged connections for pipes are to be kept to the minimum and used only for connections to vessel, equipments, flanged valves and other fittings like strainer/traps/orifices etc. for ease of connection and maintenance etc. Rubber lined pipes shall be flange joined only.

(b) All flanged valves intended for installation on steel piping system, shall have their flanges drilled to ANSI B 16.5 (or equivalent) and according to the pressure class stated in their respective piping material specification.

(c) Drilling on flanges of flanged valves must correspond to the drilling of flanges on the piping system on which the valves are installed.

2.07.00 **Bends/elbows/mitre bends/ Tees/ Reducers & other fittings**

2.07.01 For pipe fittings such as elbows (long radius), reducers, tees, etc. the material shall be to ASTM-A-234 Gr. WPB/ASTM-105 up to 300 NB. For pipe fittings above 300 NB, the fittings may be fabricated conforming to parent pipe material. Provision of compensation pads shall be kept as per ANSI B 31.1. The fitting shall conform to the dimensional standard of ANSI B-16.9/ 16.11.Further branching in pipes for sizes 65nb and above is also acceptable (ANSI B 31.1).

However, for pipes up to 150 NB, pipe fittings may be supplied with material and dimension conforming to IS 1239 in case parent pipes also conform to IS 1239.

2.07.02 For pipe size 350Nb and above mitre bends may be used for all pipes except rubber lined pipes. The bend radius shall be 1½ times the nominal pipe diameter. 90 deg. bends (mitre) shall be in 4 pieces (3 cuts) and 45 deg. mitre bends shall be in 3 pieces 22½ deg. Fabrication of mitre bends shall be as detailed in BS 2633/BS534.

2.07.03 For pipes, above 1200 NB, reducer and tees shall be to dimensional standard of AWWA-C-208.

2.07.04 Stainless steel fittings shall conform to either ASTM-A-182 Gr. 304 or ASTM-A-403 Grade WP. 304 Class-S, for sizes upto and including 50 mm NB, i.e. the fittings shall be of seamless construction. However, for stainless fittings above 50 mm NB, the same shall conform to ASTM-A-403 Gr. WP 304 Class W i.e. the fittings shall be of welded construction strictly in accordance with ASTM-A-403.

2.07.07 In no case, the thickness of fittings shall be less than the thickness of parent pipe, irrespective of material of construction.

2.08.00 **Flanges**

2.08.01 Flanges shall be slip on type. Welding of flanges in tension is not permitted.,

2.08.02 All flanges and-flanged drilling shall be to ANSI B 16.5/BS EN-1092 of relevant pressure/temperature class. Flanges shall be fabricated from steel plates conforming to ASTM A 105/IS 2062 Gr. E-250B. However stainless steel flanges shall be fabricated from SS plates to ASTM-A-240, Gr. 304 or equivalent.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

2.09.00 **Specific technical requirement of laying buried pipe with anti corrosive treatment**

The pipe in general shall be laid with the top of the pipe minimum 1.0 (one) meter below finished general ground level.

2.09.01 **Trenching**

(a) The trench shall be cut true to the line and level and shall follow the gradient of the pipeline. The width of the trench shall be sufficient to give free working space on each side of the pipe. Trenches shall conform to IS 5822 or any international standard.

2.09.02 **Preparation and cleaning of piping**

(a) The pipeline shall be thoroughly cleaned of all rust, grease, dirt, weld scales and weld burrs etc. moisture or other foreign matter by power cleaning method such as sand or grit blasting, power tool cleaning, etc. Grease or heavy oil shall be removed by washing with a volatile solvent such as gasoline. Certain inaccessible portions of the pipeline (which otherwise not possible to be cleaned by power cleaning methods) may be scrubbed manually with a stiff wire brush and scrapped where necessary with specific permission of the Project Manager.

(b) On the internal surface for pipes 1000 Nb and above, a coat of primer followed by a hot coal-tar enamel or coal tar epoxy painting (cold) shall be applied.

2.09.03 **Coating and wrapping/ Anti corrosive Protection Coal tar tape**

a. Buried piping shall be coated and wrapped, as per specification, after completion of welded and/or flanged connections, and after completion and approval of Hydro testing. Materials to be used for coating and wrapping of underground pipelines are:

(1) Coating primer (coal tar primer)

(2) Coating enamel (coal tar enamel)

(3) Wrapping materials.

All primer/coating/wrapping materials and methods of application shall conform to IS: 10221 except asphalt/bitumen material. Materials (primer/coating/wrapping) as per AWWA-C-203 are also acceptable.

Protective coating shall consist of coal tar primer, coal tar enamel coating, glass fiber, tissue inner wrap followed by glass fiber or coal tar impregnated Kraft outer wrap or finish coat.
Number of coats and wraps, minimum thickness for each layer of application shall be as per IS-10221. Number of. Coats and wraps shall be decided based on soil corrosivity/resistivity as indicated in IS-10221. Soil data-for this purpose shall be made available.

Total thickness of completed coating and wrapping shall not be less than 4.0 mm.

b. Alternatively, the anti-corrosive protection for buried pipes can consist of anti-corrosive protection Coal-tar tapes. Material and application of tapes shall conform to IS 15337 or equivalent. These-tapes shall be applied hot over the cold coal tar primer in steps of 2mm thickness so as to cover the spiral edges of the first tape by the application of second tape. The total nominal thickness of the finished protective coating shall be 4.0 mm.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| 2.09.04 | **Trench bed preparation and back filling**<br><br>Prior to lowering and laying pipe in any excavated trench, the bottom of the trench may require to be back filled and compacted (or as the case may be) to provide an acceptable bed for placing the pipe. Bed preparation in general shall be as per IS: 5822. |
| 2.09.05 | **laying of galvanized steel (GI) pipes**<br><br>All the joints shall be screwed with socket or flanged. Screwed ends of GI pipes shall be thoroughly cleaned and painted with a mixture of red and white lead before jointing Threaded portion on either side of the socket joint shall be applied with Zinc silicate paste.<br><br>All the provisions for trenching' bed preparation' laying the pipe application of primer' coating' wrapping with tapes and back filling etc. as indicated for "laying of buried piping" and " anti corrosive protection for buried piping" are applicable for buried galvanized steel (GI) pipes also. |
| 2.10.00 | **Cleaning and flushing** |
| 2.10.01 | All piping shall be cleaned by the Bidder before and after erection to remove grease, dirt, dust, scale and welding slag. |
| 2.10.02 | Before erection all pipe work, assemblies, sub-assemblies, fittings, and components, etc. shall be thoroughly cleaned internally and externally by blast cleaning or by power driven wire brushes and followed by air-blowing . However for pipe sizes below 100nb the pipes may be cleaned internally by compressed air blowing as an alternative to internal blast cleaning. The brushes shall be of the same or similar material as the metal being cleaned. Cleaning of Galvanized pipes shall be done by air blowing only. |
| 2.10.03 | After erection, all water lines shall be mass flushed with water. The cleaning velocities in water lines shall be 1.2-1.5 times the operating velocities in the pipelines. |
| 2.10.04 | All compressed air pipe work shall be cleaned by blowing compressed air. |
| 2.11.00 | **Specification for hangers and supports** |
| 2.11.01 | All supports and parts shall conform to the requirement of power piping code ANSI B 31.1 or approved equivalent. |
| 2.11.02 | The maximum spans of the supports of straight length shall not exceed the recommended values indicated in ANSI B 31.1. |
| 2.11.03 | At all sliding surfaces of supports suitable arrangement is to be provided to minimize sliding friction. |
| 2.12.00 | **Design/Construction/Material Particulars of Gate/ Globe /Check /Butterfly / Ball / Air release /Float valves / Moisture Traps.** |
| 2.12.01 | **GENERAL**<br><br>(a) All valves shall have indicators or direction clearly marked on the hand-wheel so that the valves opening/closing can be readily determined.<br><br>(b) Special attention shall be given to operating mechanism for large size valves with a view to obtaining quick and easy operation ensuring that a minimum of maintenance is required. |

(c) The valves coming in vacuum lines shall be of extended gland type and/or water sealed.

(d) The actuator-operated valves shall be designed on the basis of the following:

(1) The internal parts shall be suitable to support the pressure caused by the actuators;

(2) The valve-actuator unit shall be suitably stiff so as not to cause vibrations, misalignments, etc.

(3) All actuator-operated valves shall be provided with hand operated gearing mechanism also.

(4) All actuators operated valves shall open/ close fully within time required by the process.

(e) Valves coming under the purview of IBR shall meet IBR requirements.

(f) All valves shall be provided with embossed name plate giving details such as tag number, type, size etc.

(g) Wherever required valves shall be provided with chain operator, extension spindles and floor stands or any other arrangement approved by employer so that they can be operated with ease from the nearest operating floor. Wherever necessary for safety purpose locking device shall be provided. Further, necessary small platforms for facilitating easy valve operation shall be provided by the contractor wherever necessary in consultation with project manager within the bid price at no extra cost to employer

2.12.02 **VALVE BODY MATERIAL**

Valve body material for various services shall be as follows:

Valve body material for water application like Secondary circuit auxiliary cooling water of ECW system, Raw water, Ash water make-up, service water, clarified water, DM cooling water (pH corrected) , drinking water etc. shall be cast iron for sizes 65NB and above; gun-metal for sizes 50 Nb and below.

For compressed air application, valve body material shall be cast carbon steel or forged carbon steel for sizes 65 mm NB & above and Gun metal for sizes 50 NB and below.

DM water: SS body and disc along with SS internals. However for butterfly valves, Cast Iron /Ductile Iron/SG iron/carbon steel body and disc with elastomer lining are also acceptable.

Condensate: Cast Carbon Steel / Forged Carbon Steel.

2.12.03 The design, material, construction, manufacture, inspection, testing and performance of valves shall comply with all currently applicable statutes, regulations and safety codes in the locality where the valves will be installed. The valves shall conform to the latest editions of applicable codes and standards as mentioned elsewhere. Nothing in this specification shall be construed to relieve the Bidder of his responsibility. Valves in general shall conform to the requirements of the following standards.

**Standards and Codes**

AWWA-C-504 Rubber seated butterfly valves.

| | | |
|---|---|---|
| | BS-5155/EN-593 | Cast iron and steel body butterfly valves for general purpose. |
| | IS-778 | Gun-metal gate, globe and check valves for general purpose. |
| | BS-5154 | Copper alloy globe/globe stop and check and gate valves for general purpose. |
| | IS-780 | Sluice valves for water works purpose (50-300 mm size) |
| | IS-2906 | Sluice valves for water works purpose (350-1200 mm size) |
| | IS-5150 | Cast iron wedge and double disc gate for general purpose. |
| | BS-5152 | Specification for cast iron globe valves. |
| | BS-5153 | Cast iron check valves for general purpose. |
| | IS-5312 | Swing check type reflux (non-return) valves. |
| | ANSI B 16.34 | Standard for valves. |
| | API-594 | Standard for Dual-check valves. |
| | API-600 | Steel gate valves. |
| | ANSI-B-16.10 | Valves face to face and other relevant dimension. |
| | API-598 | Valves inspection test. |

2.12.04 **End Connections**

The end connections, shall comply with the following:

Socket welding (SW) - ANSI B 16.11

Butt Welding (BW) - ANSI B 16.25.

Threaded (SC) - ANSI B 2.1

Flanged (FL) - ANSI B 16.5& AWWA-C-207 (steel flanges), ANSI B 16.1 (Cast Iron flanges).

2.13.00 **Gate/Globe/Check Valves**

(a) All cast iron body valves (gate, globe and non-return) shall have flanged end connections; (screwed ends for Ductile D.2NI body valves are not acceptable).

(b) All steel and stainless steel body valves of sizes 65 mm and above shall have flanged or butt welding ends. Valves of sizes below 65mm shall have flanged or socket welded ends. Compatibility of welding between valve body material and connecting pipe material is a pre-requisite in case of butt-welded joints.

(c) All gun metal body valves shall have screwed ends.

(d) All flanged end valves/specialties. shall be furnished along with matching counter flanges, fasteners, gaskets etc. as required to complete the joints.

(e) Gate/sluice valves shall be used for isolation of flow. All gate valves shall be of the full-way type, and when in the full open position the bore of the valve shall not be constricted by any part of the gate.

Gate valves shall be of the solid/elastic or articulated wedge disc. Gate valves shall be provided with the following accessories in addition to other standard items:

(1) Hand wheel

(2) Position indicator (for above 50 mm NB valve size)

(3) Draining arrangement wherever required.

(f) Globe valves shall be used for regulation purposes. They shall be provided with hand wheel, position indicator, draining arrangement (wherever required) and arrow indicating flow direction. Preferably, the valves shall be of the vertical stem type. Globe valves shall preferably have radiused or spherical seating and discs shall be free to revolve on the spindle.

The pressure shall preferably be under the disc of the valve. However, globe valves, with pressure over the disc shall also be accepted provided (i) no possibility exists that flow from above the disc can remove either the disc from stem or component from disc (ii) manual globe valves can easily be operated by hand. If the fluid load on the top of the disc is higher than 40-60 KN, bypass valve shall be provided which permits the downstream system to be pressurized before the globe valve is opened.

(g) Check valves shall be used for non-return service. They shall be swing. check type or double door (Dual plate)check type with a permanent arrow inscription on the valve body indicating the fluid flow direction. In long distance pipes lines with possibility of surge-occurrence, dual plate check valves are preferable for its spring controlled opening /closing of flaps/doors against flow reversals. However, dual plate check valves shall not be used for sizes more than 600mm NB.

(h) For bore greater than 2" the valves must be swing check type or dual plate check type suitable for installation in all positions (vertical and horizontal);

(i) For bore smaller than or equal to 2" the valves must be of the piston type to be installed, in horizontal position.

(j) All gate and globe valves shall be provided with back seating arrangement to enable on line changing of gland packing. The valves shall be preferably outside screw & yoke type.

(k) All gate and globe valves shall be rising stem type and shall have limit switches for full OPEN and full CLOSED indication wherever required. This will include motor-operated valves also wherever required. In such cases the limit switches shall form an integral part of the valve. Stop-gap arrangement in this respect is not acceptable.

(l) All valves except those with rising stems shall be provided with continuous mechanical position indicators; rising stem valves shall have only visual indication through plastic/metallic stem cover for sizes above 50 mm nominal bore.

(m) For CI gate, globe and check valves wherever thickness of body/bonnet is not mentioned in the valves standards, thickness mentioned in IS- 1538 for fitting shall be applicable.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

2.13.01 **MATERIAL OF CONSTRUCTION (GATE/GLOBE/CHECK VALVE)**

(a) The materials shall generally comply with the following:

(1) **Cast Steel Valves**

| | |
|---|---|
| Body & bonnet | ASTM A 216 Gr. WCB/ ASTM A 105 |
| Disc for non-return Valves | ASTM A 216 Gr. WCB/ ASTM A 105 |
| Trim. | ASTM A 182 Gr. F6 or Equivalent |

(2) **Stainless steel valves**

| | |
|---|---|
| Body & Bonnet | SS 304 |
| Disc | -do- |
| Trim. | SS 316 |

(3) **Cast iron valves**

| | |
|---|---|
| Body & bonnet | BS 1452 Gr. 14/ IS-210 Gr. FG 260 |
| Seating surfaces and rings | 13% chromium steel/ 13% Chrome overlay |
| Disc for non-return valves | BS 1452 Gr. 14/IS-210 Gr FG 260 |
| Hinge pin for non-return valves | AISI 316 |
| Stem for gate globe valves | 13% chromium steel or Equivalent |
| Back seat | 13 % chromium steel / 13% Chrome overlay |

(4) **Gun Metal valves**

| | |
|---|---|
| Body and bonnet | IS 318 Gr. 2/ Equivalent Standard |
| Trim. | -do- |

(b) Cast iron body valves shall have high alloy steel stem and seat.

(c) Material for counter flanges shall be the same as for the piping.

(d) Forged carbon steel valves are also acceptable in place of Gun metal valves.

2.14.00 **Air Release Valve**

(a) The air release valves shall be of automatic double air valve with two orifices and two floats. The float shall not close the valve at higher air velocities. The orifice contact joint with the float shall be leak tight joint.

(b) The valve shall efficiently discharge the displaced air automatically from ducts/pipes while filling them and admit air automatically into the ducts/pipes while they are being emptied. The valve shall also automatically release trapped air from ducts/pipes during operation at the normal working pressure.

(c) Body material of automatic air release valves shall comply generally with BS 1452 Gr. 14/IS: 210 Gr. FG 260. and spindle shall conform to high tensile brass.

(d) Air release valves shall not have any integral isolation device within them. Each Air release valve shall be mounted, preceded by a separate isolation gate/ butterfly valve.

2.15.00 **Butterfly valves**

2.15.01 **Design/Construction**

(a) The valves shall be designed for the design pressure/temperature of the system on which it is installed and in accordance with AWWA-C-504, EN-593 or any other approved equivalent standard latest edition. Fabricated steel (IS: 2062 GR. E-250B) butterfly valves instead of cast iron body valves are also acceptable for size above 300 mm nb diameter.

(b) The valves shall be suitable for installation in any position (horizontal/vertical etc.) and shall be generally of double-flanged construction. However for sizes 600 NB and below the valves of Wafer construction are also acceptable

(c) Valves-350Nb and above shall have pressure equalizing bypass valves, wherever system parameters warrant the same.

(d) Valves-200Nb and above shall also be provided with gear operator arrangement as a standard practice suitable for manual operation. Manual operation of valve shall be through gear arrangement having totally enclosed gearing with hand wheel diameter and gear ratio designed to meet the required operating torque It shall be designed to hold the valve disc in intermediate position between full open and full closed position without creeping or fluttering. Adjustable stops shall be provided to prevent over travel in either direction.

Limit and torque switches (if applicable) shall be enclosed in water tight enclosures along with suitable space heaters for motor actuated valves, which may be either for On-Off operation or inching operation with position transmitter.

2.15.02 **Material of Construction (Butterfly Valves)**

Materials and other design details shall be as indicated below :

(a) **Cast Iron Butterfly Valves**

| | |
|---|---|
| Body & Disc | ASTM A48, Gr. 40 with 2% Ni / IS: 210. Gr. FG-260, with 2% Ni / SG iron BSEN 1563, Gr EN GJS-400-15 with 2%Ni and epoxy coated |
| Shaft | BS 970 431 S: 291 / EN 57, or AISI-410 or AWWA-permitted shaft material equivalent to EN-57/AISI-410 or better. |
| Seat ring | 18-8 Stainless steel |

| | |
|---|---|
| | Seal — Nitrile Rubber |
| | (b) **Stainless Steel Butterfly Valves** |
| | Body & Disc — SS 304 |
| | Shaft — SS 316 |
| | Seat Rings — EPT/BUNA-N/Neoprene |
| | (c) **Carbon steel Butterfly Valves** |
| | Body & Disc — ASTM A 216, Gr. WCB |
| | Shaft — SS 304 |
| | Disc & Seat Rings — EPT/BUNA-N/Neoprene |
| | (d) **Elstomer lined Butterfly Valves** |
| | Body & Disc — ASTM A48, Gr. 40 / IS: 210. Gr. FG-260 / SG Iron (ductile iron) IS 1865 Gr 400-15 or BSEN 1563, Gr EN GJS-400-15 / ASTM A 216, Gr. WCB with elastomer lining. |
| | Shaft — SS 316 |
| 2.15.03 | **Proof of Design Test (Type Test) for Butterfly Valves**<br>Proof of Design (P.O.D.) test certificates shall be furnished by the bidder for all applicable size-ranges and classes of Butterfly valves supplied by him, in the absence of which actual P.O.D. test shall be conducted by the bidder.<br>All valves that are designed and manufactured as per AWWA-C-504 / AWWA-C-516 shall be governed by the relevant clauses of P.O.D test in AWWA-C-504/AWWA-C-516. For Butterfly valves, designed and manufactured to EN-593 or equivalent, the P.O.D. test methods and procedures shall generally follow the guidelines of AWWA-C-504 in all respect except that Body & seat hydro test and disc-strength test shall be conducted at the pressures specified in EN-593 or the applicable code. Actuators shall also meet requirements of P.O.D. test of AWWA-C-504/AWWA-C-516. |
| 2.16.00 | **Float operated valves**<br>(a) Valve shall automatically control the rate of filling and will shut off when a predetermined level is reached and close to prevent over flow on pre-set maximum water level. Valve shall also open and close in direct proportion to rise or fall of water level.<br>(b) DESIGN AND CONSTRUCTION FEATURES<br>The following design and construction feature of the valve shall be the minimum acceptable.<br>(c) Valves shall be right-angled or globe pattern.<br>(d) Valves shall be balance piston type with float ball.<br>(e) Leather liner shall not be provided. |

(f) The body and cover material shall be cast iron conforming to ASTM-A 126 Grade 'B' or IS: 210 Grade 200 or equivalent, and Float shall be of copper with epoxy painting of two (2) coats.

(g) Valves shall be suitable for flow velocities of 2 to 2.5m/sec.

(h) The valves shall have flanged connections.

# NTPC Limited

(A Government of India Enterprise)

# LOT 1A PROJECTS

# PART – B
# (DETAILED TECHNICAL SPECIFICATION)

# SUB-SECTION-III-C
# (CONTROL & INSTRUMENTATION SYSTEM)

# SECTON – VI

# TECHNICAL SPECIFICATION

# FOR

# FLUE GAS DESULPHURISATION (FGD)

# SYSTEM PACKAGE

**BIDDING DOCUMENT NO. : CS-0011-109(1A)-2**

# PART – B (DETAILED TECHNICAL SPECIFICATION)

# SUB-SECTION-III-C (CONTROL & INSTRUMENTATION SYSTEM)

# SUB-SECTION-III-C1

# BASIC DESIGN CRITERIA

## BASIC DESIGN CRITERIA

**1.00.00 GENERAL REQUIREMENTS**

1.01.00 The Contractor shall provide Independent Control & Instrumentation system for control, monitoring and operation of associated drives in all regimes of operation in safe and most efficient manner including Primary and Secondary Instruments, Panels/ Desks, Process Connection and Piping, charges & batteries, associated Instrumentation Cables etc. as identified in the specification.

1.02.00 The Contractor shall provide all material, equipment and services so as to make a totally integrated Instrumentation and Control System together with all accessories, auxiliaries and associated equipments ensuring operability, maintainability and reliability. This work shall be consistent with modern power plant practices and shall be in compliance with all applicable codes, standards, guides, statutory regulations and safety requirements in force.

1.03.00 Further Bidder shall also include in his proposal and shall furnish all equipment, devices and services which may not be specifically stated in the specification but are needed for completeness of the equipment/systems furnished by the Bidder and for meeting the intent and requirements of the specification.

1.04.00 Bidder shall include in his bid a detailed Bill of Material (BOM) for each of the systems.

1.05.00 In addition to requirements specified under this Section-VI, Part-B, all C&I systems/ sub-systems/ equipment/ devices shall also meet other requirements stipulated under other Sub-sections/ parts/ sections of specification.

**2.00.00 RELIABILITY AND AVAILABILITY**

2.01.00 Each component and system offered by the Bidder shall be of established reliability. The minimum target reliability of each piece of equipment like each electronic module/card, Power supply, Peripheral etc. shall be established by the Bidder, considering its failure rate/mean time between failures (MTBF), meantime to repair (MTTR), such that the availability of the complete C&I system is assured .

2.02.00 When more than one device uses the same measurement or control signal, the transmitter and other components/ module shall be fully equipped to provide all signal requirements. All the 4-20 mA output signals from transmitters/other control system shall be able to drive minimum 500 Ohms load resistance. The system shall be arranged so that the failure of any monitoring device or control components or spurious intermediate grounding in the signal path shall not open the signal loop nor cause the loss or malfunction of signal to other devices using the same signal.

| | |
|---|---|
| 2.03.00 | To ensure availability, adequate redundancy in system design shall be provided at hardware, software and sensor level to satisfy the availability criteria mentioned above. For the protection system, independent sensing device shall be provided to ensure adequate safety of plant equipment. |
| **3.00.00** | **OPERABILITY & MAINTAINABILITY** |
| 3.01.00 | The design of the control systems and related equipments shall adhere to the principle of 'Fail Safe' Operation wherever safety of personnel / plant equipment is involved. 'Fail Safe' operation signifies that the loss of signal, loss of excitation or failure of any component shall not cause a hazardous condition. However, it shall also be ensured that occurrence of false trips are avoided / minimised . |
| 3.02.00 | The types of failure that shall be taken into account for ensuring operability of the plant shall include but not be limited to:<br>— Failure of sensor or transmitter.<br>— Failure of main and/or redundant controller/other modules.<br>— Loss of motive power to final control element.<br>— Loss of control power.<br>— Loss of instrument air. |
| 3.03.00 | The choice of hardware shall also take into account sound maintainability principles and techniques. The same shall include but shall not be limited to the following:<br>— Standardization of parts.<br>— Minimum use of special tools.<br>— Grouping of functions.<br>— Interchangeability.<br>— Malfunction identification facility/self surveillance facility.<br>— Easy modular replacement.<br>— Fool proof design providing proper identification and other features to preclude improper mounting and installation.<br>— Appropriate de-rating of electronic components and parts. |

3.04.00 The equipment shall employ latest state of the art technology to guard against obsolescence. In any case, Bidder shall be required to ensure supply of spare parts for lifetime of the plant. In case, the Bidder feels that certain equipment/component is likely to become obsolete, the Bidder shall clearly bring out the same in his Bid and indicate steps proposed to deal with such obsolescence.

3.05.00 Control & Monitoring

3.05.01 The control, monitoring & operation of flue gas desulphurization system shall be as detailed out in Sub-section PLC Based Control system and Sub-section C & I for flue gas desulphurization system. Further, flue gas desulphurization system, link shall be provided for collection of data in the DDCMIS (In Employer's Scope) in UCR for the information of unit-incharge / shift-incharge etc. through Station Wide LAN.

**4.00.00 ENVIRONMENTAL CONDITIONS**

4.01.00 Instruments, devices and equipments for location in outdoors/indoor/air-conditioned areas shall be designed to suit the environmental conditions indicated below and shall be suitable for continuous operation in the operating environment of a coal fired utility station and also during periods of air conditioning failure without any loss of function, or departure from the specification requirements covered under this specification.

| Ambient Temperature (outside cabinets) | Pressure | Relative humidity | Atmosphere | Required protection Class of panels/ cabinets/ desks to be provided by contractor. |
|---|---|---|---|---|
| **Outdoor Location** | | | | |
| 55 degree C max. | Atmosp here | 100 % Max. | Air (dirty) | IP 55 |
| 4 degree C min. | Atmosp here | 5 % min. | Air (dirty) | IP 55 |
| **Indoor Location** | | | | |
| 55 degree C max. | Atmosp here | 95 % Max. | Air | IP 54** |

| | | | | |
|---|---|---|---|---|
| 4 degree C min. | Atmosphere | 5 % min. | Air | IP 54** |
| **Air Conditioned Areas** | | | | |
| 24 +/- 5 degree C normal | Atmosphere | 95 % Max. | Air | IP 22*** |
| 50 degree C max. * | Atmosphere | 5 %min. | Air | IP 22*** |
| * During air conditioning failure. | | | | |
| ** For non-ventilated enclosures. For ventilated enclosures, protection class shall be IP 42. | | | | |
| *** With a suitable canopy at the top to prevent ingress of dripping water. | | | | |

For PCs, OWS, EWS, Servers, Printers and other peripherals, maximum temperature limit shall be 35 Deg.C. For mini-UPS, the same shall be 40 Deg.C.

**5.00.00 GROUNDING SYSTEM**

All panels, desks, cabinets shall be provided with a continuous bare copper ground bus. The ground bus shall be bolted to the panel structure on bottom on both sides. The bolts shall face inside of panels.

The system ground shall be isolated from the panel ground with suitable isolators. All internal component grounds or common shall be connected to the system ground, which shall be fabricated of copper flat (size 25mm x 6mm min., length as applicable).

Shield on instrumentation cables shall be grounded on panel side. When shielding termination are required in cabinets furnished under this specification, suitable terminals shall be furnished on copper flat forming system ground. System and shield ground shall be connected to earthing strip using suitable size of cable to be provided by the contractor.

The Contractor shall submit with the offer recommended grounding scheme required for his system. The exact grounding scheme shall be finalised during detailed engineering.

# SUB-SECTION-III-C2

# MEASURING INSTRUMENTS (PRIMARY AND SECONDARY)

| | |
|---|---|
| **LOT-IA PROJECTS**<br>**FLUE GAS DESULPHURISATION (FGD) SYSTEM PACKAGE** | **TECHNICAL SPECIFICATION**<br>**SECTION-VI**<br>**BID DOCUMENT NO.: CS-0011-109(1A)-2** |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| 1.00.00 | **MEASURING INSTRUMENTS (PRIMARY AND SECONDARY)** |
| 1.01.00 | Measuring instruments/equipment and subsystems offered by the Bidder shall be from reputed experienced manufacturers of specified type and range of equipment, whose guaranteed and trouble free operation has been proven. Refer Sub-section Basic Design Criteria. Further, all instruments shall be of proven reliability, accuracy, and repeatability requiring a minimum of maintenance and shall comply with the acceptable international standards and shall be subject to Employer's approval. |
| 1.02.00 | Every panel-mounted instrument requiring power supply shall be provided with easily replaceable glass cartridge fuses of suitable rating. Every instrument shall be provided with a grounding terminal and shall be suitably connected to the panel grounding bus. |
| 1.03.00 | All transmitters, sensors, switches and gauges for parameters like pressure, temperature, level, flow etc. as required for the safe and efficient operation and maintenance as well as for operator and management information (including all computation) of equipment in the system under the scope of specification shall be provided on as required basis with in quoted lump sum price. The Contractor shall furnish all Instrumentation / Control equipment & accessories under this specification as per technical specification, ranges, makes & model as approved by the Employer during detailed engineering. |
| 1.04.00 | The necessary root valves, impulse piping, drain cocks, gauge-zeroing cocks, valve manifolds and all the other accessories required for mounting/erection of these local instruments shall be furnished, even if not specifically asked for, on as required basis. The contacts of equipment mounted instruments, sensors, switches etc. for external connection including spare contacts shall be wired out in flexible/rigid conduits, independently to suitably located common junction boxes. The proposal shall include the necessary cables, flexible conduits, junction boxes and accessories for the above purpose. Double root valves shall be provided for all pressure tapping where the pressure exceeds 40 Kg./sq.cm. |
| 1.05.00 | All instruments envisaged for sea water applications, shall be provided with wetted parts made of Monel/ Hastelloy C or any other material (if provenness experience of the proposed material for such applications is established by contractor).<br>For Chlorine application: Instruments shall be provided with wetted parts (e.g. diaphragm seal, etc.) made of Hastelloy C. Also, filled liquid shall be Fluorolube oil/ Inert Hydrocarbon / CTFE etc., for these applications.<br>For applications of FECL3 solution: Instruments shall be provided with wetted parts (e.g. diaphragm seal, etc.) made of Tantalum. |
| 1.06.00 | For coastal areas, all instruments shall be provided with durable epoxy coating for housings and all exposed surfaces of the instruments. |
| 1.07.00 | The instruments, for which technical specification is not attached, shall be supplied as per the standard and proven practice of the contractor. The same shall be established by the contractor during detailed engineering by providing detailed explanation/concepts, if required by the employer, of such implementation along with standard documentation. |

2.00.00 **SPECIFICATION FOR ELECTRONIC TRANSMITTERS**

2.01.00 **SPECIFICATION FOR ELECTRONIC TRANSMITTER FOR PRESSURE, DIFF PRESS AND DP BASED FLOW / LEVEL MEASUREMENTS**

| Sl.No. | Features | Essential/Minimum Requirements |
|---|---|---|
| 1. | Type of Transmitter | Microprocessor based 2 wire type (loop powered), Hart protocol compatible. |
| 2. | Accuracy | ± 0.1% of calibrated span (minimum) |
| 3. | Output signal range | 4-20 mA DC (Analog) along with superimposed digital signal (based on HART protocol) |
| 4. | Turn down ratio (minimum) | 10:1 for vacuum/very low pressure applications (i.e. pressure <= 200 mmWC)<br>5:1 for very high pressure application (i.e. pressure >= 200 Kg/cm2)<br>30:1 for other applications |
| 5. | Stability | ± 0.1% of calibrated span for six months for Ranges up to and including70 Kg/cm² <br>± 0.25% of calibrated span for six months for Ranges more than 70 Kg/cm² |
| 6. | Zero and span drift | +/- 0.015% per deg.C at max span<br>+/-0.11% per deg.C at min. Span |
| 7. | Load impedance | 500 ohm (minimum) |
| 8. | Housing | Weather proof as per IP-65, metallic housing with durable corrosion resistant coating |
| 9. | Over Pressure | 150% of max. Operating pressure |
| 10. | Connection (Electrical) | Plug and socket type |
| 11. | Process connection | 1/2 inch NPT (F) |
| 12. | Span and Zero | Continuous, tamper proof, Remote as well as manual adjustability from instrument with zero suppression and elevation facility. |
| 13. | Accessories | -Diaphragm seal, pulsation dampeners, syphon etc. as required by service and operating condition.<br>-2 valve manifold for absolute & Gauge pressure transmitters, 3-valve and 5 valve manifold for DP/Level/Flow applications. The valve manifold shall be non integral type (except Fuel Oil area). |

| | | |
|---|---|---|
| | | -For hazardous area, explosions proof enclosure as described in NEC article 500<br>Mounting: 2 inch pipe mounting. |
| 14. | Diagnostics & display | Self-Indicating feature and digital display on transmitter |
| 15. | Power supply | 24V DC ± 10%. |
| 16. | Adjustment/calibration/maintenance | From hand held HART calibrator/ centralized PC based system (as applicable). |

Notes

- For primary air/ secondary air/flue gas applications, DP type transmitters shall be provided for pressure measurement.
- LVDT type is not acceptable.
- Where the process fluids are corrosive, viscous, solid bearing or slurry type, diaphragm seals shall be provided. Parts below the diaphragm shall be removable for cleaning. The entire volume above the diaphragm shall be completely filled with an inert liquid suitable for the application.

2.02.00 **GUIDED WAVE RADAR TYPE LEVEL TRANSMITTER**

| | |
|---|---|
| Type | Microprocessor based 2 wire type (loop powered), HART protocol compatible Guided wave radar transmitter. |
| Principle | TDR (Time domain reflectometry) |
| Probe Type & Material | (i) Coaxial probe of SS316/316L. If required, probe shall be suitable for overfill prevention.<br><br>(ii) Rod probe, cable probe of SS316/SS316L can be used for applications wherever coaxial probe is not suitable. |
| Output signal | 4-20 mA DC along with superimposed digital signal (based on HART protocol), suitable for over fill prevention. |
| Accuracy | +/- 0.5% of calibrated span or minimum 5mm. |
| Power supply | 24 VDC +/- 10%. |
| Housing | Weather proof as per IP-65, metallic housing with durable corrosion resistance coating. |

| | |
|---|---|
| Adjustment/ calibration | Using hand held HART calibrator/ centralized PC based system (as applicable). |
| Zero & span adjustment | Continuous, temper proof, remote as well as manual adjustability from instrument. It should be possible to calibrate the instrument without any level in the tank/sump etc. |
| Display | Integral digital display. |
| Load Impedance | 500 ohms (minimum). |
| Electromagnetic compatibility | Shall meet EN 61326-1 (1997) and AmdtA1, class A equipment/EN 50081-2 & EN 5008 1-2 & EN 50082-2 |
| Mounting | (i) External cage shall be provided where ever side mounting is required. External cage and other mounting accessories to be provided by the contractor.<br><br>(ii) Where ever top mounting is required, all mounting accessories, stilling well (as required) etc., shall be provided by the contractor.<br><br>(iii) All weather canopy shall be provided for protection from direct sunlight and direct rain for open locations. |

Note: Four wire type transmitters can also be provided for applications where 2- wire transmitter has some technical limitations, subject to employer's approval during detailed engineering stage. However, in such cases isolated 4-20 mA DC (analog) output shall be provided. Power supply required for such transmitters shall be 240V AC / 24V DC.

2.03.00 **Ultrasonic Type level Transmitter**

| S.No. | Features | Essential/Minimum requirement |
|---|---|---|
| 1. | Type of Transmitter | Non-contact Microprocessor based 2 wire type (loop powered), HART protocol compatible Ultrasonic transmitter. |
| 2. | Output signal | 4-20 mA DC (Analog) along with superimposed digital signal (based on HART protocol). |

| | | |
|---|---|---|
| 3. | Accuracy | +/- 0.5% of calibrated span or minimum 5mm. |
| 4. | Power supply | 24 V DC +/- 10%. |
| 5. | Temperature compensation | To be provided within transducer. |
| 6. | Housing | Weather proof as per IP-65, metallic housing with durable corrosion resistance coating. |
| 7. | Adjustment/calibration/ maintenance | Using hand held HART calibrator/ centralized PC based system (as applicable). . |
| 8. | Zero and Span adjustment | Continuous, tamper proof, remote as well as manual adjustability from instrument. It should be possible to calibrate the instrument without any level in the tank/sump etc. |
| 9. | Sensor Material | Corrosion resistant material to suit individual application requirement. |
| 10. | False signal tolerance | Transmitter shall be capable of ignoring false echoes from internal tank/sumps obstructions such as pipes, heating coils or agitator blades. Also transmitter shall have adjustable damping circuitry. |
| 11. | Range | Range of transmitter shall be capable of covering the complete level span of tank taking care of blocking distance, frequency attenuation due to surface, obstructions, vapors etc. |
| 12. | Display | Integral digital display |
| 13. | Diagnostics | Loss of echo alarm etc. |
| 14. | Load Impedance | 500 ohms (minimum). |
| 15. | Electrical Connection | Plug and socket |

| | | |
|---|---|---|
| 16. | Accessories | • All weather canopy shall be provided for protection from direct sunlight and direct rain for open locations.<br>• All mounting accessories required for erection and commissioning shall be provided.<br>• For hazardous area, explosion proof enclosure as described in NEC article 500 |

**Note:**

1) Contractor can also provide Radar type transmitter as per above specification in place of ultrasonic transmitter subject to approval by Employer during detailed Engineering. Sonic frequency based transmitters can also be provided under "ultrasonic transmitters" category for fly ash silo level.

2) Four wire type transmitters can also be provided for applications where 2- wire transmitter has some technical limitations, subject to employer's approval during detailed engineering stage. However, in such cases isolated 4-20 mA DC (analog) output shall be provided. Power supply required for such transmitters shall be 240V AC / 24V DC.

3) For applications where transmitter location is not accessible, the transmitter shall have separate sensor unit and electronic unit for such applications. It shall be possible to mount the electronic unit at accessible location.

2.04.00 **Specification for ULTRASONIC TYPE FLOW TRANSMITTER**

| S.No | Features | Essential/Minimum requirement |
|---|---|---|
| 1. | Type of Transmitter | Non contact Microprocessor based 2 wire type, HART protocol compatible Ultrasonic transmitter. Insertion type. |
| **2.** | Output signal | 4-20 mA DC (Analog) along with superimposed digital signal (based on HART protocol). |
| **3.** | Sensor Accuracy | +/- 2% of calibrated span. |

| | | |
|---|---|---|
| **4.** | Power supply | 24 V DC +/-10%. |
| **5.** | Temperature compensation | To be provided within transducer. |
| **6.** | Housing | Weather proof as per IP-55 with durable corrosion resistance coating. |
| **7.** | Adjustment/calibration/ maintenance | From hand held calibrators/centralized PC based system (as applicable). |
| **8.** | Zero and Span adjustment | Continuous, tamper proof, remote as well as manual to calibrate the instrument without any process flow. |
| **9.** | Sensor Material | Corrosion resistant material to suit individual application requirement. |
| **10.** | False signal tolerance | Transmitter shall be capable of ignoring false echoes from internal tank/sumps obstructions such as pipes, heating coils or agitator blades. Also transmitter shall have adjustable damping circuitry. |
| **11.** | Range | Should be suitable for the required process range. |
| **12.** | Display | LCD display with integral keypad to be provided. |
| **13.** | Diagnostics | Loss of echo alarm etc. |
| **14.** | Load Impedance | 500 ohms minimum |
| **15.** | Electrical Connection | Plug and socket |
| **16.** | Accessories | • All weather canopy for protection from direct sunlight and direct rain.<br>• All mounting hardware and accessories required for erection and commissioning mounting fittings materials shall be SS 316.<br>• For hazardous area, explosion proof enclosure as described in NEC article 500 |

2.05.00 **HART Hand Held calibrator**

Hand held calibrator shall be provided for adjustment/calibration/maintenance of the HART compatible transmitters. The hand held calibrator shall be suitable for all types of transmitters supplied in the package. If one type of hand held type calibrator is not suitable for communicating with all types of transmitters then separate hand held calibrator will be provided for that specific type of transmitter.

3.00.00 **Temperature Elements and accessories**

3.01.00 **Thermocouple**

| Sr. No. | Features | | Essential/Minimum Requirements |
|---|---|---|---|
| 1 | Type of Thermocouple. | : | 16 AWG wire of Chromel-Alumel (Type K) or 24 AWG wire Pt-Rhodium Pt (Type R) depending on operating temperature Range (ungrounded separate junction type). |
| 2 | No. of element | : | Duplex |
| 3 | Housing/Head | : | IP-65/Diecast Aluminium. Head of TE to be provided with sufficient space and arrangement to mount head mounted temperature transmitter (as applicable). Plug in connectors are to be provided for external signal cable connection. TE terminal head shall be spring loaded for positive contacts with the thermo well. |
| 4 | Insulation and Sheathing of Thermocouple | : | Swaged type mineral (magnesium oxide) insulation and SS316 sheath. |
| 5 | Calibration and accuracy | : | As per IEC-584/ ANSI-MC-96.1 (special limits of errors/ class1) for T/C. |
| 6 | Accessories | : | Thermo well and associated fittings |
| 7 | Standard | : | IEC-584/ ANSI MC 96.1 for Thermocouple and ASME PTC-19.3 for Thermo-well |

3.02.00 **Resistance Temperature Detector ( RTD )**

| Sr. No. | Features | | Essential/Minimum Requirements |
|---|---|---|---|
| 1 | Type of RTD. | : | Four wire, Pt-100 (100 Ohms resistance at zero degree Centigrade). |
| 2 | No. of element | : | Duplex |
| 3 | Housing/Head | : | IP-65/Diecast Aluminium. Head of TE to be provided with sufficient space and arrangement to mount head mounted temperature transmitter (as applicable). Plug in connectors are to be provided for external signal cable connection. TE terminal head shall be spring loaded for positive contacts with the thermo well |
| 4 | Insulation and sheathing of RTD | : | Mineral (magnesium oxide) insulation and SS316 sheath, |
| 5 | Calibration and accuracy | : | As per As per IEC-751/ DIN-43760 Class-A for RTD |
| 6 | Accessories | : | Thermo well and associated fittings |
| 7 | Standard | : | IEC-751/ DIN-43760 for RTD and ASME PTC-19.3 for Thermo-well. |

**NOTES :**

1) The specifications for RTDs of winding/ bearings of motor/pump, can be as per their manufacturer standards. The manufacturer shall submit the adequate supporting documents for establishing their standard practice. However the type of RTD shall be Pt100.

2) The specifications of temp elements for air conditioning & ventilation system / process can be as per system manufacturer's standards. The manufacturer shall submit the adequate supporting documents for establishing their standard practice.

3.03.00 **Metal Temperature Thermocouples**

| | |
|---|---|
| Measuring Medium | Metal Temperature |
| Material of Thermocouple. | Chromel Alumel Type K |
| Type of Thermocouple | Duplex with ungrounded separate hot junctions |
| Insulation | Mineral Insulation (Magnesium Oxide). |

| | |
|---|---|
| Thermocouple wire gauge | 16 AWG |
| Protective sheath | SS 321 |
| Protective sheath dia | 8 mm OD |
| Calibration & accuracy | As per IEC-584/ ANSI-MC-96.1 (special limits of error) for T/C |
| Mounting accessories | 1/2" BSP SS sliding end connector, weld pad, clamps of heat resistant steel SS310. Adjustable gland fitting for connection at the junction box end as per manufacturer's standard. |
| Cold end sealing | SS pot seal with colour coded PTFE Insulated flexible tails. Sealing compound- Epoxy resin. Length of PTFE insulated flying leads shall be minimum 750 mm. |
| Minimum bending radius | 30 mm |
| Length of T/C | On as required basis considering location of measurement point and the JB/TTJB location. |

**Notes :**

1) The specification for thermocouples of bearings metal temp measurements can be as per their manufacturer standards. The manufacturer shall submit the adequate supporting documents for establishing their standard practice. However type of thermocouples shall be K-type.

3.04.00 **Thermo well** (for all process temp. elements)

(a) Shall be one piece solid bored type of 316 SS of step-less tapered design. (As per ASME PTC 19.3, 1974)

(b) For Mill classifier outlet long life solid sintered tungsten carbide material of high abrasion resistance shall be provided.

(c) For Air & Flue gas 316 SS protecting tube with welded cap. (However contractor shall provide better material for Flue gas service if required based on the specified boiler design parameters).

(d) For furnace zone, impervious ceramic protecting tube of suitable material along with Incoloy supporting tubes and adjustable flanges.

3.05.00 TEMPERATURE TRANSMITTER (TT)

Following types of 2-wire (loop powered) temperature transmitter (directly powered from 4-20mA input cards of DDCMIS/PLC) shall be provided. The temperature transmitter shall be fully compatible with thermocouples and RTDs being provided by the contractor. Temperature compensation of the thermocouples shall be performed in the temperature transmitter itself.

a. Single Input Head mounted Temperature Transmitter

These shall be suitable for mounting in the head of temperature element itself. Temperature transmitter and associated temperature element shall be factory fitted.

b. Single Input DIN-rail mounted Temperature Transmitter

These shall be suitable for mounting on DIN-rails in JBs. The specifications of the JBs shall be same as indicated in Subsection INST CABLE with additional DIN-rails and IP 65 Protection class. This temperature transmitter shall be the ones which are especially designed for DIN-rail mounting with IP 20 protection class. These shall have terminals for input/output provided on front side when mounted on DIN-rail. Head mounted temperature transmitter with clamps to make it suitable for DIN-rail mounting shall not be acceptable under this category.

c. Dual-input Temperature Transmitter With **integral** Indicator:

These shall be suitable for mounting on pipes/ support. Both elements of the duplex thermocouple/ RTD shall be wired to a single transmitter. Integral indicator shall be provided with these transmitters. These transmitters shall have bump less change over facility to second sensor in case first sensor fails .This change-over is to be alarmed. Protection class shall be IP65 minimum.

d. Common requirements for each of the above type of temperature transmitters.

| | | | |
|---|---|---|---|
| Output | : | 2-wire (power supply from input card of Control System) with 4-20mA output with superimposed HART protocol signal. | |
| Input | : | Same transmitter shall be capable to handle Pt-100 RTD, Thermocouples –K & R types (input type to be selectable at site through HART terminal). | |
| Isolation | : | Min. 500 V AC. | |
| EMC compatibility | : | As per EN 61326. | |
| Operating ambient temperature | : | 0 to 85 deg C (without indicator). | |
| | | 0 to 70 deg C (with indicator). | |
| Power supply | | 24V DC +/- 10%. | |
| Accessories | | Mounting arrangements including clamps etc. | |
| Composite Accuracy | (i) | For head mounted and DIN-rail mounted types: | |
| (Refer note 2 ) | | RTD | =<0.4% of 0-250 deg C span |
| | | T/C-K type | =<0.4% of 0-600 deg C span |
| | | T/C-R type | =<0.4% of 0-1000 deg C span |
| | | CJC accuracy (for thermocouples) shall be =< 1 deg C | |
| | (ii) | For dual-input type: | |
| | | RTD | =<0.25% of 0-250 deg C span |
| | | T/C-K type | =<0.2% of 0-600 deg C span |
| | | CJC accuracy (for thermocouples) shall be =< 1 deg C | |

Notes ***(Common for a) to d) above):-***

1. In case of failure (open or burn-out) of RTD/thermocouple, temp. Transmitter shall provide low temperature output.
2. Composite Accuracy is to be calculated as summation of all applicable accuracies of temp transmitter, for converting sensor input to output in 4-20 mA (e.g., basic accuracy, digital accuracy, D/A accuracy, etc.) and temperature effect on these accuracies at ambient temperature of 50 deg C, based on the figure/ formula given in the standard product catalogue for span as specified above for various types of Temperature Elements specified. All such accuracy/ temp effect figures in catalogue shall be first converted to deg C, and then percentage of this converted accuracy in specified span shall be calculated to compare with the specified composite accuracy figures. All temperature transmitters are to be interchangeable (i.e. can be used for either RTD or thermocouple) and composite accuracy shall be met for each type of input specified in (i) & (ii).

4.00.00 **SPECIFICATIONS FOR PR. GAUGE, D.P. GAUGE, TEMP. GAUGE AND LEVEL GAUGE.**

| Sl. No | FEATURES | ESSENTIAL/MINIMUM REQUIREMENTS | | |
|---|---|---|---|---|
| | | Pr. Gauge/ DP Gauge/ Draught gauges | Temperature Gauge | Level Gauge |
| 1 | Sensing Element | Bourdon for high pressure, Diaphragm/ Bellow for low pr. | Inert gas actuated/ Liquid filled other than mercury | Tempered * toughened Borosilicate gauge glass steel armoured reflex or transparent type. |
| 2 | Material of sensing element | SS 316 | SS 316 | |
| 3 | Material of movement | SS 304 | SS 304 | |
| 4 | Body material | Die-cast aluminium | Die-cast aluminium | Forged carbon steel/304 SS |
| 5 | Dial size | 150mm | 150 mm | Tubular covering entire range |
| 6 | End connection | 1/2 inch NPT (M) | 1/2 inch or 3/4 inch NPT (M). | Process connection as per ASME PTC and drain/vent 15 NB |

| | | | | |
|---|---|---|---|---|
| 7 | Accuracy | ±1% of span | ± 1% of span | ± 2% |
| 8 | Scale | Linear, 270° arc graduated in metric units | Linear, 270° arc graduated in °C | Linear vertical |
| 9 | Range selection | Shall cover 125% of max. operating press | Shall cover 125% of max. operating temp | Shall cover max. Operating level. |
| 10 | Over range | 125% of FSD | 125% of FSD | - |
| 11 | Housing | Weather and dust proof as per IP-55 | Weather and dust proof as per IP-55 | CS/304 SS leak proof |
| 12 | Zero/span adjustment | Provided | Provided | -- |
| 13 | Identification | Engraved with service legend or laminated phenolic name plate | | |
| 14 | Accessories | Blow out disc, siphon, snubber, pulsation dampener, chemical seal (if required by process) gauge isolation valve | SS Thermowell | Gasket for all KEL-F shield for transparent type vent and drain valves of Steel/SS as per CS/Alloy process Requirement. |
| Notes:- | | | | |

*Bicolour type level gauges will be provided for applications involving steam and water except for condensate and feed water services.

Length of gauge glass shall not be more than 1400 mm. If the vessel is higher, multiple gauge glasses with 50 mm overlapping shall be provided.

Where the process fluids are corrosive, viscous, solid bearing or slurry type, diaphragm seals shall be provided. Parts below the diaphragm shall be removable for cleaning. The entire volume above the diaphragm shall be completely filled with an inert liquid suitable for the application.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

5.00.00 **PROCESS ACTUATED SWITCHES**

| FEATURES | ESSENTIAL / MINIMUM REQUIREMENTS | | |
|---|---|---|---|
| | Pressure/ Draft Switches/ DP Switches | Temperature switches | Level switches |
| Sensing Element | Piston actuated for high pressure and diaphragm or bellows for low pr./ vacuum | Vapor pressure sensing, liquid filled bellow type with SS bulb and capillary (5 m minimum, to suit application) | Capacitance types, float type, conductivity type, RF type, Ultrasonic type as per suitability to the application. . |
| Material | 316 SS | Bulb 316 SS/ capillary 304 SS | 316 SS |
| End connection | ½ inch NPT (F) | ½ inch NPT (F) | Manufacturer standard |
| Over range/ proof pressure | 150% of maximum operating pr. | - | 150% of maximum operating pr. |
| Repeatability | +/- 0.5% of full range | | |
| No. of contacts | 2 No.+2NC. SPDT snap action dry contact | | |
| Rating of contacts | 60 V DC, 6 VA (or more if required by DDCMIS) | | |
| Elect. Connection | Plug in socket. | | |
| Set point adjustment | Provided over full range. | | |
| Dead band adjustment | Adjustable/ fixed as per requirement of application. | | |
| Enclosure | Weather and dust proof as per IP-55, metallic housing. | | |
| Accessories | Siphon, snubber, chemical seal, pulsation dampeners as required by process | Thermo well of 316 SS and packing glands | All mounting accessories |
| Mounting | Suitable for enclosure/ rack mounting or direct mounting | Suitable for rack mounting or direct mounting | - |

| | |
|---|---|
| Power Supply (wherever required) | As per Contractor's Standard practice. |

Notes :-

1) Where the process fluids are corrosive, viscous, solid bearing or slurry type, diaphragm seals shall be provided. Parts below the diaphragm shall be removable for cleaning. The entire volume above the diaphragm shall be completely filled with an inert liquid suitable for the application.

2) Pressure/ Diff pressure switches for very low press/ DP measurements can have sensor material other than SS316 in case of any technical limitation and the offered product is standard product of the manufacture for very low pressure applications.

3) Repeatability can be upto +/-1% of full range in case of switches with diaphragm seals or very low pressure/DP range.

4) The specifications of switches for air conditioning & ventilation system / process can be as per system manufacturer's standards. The manufacturer shall submit the adequate supporting documents for establishing their standard practice.

6.00.00 **SOLENOID VALVES**

Solenoid valves shall fulfill the following requirements: -

a) Type 2/3/4 way SS 316/ forged brass (depending on the application subject to Employer's approval during detailed engg.)

b) Power supply 24V DC.

c) Plug in connector connection.

d) Insulation : Class "H"

7.00.00 **Limit switches**

e) Limit switches shall be silver plated with high conductivity and non-corrosive type. Contact rating shall be sufficient to meet the requirement of Fire alarm Control System subject to a minimum of 60V, 6VA rating. Protection class shall be IP-55.

8.00.00 **SPECIFICATION FOR CORIOLIS FLOW TRANSMITTER**

| | |
|---|---|
| Type | Coriolis |
| Material of Wetted Parts | 316 SS |
| Material of Housing | 304L SS |
| Accuracy | ± 0.2% of Rate |
| Repeatability | ± 0.1% of Rate |

| | | |
|---|---|---|
| | Output | 4-20 mA DC, HART Compatible |
| | Power Supply | 230 VAC or 24VDC operated |
| | Process Temperature range | 0-200 degree Celsius |
| | Others | Drain / purging arrangement shall be provided as per standard practice. |
| | Viscosity range of Fluid | 0-500cst for HFO |

The offered Coriolis type flow transmitter shall be suitable for intended application. Contractor shall submit flow and sizing calculation for Employer's approval. For each type of Coriolis type flow transmitter general arrangement and assembly drawing and cable wiring diagram shall be submitted for Employer's approval.

9.00.00 **SPECIFICATION FOR FLOW ELEMENTS**

9.01.00 **Orifice Plate**

| Features | Essential/Minimum Requirements |
|---|---|
| Type | Concentric as per ASME PTC-19.5 (Part-II), ISA RP-3.2, 1960 or BS-1042, ISO 5167 |
| Material | 316 SS |
| Thickness | 3 mm for main pipe diameter up to 300 mm and6 mm for main pipe dia above300 mm. |
| Material of branch pipe | Same as main pipe |
| Root valve type | Globe |
| Root valve material | Same as pipe material |
| Root valve size | 1 / 2 inch or 1 inch (as applicable) |
| Impulse pipe of same material up to root valve | Required |
| Tappings | Flanged weld neck or D & D/2 with 3 pairs of tapping ( as applicable ). Root valves to be provided in all the tappings. However for flow elements in CPU, DM & PT plant- 2 Pairs of Tappings shall be provided as minimum. |
| Beta Ratio | 0.34 to 0.7 |
| Beta Ratio calculation to be submitted | Yes |
| Assembly drg. and flow Vs DP Curves | Yes |
| Accessories | Root valves, flanges, Vent/drain hole(As required) |

Contractor shall submit certified flow calculation and differential pressure vs. flow curves for each element for Employer's approval. Sizing calculation, precise flow calculation for all the flow elements, fabrication and assembly drawings and installation drawings shall be submitted for Employer's approval.

9.02.00 **Flow Nozzle**

| Features | Essential/Minimum Requirements |
|---|---|
| Type | Long radius, welded type as per ASME PTC-19.5 (Part-III) or BS-1042 |
| Material | 316 SS |
| Thickness | Suitable for intended application. |
| Material of branch pipe | Same as main pipe |
| Root valve type | Globe |
| Root valve material | Same as pipe material |
| Root valve size | 1 inch |
| Impulse pipe of same material up to root valve | Required |
| Tapping | Flanged weld neck or D & D/2 with 3 pairs of tapping ( as applicable ). Root valves to be provided in all the tappings. However for flow elements in CPU, DM & PT plant- 2 Pairs of Tappings shall be provided as minimum. |
| Beta Ratio | Around 0.7 |
| Beta Ratio calculation to be submitted | Yes |
| Assembly drg. and flow Vs DP Curves | Yes |
| Accessories | Root valves, vent and drain hole. |

Contractor shall submit certified flow calculation and differential pressure vs. flow curves for each element for Employer's approval. Sizing calculation, precise flow calculation for all the flow elements, fabrication and assembly drawings and installation drawings shall be submitted for Employer's approval.

9.03.00 **Venturi (For Liquid applications)**

| Features | Essential/Minimum Requirements |
|---|---|
| Type | Rough Welded (for Pipe dia between 200mm to 1200mm) or Machined (for Pipe dia 50mm to 250mm) as per ISO 5167-4:2003, |
| Material | Same as Main Pipe |
| Thickness | Same as Main Pipe. |
| Root valve type | Globe Type |
| Root valve material | Same as Pipe material |
| Root valve size | 1 inch |
| Impulse pipe of same material up to root valve | Required |
| Tapping | 3 pairs of tappings for each Venturi as per ISO 5167-4:2003, However for some areas like CPU, DM & PT plant- 2 Pairs of Tappings shall be provided as minimum. |
| Beta Ratio | 0.4 to 0.7 |
| Beta Ratio calculation to be Submitted | Yes |
| Assembly drg. and flow Vs DP Curves | Yes |
| Accessories | Root valves, vent and drain hole. |

Contractor shall submit certified flow calculation and differential pressure vs. Flow curves for each element for employer's approval. Sizing calculation, precise flow calculation for all the flow elements, fabrication and assembly drawings and installation drawings shall be submitted for employer's approval.

9.04.00 **ROTAMETERS**

| Sr. No. | Features | Essential / minimum requirements | |
|---|---|---|---|
| 1. | Type | Variable Area Metal Tube | |
| 2. | Fluid media | Water/oil | |
| 3. | Tube body | SS316 | |
| 4. | Material of float | 316 SS | |
| 5. | Indicator | Linear scale | |

| | | | |
|---|---|---|---|
| 6. | Accessories | Flange, orifice in case of bypass Rota meter (for line size above 100 mm) | |
| 7. | Housing protection class | IP-55 | |
| 8. | Accuracy | ± 2% of measured value. | |

10.00.00 **ANALYSER INSTRUMENTS (OTHER THAN CEMS):**

| Common Requirements | | |
|---|---|---|
| 1 | Output signals | |
| | Analog | 4-20 mA DC galvanically isolated. If analyser provides superimposed HART signal on 4-20 mA DC output, It shall also be connected to PC based station. |
| | Binary | 2 NO + 2 NC for high alarm |
| 2 | Zero & span Adjustment | To be provided with range selection facility. |
| 3 | Ambient temp. | 50°C |
| 4 | Indication | Digital Alphanumeric Display. Display of reading in engineering units shall be provided. |
| 5 | Enclosure Type/Material | Weather & Dust proof (IP 55) Die cast Aluminium/SS. |
| 6 | Type of Electronics | Microprocessor based with self diagnostic. |
| 7 | Digital Signal transmission | HART / RS 485 Port Modbus Protocol / Ethernet TCP/IP protocol for communication with plant control system. |
| 8 | Calibration | Auto & Manual (from Remote) |
| 9 | Power Supply | To be arranged by Contractor subject to Employer's approval. |
| 10. | Others | All interconnection tubing and cabling between probe and analyser / analyser panel and cabling from analyser/ analyser panel to local junction box are to be provided. |

| | | |
|---|---|---|
| | | All the calibration gases required for one year continuous operation shall be provided. The calibration gas container material shall not contaminate the calibration gas. |
| 11. | Compliance to standards | USEPA, TUV, MCERTS or equivalent standards |
| 12. | Type of Technology | SO2:- Hot-extractive sampling type/ Dilution Extractive/ In-situ (Path) type<br>For Hot-extractive sampling type and Dilution extractive type systems, the entire system including analysers, sample handling/conditioning system etc offered shall be sourced from/assembled at Original Analyser manufacturer(OAM) works |
| 13 | Measurement Range, Tapping point | As per FGD system design and process parameter |

10.01.00 **Specific requirements for Hot-extractive sampling type SO2 analysers**

| **Specification Requirements** | **SO2 Analyser cum monitor (combined)** |
|---|---|
| Type of Instrument | Sampling type - Hot Extractive type |
| Principle of Measurement | Radiation absorption |
| Accuracy | +/- 1% of FS |
| Linearity | +/- 1% of FS |
| Repeatability | $\leq$ 1% of Span |
| Response time(up to 90% of full scale) | $\leq$ 5 secs |
| a) Temperature Drift | +/- 2% / 10 deg.C |
| b) Zero Drift | < 1% span/week |
| c) Span Drift | < 1% measured value/week |
| Operating Temperature Range for probe | 0-300 deg.C |
| Filter | Ceramic 3.5 Micron |
| Accessories for purging system | Purging system including Auto Scavenging facility shall be provided |

| | |
|---|---|
| Sample gas inlet temperature to analyser | Temperature of the sample gas inlet to analyser shall be controlled before analyser as per manufacturer standards**.** |

10.02.00 **Specific requirements for Dilution Extractive type SOx Analsyers**

The design of the Dilution Extractive type system shall be satisfying the following requirements. The sampling system shall consist of In-situ dilution probe, dilution probe controller, sample conditioning system like air drier and filters etc and other accessories meeting the following requirements as a minimum. All system components and accessories required for completion of this system shall be furnished although these may not be individually specified herein. Following are the minimum requirements:

| |
|---|
| a) Modular Electronic Design. |
| b) Heatless Air dryer with inlet filter, chemical scrubbers to remove traces of NOx/CO2/SO2 from air and accumulator |
| c) Self test facility with screen display |
| d) Protection of instrument in case ambient or surrounding temp going high beyond stipulated limit |
| e) The following are the minimum requirement for the probe:-<br>• Flange and counter flange for inserting probe<br>• Coarse and Fine filters<br>• Critical orifice<br>• Automatic blow back or purging facility<br>• SS316L probe material |
| f) Further dilution probe controller shall be provided with the ability to control dilution ratio |
| (g) Unheated umbilical chord to be provided for transportation of the diluted sample, zero air, vacuum pressure, and calibration gas. This chord has to be a single bundle in FRLS PVC outer sheath. The sample line has to be of PTFE. |

| **Specification Requirements** | **SO2 Analsyer** |
|---|---|
| Principle of measurement | Pulsed/UV Fluorescence technology. |
| Probe operating temp | 0-300 deg C |
| Zero drift | <1 ppb/day |
| span drift | +/-1% FS/day |
| Lower detection limit. | <=1.0 ppb |
| Response time(up to 95% of full scale) | 100 sec |
| Accuracy/Precision. | +/- 1% |
| Linearity | +/- 1% Full scale |
| Sample gas inlet temperature to analyser | 5 deg.C - 40 deg.C |

10.03.00 **Specific requirements for In-situ (Path) type SO2 analysers**

| **Specification Requirements** | **SO2 Analyser cum monitor** |
|---|---|
| Principle of Measurement | Differential Optical Absorption Spectroscopy |
| Accuracy | <= 2% of measured value for SO2 |
| Linearity | +/-1% of measurement span |
| Probe Operating Temperature Range | 0 to 300 deg C |
| Accessories for purging system | Purging system to be provided with heavy duty blowers and shutter mechanism for automatic isolation of lens during purge air failure. |
| Temperature compensation | Automatic temperature compensation to be provided |

10.04.00 **pH Analyser**

| | | |
|---|---|---|
| **a)** | **Type** | **:** Cell - flow through |
| **b)** | **Accuracy** | **:** < ± 1% of reading |
| **c)** | **Range** | **:** 0 - 14 pH freely programmable (For others) |
| **d)** | **No. of steams** | **:** Single |
| **e)** | **Temp. compensation** | **:** Automatic |

11.00.00 **CONTINUOUS EMISSION MONITORING SYSTEM (CEMS):-**

Continuous Emission Monitoring system consisting of the following equipments (Analysers/monitors) shall be provided for measurement of emissions in stack of each unit:-

1. SO2/NOx Analyser
2. CO analyser
3. CO2 analyser
4. Flue gas Flow Meter
5. Flue gas temperature measurement( As defined under Particulate Emission Analyser)
6. Particulate Emission (Stack Opacity) Analyser
7. Mercury Analyser

The common requirements to be met for all types of analysers are as below. The specific requirements to be met by each type of analyser are detailed in the subsequent clauses.

11.01.00 **Common Requirements for all Analysers**

| | | |
|---|---|---|
| 1 | Output signals | |
| | Analog | 4-20 mA DC galvanically isolated. |
| 2 | Zero & span Adjustment | To be provided for all selectable ranges. |
| 3 | Ambient temp. | 0-50°C unless defined otherwise. |
| 4 | Indication | Digital Alphanumeric Display. Display of reading in engineering units shall be provided. |
| 5 | Analyser enclosure Type/Material | Die cast Aluminium/SS. Weather protection for analyser mounted inside analyser panel shall be IP-22 or better. For all other analysers, weather protection class shall be IP-55. |
| 6 | Type of Electronics | Microprocessor based with self diagnostic. |
| 7 | Digital Signal transmission | RS232/ RS485 Modbus Protocol/ Ethernet TCP/IP protocol for bidirectional communication of stack emission data to Employer's cloud server |
| 8 | Calibration | Auto & Manual (from Remote) |
| 9 | Power Supply | To be arranged by Contractor subject to Employer's approval. |
| 10. | Others | I) All interconnection tubing and cabling between probe and analyser / analyser panel and cabling from analyser/ analyser panel to DCS (in respective unit control room) are to be provided by Contractor. |
| | | ii) All the calibration gases required for one year continuous operation shall be provided. The calibration gas container material shall not contaminate the calibration gas. |
| 11 | Location of probe | SO2/NOx/CO/CO2-On stack at approximate elevation of 35 Mtrs.<br>Particulate Emission (Stack Opacity) & Flow measurement -On stack at approximate elevation of 88 Mtrs<br>Mercury:- on stack at 35 Mtrs. |
| 12 | Location of the analysers (other than insitu type)/Analyser Panel. | AT 0' Mtrs near stack for CEMS |
| 13 | Compliance to standards | USEPA, TUV, MCERTS or equivalent standards |
| 14 | Type of Technology | SO2/NOx :- Hot-extractive sampling type/ Dilution Extractive/ In-situ (Path) type |

| | | |
|---|---|---|
| | | CO :- Hot-extractive sampling type/ Dilution Extractive/ In-situ (Cross-duct) type. (can be combined with SO2/NOx)<br>CO2 :- Hot-extractive sampling type/ Dilution Extractive/ In-situ (Cross-duct) type (can be combined with CO or SO2/NOx above).<br>Stack Opacity :- In-situ (Path)type<br>Note:- For Hot extractive sampling type and Dilution extractive sampling type system – The components involved in sample handling system shall be imported & further, Sample handling system design shall be vetted by Original Analyzer Manufacturer (OAM). Necessary documents shall be furnished during detailed engineering in order to establish the above requirement. Technical expert of OAM shall witness testing of sample handling system and validate it. Alternatively sampling handling system assembled at Original Analyzer manufacturer (OAM) works shall also be accepted. |
| 15 | Contractual conditions for CEMS system | Warranty:- As defined elsewhere in the Contract.<br>Comprehensive Annual Maintenance Contract:-. Refer sub-section-IIC-C& I/ Section-VI/ Part-A. This shall cover total maintenance of all hardware and software related to CEMS and shall include free repair/replacement of all components/cables/equipment etc and Supply of expendable items.<br>Availability of valid data:-AT least 90% of time during warranty and CAMC period. For this purpose, contractor may take necessary steps to ensure availability.<br>Services to be provided during Warranty and CAMC period shall be as per clause no. 2.04.00, 2.05.00 and 2.06.00, Sub-Section-III-C, SECTION-VI, PART-A |

11.02.00 **Specific requirements for Hot-extractive sampling type SO2/NOx, CO2 & CO analysers**

| **Specification Requirements** | **SO2 Analyser and Nox Analyser cum monitor (combined)** | **CO2 ANALYZER** | **CO Analyser** |

11.03.00 **Specific requirements for Dilution Extractive type SOx/NOx/CO2 & CO Analsyers**

The design of the Dilution Extractive type system shall be satisfying the following requirements. The sampling system shall consist of In-situ dilution probe, dilution probe controller, sample conditioning system like air drier and filters etc and other accessories meeting the following requirements as a minimum. All system components and accessories required for completion of this system shall be furnished although these may not be individually specified herein. Following are the minimum requirements:

| |
|---|
| a) Modular Electronic Design. |
| b) Heatless Air dryer with inlet filter, chemical scrubbers to remove traces of NOx/CO2/SO2 from air and accumulator |
| c) Self test facility with screen display |
| d) Protection of instrument in case ambient or surrounding temp going high beyond stipulated limit |
| e) The following are the minimum requirement for the probe:-<br>• Flange and counter flange for inserting probe |

- Coarse and Fine filters
- Critical orifice
- Automatic blow back or purging facility
- SS316L probe material

f) Further dilution probe controller shall be provided with the ability to control dilution ratio

g) Unheated umbilical chord to be provided for transportation of the diluted sample, zero air, vacuum pressure, and calibration gas. This chord has to be a single bundle in FRLS PVC outer sheath. The sample line has to be of PTFE.

| **Specification Requirements** | **SO2 Analsyer** | **NOx Analsyer** | **CO2 Analsyer** | **CO Analsyer** |

11.05.00 **Specific requirements for Particulate Emission (Dust density Stack Opacity) monitor**

| Specification Requirements | PARTICULATE EMISSION (Dust density Stack Opacity) monitor |
|---|---|
| Type of Instrument * | In-Situ dry type visible light (through LED) stack |
| Principle of Measurement | Transmission and absorption |
| Measurement Range | 0 to 999mg/m2, (Programmable) |
| Accuracy | 2% of FS |
| Linearity | +/- 1% of FS |
| Repeatability | ≤ 1% of Span |
| Response time(up to 90% of full scale) | ≤ 5 sec |
| a) Temperature Drift | +/-1% in 24 hrs |
| b) Zero Drift | < 1% span/week |
| c) Span Drift | < 1% measured value/week |
| Operating Temperature Range for probe | 0-300 deg.C |
| Filter | To be provided |
| Accessories purging system | Purging system to be provided with heavy duty blowers and shutter mechanism for automatic isolation of lens during purge air failure. |
| Temperature compensation/measurement | Temperature compensation to be provided. Further, additional 4-20 mA signal for stack temperature through temperature transmitter shall be provided and connected to DDCMIS. |

Note: * For stack dust density measurement - In case specified type of instrument is not suitable for the actual flue gas parameters at chimney, the contractor can provide suitable instrument based on other proven technology for the intended application & meeting the other technical requirements specified above, subject to Employer's approval during detailed engineering. Contractor shall furnish necessary documents in support of suitability and provenness of instruments for envisaged application.

11.06.00 **Specific requirements for Continuous On-line Mercury Analyser**

| S.NO. | PARAMETER | DETAILS |
|---|---|---|
| 1 | Measurement Principle | Atomic Absorption Spectrometry/ Atomic Fluorescence spectrometry. |
| 2 | Range | 0-100 microgram/Nm3 |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

11.07.00 **ULTRASONIC FLOW METER FOR FLUE GAS FLOW IN STACK**

| | |
|---|---|
| Type | Transit time Ultrasonic meter |
| Mounting Style | Transducers on the duct/stack |
| Transducer type and material | Single pair of Corrosion resistant material to be provided |
| Zero and Span adjustment | To be provided |
| Flow measurement | Instantaneous Flow rate as well as totalized flow |
| Power supply Distribution | to be arranged by the Contractor from Employer's terminal point. |
| Outputs :<br>Analog<br>Datalink | <br>4-20 mA DC galvanically isolated.<br>RS 232/RS485/Modbus protocol/ Ethernet TCP/IP protocol for bidirectional communication link with Employer's cloud server |
| Display/Indication | Flow meter with LCD screen backlight based local display and keypad . If required, transmitter shall be suitably located away from the sensor for better access and visibility. |
| Recording / Totalizing/Logging Facilities | To be provided |
| Diagnostics | False signal tolerance , power supply failure etc |
| Protection class | IP-65 or better |
| Ambient temperature | -20 deg to +60 deg C |
| Accuracy | <+/- 2% |
| Electrical connection | Plug and socket |
| Accessories | All mounting hardware required like clamping fixtures, mechanism to remove the transducers online, interconnecting cables to DDCMIS, cables, flexible conduits, junction boxes etc<br>Purging arrangement for Cleaning sensors to be provided. Material of all fittings shall be SS 316. |
| Software features | Compensation for temperature and pressure and any cross path errors.<br>Programming, configuration, shall be possible from front panel. |

**NOTES:-**

01. Hot extractive sampling type/ Dilution extractive type systems shall be provided with dual sample probes along with all required accessories such as redundant

heavy duty pumps with continuous rated motors, moisture detection facility, pre-fabricated heated (for sampling type only) sample lines from probes to analyser panel, solenoid valves, filters, coolers along with level switch in gas coolers for auto draining purpose and flow meter etc as applicable.

02. Not used

03. If the SOx, NOx, CO2 & CO ( if sampling/dilution type) analyzers do not meet the environmental conditions specified at cl. 4.00.00 of Sub Sec IIIC-01, Section-VI, Part-B, panel AC shall be provided in analyzer cabinets to meet the requirement.

04. Not used

11.08.00 Connectivity with DDCMIS and provision for bidirectional communication with Employer's Cloud Server

1. 4-20mA signals from all the above analysers/flow meters/temperature transmitter to DCS of respective unit.

2. RS232/ RS485 Modbus protocol/ Ethernet TCIP/IP protocol for bidirectional communication with Employer's Cloud Server as defined in Sub-section-IIC-C&I/ Section-VI/ Part-A.

All the accessories and cables required for connecting Analysers outputs to DCS and provision of bidirectional communication as defined above shall be provided by Contractor on as required basis.

12.00.00 **SPECIFICATION OF ANALYSERS**

12.01.00 **Common Requirements**

| | | |
|---|---|---|
| **1.** | Type of electronics | Microprocessor based |
| 2. | Zero & span Adjustment | To be provided |
| 3. | Ambient temp. | 50°C |
| 4. | Display | LCD |
| 5. | Enclosure Type / Material | Weather and Dust proof (IP 55), Die cast aluminum with corrosion resistant epoxy coating for external field mounting analysers |
| 6. | Output signals Analog | 4-20 mA DC |
| 7. | Error / fault Diagnostic | To be provided. |
| 8. | Power supply | The power supply to all the analyzers / monitors shall be supplied by contractor |

| | | |
|---|---|---|
| | | with all necessary switches, fuses, wiring / cabling and other required accessories etc. for distribution to individual requirements. |
| | 9. Load | 500 Ohms minimum |
| | 10. Mounting | All mounting arrangements for the sensors and the monitors are to be provided by the Contractor. SWAS instruments to be mounted in the panel except Hotwell analysers.<br>For the same and other field application free standing cabinet(s) / panel / rack is to be provided by the Contractor for mounting the analysers / transmitters / meters as applicable due to environment. |
| | 11. Other Requirements | All chemical reagents required for silica, phosphate, sodium, chloride, residual chlorine and hydrazine analyzers for 12 months operation is to be supplied in phased manner depending on shelf life. |

12.02.00 **Conductivity Analyser**

| | |
|---|---|
| 1. Type | Continuous flow through type |
| 2. Range | • As per the process requirement, Freely programmable<br>• 0-2500 ppm for Total Dissolved Solids (TDS). |
| 3. Accuracy | <=+/- 1 % of reading |
| 4. Temperature Compensation | Automatic |
| 5. Response time | <=5Sec |
| 6. No. of Streams | Single |
| 7. Other | Wherever cation conductivity measurement have been specified dual cation exchange column shall be provided. |

12.03.00 **pH analyser**

| | |
|---|---|
| 1. Type | Continuous flow through type |
| 2. Range | 0 - 14 pH freely programmable |
| 3. Accuracy | < ± 1% of reading |
| 4. Temperature Compensation | Automatic |
| 5. No. of Streams | Single |

12.04.00 **Turbidity Analyser**

| | |
|---|---|
| 1. Type | Light reflection principle |
| 2. Range | 0-100, 0-200 NTU programmable |
| 3. Accuracy | <= 2% for range 0 – 50 NTU<br><= 5% for range 50 - 200 NTU |
| 4. Response time (90 % of full scale) | <= 5 minutes. |
| 5. No. of Streams | Single |

12.05.00 **Phosphate Analyser**

| | |
|---|---|
| 1. Type | Colorimetric |
| 2. Range | 0-10 ppm freely programmable |
| 3. Accuracy | <= +/- 5 % of reading |
| 4. Temperature Compensation | Automatic, however, If the measurement technique is temperature insensitive within the range or if the temperature is closely maintained at a set value, the same are also acceptable. |
| 5. Response time | <= 15 min |
| 6. Sample Flow | 1000 ml/min (Max) |

12.06.00 **Chloride Analyser**

| | |
|---|---|
| 1. Type | Continuous Flow through type with chloride and sulphate Responsive electrodes |
| 2. Range | 0-1000 ppb freely programmable |
| 3. Accuracy | <= +/- 5 % of reading |
| 4. Temperature Compensation | Automatic |
| 5. No. of Streams | Single |

12.07.00 **Silica Analyser**

| | |
|---|---|
| 1. Type | Continuous Colorimetric Type |
| 2. Range | 0-50, 0-100, 0-500 ppb freely programmable |
| 3. Accuracy | <= +/- 5 % of reading |
| 4. Temperature Compensation | Automatic, however, If the measurement technique is temperature insensitive within the range or if the temperature is closely maintained at a set value, the same are also acceptable. |
| 5. Response time | <= 15 min |
| 6. No. of Streams | Multi Stream with at least one stream as spare. |
| 7. Sample Flow | 50-150 ml/min |
| 8. Other requirement | Sample shut off solenoid valve to be provided |

12.08.00 **Sodium Analyser**

| | |
|---|---|
| 1. Type | Continuous Flow Through Sample |
| 2. Range | 0-1, 0-10, 0-200, 0-2000 ppb freely programmable |
| 3. Accuracy | <= +/- 10 % of reading |
| 4. Temperature Compensation | Automatic |
| 5. Response time | <= 4 min |
| 6. No. of Streams | Multi Stream with at least one stream as spare. |

| | |
|---|---|
| 7. Sample Flow | 125 ml/min (max) |

12.09.00 **Hydrazine Analyser**

| | |
|---|---|
| 1. Type | Automatic Continuous Electrochemical Type |
| 2. Range | 0-50, 0-100, 0-500 ppb freely programmable |
| 3. Accuracy | <= +/- 5 % of full scale |
| 4. Temperature Compensation | Automatic |
| 5. Response time | <= 3 min |
| 6. No. of Streams | Single |
| 7. Sample Flow | 500 ml/min (max) |
| 8. Other requirement | Sample shut off solenoid valve to be provided |

12.10.00 **Dissolved O2 Analyser**

| | |
|---|---|
| 1. Type | Continuous Flow Through Sample |
| 2. Range | 0-20, 0-200 ppb freely programmable |
| 3. Accuracy | <= +/- 5 % of full scale |
| 4. Temperature Compensation | Automatic |
| 5. Response time | <= 30 sec |
| 6. No. of Streams | One single stream, one switchable between two. |
| 7. Sample Flow | 500 ml/min (max) |

12.11.00 **Residual Chlorine Analyser**

The analyser shall comply with the following specification requirements, as a Minimum

| | |
|---|---|
| 1. Type | Amperometric type |
| 2. Range | 0 to 20.0 mg/L (ppm) |
| 3. Accuracy | <=+/- 5 % ( see Note – 1) |
| **4. Alarm annunciation** | High and low alarms to be provided on panel and shall be field adjustable. |
| 5. **Calibration** | Zero and span adjustment facility to be provided. Final calibration adjustments of the analyser to be done at site and duly verified by titration. Temperature compensation range 0 to 50 deg.C. |
| 6. Connections | All connections for sampling drain etc. to be provided. |
| 7. Cabling | All field cabling power cables and panel wiring etc., to be provided. |
| **8. Electrodes** | Platinum/Gold and copper electrodes shall be provided with cell cleaning system. |

**Note-1:** The measurement accuracy shall not be affected by presence of treatment chemicals as chromates, phosphates, de-former highly polluted water, change in temperature etc.

**Note-2:** Circulating water as sample to residual chlorine analyser shall be taken from hot circulating water pipe work before entry to cooling towers. Exact location and layout of sampling arrangement shall be finalized during detailed Engg. stage. Bidder shall provide necessary pumping system (with 100% standby) for meeting the analyser requirements, if needed. All the drains shall be terminated up to the nearest Employer's plant drainage system.

13.00.00 **Parshall Flume**

Parshall Flume shall be provided wherever indicated in P&IDS. The Bidder shall provide all the control and Instrument devices including primary sensors, transmitters, flow indicator cum integrator / totaliser and shall include all required accessories for the flow measurement of raw water through the clarifier. The system shall be of reputed make and acceptable to the owner.

Level measurement shall be based on ultrasonic/radan technology. The flow compensation is to be implemented in the transmitter itself. The transmitter shall provide 4-20 mA DC in direct proportion to flow and shall be able to drive a load impedance of 500 ohms minimum. Accuracy shall be +/- 1 % or better.

All the mounting hardware and accessories required for erection and commissioning of the same are to be provided by the contractor. Mounting fittings material shall be SS316. All weather canopy is to be provided for electronics/sensor to protect the same from The Type makes and models no. shall be subject to Owner's approval.

14.00.00 **Electronic Flow-Meter**

Electronic Flow-meters shall be provided where ever indicated in the P&IDs.
The electronic flow meter shall include flow sensor and flow indicator cum integrator/totaliser and shall include all required accessories for satisfactory operation. The flow meter shall be based on full bore ultrasonic/electromagnetic principle and shall be electronic type of proven design, make and model acceptable to the owner.
The Bidder shall submit all necessary technical literature and details of selection criteria of the instrument offered to substantiate the model selected. The Bidder shall also furnish list of similar installation along with feedback on satisfactory performance of the instruments.

The flow meter shall meet or exceed the following requirement:

| | |
|---|---|
| (a) Output : | 4-20 mA DC Isolated output |
| (b) Accuracy : | ± 0.5% of calibrated span or better * |
| (c) Repeatability : | ± 0.2% of calibrated span or better |
| (d) Ambient Temp. & Humidity : | 4 deg.C to 55 deg.C.<br>5% to 100% RH |
| (e) Power Supply : | 240V AC ± 10%, 50 HZ ± 5%/ 24 V DC, to be arranged by the contractor. |
| (f) Protection class : | IP-55 |
| (g) Flow tube | SS304 |
| (h) liner | Hard Rubber |

The flow meter shall provide local indication for instantaneous flow. It should also be possible to get local display for daily and monthly discharge. The flow meter shall indicate totaliser / integrator to get the daily and monthly discharge as stated above.

# SUB-SECTION-III-C3

# PROCESS CONNECTION AND PIPING

| | |
|---|---|
| **LOT-IA PROJECTS**<br>**FLUE GAS DESULPHURISATION (FGD) SYSTEM PACKAGE** | **TECHNICAL SPECIFICATION**<br>**SECTION-VI**<br>**BID DOCUMENT NO.: CS-0011-109(1A)-2** |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

## PROCESS CONNECTION AND PIPING

1.00.00 **PROCESS CONNECTION PIPING**

1.01.00 The Contractor shall provide, install and test all required material for completeness of Impulse Piping System and Air Piping System as per the requirements of this Sub-Section on as required basis for the connection of all instruments and control equipments of entire plant.

1.01.01 **IMPULSE PIPING, TUBING, FITTINGS, VALVES AND VALVE MANIFOLDS**

1.01.02 All impulse pipes shall be of seamless type conforming to ANSI B36.10 for schedule numbers. The size of impulse pipe shall be ½" for Steam & Water Application and ¾" for Air & Flue Gas applications. The rating of material of impulse pipes, tubes, fittings, valves and their installation thereof shall conform to the latest edition of standards as per following table:

| | |
|---|---|
| Impulse Pipes, Tubes (Material, Rating) | ANSI B31.1, ANSI B31.1a, ANSI/ISA 77.70 |
| Valves (Material, Pr. Class, Size) | ASTM A182/ASTM A105 as per ASME 16.34 |
| Fittings (Size, Rating, Material) | ANSI B31.1, ANSI B31.1a, ASME B16.11-2009 |
| Installation Schemes | BS 6739-2009, ANSI/ISA 77.70 |

Stainless steel tube shall be provided inside enclosures & racks from tee connection to valve manifold and then to instrument. The source shut-off (primary process root valve) and blow down valve shall be of 1/2 inch size globe valve type for all applications except for air and flue gas service wherein no source shut-off valves are to be provided. Two root valves are to be used wherever pressure is more than 40 Kg/cm$^2$ or Temp>280 $^o$C. The end connections of valves shall be of socket welded type. Typical installation scheme of DP Transmitter (inside LIE/LIR) mounted below instrument source point is indicated in Drg. No. 0000-999-POI-A-036. Same scheme with necessary changes shall be applied for other instruments.

1.01.03 The valve manifolds of 316 SS with pressure rating suitable for intended application shall be provided as given below:

| Manifold | Application/Measurement |
|---|---|
| 2 Valve | Pressure measurements using pressure transmitters/pressure switches |
| 3 Valve | Pressure measurements using differential pressure transmitter/ switches |
| 5 Valve | Differential Pressure, Flow and Level Measurements |

For Pr./D.P gauges, two-way globe/gate valve shall be provided on each impulse line to the instrument in Fluid/Air & Flue Gas applications respectively .

2.00.00 **AIR SUPPLY PIPING**

2.01.01 All pneumatic piping, fittings, valves, air filter cum regulator, purge rotameter and other accessories required for instrument air for the various pneumatic devices/ instruments shall be provided. This will include as a minimum air supply to pneumatically operated control valves, actuators, instruments, continuous and intermittent purging requirements etc.

2.02.00 Instrument air and Service air supply shall be provided for continuous and intermittent purging respectively for all transmitters of mill, dirty air and flue gas applications. Purging Scheme shall be as per Drg. No. 0000-999-POI-A-036.

2.03.00 The Contractor shall also provide SS Tubing and associated fittings (screwed type) of suitable sizes for all pneumatic equipments/actuators (including supply air, signal air and output to actuators) conforming to ANSI 31.1 and 31.3 standard. All other air supply lines shall be of mild steel hot dipped galvanized inside and outside as per IS-1239, heavy duty

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| | with threaded ends. Fittings for air supply line shall be of forged carbon steel A234 Gr. WPB galvanized inside and outside, screwed as per ASA B2.1. Dimensions of fittings shall be as per ASA B16.11 of rating 3000 lbs. Air supply piping shall be adequately sloped to prevent accumulation of condensed water within the pipe. The air supply headers, sub-headers and branch pipes shall be supported properly by clamps or supports. |
| 2.04.00 | The instrument/service air supply to each equipment/devices requiring air supply shall be provided by a well designed air distribution scheme comprising of 2" GI Pipe Header feeding 1" GI Pipe sub-header feeding ½" pipe at each equipment/device. Instrument air filters cum regulator set with mounting accessories shall be provided for each pneumatic device requiring air supply except for Ash Handling System wherein it shall be provided on instrument air header at each location. |
| 2.05.00 | All the isolation valves in the air supply line shall be gate valves as per ASTM B62 inside screw rising stem, screwed female ends as per ASA B2.1. Valve bonnet shall be union type & trim material shall be stainless steel, body rating 150 pounds ASA. The valve sizes shall be ½ inch to 2 inch. |
| 2.06.00 | Instrument air filters cum regulator set with mounting accessories shall be provided for pneumatic device requiring air supply. The filter regulators shall be suitable for 10-kg/ sq.cm max. Inlet pressure. The filter shall be of size 5 microns and of material sintered bronze. The air set shall have 2-inch size pressure gauge and built in filter housing blowdown valve. The end connection shall be as per the requirement to be finalized during detailed engineering. |
| 3.00.00 | **INSTALLATION AND ROUTING** |
| 3.01.01 | All instrument piping, tubing and its accessories shall be supported in a safe manner to prevent excessive vibrations and anchored sufficiently to prevent undue strain on connected equipment. Impulse piping shall be supported at an interval not exceeding 1.5 meters. The slope of the impulse pipe form the process connection to the instrument shall be as per ANSI/ISA 77.70 latest edition and BS 6739-2009. All impulse piping shall be installed to permit free movement due to thermal expansion. Wherever required expansion loops shall be provided.<br><br>Condensate pots shall be provided for all level measurements in steam and water services, all flow measurement in steam services and for flow measurements in water services above 120 Deg. C. Colour coding of all impulse pipes shall be done by the Contractor in line with the colour coding being followed for the parent pipes. |
| 4.00.00 | **SHOP AND SITE TESTS** |
| 4.01.01 | The equipment and work performed as per this Sub-section shall be subject to shop and site test as per requirements of Sub-section-IIIE-04 (Quality Assurance & Inspection) other applicable clauses of this Sub-section and Employer approved quality assurance plan. |
| 4.01.02 | Hydrostatic and Pneumatic leakage tests shall be performed on all pipes, tubing and systems and shall conform to ANSI B31.1. |
| 5.00.00 | **LOCAL INSTRUMENT ENCLOSURE AND RACKS**<br><br>All transmitters, switches etc. for FGD system and other system being provided under the contract shall be suitably grouped together and mounted inside (i) local instruments enclosures in case of open areas of the plant and (ii) In local instrument racks in case of covered areas. The GA of LIE with purging indicated in the Drg. No. 0000-999-POI-A-036 is to be followed by contractor. The GA of LIR shall be similar to LIE except for front/rear doors and side panels. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

The internal layout shall be such that the impulse piping/ blow down lines are accessible from back side of the enclosure / rack and the transmitters etc. are accessible from front side for easy maintenance. Bulkheads, especially designed to provide isolation from process line vibration shall be installed on instrument enclosures/racks to meet the process sensing line connection requirement. Vibration dampeners shall be installed for each enclosure / rack. The Degree of Protection of LIE and JB of LIE/LIR shall be IP-55.

The enclosures shall be constructed of 3 mm sheet plate and shall be of modular construction with one or more modules and two end assemblies bolted together to form an enclosure. Double inter locking doors shall be provided. The doors shall be the three-point locking type constructed of not less than 1.6 mm thick steel. Doors shall have concealed quick removal type pinned hinges and locking handles. Door locks shall accept the same key.

The instrument racks shall be free standing type constructed of suitable 5 mm thick channel frame of steel and shall be provided with a canopy to protect the equipment mounted in racks from falling objects, water etc. The canopy shall not be less than 3 mm thick steel, and extended beyond the ends of the rack.

Enclosures/Racks shall be reinforced as required to ensure true surface and to provide adequate support for instruments and equipment mounted therein. Centre posts or any member which would reduce access shall not be provided.

Contractor shall provide not more than three variants for LIE/LIR with respect to max. no. transmitters mounted in each LIE/LIR.

**5.01.00** ENCLOSURE / RACKS FOR DUAL I/P TEMPERATURE TRANSMITTERS

All Dual Input temperature transmitters for FGD system and other system being provided under the contract shall be suitably grouped together and mounted inside (i) Enclosures in case of open areas of the plant and (ii) Racks in case of covered areas. Integral JB shall be provided with each Enclosure and Rack.

The internal layout shall be such that the transmitters are accessible from both front and back side of the enclosure / rack for easy maintenance.

Enclosure/ Racks shall be of robust and rugged design. Vibration dampeners shall be installed for each enclosure / rack. The Degree of Protection of Enclosure and JB shall be IP-55.

Enclosure and Racks shall be free standing type.

Enclosures/Racks shall be reinforced as required to ensure true surface and to provide adequate support for instruments and equipment mounted therein.

Contractor shall provide not more than five variants for Enclosure/ Rack with respect to max. no. transmitters mounted in each Enclosure/ Rack. However, the maximum number of Transmitters that can be grouped in one Enclosure/ Rack shall be decided during detail Engineering.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| **6.00.00** | **INSTALLATION OF OTHER INSTRUMENTS:**<br><br>For installation and routing of other field mounted instruments which are not covered in Cl. No. 5.00.00, please refer Cl. No 52.04.00(J) of Section-VI, Part-D, Erection Conditions of Contract (ECC) of Technical Specifications. |

# SUB-SECTION-III-C4

# INSTRUMENTATION CABLES

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

**1.00.00** **INSTRUMENTATION CABLE, CONTROL & POWER SUPPLY CABLE, INTERNAL WIRING AND ELECTRICAL FIELD CONSTRUCTION MATERIAL (CABLE SUB-TRAYs ETC)**

**1.01.00** **General requirements**

1.01.01 All cables including special cables, internal wiring and electrical field construction material shall conform to this specification, Employer approved detail engineering drawings & documents and the latest edition of the relevant standards & guidelines. The Bidder shall furnish all material and services required for the completeness of the work identified in his scope as per this specification.

1.01.02 The Contractor shall supply, erect, terminate and test all instrumentation cables for control and instrumentation equipment/devices/systems included under Contractor's scope and ensuring completeness of the control system.

1.01.03 Any other application where it is felt that instrumentation cables are required due to system/operating condition requirements, are also to be provided by Contractor.

1.01.04 Other type of cables like fiber optic/co-axial cables for system bus, cables for connection of peripherals etc. (under Contractor's scope) are also to be furnished by the Contractor.

1.01.05 Contractor shall supply all cable erection and laying hardware from the main trunk routes like branch cable trays/sub-trays, supports, flexible conduits, cable glands, lugs, pull boxes etc. on as required basis for all the systems covered under this specification.

1.01.06 Wherever the quantity has been defined as on as required basis, the same are to be furnished by contractor on as required basis within his quoted lump sum price without any further cost implication to the Employer.

**2.00.00** **SPECIFICATION OF INSTRUMENTATION CABLE**

**2.01.00** **Common Requirements**

| S. No. | Property | Requirement |
|---|---|---|
| 1 | Operating Voltage | 225 V (peak value) |
| 2. | Codes and standard | All instrumentation cables shall comply with VDE 0815, VDE 0207, Part 4, Part 5, Part 6, VDE 0816, VDE 0472, SEN 4241475, ANSI MC 96.1, IS-8784, IS-10810 (latest editions) and their amendments read along with this specification. |
| 3. | Continuous operation suitability | At 205 Deg C for Type-C cables & heat resistant cables, at 70 Deg C for all other type of cables. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

| S. No. | Property | Requirement |
|---|---|---|
| 4. | Marking :- a.*Progressive automatic on-line sequential marking of length in meters to be provided at every one meter on outer sheath.*<br><br>*b.*Marking to read 'FRLS' to be provided at every 5 meters on outer sheath except for Type-C cable<br><br>c.Durable marking at intervals not exceeding 625 mm shall include manufacturer's name, insulation material, conductor's size, number of pairs, voltage rating, type of cable, year of manufacturer to be provided on outer sheath. | |
| 5. | Allowable Tolerance on overall diameter | +/- 2 mm (maximum) over the declared value in data sheet |
| 6. | Variation in diameter | Not more than 1.0 mm throughout the length of cable. |
| 7. | Ovality at any cross-section | Not more than 1.0 mm |
| 8. | CAGE-CLAMP suitability | To be provided |
| 9. | Color | The outer sheath shall be of blue color. |
| 10. | Others | Repaired cables shall not be acceptable. |

| Attenuation Figure At 1 Khz (Max) | N.A. | | 1.2 db/km | N.A. |
| **H. COMPLETE CABLE** | | | | |
| Complete Cable assembly | Shall pass Swedish Chimney test as per SEN-SS 4241475 class F3. | | | N.A. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

| Specification Requirements | Type-A cable | Type-B cable | Type F & G cable | Type-C cable |
|---|---|---|---|---|
| Flammability | Shall pass flammability as per IEEE-383 read in conjunction to this specification | | | As per manufacturer's standard subject to employer's approval |
| **I. CABLE DRUM** | | | | |
| Type | Non-returnable wooden drum (wooden drum to be constructed from seasoned wood free from defects with wood preservative applied to entire drum) or steel drum. | | | |
| Length | 1000 m ± 5% for up to & including 12 pairs<br>500 m ± 5% for above12 pairs | | | |

Note: Heat resistant instrumentation cable shall have same specification as of G/F type instrumentation cable as specified above, except that insulation and outer sheath material shall be Teflon and cable shall be suitable for continuous operation at 205 Deg. C

**3.00.00 SPECIFICATION OF OPTICAL FIBER CABLES (OFC)**

3.01.00 Optic Fiber cable shall be 4/8/12 core, Electrolytically chrome plated corrugated steel taped (ECCST), fully water blocked with dielectric central member for outdoor/indoor application so as to prevent any physical damage. The cable shall have multiple single-mode or multi mode fibers on as required basis so as to avoid the usage of any repeaters. The outer sheath shall have Flame Retardant, UV resistant properties and are to be identified with the manufacturer's name, year of manufacturer, progressive automatic sequential on-line marking of length in meters at every meter.

3.02.00 The cable core shall have suitable characteristics and strengthening for prevention of damage during pulling viz. Dielectric central member, Loose buffer tube design, 4 fibers per buffer tube (minimum), Interstices and buffer tubes duly filled with Thixotropic jelly etc. The cable shall be suitable for a maximum tensile force of 2000 N during installation, and once installed, a tensile force of 1000 N minimum. The compressive strength of cable shall be 3000 N minimum& crush resistance 4000 N minimum. The operating temperature shall be – 20 deg. C to 70 deg.C

3.03.00 All testing of the fiber optic cable being supplied shall be as per the relevant IEC, EIA and other international standards.

3.04.00 Bidder to ensure that minimum 100% cores are kept as spares in all types of optical fibre cables.

3.05.00 Cables shall be suitable for laying in conduits, ducts, trenches, racks and under ground buried installation.

3.06.00 Spliced / Repaired cables are not acceptable.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

3.07.00 Penetration of water resistance and impact resistance shall be as per IEC standard.

**4.00.00 SPCIFICATION OF CONTROL & POWER SUPPLY CABLES**

Refer Electrical sub-sections

**5.00.00 INSTRUMENTATION CABLE INTERCONNECTION AND TERMINATION PHILOSOPHY**

The cable interconnection philosophy to be adopted shall be such that extensive grouping of signals by large scale use of field mounted Group Junction Boxes (JBs) at strategic locations (where large concentration of signals are available, e.g. valves limit & torque switches, switchgear) is done and consequently cable with higher number of pairs are extensively used. The details of termination to be followed are mentioned in the given Table A.

TABLE A: CABLE TERMINATION TO BE FOLLOWED

| Application | | Type Of Termination | | Type Of Cable |
|---|---|---|---|---|
| **FROM (A)** | **TO (B)** | **END A** | **END B** | |
| Valves/dampers drives (Integral Junction box) | Marshalling / Marshalling – cum Termination Cubicle / local group JB | Plug in connector | Post mount cage clamp type. | G |
| Transmitters, Process Actuated switches mounted in LIE/LIR | Integral Junction box of LIE/LIR | Plug in connector | Cage clamp (Rail mount) type. | F,G |
| RTD heads | Local junction box | Plug in connector | Cage clamp (Rail mount) type. | F |
| Thermocouple | Local junction box / CJC box (if applicable) | Plug in connector | Cage clamp (Rail mount) type. | A, B, C* |
| Other Field mounted Instrument | Local JB / Group JB | Plug in connector | Cage clamp (Rail mount) type. | F,G |
| RTD | Temperature transmitter | Plug in connector | Screwed, Cage clamp type | F |
| Thermocouple | Temperature transmitter | Plug in connector | Screwed, Cage clamp type | A, B, C* |
| Local Junction box, Temperature Transmitter, Int. Junction box of LIE/ LIR/ MCC/SWGR | Group JB | Cage clamp (Rail mount) type. | Cage clamp (Rail mount) type. | F,G |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

| Application | | Type Of Termination | | Type Of Cable |
|---|---|---|---|---|
| **FROM (A)** | **TO (B)** | **END A** | **END B** | |
| Local Junction box, Temperature Transmitter, Int. Junction box of LIE/ LIR/ Group JB / MCC/SWGR | Marshalling / Marshalling – cum Termination Cubicle | Cage clamp (Rail mount) type. | Cage clamp (Post mounted) type. | F,G |
| Marshalling cubicle/ Termination Cabinet | Electronic system cabinet | Cage clamp (Post mounted) type. | Plug-in connector / other system as per Mfr.'s Standard | Internal wiring |
| Marshalling/ Termination System Cabinets | UCD mounted equipments | Cage clamp (Post mounted) type. | Plug in connector / Cage clamp type (rail mounted). | F,G (with plug-in connector at one end) |
| DDCMIS/PLC cabinets | PC, Printers etc. | Plug in connector | Plug in connector | Mfr.'s Standard |

Notes

1 Normally 10% spare cores shall be provided when the numbers of pairs of cables are more than four pairs, except for pre-fabricated cables which shall be as per manufacturer's standard.

2 For analog signals, individual pair shielding & overall shielding & for Binary signals, only overall shielding of instrumentation cables shall be provided.

3 * For high temperature applications only.

4 . For connection between field/JB and DDCMIS marshalling cabinet

Minimum 4 pair instrumentation cable shall be used.

5 All the spare cores of instrumentation cable have to be terminated in Marshalling cabinets/ DCS panel end.

6 Not used.

**6.00.00 TERMINAL BLOCKS**

6.01.00 All terminal blocks shall be rail mounted/post mounted, cage clamp type with high quality non-flammable insulating material of melamine suitable for working temperature of 105 deg. C. The terminal blocks in field mounted junction boxes, temperature transmitters, instrument enclosures/racks, etc., shall be suitable for cage clamp connections. The terminal blocks in Control Equipment Room logic/termination/marshalling cubicles shall be suitable for post

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

| | |
|---|---|
| | mounted cage clamp connection at the field input end. The exact type of terminal blocks to be provided by the Bidder and the technical details of the same including width etc. shall be subject to Employer's approval. |
| 6.02.00 | All the terminal blocks shall be provided complete with all required accessories including assembly rail, locking pin and section, end brackets, partitions, small partitions, transparent covers, support brackets, distance sleeves, warning label, marking, etc. |
| 6.03.00 | The marking on terminal strips shall correspond to the terminal numbering on wiring diagrams. At least 20% spare unused terminals shall be provided everywhere including local junction boxes, instrument racks/enclosures, termination/marshalling cabinets, etc. All terminal blocks shall be numbered for identification and grouped according to the function. Engraved labels shall be provided on the terminal blocks. |
| 6.04.00 | For terminating each process actuated switches, drive actuators, control valves, Thermocouple, RTD, etc. in Local Junction Boxes, etc, refer Drg no. 0000-999-POI-A-065. |
| 6.05.00 | The terminal blocks shall be arranged with at least 100 mm clearance between two sets of terminal blocks and between terminal blocks and junction box walls. |
| **7.00.00** | **INTERNAL PANELS/ SYSTEM CABINETS WIRING** |
| 7.01.00 | Internal panel/cabinet wiring shall be of multi-stranded copper conductor with FRLS PVC insulation without shield and outer sheath meeting the requirements of VDE 0815. |
| 7.02.00 | All internal wires shall be provided with tag and identification nos. etched on tightly fitted ferules at both ends. All wires directly connected to trip devices shall be distinguished by one additional red colour ferrule. |
| 7.03.00 | All external connection shall be made with one wire per termination point. Wires shall not be tapped or spliced between terminal points. |
| 7.04.00 | All floor slots of desk/panels/cabinets used for cable entrance shall be provided with removable gasketed gland plates and sealing material. Split type grommets shall be used for prefabricated cables. |
| 7.05.00 | All the special tools as may be required for solder less connections shall be provided by Bidder. |
| 7.06.00 | Wire sizes to be utilised for internal wiring. |

| | | |
|---|---|---|
| (i) | Current (4-20 mA), low voltage signals (48V); Ammeter/Voltmeter circuit, control switches etc. for electrical system. | 0.5 Sq.mm. |
| (ii) | Power supply and internal illumination. | 2.5Sq.mm. minimum (shall be as per load requirement.) |

| | |
|---|---|
| **8.00.00** | **INSTRUMENTATION CABLE INSTALLATION AND ROUTING** |
| 8.01.00 | All cables assigned to a particular duct/conduit shall be grouped and pulled in simultaneously using cable grips and suitable lubricants. Cables removed from one duct/conduit shall not be reused without approval of Employer. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

8.02.00 Cables shall be segregated as per IEEE Std.-422. In vertically stacked trays, the higher voltage cable shall be in higher position and instrumentation cable shall be in bottom tier of the tray stack. The distance between instrumentation cables and those of other system shall be as follows:

| | | |
|---|---|---|
| From 11 kV/6.6 kV/3.3 kV tray system | - | 914 mm |
| From 415V tray system | - | 610 mm |
| From control cable tray system | - | 305 mm |

8.03.00 Cables shall terminate in the enclosure through cable glands. All cable glands shall be properly gasketed. Sealing (to prevent ingress of dust entry and propagation of fire) shall be provided for all floor slots used for cable entrance. Compression cable glands (double for armoured and single for other cables) shall be provided.

8.04.00 Not in use

8.05.00 The cables emanating from redundant equipment/devices shall be routed through different paths. The above segregation of cables & wiring for redundant equipments/devices shall be in accordance with IEEE-Std-422.

**9.00.00 CABLE LAYING AND ACCESSORIES**

9.01.00 CABLE LAYING

1 Cables shall be laid strictly in line with cable schedule.

2 Identification tags for cables.

Indelible tags to be provided at all terminations, on both sides of wall or floor crossing, on each conduit/duct/pipe entry/exit, and at every 20 m in cable trench/tray.

3 Cable tray numbering and marking.

To be provided at every 10m and at each end of cable way & branch connection.

4 No jointing is permissible for Instrumentation cables. For other cables Jointing for more than 250 Meters run of cable shall be permitted.

5 Buried cable protection

With concrete slabs; Route markers at every 20 Meters along the route & at every bend.

6 Road Crossings

Cables to pass through buried high density PE pipes encased in PCC. At least 300 mm clearance shall be provided between

- HT power & LT power cables,
- LT power & LT control/instrumentation cables,

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

Spacing between cables of same voltage grade shall be in accordance with the derating criteria adopted for cable sizing.

7 Segregation (physical isolation to prevent fire jumping)

a All cable associated with the unit shall be segregated from cables of other Units.

b Interplant cables of station auxiliaries and unit critical drives shall be segregated in such a way that not more than half of the drives are lost in case of single incident of fire.

8 Cable clamping

All cables laid on trays shall be neatly dressed up & suitably clamped/tied to the tray. For cables in trefoil formation, trefoil clamps shall be provided.

9 Optical fiber cables ( OFCs) :

Outside Building Area - to be laid necessarily inside GI conduit with support from cable tray/Trestle structure

**Inside Building Area – to be laid on separate cable sub-trays**

While buried- in separate burried trench approx.1.0 meter depth, to be laid in 2" rodent proof HDPE conduits covered with sand, brick, laid breadth-wise and soil along the pipe line route by contractor;

While crossing roads - to be laid in GI/ rodent proof HDPE conduits with sand filling at bottom and sand, soil filling at top with cement concrete;

While crossing canals/river- to be laid in rodent proof HDPE conduits within hume pipe.

10 **Laying of Network Cable (UTP/STP) :**

**Out side Building Area- to be laid necessarily inside GI conduits with support from cable tray / Trestle structure.**

**Inside Building Area- to be laid necessarily inside GI conduits on separate cable sub-trays.**

9.02.00 Bidder shall supply and install all cable accessories and fittings like Light Interface Units, Surge suppressors, Opto isolators, Interface Converters, Fibre Optic Card Cage, Fibre Optic Line Driver, Repeater / Modem (for Optical Fibre Cables), cable glands, grommets, lugs, termination kits etc. on as required basis.

9.03.00 Cables, which terminate in cabinets of draw out sections shall have sufficient cable coiled in the bottom of the cabinet to permit full withdrawal of draw out sections without disconnecting the cables. When prefabricated cables with factory connectors on both ends are longer than required, the excess cable shall be coiled in the bottom of one or both termination cabinets.

9.04.00 The Bidder shall be responsible for proper grounding of all equipment under this package. Further, proper termination of cable shields shall be verified and the grounding of the same shall be coordinated so as to achieve grounding of all instrumentation cable shields at same potential. This shall be completed prior to system tests.

| CLAUSE NO. | TECHNICAL REQUIREMENTS | |
|---|---|---|
| 9.05.00 | The Contractor shall take full care while laying / installing cables as recommended by cable manufacturers regarding pulling tensions and cable bends. Cables damaged in any way during installation shall be replaced at the expense of the Contractor. | |
| **10.00.00** | **FIELD MOUNTED LOCAL JUNCTION BOXES** | |
| | (i) No. of ways | 12/24/36/48/64/72/96/128 with 20% spares terminals. |
| | (ii) Material and Thickness | 4mm thick Fiberglass Reinforced Polyester (FRP). |
| | (iii) Type | Screwed at all four corners for door. Door gasket shall be of synthetic rubber. |
| | (iv) Mounting clamps and accessories | Suitable for mounting on walls, columns, structures etc. The brackets, bolts, nuts, screws, glands required for erection shall be of SS, included in Bidders scope of supply. |
| | (v) Type of terminal blocks | Rail mounted cage-clamp type suitable for conductor size upto 2.5 $mm^2$. A M6 earthing stud shall be provided. |
| | (vi) Protection Class | IP: 55 minimum for indoor & IP-65 minimum for outdoor applications. |
| | (vii) Grounding | To be provided. |
| | (viii) Color | RAL 7035 |
| **11.00.00** | **CONDUITS** | |
| 11.01.00 | Conduits shall be generally used for interconnecting cables from field instruments to Local JB's. All rigid conduits, couplings and elbows shall be hot dipped galvanised rigid mild steel in accordance with IS: 9537 Part-I (1980) and Part-II (1981). The conduit interior and exterior surfaces shall have continuous zinc coating with an overcoat of transparent enamel lacker or zinc chromate. Flexible conduit shall be heat resistant **terne coated steel** with , water leak, fire and rust proof protected *for the areas of* Mills,Drum, Main Steam, RH steam Air Heaters and Furnace, BFPDT's .<br>*And for remaining applications, water leak, fire and rust proof flexible GI conduits shall be provided.* The temperature rating of flexible conduit shall be suitable for actual application. | |
| 11.02.00 | All rigid conduit fittings shall conform to the requirements of IS: 2667, 1976. Galvanized steel fitting shall be used with steel conduit. All flexible conduit fittings shall be liquid tight, galvanized steel. The end fittings shall be compatible with the flexible conduit supplied. | |
| 11.03.00 | Conduit sealing, explosion proof, dust proof and other types of special fittings shall be provided as required by these specifications and shall be consistent with the area and equipment with which they are installed. Fittings installed outdoors and in damp locations shall be sealed and gasketed. Hazardous area fittings and conduits sealing shall conform with NEC requirements for the area classification. | |
| 11.04.00 | Contractor shall provide double locknuts on all conduit terminations not provided with threaded hubs and couplings. Water tight conduit unions and rain tight conduit hubs shall be | |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| | utilised for all the application which shall be exposed to weather. Moisture pockets shall be eliminated from conduits. |
| 11.05.00 | Conduits shall be securely fastened to all boxes and cabinets. |
| **12.00.00** | **CABLE SUB-TRAY & SUPPORT** |
| 12.01.00 | The cable sub-trays and the supporting system, to be generally used between Local/Group JBs and the main cable trays and the same shall be furnished and installed by the Contractor. It is the assembly of sections and associated fittings forming a rigid structural system used to support the cable from the equipment or instrument enclosure upto the main cable trays (trunk route). |
| 12.02.00 | The covers on the cable sub-trays shall be used for protection of cables in areas where damage may occur from falling objects, welding spark, corrosive environment, etc. & shall be electrically continuous and solidly grounded. |

# SUB-SECTION-III-C5

# PLC BASED CONTROL SYSTEM

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

## PLC BASED CONTROL SYSTEM

**1.00.00 CONTROL AND INSTRUMENTATION FOR PLANT AUXILIARY PACKAGES**

1.01.00 Contractor shall provide complete Control and Instrumentation system with all accessories, auxiliaries and associated equipments and cables for the safe, efficient and reliable operation of the plant auxiliary systems as indicated under scope part at III C, Part-A, Section VI.

1.02.00 The quantity of instruments for each plant auxiliary system shall be as per tender P&ID wherever provided of the respective system as a minimum, for bidding purpose. However, Bidder shall also include in his proposal all instruments and devices, which are needed for the completeness of the plant auxiliary system/equipment, supplied by the Contractor, even if the same is not specifically appearing in the P&ID.

1.03.00 All instruments and control equipments like primary and secondary instruments etc. shall meet the requirements specified in Sub-Section - MEAS INST, Part-B, Section VI. In addition, all electrical instrument devices like switches/ transmitters/ controllers/analyzers/solenoid valves which are located in the field/hazardous locations shall be provided with explosion proof enclosure suitable for hazardous areas described in National Electric Code (USA), Article 500, Class-I, Division-I. All fittings, cable glands etc. shall be strictly as per NEC recommendation article, 500 to 503.

1.04.00 Contractor shall provide independent control systems for safe, efficient and reliable operation of each of the plant auxiliary systems. The type of control system shall be as indicated under scope part at III C, Part-A, Section VI.

1.05.00 ON/OFF control, indication, annunciation of incomers and bus-coupler (even if they are not in the scope of the contractor) are also to be performed from Contractor's Control System for each of the plant auxiliary system as applicable.

1.06.00 It shall be possible to remove/replace online various modules (like any I/O module, interface module, etc.) from its slot for maintenance purpose without switching off power supply to the corresponding rack. System design shall ensure that while doing so, undefined signaling and releases do not occur and controller operation in any way is not affected (including controller trip to manual, etc) except that information related to removed module is not available to controller. Further, it shall also be possible to remove/replace any of the redundant controller module without switching off the power to the corresponding rack and this will not result in system disturbance or loss of any controller functions for the other controller. The on-line

| | |
|---|---|
| | removal/insertion of controller, I/O modules shall in no way jeopardize safety of plant and personnel. |
| 1.07.00 | The control system shall provide safe operation under all plant disturbances and on component failure so that under no condition the safety of plant, personnel or equipment is jeopardized. Control system shall be designed to prevent abnormal swings due to loss of Control System power supply, failure of any Control System component, open circuit/short circuit, instrument air supply failure etc. On any of these failures the controlled equipment/parameter shall either remain in last position before failure or shall come to fully open/close or on/off state as required for the safety of plant/personnel/equipment and as finalised during detailed engineering. System shall be designed such that there will be no upset when Power is restored. |
| 1.08.00 | The Control system shall include on-line self-surveillance, monitoring and diagnostic facility giving the details of the fault on the Human Machine Interface System (HMIS). The faults to be reported shall include fault in main & standby power supplies, sensor fault, Input/ Output card failure, Memory Status, Controller fault, failure of Communication/ Network links to PLCs, LAN etc. These faults shall be reported as color change on system status display and as messages on HMIS as well as through local indication on the faulty module and on respective rack/ cubicle. The diagnostic system shall ensure that the faults are detected before any significant change in any controller output has taken place. |
| 1.09.00 | The Control system shall be located in Air conditioned area. However the referred control system shall be designed to operate in non-air conditioned area also and shall meet the minimum requirements as specified below. |
| 1.10.00 | Also refer configuration diagram for PLC based off-site control system, drawing no. 0000-151-POI-A-013. |
| **2.00.00** | **PROGRAMMABLE LOGIC BASED CONTROL SYSTEM** |
| **2.01.00** | **PLC PROCESSOR** |
| | The processor unit shall be capable of executing the following functions:- |
| | a Receiving binary and analog signals from the field and providing command output to MCC/SWGR/Drive etc. through Input / Output modules and operator initiated commands from HMIS / control panel. |
| | b Implementing all logic functions for control, protection and annunciation of the equipment and systems. |

c Implementing modulating control function for certain application as specified elsewhere in the specification.

d Providing supervisory information for alarm, various types of displays, status information, trending, historical storage of data etc.

e Performing self-monitoring and diagnostic functions.

2.02.00 Wherever Dual processor based PLC system has been specified, each PLC unit shall be provided with two processors (Main processing unit and memories) one for normal operation and one as hot standby. In case of failure of working processor, there shall be an appropriate alarm and simultaneously the hot standby processor shall take over the complete plant operation automatically. The transfer from main processor to standby processor shall be totally bump less and shall not cause any plant disturbance whatsoever. In the event of both processors failing, the system shall revert to fail safe mode. It shall be possible to keep any of the processors as master and other as standby. The standby processor shall be updated in line with the changes made in working processor.

Wherever multiple functional groups have been specified/ required, the above requirements are applicable for each functional group.

2.03.00 The memory shall be field expandable. The memory capacity shall be sufficient for the complete system operation and have a capability for at least 20% expansion in future. Programmed operating sequences and criteria shall be stored in non volatile semi conductor memories like EPROM. All dynamic memories shall be provided with buffer battery back up which shall be for at least 360 hours. The batteries shall be lithium or Ni-Cd type.

2.04.00 Priority of different commands shall be as follows:

2.04.01 Manual intervention shall be possible at any stage of operation. Protection commands shall have priority over manual commands and manual commands shall prevail over auto commands.

2.04.02 A forcing facility shall be provided for changing the states of inputs and outputs, timers and flags to facilitate fault finding and other testing requirements. It shall be possible to display the signal flow during operation of the program.

**2.05.00 HUMAN MACHINE INTERFACE SYSTEM (HMIS)**

2.05.01 Operator work station (OWS) shall perform control, monitoring and operation of all auxiliaries/ drives interacting with PLC based control system. It shall be possible to use the same as programming station of the PLC and the Human Machine Interface

| | |
|---|---|
| | System. It shall basically perform the following functions. In case the PC based OWS can not be used as programming station of the PLC and the Human Machine Interface System, then separate PC based programming station shall be provided. |
| 2.05.02 | Operator shall be able to access all control/information related data under all operating conditions including a single processor/computer failure in the HMIS. |
| 2.05.03 | All frequently called important functions including major displays shall be assigned to dedicated function keys on a soft keyboard for the convenience of the operator for quick access to displays & other operator functions. |
| 2.05.04 | The operator functions for each OWS shall as a minimum include Control System operation (A/M selection, raise/lower, set point/bias change, on/off, open/close operation, mode/device selection, bypassing criteria, sequence auto, start/stop selection, drive auto selection, local-remote/other multi-position selection etc.); alarm acknowledge; call all kind of displays, logs, summaries, calculation results, etc.; printing of logs & reports; retrieval of historical data; and any other functions required for smooth operation, control & management of information as finalized during detailed engineering. |
| 2.05.05 | The display selection process shall be optimized so that the desired display can be selected with the minimum no. of operations. Navigation from one display to any other should be possible efficiently through paging soft keys as well as through targets defined on the displays. There should be no limitation on number of such targets. |
| 2.05.06 | The system shall have built-in safety features that will allow/disallow certain functions and entry fields within a function to be under password control to protect against inadvertent and unauthorized use of these functions. Assignment of allowable functions and entry fields shall be on the basis of user profile. The system security shall contain various user levels with specific rights as finalised by the Employer during detailed engineering. However, no. of user levels, no. of users in a level and rights for each level shall be changeable by the programmer (Administrator).<br><br>When any drive or sequence is being controlled from one OWS, the system shall inhibit control access of the same drive or sequence from other OWS or Local Control Panel. |

**2.06.00 PROGRAMMING FUNCTIONALITIES**

Programming of the PLC Processor / controller as well as programming of HMIS shall be user friendly with graphical user interface and shall not require knowledge of any specialized language. For example, the programming of PLC shall use either of the following:-

- Flow-chart or block logic representing the instructions graphically.

- Ladder diagrams.

The programming of HMIS (like development and modification of data base, mimics, logs / reports, HSR functionalities etc.) shall also be possible through user-friendly menus etc

All programming functionalities shall be password protected to avoid unauthorised modification.

**2.07.00 SOFTWARE REQUIREMENT**

2.07.01 All necessary software required for implementation of control logic, operator station displays / logs, storage & retrieval and other functional requirement shall be provided. The programs shall include high level languages as far as possible. The contractor shall provide sufficient documentation and program listing so that it is possible for the Employer to carry out modification at a later date.

2.07.02 The Contractor shall provide all software required by the system for meeting the intent and functional/parametric requirements of the specification.

2.07.03 Industry standard operating system like UNIX/WINDOWS (latest version) etc. to ensure openness and connectivity with other system in industry standard protocols (TCP-IP/ OPC etc.) shall be provided. The system shall have user friendly programming language & graphic user interface.

2.07.04 All system related software including Real Time Operating System, File management software, screen editor, database management software. On line diagnostics/debug software, peripheral drivers software and latest versions of standard PC-based software and latest WINDOWS based packages etc. and any other standard language offered shall be furnished as a minimum.

2.07.05 All application software for PLC system functioning like input scanning, acquisition, conditioning processing, control and communication and software for operator

interface of monitors, displays, trends, curves, bar charts etc. Historical storage and retrieval utility, and alarm functions shall be provided.

2.07.06 The Contractor shall provide software locks and passwords to Employer's engineers at site for all operating & application software so that Employer's engineers can take backup of these software and are able to do modifications at site.

**2.08.00 PARAMETRIC REQUIREMENTS**

The control system shall be designed such that under worst case loading conditions the response time shall not be worst than the following:-

| | | |
|---|---|---|
| On/Off Command | - | The response time for screen update after the execution of the control command from the time the command is issued (for example command to start a motor to the time the screen is updated) shall be two seconds (excluding the drive actuation time). |
| Adjustment Command | - | 0.5 to 1 second. |
| On screen Updating | - | 1 second. |
| All Control related displays | - | 1 second. |
| Bar Chart displays | - | 2 to 3 seconds. |
| Plant Mimic displays | - | 2 to 3 seconds. |
| Group review displays | - | 2 to 3 seconds. |
| X-T Plot Displays | - | 1 to 2 seconds. |
| Plant Summary Displays | - | 1 to 2 seconds. |

Even under worst case loading condition of HMIS and system Bus, each HMIS processor shall have 50 % spare time when measured over any one minute period and the system bus shall have at least 50 % spare duty cycle.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| **3.00.00** | **INPUT/OUTPUT MODULES** |
| 3.00.01 | The PLC system should be designed according to the location of the input/output cabinets as specified. |
| 3.00.02 | Input Output modules, as required in the Control System for all type of field input signals ( 4-20 mA, non change over/change over type of contact inputs etc.) and outputs from the control system (non change over/change over type of contact, 24/48 VDC output signals for energising interface relays,4-20 mA output etc.) are to be provided by the Contractor. Contractor to refer drawing no. 0000-999-POI-A-065 for interface/termination requirements of Field Instruments/ Drives. |
| 3.00.03 | Electrical isolation of 1.5KV with optical couplers between the plant input/output and controller shall be provided on the I/O cards. The isolation shall ensure that any inadvertent voltage or voltage spikes (as may be encountered in a plant of this nature) shall not damage or mal-operate the internal processing equipment. |
| 3.00.04 | The Input/output system shall facilitate modular expansion in fixed stages. The individual input/output cards shall incorporate indications on the module front panels for displaying individual signal status. |
| 3.00.05 | Individually fused output circuits with the blower fuse indicator shall be provided. All input/output points shall be provided with status indicator. Input circuits shall be provided with fuses preferably for each input, alternatively suitable combination of inputs shall be done and provided with fuses such that for any fault, fuse failure shall affect the particular drive system only without affecting other systems. |
| 3.00.06 | All input/output cards shall have quick disconnect terminations allowing for card replacement without disconnection of external wiring and without switching of power supply. |
| 3.00.07 | The Contractor shall provide the following monitoring features:<br>a Power supply monitoring.<br>b Contact bounce filtering.<br>c Optical isolation between input and output signals with the internal circuits<br>d In case of power supply failure or hardware fault, the critical outputs shall be automatically switched to the fail-safe mode. The fail-safe mode shall be intimated to the successful Contractor during detailed engineering. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| 3.00.08 | Binary Output modules shall be rated to switch ON/OFF coupling relays of approx. 3 VA at 24 VDC. Analog output modules shall be able to drive an load impedance of 500 Ohms minimum. |
| 3.00.09 | Output module shall be capable of switching ON/OFF inductive loads like solenoid valves, auxiliary relays etc. without any extra hardware. |
| 3.00.10 | Only one changeover contact shall be provided in MCC for control and interlock requirement. Further multiplication, if required, shall be done by the contractor in PLC system. |
| 3.00.11 | All input fields interrogation voltage shall be 24V DC or 48 V DC. |
| 3.00.12 | In case of loss of I/O communication link with the main processing unit, the I/O shall be able to go to predetermined fail safe mode (to be decided during detailed engineering) with proper annunciation. |
| 3.01.00 | Wiring Scheme for inputs to control system shall be as follows: |
| 3.01.01 | Input used for interlock/protection shall be dual redundant. Each of the redundant binary & analog inputs shall be wired to separate input modules. These redundant modules shall be placed in different racks, which will have separately fused power supply distribution. Implementation of multiple measurement scheme of these inputs will be performed in the redundant hardware. Loss of one input module shall not affect the signal to other modules. Other channels of these modules can be used by other inputs of the same functional group. |
| 3.01.02 | The single (i.e. non-redundant) binary & analog signal required for control purposes shall be wired as follows: |
| 3.01.03 | All single analog & binary inputs including the limit switches of valves/dampers MCC/SWGR check-backs of all drives & information related signals shall be wired to single (i.e. non-redundant) input modules. |
| 3.01.04 | The on-off status of HT drives etc, however, be wired to two input modules in parallel. |
| 3.01.05 | Inputs and Outputs related to each of the redundant drives / equipments ( eg. each of the 3x50 % drives, each of the storage vessel/sump/tank storing same fluid, each of the streams and its related drives etc. ) shall be wired to separate input and output modules. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

3.02.00 The signal conditioning functions like multiple measurement schemes, square root extraction for flow signals, pressure and temperature compensation, limit value computation can be performed either in the controllers or in signal conditioning and processing hardware outside controllers.

3.03.00 The maximum number of inputs/outputs to be connected to each type of module shall be as follows:

| | | |
|---|---|---|
| 1. | Analog input module | 16 |
| 2. | Analog output module | 16 |
| 3. | Binary input module | 32 |
| 4. | Binary output module | 32 |
| 5. | Analog input & output (combined) | 16 |
| 6. | Binary input and output (combined) | 32 |

3.04.00 Any single sensor/transducer/transmitter failure alarm shall be provided on programmer station screens for all sensors/transducers/transmitters. Similarly sensor break alarm for thermocouples etc. shall also be displayed on the screens.

3.05.00 Contractor shall provide remote Input/Output modules Housed in free-standing cabinets/racks (with suitable redundant data link to the central PLC system) as specified. These Input/Output modules shall meet the technical requirements as mentioned in the above clauses. Further these Input/Output modules shall be designed to continuously work under the environment expected to be encountered in assigned areas without any air-conditioning support. Wherever the cable route distance of these I/O cabinets/racks exceeds a distance of 300 meters from the Central PLC, fiber optic data link has to be provided.

**4.00.00 SYSTEM SPARE CAPACITY**

4.01.00 Over and above the equipment and accessories required to meet the fully implemented system as per specification requirements, Control System shall have spare capacity and necessary hardware/ equipment/ accessories to meet following requirement for future expansion at site:

4.02.00 10% spare channels in input/output modules fully wired up to cabinets TB.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| 4.03.00 | Wired-in "usable" space for 20% modules in each of the system cabinets for mounting electronic modules wired up to corresponding spare terminals in system cabinets. Empty slots between individual modules/group of modules, kept for ease in maintenance or for heat dissipation requirement as per standard practice of Contractor shall not be considered as wired-in "usable" space for I/O modules. Terminal assemblies (if any in the offered system), corresponding to the I/O modules shall be provided for above mentioned 20 % blank space. |
| 4.04.00 | Each processor / controller shall have 30% spare functional capacity to implement additional function blocks, over and above implemented logic/ loops. Further, each processor / controller shall have spare capacity to handle minimum 30% additional inputs/ outputs of each type including above specified spare requirements, over and above implemented capacity. Each of the corresponding communication controllers shall also have same spare capacity as that of processor/controller. |
| 4.05.00 | The Data communication system shall have the capacity to handle the additions mentioned above. |
| 4.06.00 | Twenty (20) percent spare relays of each type and rating mounted and wired in cabinets TB. All contacts of relays shall be terminated in terminal blocks of cabinets. |
| 4.07.00 | The spare capacity as specified above shall be uniformly distributed throughout all cubicles. The system design shall ensure that above mentioned additions shall not require any additional controller/processor/ peripheral drivers in the system delivered at site. Further, these additions shall not deteriorate the system response time / duty cycle, etc. from those stipulated under this specification. |
| **5.00.00** | **DATA COMMUNICATION SYSTEM (DCS)** |
| 5.01.00 | The Data Communication System shall include a redundant Main System Bus with hot back-up. Other applicable bus systems like cubicle bus, local bus, I/O bus etc shall be redundant except for backplane buses which can be non-redundant.<br><br>The DCS shall have the following minimum features :<br><br>a Redundant communication controllers shall be provided to handle the communication between I/O Modules (including remote I/O) and PLCs and between PLCs and operator work station.<br><br>b The design shall be such as to minimise interruption of signals. It shall ensure that a single failure anywhere in the media shall cause no more than a single message to be disrupted and that message shall automatically be retransmitted. Any failure or physical removal of any |

station/module connected to the system bus shall not result in loss of any communication function to and from any other station/module.

c If the system bus requires a master bus controller philosophy, it shall employ redundant master bus controller with automatic switchover facility.

d Built-in diagnostics shall be provided for easy fault detection. Communication error detection and correction facility (ECC) shall be provided at all levels of communication. Failure of one bus and changeover to the standby system bus shall be automatic and completely bump less and the same shall be suitably alarmed/logged.

e The design and installation of the system bus shall take care of the environmental conditions as applicable.

f Data transmitting speed shall be sufficient to meet the responses of the system in terms of displays, control etc. plus 25% spare capacity shall be available for future expansion.

g Passive coaxial cables or fibre optic cables shall be employed.

The Contractor shall furnish details regarding the communication system like communication protocol, bus utilisation calculations etc.

5.02.00 The reaction time of the programmable control system from input signals at the input cards to output of the associated signals or commands of the output card inclusive of programmed logic processing, comprising a mixture of logic gates, arithmetic operations and other internal operations shall be less than 100 milli seconds under the most arduous control system operating conditions.

**5.03.00 Controls/Open Loop Control System (OLCS) Functions**

5.03.01 These clauses are applicable for all the Binary controls of PLC included in Contractor's Scope including all the control logics of FGD system.

5.03.02 The OLCS shall include sequence control, interlock & protection for various plant auxiliaries/valves/dampers/drives etc. The sequence control shall provide safe and automatic startup and shutdown of FGD system. The interlock and protection system shall ensure safe operation of FGD system at all times and shall automatically shut down FGD system when unsafe conditions arise.

5.03.03 The OLCS shall be arranged in the hierarchical control structure consisting of unit level, group level, subgroup level & drive level (as applicable).

5.03.04 It shall be possible to perform automatic FGD startup & shutdown by issuing minimum number of command from OWS. Thus, the unit level shall control all the Control System Blocks and issue appropriate startup & shutdown commands to various blocks of this Control System and receive corresponding commands/check backs/feedbacks.

5.03.05 The group level shall control a set of functional sub-groups of drives. Appropriate start-up and shut down commands shall be issued to the sub-group control and various check-backs shall be received from sub-groups or drives. Each sub-group shall execute the sequential start-up and shut down programs of a set of inter-related drives along with system interlocks and protections associated with that sub-group as well as basic interlocks and protections related to individual drive falling under that sub-group. The drive level shall accept commands from the sub-groups, push buttons (wherever provided), etc., and transmit them to the respective drive, after taking into account various interlocks and protections and the safety of that particular drive. For HT drive, first-up logic shall be incorporated to indicate the cause of protection/trip.

5.03.06 **Sequence Control**

1 A sequence shall be used to move a set of groups, sub-groups from an initial steady state (for instance 'OFF') to a final steady state (for instance 'ON'). The sequence initiating command for the unit & group level shall be issued from OWS.

2 A sequence shall be made of steps. The steps shall be executed in predetermined order according to logic criteria and monitoring time consisting of the interlock & protection requirements and check back of previous step which shall act as preconditions before the sequence control can execute the command for that step.

3 Each step shall have a "waiting time" implying that the subsequent step would not be executed unless the specified time elapses. A monitoring time shall also be defined as the maximum time required in executing the commands of any step and the time required for appearance of check back signals. In case, this is not completed within the specified time, a message shall be displayed and programme will not proceed further.

4 Manual intervention shall be possible at any stage of operation and the sequence control shall be able to continue at the correct point in the programme on return to automatic control. Protection commands shall have priority over manual commands, and manual commands shall prevail over auto commands.

5 Open or close priority shall be selectable for each drive.

6 The sequence startup mode shall be of the following types.

A Automatic Mode

B Semi-Automatic Mode

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| | C Operator Guide Mode / Test Mode |
| 5.03.07 | For the drives, the command shall be provided through redundant O/P module to MCC/SWGR/Actuator as applicable and inputs (status, SWGR & process) shall be acquired through input modules. The failure of one of the redundant output module shall in no way affect the function of the other output module. |
| 5.03.08 | The output modules control module shall have the feature that ensures that in case of failure, all the outputs are driven to zero. The 24V DC command outputs to drives for ON/OPEN, OFF/CLOSE shall be separate and independent and inverted outputs shall not be employed. Keeping +24 V DC extended to the relays for these outputs continuously and extending ground/ negative when command is to be issued is not acceptable except some of the auxiliary plants as to be decided during detailed engineering. |
| 5.03.09 | For inching type of drives, position transmitter power supply and monitoring of position transmitter signal shall be provided. |
| 5.03.10 | The termination for OPEN (ON)/CLOSE (OFF) command for the drive actuator shall be performed in the actuators specified elsewhere in the specification. However, OPEN (ON)/CLOSE (OFF) and disturbance status as a minimum shall be monitored in OLCS. |
| 5.03.11 | The sequence interlock & protection requirements shall be finalized during detailed engineering and the same shall be subject to Employer's approval. |
| 5.03.12 | The drive function i.e. basic interlock & protection logic of the drive shall be implemented in redundant controllers. The drive function shall ensure that protection signals for the safety of the drive shall be effective under all conditions and under all modes of operation. The different commands shall be performed according to the priority of protection 'Off', Protection 'On', manual and automatic. The standard functions like running time monitoring, status signaling, alarm/drive annunciation, etc. shall be performed in drive function. The drive function shall prevent hunting of the actuator in the presence of both open & close commands for actuators of the valves & dampers. The drive function shall be implemented in dedicated standard software functional block. |
| 5.03.13 | The reversible drives to be controlled under OLCS shall be actuators with integral starters. These actuators will have coupling/interposing relays for accepting commands from OLCS and shall provide check back signals to OLCS. As such, all drive related inputs/outputs for reversible drives shall be available from actuators in field. The 'Open' and 'Closed' limit switches of each actuator shall be monitored with selectable delay time to check & alarm the contradictory condition of both contacts indicating 'Open' or 'Closed' status of actuators. The actuators for valves & dampers shall be interfaced as follows : |
| 5.03.14 | The open/close commands and check back signals from limit switches and disturbance signals shall be hardwired to respective OLCS group through I/O modules from actuators in the field. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| **5.04.00** | **Modulating Controls/Closed Loop Control System (CLCS) Functions** |
| 5.04.01 | This Clause is applicable for all analog controls of PLC. |
| 5.04.02 | The controller capability shall, as a minimum, include (i) P, PI, PD and PID control functions and their variations (ii) cascade control (iii) feed forward control (iv) On-Off control, (v) Ratio and bias control, (vi) Logical operation . |
| 5.04.03 | The loop reaction time (from change of output of the transmitter/temperature element to the corresponding control command output) shall be within 500 milli seconds. For binary control the response time shall be within 100 milli seconds only. |
| 5.04.04 | The control loop shall have enough flexibility and various features to perform feed forwards, balancing of controller, increasing the response to achieve the desired process parameter within prescribed time frame. |
| 5.04.05 | The control system shall be bumplessly transferred to manual on the conditions of Control power supply failure, Failure of redundant controllers, Field input signal not available, Analog input exceeding preset value, etc. as a minimum and as finalized during detailed engineering. |
| 5.04.06 | Any switch over from auto to manual, manual to auto and switchover from OWS operation to H/A station operation and vice versa shall be bump less and without resulting in any change in the plant regulations and the same shall be reported to the operator and recorded automatically. |
| 5.04.07 | The System being supplied shall be such that when permissible limits are exceeded, an automatic switchover from an operation governed by maximum efficiency, to an operation governed by safety and availability is affected. |
| 5.04.08 | For safety reasons, switchover logics associated with the modulating control loops shall be performed within the closed loop control equipment. Modulating control loops shall be provided with standard features to interface overriding commands from OLCS/Protection System like open, protection open etc. |
| 5.04.09 | All controllers shall be freely configurable with respect to requisite control algorithms. |
| **6.00.00** | **SYSTEM REACTION TIME** |
| 6.01.00 | The reaction time of the programmable control system from input signals at the input cards to output of the associated signals or commands of the output card inclusive of programmed logic processing, comprising a mixture of logic gates, arithmetic operations and other internal operations shall be less than 100 milli seconds under the most arduous control system operating conditions. |
| **7.00.00** | **OPERATOR INTERFACE DISPLAYS/LOGS/REPORTS** |
| 7.01.00 | Suitable Operator Interface Displays/Logs/Reports for control operation & monitoring shall be provided. The details shall be finalised during detailed Engg. stage. |

7.02.00 Minimum quantities shall be as follows:-

1 Various displays on the OWS shall as a minimum include P&ID displays or mimic, bar chart displays, x-y & x-t plot (trend) displays, operator guidance message displays, group displays, plant start-up/shutdown message displays, system status displays etc. Number of displays and the exact functionality shall be on as required basis and as finalised during detailed engineering subject to the minimum quantities as given in subsequent clauses. For x-t & x-y plots, the facility of providing a background grid on operator request shall be variable with adequate no. Of divisions in both co-ordinates.

2 The Minimum Quantity of Major Types of Displays per unit shall be as follows:

| | | |
|---|---|---|
| a) | Control displays (group/sub-group/ sequence/loop) | (On as reqd. basis subject to 100 minimum) |
| b) | P&ID/ mimic display | 20 |
| C) | X-Y Plot (with superimposed operating curves + using user selectable stored data) | 25 + 25 |
| D) | Group displays | 20 |
| E) | Operator guidance message | 10 |
| F) | System status & other diagnostic display | on as required basis |

The assignment for the above will be done by the contractor as per the requirement of operation of contractor's system as well as for maintenance. The balance displays shall be left as spare for future modification/addition.

**8.00.00 HISTORICAL STORAGE AND RETRIEVAL SYSTEM (HSRS)**

8.00.01 The HSRS shall collect, store and process system data from MMIPIS data base. The data shall be saved online on hard disk and automatically transferred to erasable long term storage media once in every 24 hours periodically for long term storage. Provision shall be made to notify the operator when hard disk is certain percentage full. The disk capacity shall be sufficient to store at least seven days data .

8.00.02 The data to be stored in the above system shall include alarm and event list, periodic plant data, selected logs/reports . The data/information to be stored & frequency of storage and retrieval shall be as finalised during detailed engineering. The system shall provide user-friendly operator functions to retrieve the data from historical storage. It shall be possible to retrieve the selected data on OWS or printer in form of trend/report by specifying date, time & period. Further, suitable index files/directories shall also be provided to facilitate the same. The logs/reports for at least last seven (7) days shall be available on the disk.

8.00.03 In addition to above, the system shall also have facility to store & retrieve important plant data for a very long duration (plant life) on portable long term storage media). These data will include any data from the database as well as processed/computed data based an various calculations/transformation. The retrieved data from long term storage media should be possible to be presented in form of alarms, logs, reports, etc.

**9.00.00 CONTROL & POWER SUPPLY SCHEME**

9.00.01 **General Requirements**

The requirements of Electrical Power Supply system are specified herein on system basis. The Contractor shall be responsible for engineering and furnishing a complete and operational system fully meeting the intent and requirements of this specification including tender drawings and Employer approved drawings during detailed engineering. All equipment and accessories required for completeness of this system shall be furnished by the Contractor whether these are specifically mentioned herein or not. All the equipments and sub systems offered shall be from reputed experienced manufacturers. All system cabinets, enclosures, & distribution boards shall be manufactured, assembled, wired and fully tested as a complete assembly as per the requirements of this specification at the manufacturer's works.

The Contractor shall furnish all required equipment cubicles and wiring required for conversion and/or stabilization of the power sources provided by the Employer to all other levels which may be necessary for meeting the individual requirement of equipment/system furnished by him including the panel/desk mounted equipment.

24 V DC power supply system shall be provided as below:-

**i)** 24V DC power supply system for PLC based control system shall comprise of two sets, each set shall consist of 1 x 100% microprocessor controlled, intelligent, modular rectifier banks, Controller – one for each rectifier bank, 1 x 100% Nickel - Cadmium batteries for one (1) hour duty, 1 X 100% DC distribution board. 1x100% Microprocessor controlled Battery Health Monitoring System (BHMS)–common for both the sets.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| | Necessary redundant transformers shall be provided by the contractor to derive the power supply from 415V, 3 phase, 3 wire incomers for above. |
| 9.01.00 | **POWER SUPPLY SYSTEM FOR PLC BASED CONTROL PANELS** |
| 9.01.01 | Microprocessor based, Intelligent, Modular Power Supply. |
| 9.01.02 | Microprocessor based, intelligent, modular power supply shall be sized to meet connected load requirements and keep the connected battery full charged in Float/ Boost mode. A provision of 10% design margin shall be kept over and above the load requirement. Either of the bank of rectifier modules shall be able to recharge fully discharged battery within 8 hours. It shall also be possible to discharge batteries periodically manually. Each rectifier bank shall have N+1 rectifier modules for all applications. The exact sizing of the rectifiers in one bank shall be as approved by Employer during detailed engineering. While selecting the components and finalizing the cooling arrangements, Bidder to note that these rectifier modules are required to operate at 30-40 % of the rated load for most of the time. While sizing, the temperature derating factor as applicable, is to be considered for arriving at the rating of the modules as per Bidder's manufacturing standard if the modules are rated for lower than the 50 deg. C ambient. For the rectifier bank, matching controller along with applicable software shall be provided to meet system requirements under all modes of operation." |
| 9.01.03 | The rectifier module shall be microprocessor controlled, IGBT/Power MOSFET based, high frequency with active load sharing, designed for single and parallel operation with battery and shall have automatic voltage regulators for a close voltage stability even when AC supply voltage and DC load fluctuates, effective current limiting features, front access design, programmable temperature compensation feature for battery charging and filters on both input and output to minimize harmonics. The rectifier module output regulation shall be +/- 1% or better from no load to full load with an input power supply variation of +/- 10% in voltage and +/- 5% in frequency. In addition to indications / display on rectifier panel, alarms along with relevant analog measurements shall also be provided by employing RS 485 Port Modbus Protocol / Ethernet TCP/IP protocol for use in PLC system. Further isolated 4-20 mA signals shall be provided for important parameters like rectifier bank voltage, rectifier bank current, battery voltage, battery current, DCDB Voltage, DCDB current etc. The list of alarm output & 4-20 mA signals shall be as approved by Employer during detailed engineering. Necessary provision shall be done in PLC end also. |
| 9.01.04 | "Float / Boost" charge functions shall be provided with alarm / indications. |
| 9.01.05 | Each rectifier bank shall be rated for 100% load requirement and keep the connected battery full charged and one spare rectifier module. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| 9.01.06 | The rectifier module circuitry shall be of fail-safe design and failure of any component should not result in any rectifier bank output voltage to increase beyond acceptable limits of the C&I system being fed from it. |
| 9.01.07 | The rectifier module shall be current limited for circuit protection and protection of battery from overcharge. The current limit shall be continuously programmable. |
| 9.01.08 | The rectifier module shall have a slow walk-in circuit which shall prevent application of full load DC current in less than 10 seconds after AC power is energized. |
| 9.01.09 | The rectifier module shall be fed from 415 V AC, 50 HZ, 3 phase, 3 wire system. Bidder shall provide all required power cables & other accessories etc. from 415 V AC power supply system to his electrical power supply system. |
| 9.01.10 | The full load efficiency of rectifier module at nominal input and output shall be 90%. The ripple content shall be limited to +/- 0.5% of output voltage. |
| 9.01.11 | Bidder shall furnish the equipment complete in all respect along with rectifier module rating & voltage drop calculations, supporting curves / data etc. |
| 9.01.12 | The Controller shall be intelligent, microprocessor controlled for monitoring & control of rectifier modules with features viz. auto / manual battery discharge test, battery reserve time prediction, energy management, float / boost mode control etc. |
| 9.01.13 | All software as required for smooth operation and monitoring of rectifier modules in conjunction with controller & BHMS shall be provided by the Contractor. |
| 9.02.00 | **Batteries for PLC system** |
| 9.02.01 | The batteries shall be heavy duty Nickel-cadmium type and shall be sized for one hour of full load operation during non-availability of AC supply / chargers. The Ni-Cd batteries shall conform to IS: 10918. The batteries shall be sized as per relevant IEEE Standards. For sizing calculation, an aging factor of 0.8 and a temperature correction factor as per manufacturer's standard at 4 deg. C electrolyte temperature (Based on temperature characteristics curve to be submitted by the Contractor at a temperature of 4 deg. C). Capacity factor, Float Correction Factor, as per Battery Supplier Standard, shall be taken into consideration, if applicable and ambient temperature shall be considered as the electrolytic temperature. The sizing of the battery shall be as approved by Employer during detailed engineering. However, Contractor shall consider a suitable voltage drop of 2V from battery room to DCDB and DCDB to load, while sizing the battery. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| 9.03.00 | **DC DISTRIBUTION BOARD (DCDB)**<br><br>Redundant DC feeders (one from each DCDB) shall supply each of the connected panels. From DCDB / panel to driver/load feeder shall be in scope of Bidder. The exact design, rating & number of feeders of the each redundant DCDB shall be as finalized during detailed engineering and as approved by Employer. However, 25% spare feeder (min. 1 no.) with fuses for each rating shall be provided in each DCDB. |
| 9.04.00 | **Battery Health Monitoring System (BHMS)**<br><br>BHMS, wherever applicable, shall include microprocessor based hardware and software to monitor the condition of each battery cell of 24 V DC systems on-line. With BHMS it shall be possible to measure & analyze the minimum and maximum voltage values of each battery-cell so that any damage to battery shall be prevented by pro-active maintenance. BHMS shall communicate with the charger/PLC and provide alarms as finalized by Employer during detailed engineering. |
| **9.05.00** | The UPS Power Supply for various systems shall consist of one or more of the following configurations.<br><br>Bidder shall clearly bring out in the proposal the redundancy feature along with configuration diagram, single line diagram and data sheets etc. & this shall be finalized subject to employer's approval during detailed engineering.<br><br>**Configuration B :** UPS system shall consist of 1 x 100% charger and inverter, 1 x 100% Ni Cd Battery Bank for 1 hour, Bypass Line Transformers and Voltage Stabilizer, static switch, manual bypass switch, 2 x 100% ACDB, 1x100% Microprocessor controlled Battery Health Monitoring System (BHMS) and other necessary protective devices and accessories.<br><br>The specifications for this UPS configuration shall be as per Cl.No. 9.06.00 to 9.06.05 and specifications for Battery shall be as per Cl. No 9.06.06 for Ni-Cd type Batteries.<br><br>**Configuration C :** On line UPS with remote monitoring having a battery backup of 30 min. The batteries for UPS System shall be Sealed Maintenance Free type and shall be as per Control System Vendor's standards. |
| **9.06.00** | **UNINTERRUPTIBLE POWER SUPPLY (UPS) SYSTEM**<br><br>The minimum capacity of the UPS at load factor of 0.8 lagging inclusive of 10% design margin at 50 deg c. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| | The UPS system shall meet the following requirements as a minimum.<br><br>If UPS KVA rating is applicable at a lower ambient temperature than specified 50 deg.c, the bidder shall consider a derating factor of at least 1.5%/deg.c for arriving at the specified UPS capacity at 50 deg.c ambient. The UPS shall have an overload capacity of 125 % rated capacity for 10 minutes and 150 % rated capacity for 10 seconds. The inverter shall have sufficient capability to clear fault in the maximum rated branch circuit, limited to 8 percent of finally selected ups capacity. |
| **9.06.01** | **Chargers** |
| **9.06.01.01** | The chargers shall be self regulating, solid state silicon controlled, full-wave rectifier type designed for single and parallel operation with battery and shall have automatic voltage regulators for close voltage stability even when AC supply voltage fluctuates, effective current limiting features and filters to minimise harmonics. The charger should be capable to fully charge the required batteries as well as supply the full rated load through inverter. Furthermore the charger should be able to re-charge the fully discharged battery within 8 hours. The charger output regulation shall be ± 1% from no load to full load with an input power supply variation of ± 10% in voltage and ± 5% in frequency. In addition to indications/display on charger panel, alarms along with relevant analog measurements shall also be provided by employing RS 485 Port Modbus Protocol / Ethernet TCP/IP protocol for use in DDCMIS. The list of alarm output & 4-20 mA signals shall be as approved by Employer during detailed engineering. |
| **9.06.01.02** | The charger shall be current limited for charger circuit protection and protection of battery from overcharge shall also be provided. The current limit shall be continuously adjustable. The chargers shall have a slow walk-in circuit which shall prevent application of full load DC current in less than 10 seconds after AC power is energised. |
| 9.06.01.03 | The chargers shall be fed from 415V AC, 50 HZ, 3 phase, 3 wire system. Charger design shall ensure that there is no component failure due to fluctuations of input supply or loss of supply and restoration. |
| 9.06.01.04 | The minimum full load efficiency at nominal input and output shall be 90%. The ripple content shall be limited to +/- 2 % of Charger output voltage. |
| 9.06.01.05 | The UPS battery shall have sufficient amp-hour capacity to supply the steady state KVA rating of the UPS specified for 60 minute, irrespective of the actual load on UPS. |
| 9.06.01.06 | The UPS system shall be capable of operating without D.C. battery in circuit under all conditions of load and the performance of various components of UPS like inverter, charger, static switch etc. shall be guaranteed without the battery in circuit. |
| 9.06.01.07 | The UPS system design shall ensure that in case of failure of mains input power supply to one of the chargers, the other charger whose mains input power supply is |

healthy, shall feed to one or both the inverters as the case may be as per manufacturer's standard practice & continue to charge the D.C. battery at all load conditions. The Bidder should note that this situation should not in any way lead to the discharge of the D.C. Battery.

**9.06.02** **Static Inverters**

The static inverter shall be of continuous duty, solid state type using proven Pulse Width Modulation (PWM)/Quasi square wave/step wave technique. Ferro-resonant types Inverters are not acceptable. The nominal voltage output shall be 230 Volts. single phase ,50 Hz. The inverter equipment shall include all necessary circuitry and devices to conform to requirements like voltage regulation, current limiting, wave shaping, transient recovery, automatic synchronization etc. The steady state voltage regulation shall be +/-2% and transient voltage regulation (on application/removal of 100% load) shall be +/-20%. Time to recover from transient to normal voltage shall not be more than 50 mSec. Frequency regulation for all conditions of input supplies, loads and temperature occurring simultaneously or in any combination shall be better than ± 0.5% (automatically controlled). The total harmonic content shall be 5% maximum and content of any single harmonic shall be 3% maximum. The inverter efficiency shall be at least 85% on full load and 80% on 50% load. The synchronisation limit for maintenance of synchronisation between the inverter and stand by AC source shall be 48-52Hz, field adjustable in steps of 1 Hz.

**9.06.03** **Static Switch and Manual Bypass Switch**

The static switch shall be provided to perform the function of transferring UPS loads automatically without any break from (i) faulty inverter to healthy inverter in case of failure of one of the two inverters and (ii) from faulty inverter to standby AC source in case of failure of both the inverters. The transfer time shall be ¼ cycle maximum in synchronous mode.

Manual bypass switch shall be employed for isolating the UPS during maintenance.

Continuous and overload capacity of the switches shall be equal to 100% of the continuous and overload rating of each inverter. Peak Capacity shall be 1000% of continuous rating for 5 cycles.

**9.06.04** **Step Down Transformer and Voltage Stabiliser**

One 415V three phase to 230V, single phase transformer along with associated voltage stablizer shall be furnished with each UPS system. The transformer and stablizer combination shall convert Employer furnished 415V ± 10% three phase plant auxiliary AC supply to 230 V ± 2%, single phase standby AC Power Supply source.

The transformer shall be of low impedance air-cooled type and its KVA rating and percentage impedance should be selected so that extremely fast fault clearance is achieved.

The overload capacity of the transformer and voltage stabilizer shall not be less than 300% for 200 millisecond duration. The voltage stabilizer shall employ servo-controlled circuitry and shall maintain the specified output voltage for 0-100% load with maximum input voltage variations as indicated above. The efficiency of the stabiliser shall be 95% or better.

The type and other details shall be subject to Employer's approval.

**9.06.05** **AC Distribution Board (ACDB)**

The details of the AC distribution board, i.e. exact, rating and number of feeders etc. of the 2x100% ACDB shall be designed to cater to the requirements of Contractors systems. 25% Spare feeders of each type and rating to be provided in each ACDB.

**9.06.06** The batteries shall be heavy duty Nickel-cadmium type and shall be sized for one hour of full load operation during non-availability of AC supply / chargers. The Ni-Cd batteries shall conform to IS: 10918. The batteries shall be sized as per relevant IEEE Standards. For sizing calculation, an aging factor of 0.8 and a temperature correction factor as per manufacturer's standard at 4 deg. C electrolyte temperature (Based on temperature characteristics curve to be submitted by the Contractor at a temperature of 4 deg. C). Capacity factor, Float Correction Factor, as per Battery Supplier Standard, shall be taken into consideration, if applicable and ambient temperature shall be considered as the electrolytic temperature. The sizing of the battery shall be as approved by Employer during detailed engineering. However, Contractor shall consider a suitable voltage drop from battery room to ACDB and ACDB to load, while sizing the battery.

**10.00.00** **CONTROL CABINETS / PANELS / DESKS**

10.01.00 The cabinets shall be IP-22 protection class. The Contractor shall ensure that the packaging density of equipment in these cabinets is not excessive and abnormal temperature rise, above the cabinet temperature during normal operation or air-conditioning failure, is prevented by careful design. This shall be demonstrated to the Employer during the factory testing of the system. The Contractor shall ensure that the temperature rise is limited to 10 deg. C above ambient and is well within the safe limits for system components even under the worst condition and specification requirements for remote I/O cabinets. Ventilation blowers shall be furnished as required by the equipment design and shall be sound proof to the maximum feasible extent. If blowers are required for satisfactory system operation, dual blowers with blower failure alarm shall be provided in each cabinet with proper enclosure and details shall be furnished with proposal. Suitable louvers with wire mesh shall be provided on the cabinet.

10.01.01 The cabinets shall be designed for front access to system modules and rear access to wiring and shall be designed for bottom entry of the cables.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| 10.01.02 | The cabinets shall be totally enclosed, free standing type and shall be constructed with minimum 2 mm thick steel plate frame and 1.6 mm thick CRCA steel sheet or as per supplier's standard practice for similar applications, preferred height of the cabinet is 2200 mm. The cabinets shall be equipped with full height front and rear doors. The floor mounting arrangement for other cabinets shall be as required by the Employer and shall be furnished by the Contractor during detailed engineering. |
| 10.01.03 | Cabinet doors shall be hinged and shall have turned back edges and additional braking where required ensuring rigidity. Hinges shall be of concealed type. Door latches shall be of three-point type to assure tight closing. Detachable lifting eyes or angles shall be furnished at the top of each separately shipped section and all necessary provisions shall be made to facilitate handling without damage. Front and rear doors shall be provided with locking arrangements with a master key for all cabinets. If width of a cabinet is more than 800 mm, double doors shall be provided. |
| 10.01.04 | Two spray coats of inhibitive epoxy primer-surface shall be applied to all exterior and interior surfaces. A minimum of 2 spray coats of final finish colour shall be applied to all surfaces. The final finished thickness of paint film on steel shall not be less than 65-75 micron for sheet thickness of 2 mm and 50 microns for sheet thickness of 1.6 mm. The finish colors for exterior and interior surfaces shall conform to following shades:<br><br>(a.) Exterior:- As per RAL 9002 (End panel sides RAL 5012), to be finalised during detailed engineering.<br><br>(b.) Interior:- Same as above. |
| 10.01.05 | Paint films which show sags, checks or other imperfections shall not be acceptable. |
| 10.01.05 | As an alternative, single coat of anodic dipcoat primer along with single textured powder coating with epoxy polyester meeting the thickness requirement is also acceptable. |
| 10.01.06 | Refer Subsection Basic Design Criteria, Part-B, Section-VI for grounding requirements. |
| 10.02.00 | The mimic shall be configured on the OWS/CRTs and it shall be possible to control, monitor and operate the plant from the same. |
| 10.03.00 | The technical specification covering panel fabrication details, wiring and termination details etc. shall be as described under Sub-Section INST CABLE of this specification. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| 10.04.00 | **CONTROL DESK** |
| 10.04.01 | Control desk shall be free standing table top type with doors at the back and shall be constructed of 3 mm thick CRCA steel plates. A 19 mm thick wooden top shall be provided on the desk to keep the TFT monitors at top and computers inside. Control desk shall consist of vertical, horizontal and base supports with their coverings for work surface, keyboard trays, mouse pads, monitor shelf and concealed cable and wire way management, perforated trays with covers in both horizontal and vertical directions. PA system hand sets, telephone sets, very few PB stations and lamps shall be mounted on the control desk on mosaic grid structure and same shall be decided during detailed engineering. ASCII Keyboard shall be capable of being pulled out through a tray. |
| 10.04.02 | The cabling / wiring between OWS & CPU'S, power supply cables etc. shall be aesthetically routed and concealed from view. |
| 10.05.00 | **FURNITURE** |
| | Chairs – Industry standard revolving chairs with wheels and with provision for adjustment of height (hydraulically/gas lift) shall be provided for the operators, unit-in-charge & other personnel in control room area. These shall be designed for sitting for long duration such that these are comfortable for the back. Chair pedestal shall be made of 5mm thick MS plate covered with poly-propylene cladding. Arm-rests in one piece shall be of poly-urethane and twin wheel castor of glass filled nylon. The exact details shall be finalized & approved by Employer during detailed engineering. |
| **11.00.00** | **ANNUNCIATION SYSTEM** |
| 11.01.00 | Only OWS based alarm system shall be provided with audio alarm facility ( beep/tone generator). No facia annunciation is envisaged in the control room. Hooters are to be provided. |
| 11.02.00 | The system shall display history of alarms in chronological order on any of the OWS. The HMIS shall have the capability to store a minimum of 500 alarms each with paging features allowing the operator to view any page. The system shall have all alarm functions and related function keys like alarm acknowledge, reset, paging, summaries etc. Other design features like set point/dead band adjustments, provision of alarm priority, manual inhibition & automatic inhibition based on predefined logic etc., shall be provided and shall be as finalised during detailed engineering. The alarm display/report format shall be as approved by the Employer. |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| 11.03.00 | Facility of audio annunciation shall be provided in OWS upon the occurrence OWS alarms irrespective of whether alarms are displayed or not. Facility to disable the audio annunciation shall be provided. |
| 11.04.00 | At least three levels of alarm priority shall be available which will be displayed in different colour. It shall be possible to display & print alarms of any of the three levels. |
| 11.05.00 | Alarm boxes shall be provided in each display to alert the operator about an alarm when he is viewing some other picture. No of alarm boxes shall be finalised during detailed engineering for each process area & each priority therein. |
| 11.06.00 | The annunciator sequence shall conform to ISA sequence ISA-2A. |
| **12.00.00** | **SOFTWARE DOCUMENTATION AND SOFTWARE LISTINGS** |
| 12.01.00 | All technical manuals, reference manuals, user's guide etc., in English required for modification/editing/addition/deletion of features in the software of the PLC System shall be furnished. The Contractor shall furnish a comprehensive list of all system/application software documentation after system finalization for Employer's review and approval. |
| 12.02.00 | All The software listings including Source code for application software, All special - to-project data files etc. shall be submitted by the Contractor. |
| **13.00.00** | **SOFTWARE LICENCES** |
| | The Contractor shall provide software license for all software being used in Contractor's System. The software licenses shall be provided for the project (e.g. organisation or site license) and shall not be hardware/machine-specific. That is, if any hardware/machine is upgraded or changed, the same license shall hold good and it shall not be necessary for Employer to seek a new license/renew license due to upgradation/change of hardware/machine in Contractor's System at site. All licenses shall be valid for the continuous service life of the plant.<br><br>As a customer support, the Contractor shall periodically inform the designated officer of the Employer about the software upgrades/new releases that would be taking place after the system is commissioned so that if required, same can be procured & implemented at site. |

**14.00.00** **SPECIFICATIONS OF PC BASED OWS**

| | |
|---|---|
| CPU | Latest generation CPU |
| Main memory | 2 GB expandable to 4 GB |
| DVD R/W | 16 x Or higher |
| Hard disk | 160 GB SAS |
| Removable bulk storage drive | 500 GB (minimum) |
| Monitor | 20" Full Flat TFT Resolution with non interfaced refresh rate min 75 Hz. |
| Graphic Memory | 128 MB |
| Communication port | 2 serial plus, one parallel, 1 USB port, Dual 100 Mbps Ethernet. |
| Expansion slots | 3 |
| Other Features | 101 Keys Keyboard and Optical Mouse |
| Software | a) General MS Windows latest version, MSOffice, Microsoft Visual Studio, Adobe Acrobat, anti-virus McAfee or equivalent, etc.<br>b) Application software - to suit project specific requirement |

**15.00.00** **PRINTER**

15.01.00 A4 size color laser printer shall be provided as a part of the HMIS system as per Part-A. It shall print out all alarm/trip conditions and event changes in plant status along with date and time of occurrence.

16.00.00 **ANNUAL MAINTENANCE CONTRACT (AMC)**

16.01.00 The Bidder shall provide maintenance services of complete control System under a comprehensive Annual Maintenance Contract (AMC) for period of one year after Warranty period and thereafter AMC for only hardware support for next two years.

16.02.00 The AMC shall cover total maintenance of all hardware & software coming under the scope of control system and shall include free repair/replacement of all cards/ modules/ peripherals/ cables/ components etc., correction of software problems and supply of expendable items. The Bidder shall ensure 99.7% availability of the system with the AMC. Bidder to ensure that system expert is available at site within 48 hours

| | |
|---|---|
| | of problem reporting by NTPC, in case the solution to the problem is not provided within 24 hours of problem reporting. |
| 16.03.00 | Further, bidder may note that during the AMC he will be allowed to use Employer's mandatory spares and has to replenish the same within three months' time or before completion of AMC period whichever is earlier. However, if in the opinion of the Bidder, more spares than those included in the mandatory spare list are required to meet the availability requirement, then Bidder shall stock the same. |
| 16.04.00 | The Bidder shall prepare detailed list of faults corrected and parts, expendables utilised during AMC period and shall furnish the same to Employer, properly documented at the end of AMC period. Further, during AMC period the details as required by Employer/ Project Manager shall be made available by Bidder's personnel. |

# SUB-SECTION-III-C6

# TYPE TEST REQUIREMENTS

## TYPE TEST REQUIREMENTS

**1.00.00 TYPE TEST REQUIREMENTS**

1.01.00 General Requirements

1.01.01 The Contractor shall furnish the type test reports of all type tests as per relevant standards and codes as well as other specific tests indicated in this specification. A list of such tests are given for various equipment in table titled 'TYPE TEST REQUIREMENT FOR C&I SYSTEMS' at the end of this chapter and under the item Special Requirement for Solid State Equipments/Systems. For the balance equipment instrument, type tests may be conducted as per manufactures standard or if required by relevant standard.

(a) Out of the tests listed, the Bidder/ sub-vendor/ manufacturer is required to conduct certain type tests specifically for this contract (and witnessed by Employer or his authorized representative) even if the same had been conducted earlier, as clearly indicated subsequently against such tests.

(b) For the rest, submission of type test results and certificate shall be acceptable provided.

i. The same has been carried out by the Bidder/ sub-vendor on exactly the same model /rating of equipment.

ii. There has been no change in the components from the offered equipment & tested equipment.

iii. The test has been carried out as per the latest standards alongwith amendments as on the date of Bid opening but not more than five (5) year back.

(c) In case the approved equipment is different from the one on which the type test had been conducted earlier or any of the above grounds, then the tests have to be repeated and the cost of such tests shall be borne by the Bidder/ sub-vendor within the quoted price and no extra cost will be payable by the Employer on this account.

1.01.02 As mentioned against certain items, the test certificates for some of the items shall be reviewed and approved by the main Bidder or his authorized representative and the balance have to be approved by the Employer.

1.01.03 The schedule of conduction of type tests/ submission of reports shall be submitted and finalized during pre-award discussion.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

1.01.04 For the type tests to be conducted, Contractor shall submit detailed test procedure for approval by Employer. This shall clearly specify test setup, instruments to be used, procedure, acceptance norms (wherever applicable), recording of different parameters, interval of recording precautions to be taken etc. for the tests to be carried out.

1.01.05 The Bidder shall indicate in the relevant BPS schedule, the cost of the type test for each item only for which type tests are to be conducted specifically for this project. The cost shall only be payable after conduction of the respective test in presence of authorize representative of Employer. If a test is waived off, then the cost shall not be payable.

**2.00.00 SPECIAL REQUIREMENT FOR SOLID STATE EQUIPMENTS/ SYSTEMS**

2.01.00 The minimum type test reports, over and above the requirements of above clause, which are to be submitted for each of the major C&I systems Analyzer instruments, various PLCs etc. shall be as indicated below:

i) Surge Protections for Solid State Equipments/ Systems

All solid state systems/ equipments shall be able to withstand the electrical noise and surges as encountered in actual service conditions and inherent in a power plant. All the solid state systems/ equipments shall be provided with all required protections that needs the surge withstand capability as defined in ANSI 37.90a/ IEEE-472. Hence, all front end cards which receive external signals like Analog input & output modules, Binary input & output modules etc. including power supply, data highway, data links shall be provided with protections that meets the surge withstand capability as defined in ANSI 37.90a/ IEEE-472. Complete details of the features incorporated in electronics systems to meet this requirement, the relevant tests carried out, the test certificates etc. shall be submitted alongwith the proposal. As an alternative to above, suitable class of IEC-60255-4 which is equivalent to ANSI 37.90a/ IEEE-472 may also be adopted for SWC test.

ii) Dry Heat test as per IEC-68-2-2 or equivalent.

iii) Damp Heat test as per IEC-68-2-3 or equivalent.

iv) Vibration test as per IEC-68-2-6 or equivalent.

v) Electrostatic discharge tests as per IEC 61000-4-2 or equivalent.

vi) Radio frequency immunity test as per EN 50082-2 or equivalent.

vii) Electromagnetic immunity as per EN 61131-2 or equivalent.

Test listed at item no. v, vi, vii, above are applicable for front end cards only as defined under item (i) above.

## 3.00.00 TYPE TEST REQUIREMENT FOR C&I SYSTEMS

| Sl No | Item | Test requirement | Standard | Test to be specifically conducted | NTPC's approval req. On test certificate | Remarks |
|---|---|---|---|---|---|---|
| Col 1 | Col 2 | Col 3 | Col 4 | Col 5 | Col 6 | Col 7 |
| 1 | Elect. Metering instruments | As per standard (col 4) | IS-1248 | No | Yes | |
| 2 | Electronic transmitter | As per standard (col 4) | BS-6447 / IEC-60770 | No | Yes | |
| 3 | INSTRUMENTATION CABLES TWISTED & SHIELDED | | | No | Yes | |
| 4 | Pressure gauge | Degree of protection test | IS-2147 | No | No | |
| | | Temp interference test | IS -3624 | No | No | |
| 5 | Temperature gauge | Degree of protection test | IS-2147 | No | No | |
| 6 | Pressure & DP switch | Degree of protection test | IS-2147 | No | No | |
| | | As per standard ( col 4) | BS 6134 | No | No | |
| 7 | Level switch | Degree of protection test | IS-2147 | No | No | |
| 8 | Control valves | CV Test | ISA 75.02 | No | Yes | |

# CONTROL VALVES, ACTUATORS & ACCESSORIES

| | |
|---|---|
| **LOT-IA PROJECTS**<br>**FLUE GAS DESULPHURISATION (FGD) SYSTEM PACKAGE** | **TECHNICAL SPECIFICATION**<br>**SECTION-VI**<br>**BID DOCUMENT NO.: CS-0011-109(1A)-2** |

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

## CONTROL VALVES, ACTUATORS & ACCESSORIES

**1.00.00 CONTROL VALVES & ACCESSORIES**

1.01.00 General Requirements

1.01.01 The control valves and accessories equipment furnished by the Bidder shall be designed, constructed and tested in accordance with the latest applicable requirements of code for pressure piping ANSI B 31.1, the ASME Boiler & pressure vessel code, Indian Boiler Regulation (IBR), ISA, and other standards specified elsewhere as well as in accordance with all applicable requirements of the "Federal Occupational Safety and Health Standards, USA" or acceptable equal standards. All the Control Valves, their actuators and accessories to be furnished under this Sub-section will be fully suitable and compatible with the modulating loops covered under the Specification.

1.01.02 All the control valves and accessories offered by the Bidder, shall be from reputed, experienced manufacturers of specified type and range of valves.

**1.02.00 CONTROL VALVE SIZING & CONSTRUCTION**

1.02.01 The design of all valve bodies shall meet the specification requirements and shall conform to the requirements of ANSI (USA) for dimensions, material thickness and material specification for their respective pressure classes.

1.02.02 The valve sizing shall be suitable for obtaining maximum flow conditions with valve opening at approximately 80% of total valve stem travel and minimum flow conditions with valve stem travel not less than 10% of total valve stem travel. All the valves shall be capable of handling at least 120% of the required maximum flow. Further, the valve stem travel range from minimum flow condition to maximum flow condition shall not be less than 50% of the total valve stem travel. The sizing shall be in accordance with the latest edition of ISA handbook on control valves. While deciding the size of valves, Bidder shall ensure that valves trim exit outlet velocity as defined in ISA handbook does not exceed 8 m/sec for liquid services, 150 m/sec. for steam services and 50% of sonic velocity for flashing services. Bidder shall furnish the sizing calculations clearly indicating the outlet velocity achieved with the valve size selected by him as well as noise calculations, which will be subject to Employer's approval during detailed engineering.

1.02.03 Control valves for steam and water applications shall be designed to prevent cavitation, wire drawing, flashing on the downstream side of valve and down stream piping. Thus for cavitation/flashing service, only valve with anti cavitation trim shall be provided. Detailed calculations to establish whether cavitation will occur or not for any given application shall be furnished.

1.02.04 Control valves shall have leakage rate as per leakage Class-IV.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| 1.02.05 | The control valve induced noise shall be limited to 85 dBA at 1 meter from the valve surface under actual operating conditions. The noise abatement shall be achieved by valve body and trim design and not by use of silencers. |
| **2.00.00** | **VALVE CONSTRUCTION** |
| 2.01.00 | All valves shall be of globe /Butterfly body design & straightaway pattern with single or double port, unless other wise specified or recommended by the manufacturer to be of angle body type. Rotary valve may alternatively be offered when pressure and pressure drops permit. |
| 2.02.00 | Valves with high lift cage guided plugs & quick-change trims shall be supplied. |
| 2.03.00 | Cast Iron valves are not acceptable. |
| 2.04.00 | Bonnet joints for all control valves shall be of the flanged and bolted type or other construction acceptable to the Employer. Bonnet joints of the internal threaded or union type will not be acceptable. |
| 2.05.00 | Plug shall be of one-piece construction cast, forged or machined from solid bar stock. Plug shall be screwed and pinned to valve stems or shall be integral with the valve stems. |
| 2.06.00 | All valves connected to vacuum on down stream side shall be provided with packing suitable for vacuum applications (e.g. double vee type chevron packing) |
| 2.07.00 | Valve characteristic shall match with the process characteristics. |
| 2.08.00 | Extension bonnets shall be provided when the maximum temperature of flowing fluid is greater than 280 deg. C. |
| 2.09.00 | Flanged valves shall be rated at no less then ANSI press class of 300 lbs. |
| **3.00.00** | **VALVE MATERIALS** |
| | Refer mechanical sections for body and trim materials. The exact body and trim materials shall be finalised during detailed engineering depending on the service applications.<br><br>However, Bidder may offer valves with body and trim materials better than specified materials and in such cases Bidder shall furnish the comparison of properties including cavitation resistance, hardness, tensile strength, strain energy, corrosion resistance and erosion resistance etc. of the offered material vis-a-vis the specified material for Employer's consideration and approval. |

**4.00.00** **END PREPARATION**

Valve body ends shall be either butt welded/socket welded, flanged (Rubber lined for condensate service) or screwed as finalised during detailed engineering and as per Employer's approval. The welded ends wherever required shall be butt welded type as per ANSI B 16.25 for control valves of sizes 65 mm and above. For valves size 50 mm and below welded ends shall be socket welded as per ANSI B 16.11. Flanged ends wherever required shall be of ANSI pressure-temperature class equal to or greater than that of the control valve body.

**5.00.00** **VALVE ACTUATORS**

All Control Valves shall be furnished with Pneumatic Actuators. The Bidder shall be responsible for proper selection and sizing of valve actuators in accordance with the pressure drop and maximum shut off pressure and leakage class requirements. The valve actuators shall be capable of operating at 60 deg.C continuously.

Valve actuators and stems shall be adequate to handle the unbalanced forces occurring under the specified flow conditions or the maximum differential pressure specified. An adequate allowance for stem force, at least 0.15 Kg/sq.cm. per linear millimeter of seating surface, shall be provided in the selection of the actuator to ensure tight seating unless otherwise specified.

The travel time of the pneumatic actuators shall not exceed 10 seconds.

**6.00.00** **CONTROL VALVE ACCESSORY DEVICES**

6.01.00 All pneumatic**ally** actuated control valve accessories such as air locks, hand wheels/hand-jacks, limit switches, Microprocessor based Positioner, diffusers, external volume chambers, position transmitters (capacitance or resistance type only), reversible pilot for Positioner, tubing and air sets, solenoid valves and junction boxes etc. shall be provided as per the requirements.

**7.00.00** **SPECIFICATIONS FOR MICROPROCESSOR BASED POSITIONERS**

| | | | |
|---|---|---|---|
| 1 | Electrical | a) Input signal | 4-20 mA |
| | | b) Power Supply | Loop powered from the output card of control system. |
| | | c) Hart Protocol | Compatibility for remote calibration & diagnostics (Super-imposed Hart signal on input signal (4-20 mA) |
| | | d) Valve position sensing | Non contact type position sensing **with** 4-20 mA output signal |

| CLAUSE NO. | TECHNICAL REQUIREMENTS | |
|---|---|---|

| | | | |
|---|---|---|---|
| 2 | Environment | a) Operating Temp | (-)30 To 80 Deg. C |
| | | b) Humidity | 0-95 % |
| | | c) Protection Class | IP-65 Minimum |
| 4 | Test reports/ certificates | Factory Valve Signature Tests reports (Pr vs Valve travel and Travel vs I/P signal) are to be provided. | |
| | | Test certificates as per Manufacture Standard/Relevant Standard are To Be Submitted | |
| 5 | Configuration/ calibration | Remote calibration, Auto & Manual calibration shall be possible. Universal HART Calibrator to be provided. | |
| 6 | Operating | Operating Range | Full range & split range signal. |
| 7 | Modes | Valve Action | Direct & Reverse valve action(selectable) |
| | | Flow Characterization | Possible to fit valve characteristic curve - Linear & Equal Percentage. |
| 8. | Fail Safe/Fail Freeze | Fail safe/Fail freeze feature is to be provided. (In case, the fail freeze feature is not intrinsic to the positioner, Bidder shall achieve the same externally through solenoid valve connected in the pneumatic circuit). | |
| 9 | Pneumatic | Air capacity | Sufficient to handle the valves selected/ boosters to be supplied if required. |
| | | Air supply pressure | To suit air supply pressure/quality available. |
| | | Process connection | 1/4 inch NPT |
| 10 | Electrical Cable Entry | 1/2-NPT, side or bottom entry to avoid water ingress. | |
| 11 | Performance | Characteristic Deviation | <=0.5 % Of Span |

| | | | |
|---|---|---|---|
| | | Ambient Temp Effect | <=0.01 %/Deg C Or Better |
| 12 | EMC & CE Compliance | Required To International Standard Like EN/IEC. | En50081-2& En50082 Or Equivalent |
| 13 | Accessories | In-built operator panel | Display with push buttons for configuration and display on the Positioner itself (password protected/hardware lock). |
| | | Press gauge block | For supply & output pressure. |
| | | Mounting assembly | On as required basis. |

**8.00.00 TEST AND EXAMINATION**

All valves shall be tested in accordance with the quality assurance programme agreed between the Employer and Contractor, which shall meet the requirements of IBR and other applicable codes mentioned elsewhere in the specifications. The tests shall include but not be limited to the following:

8.01.00 Non Destructive Test as per ANSI B-16.34.

8.02.00 Hydrostatic shell test in accordance with ANSI B 16.34 prior to seat leakage test.

8.03.00 Valve closure test and seat leakage test in accordance with ANSI-B 16.34 and as per the leakage class indicated above.

8.04.00 Functional Test: The fully assembled valves including actuators control devices and accessories shall be functionally tested to demonstrate times from open to close position.

8.05.00 **CV Test**: Refer **Cl.no 3.00.00 (8) Subsection IIIC-06 (Type test requirements)**

**9.00.00 CONTROL VALVE QUANTITIES**

Bidder shall furnish all the control valves under this package as finalised during detailed engineering stage without any price repercussions whatsoever depending on the process requirements. All the control valves provided by the Bidder for this project shall meet the specifications requirements specified herein. Specification for control valves in this Sub-section has to be read in conjunction with other relevant Sub-sections of this specification.

## 1.00.0 FLUE GAS DESULPHURISATION SYSTEM

### 1.01.0 Mills:

1.01.01 Raw material for shaft, coupling, gears and pinions, top and bottom races and other rotating components shall be subjected to UT. MPI/LPI shall be carried out to check surface soundness.

1.01.02 Wear-resistant parts shall be UT/RT tested to check soundness after suitable heat treatment. Check for chemical composition, hardness and microstructure shall be carried out.

1.01.03 Butt welds in the tube/separator/body casing of the mill shall be tested by RT and MPI. All other welds in main tube/separator shall be tested by MPI/LPI for acceptance. The tube shall be statically balanced.

1.01.04 All gearboxes shall be run tested for adequate duration to check rise in oil temperature, noise level and vibration. Check for leak tightness of gear case also shall be performed.

### 1.02.0 Feeders:

1.02.01 Any welds in the casing/pulley fabrication shall be checked with MPI.

1.02.02 Routine tests shall be done as per relevant Indian Standards or equivalent International Standards.

1.02.03 All major items like plates for casing, head pulley, tail pulley, pulley shaft and major castings shall be procured with respective material test certificates.

1.02.04 Calibration check shall be carried out on all feeders.

### 1.03.0 Dampers:

1.03.01 All the dampers shall be subjected to operational test/checks.

1.03.02 Gas tight Dampers shall be subjected to shop leakage test to demonstrate the guaranteed tightness as per NTPC Tech Specification.

### 1.04.0 PIPING, VALVE AND SPECIALITIES:

1.04.01 All pipes and fittings shall be tested as per applicable code.

1.04.02 All valves shall be hydraulically/Air tested for body, seat and back-seat (if applicable) as per relevant standard.

1.04.03 NDT on valves shall be as per relevant standard.

1.04.04 Valves shall be offered for hydro test in unpainted conditions.

1.04.05 Functional checks of the valves for smooth opening and closing shall also be done.

**1.05.00 TANKS / VESSELS:**

**1.05.01 Atmospheric tanks:**

i) All welds joints shall be DP tested and complete tanks shall be water fill tested.
ii) All atmospheric storage tanks fabricated and erected at site shall be subjected to tests (Hydro, NDT and Vacuum) according to design code as applicable.
iii) Rubber lining shall be tested for hardness and spark test, as applicable.

**1.05.02 Pressure vessels:**

1) NDT on weld joint shall be as per respective code requirements or the minimum as specified as below:

   i) 100% DPT on root run of butt weld, nozzle welds and finished fillet welds.
   ii) 10% DPT on all finished butt welds.
   iii) 10% RT (covering all 'T'/cross joints) of butt welds.

2) Butt welds of dished ends shall be stress relieved and subjected to 100% RT.
3) Each finished vessels shall be hydraulically tested to 150% of the design pressure for a duration of 30 minutes.

**1.06.0 HEAT EXCHANGER/HEATER:**

1.06.01 All material shall be tested for chemical and mechanical properties and NDT as per relevant standard.

1.06.02 NDT on welds and other checks shall be as per relevant code.

1.06.03 Air heaters shall be subjected to dimensional and clearance checks as per standard practice

1.06.04 Lub. oil system, drive system, soot blowing system etc. of Air heaters shall be checked suitably as per standard practice

**1.07.0 PUMPS:**

1.07.01 UT on shaft forgings (greater or equal to 40mm) and MPI/DPT shall be done on shafts and impeller to ensure freedom from defects.

1.07.02 The pump casing shall be hydraulically tested at 200% of pump rated head or at 150% of shut off head, whichever is higher. The test pressure shall be maintained for at least half an hour.

1.07.03 The pump rotating parts shall be subjected to static and dynamic balancing.

1.07.04 All pumps shall be tested at shop for capacity, head efficiency and brake horse power at rated speed as per relevant/applicable standard.

1.07.05 Noise and vibration shall be measured during the performance testing at shop.

**1.08.0 STRUCTURES , DUCTS, HOPPERS:**

1.08.01 All materials shall be tested for chemical and mechanical properties as per relevant standard. All plates above 40mm shall be 100% Ultrasonically tested.

1.08.02 Visual inspection of all welds shall be performed in accordance with AWSD1.1.

1.08.03 NDT requirements of structural steel welds shall be as under:

i) 100% RT/UT on butt-welds of plate thickness>= 32mm.
ii) For plates of 25mm<=thickness<32mm-10% RT and 100% MPI.
iii) For plates of thickness <25mm-10% MPI/LPI.

1.08.04 Edge for shop and field weld shall be examined by MPI for plate thickness >= 32mm.

**1.09.0 VACUUM BELT FILTER SYSTEM:**

1.09.01 Impeller, casing and shaft of vacuum pumps shall be tested for chemical and mechanical properties as per relevant standard. All plates above 40mm shall be 100% Ultrasonically tested.

1.09.02 UT on shaft (if greater or equal to 40mm) and impeller shall be carried out.

1.09.03 All vacuum pumps shall be tested at shop for capacity, power, pressure, efficiency, noise and vibration etc.

1.09.04 Filter cloths and belts shall be tested for physical properties as per relevant standard

1.09.05 Hydro cyclones shall be checked by visual, dimensional etc.

**1.10.0 SPRAY NOZZLES:**

1.10.01 Spray nozzles shall be tested for physical properties

1.10.02 Spray nozzles also shall be subjected to performance test.

**1.11.0 AGITATORS:**

1.11.01 Rubber lining shall be tested for hardness and spark test

1.11.02 Impellers shall be tested for dimensional and balancing check

1.11.03 Gear Boxes shall be tested for run test as per standard practice

**1.12.0 FANS:**

1.12.01 Rotor components shall be subjected to ultrasonic test at mill and magnetic particle inspection / liquid penetrant examination after rough machining.

1.12.02 Butt welds in rotor components shall be subjected to 100% RT and all welds shall be magnetic particle/dye penetrant tested after stress relieving.

1.12.03 All rotating components and assemblies of fan shall be balanced dynamically

1.12.04 Performance test shall be carried out on fans as per Technical specification/ Relevant standard

1.12.05 Test for Natural Frequency and hardness of Fans blades shall be carried out as per Technical specification/ Relevant standard

**1.13.0 Thermal Insulation, Lagging & Cladding:**

(a) **Lightly resin bonded mineral wool:**

LRB mattresses/sections of Rockwool/ Glasswool shall conform to & tested as per relevant clauses of Indian Standards and shall meet the requirements of NTPC data sheet. Type tests except Thermal Conductivity shall be regularly carried out once in three months, Thermal Conductivity Type Test shall be carried out minimum once in twelve months by the manufacturer. Requirements of various components like Binding wires, Lacing wires, Wire mesh, etc. shall be as per NTPC approved data sheet / as given in respective Sub-Section of Technical Requirements of Steam Generator & Auxiliaries.

(b) **Lagging & Cladding:**

All insulation shall be protected by means of an outer covering of Aluminium sheeting confirming to ASTM B-209-1060 temper H14 from reputed manufacturer meeting the requirements of NTPC data sheet.

**1.14.0 OTHER CRITICAL EQUIPMENTS:**

1.14.01 Checks/ NDTs shall be done as per relevant Indian Standards or equivalent International Standards.

# SUB-SECTION-V-QM2

# LIME & GYPSUM HANDLING

# Lime & Gypsum Handling

**1.01.00 Brakes and Clamps :**

1.01.01 Final testing of brakes shall include load, HV/IR & heat run tests.

**1.02.00 Monorails and Hoists**

1.02.01 All electric hoist shall be tested as per IS 3938 and chain pulley block shall be tested as per IS 3832.

**1.03.00 Hoppers & Liners**

1.03.01 Rack & Pinion Gates/Flap Gates/Rod Gates

a) MPI/DP test shall be conducted on rack and pinion / rod / weld joint

b) Functional checks on the gates shall be carried out along with respective actuator, if applicable.

**1.04.00 Storage Silo**

1.04.01 All material shall be tested for Chemical & Mechanical properties as per relevant standard. MPI/DP test on welding shall be carried out. Fit up assembly checks shall be carried out at shop for all despatchable segments

1.04.02 Bag Filters : Leakage test shall be carried out for pressure parts. Pulsing and sequential test on bag filter shall be done.

**1.05.00 Belt Conveyor System**

The details of the checks to be carried out in the various equipments are to be submitted by the Contractor for Owner's approval. However, some indicative checks on different items are given below which should necessarily form a part of the Quality Assurance Plan to be agreed with the Owner.

**1.05.01 Idlers**

a) Check for run out and free movement shall be carried out on idlers. Run out shall be restricted as per IS:8598

**b)** Test for dust proofness, water proofness and dynamic friction factor of the Idlers shall be conducted at shop. The detailed procedures for the same shall be submitted for review and approval.

**1.05.02 Belting**

(a) Rubber cover of finished belt shall be checked for tensile strength and elongation at break before and after ageing. Rubber cover shall also be checked for abrasion, tear strength and hardness.

(b) For finished belts, checks for elongation at 10% nominal tensile strength, tensile and elongation at break in longitudinal (warp) direction and tensile in transverse (weft) direction shall be carried out.

(c) Adhesion test between ply to ply and cover to ply shall be carried out.

(d) Troughability test and Test for fire resistance shall be carried out.

(e) Test for procedure qualification for belt vulcanizing joint (at site) shall be done. Procedure for belt vulcanizing joint shall be discussed and finalized during FQP finalization.

(f) There will be a limitation on the no. of repairs allowed on the belts. Following will be the acceptance norm for the cover repairs.

i) The maximum size of a repair shall be limited to a size equivalent to one fifth the belt width. No single dimension shall exceed one fifth(1/5) of belt width.

ii) Small local repair by dough filling of size 25mm x 25mm to a limited extent shall not be counted of repairs. However, in case of cluster of repairs, same shall be counted as a patch repair.

iii) The maximum number of patch repair shall not exceed 5 per 100 mts. However, the total number of patch and dough filling repairs shall not exceed 10 per 100 meters.

(g) In addition to above, Steel Cord belt shall also be tested for following.

i. Cord dia and breaking strength

ii. Finished belt shall be tested for cord pull-out strength before and after aeging, peeling resistance.

iii. Dynamic cord pull out test

iv. Cord dia, pitch and number of cords

(h) In no case shall the cover thickness or the width of belt be less than that given in specification.

(i) For testing purpose, belt sample shall be taken from anywhere of the belt roll length offered

**1.05.03 Belt Vulcanizing Machine**

a) Check for tensile strength shall be carried out on a sample vulcanized belt joint for each type of belt in shop. However if such test has been done earlier, the report for same shall be submitted for verification.

b) Complete assembly shall be tested at shop for temp. and pressure developed

**1.05.04 Pulleys**

a) In addition to chemical, mechanical, hardness, microstructure as per applicable material specification, pulleys shaft forgings shall be subjected to ultrasonic testing.

b) 100% MPI/DPT on all welds shall be conducted and 10% RT/UT on butt welds shall be conducted.

c) Static balancing of pulleys shall be carried out after rubber lagging.

d) Checks on rubber lagging to include abrasion loss, shore hardness test, peel-off strength test and physical properties. Peel-off strength shall be 10 Kg/Cm, Abrasion loss shall be less than 250 cubic mm when tested as per DIN 53516.

**1.05.05 Pull Chord & Belt Sway Switches**

a. Acceptance tests

i) Over all dimension and functional test.

ii) HV & IR test

iii) Degree of protection test report.

**1.05.06 Zero Speed Switch, Under Belt Switch and Chute Blockage Switch**

a Acceptance test

i) Burn in test at 50 degree C for 48 hours shall be done for electronic switches.

ii) Over all dimension and functional test shall be carried out.

iii) HV & IR

iv) Degree of protection test

**1.06.00 Drive Equipments**

**1.06.01 Gear Boxes :**

(a) In addition to checks for physical, chemical, hardness,microstructure as per relevant standard, the shaft and gear/pinion forgings shall be subjected to ultrasonic testing .

(b) MPI to be carried out on Gears/Pinions after machining. Case depth, hardness and MPI after hardfacing shall be checked to ensure freedom from defects.

(c) Gear reducer shall be checked for reduction ratio, backlash and contact pattern. No load shop trial run to be conducted on gear boxes to check for oil leakage, temperature rise, noise level and vibration .

**1.06.02 Flexible Coupling**

(a) Ultrasonic testing shall be conducted on forgings for gear sleeve and gear hub, if gear coupling is provided.

(b) MPI shall be carried out after machining to ensure freedom from cracks.

**1.06.03 Fluid Coupling**

(a) Dynamic balancing shall be carried out for the rotating parts.

(b) Check for leak tightness of the coupling shall be carried out.

(c) Functional test on fusible plug for each type of coupling shall be conducted at shop.

(d) All couplings to be run tested at shop on no load

(e) Check for temperature rise, torque-speed, torque-slip characteristics and over speed test shall be included during performance test of one coupling of each type preferably at full load.

**1.07.00 Belt Scales**

The details of the checks to be carried out in the various equipments are to be submitted by the Contractor for Employer's approval. However, some indicative checks are given below which should necessarily form a part of the quality assurance plan to be agreed with the Employer.

1.07.01 Mounting arrangement/Overall dimensional check shall be carried out on the Belt Scales.

1.07.02 Belt scale shall be calibrated with test weight/test chain in static at works and with test weight for dynamic condition at site.

1.07.03 All electronic modules shall be subjected to burn in test at 50 Degree C for 48 hours.

1.07.04 General check for load cell shall be carried out.

1.07.05 Test report for degree of protection on enclosure shall be furnished.

1.07.06 Accuracy/performance check shall be demonstrated at site.

**1.08.00 Dust Control & Miscellaneous Systems(Dust Suppression & Dry Fog Dust Suppression System)**

The details of the checks to be carried out on the various equipments are to be submitted by the Contractor for Owners approval. However some indicative checks on different items are given below which should necessarily form a part of the Quality Assurance Plan to be agreed with by the Owner.

**1.08.01 Pumps**

(a) All materials should be of tested quality and test certificates to be provided.

(b) DPT of machined shaft and impeller shall be done.

(c) Shaft forgings to be also subjected to ultrasonic testing.

(d) Impellers to be dynamically balanced to ISO 1940 Gr.6.3

(e) All pressure parts shall be hydraulically tested at 150% of the shut-off head or 200% of rated head, whichever is higher for 30 minutes. No leakage is allowed.

(f) All pumps to be performance tested as per Hydraulic Institute Standard/Indian Standard. Performance test to include check for noise, vibration level and temperature rise.

**1.08.02 Valves & Specialities**

(a) Valves and Specialities shall be tested as per relevant standards / codes.

(b) Seat Leakage and hydraulic test to be carried out as per relevant standards / codes.

**1.08.03 Pipes and Fittings**

Pipes and fittings shall be tested as per relevant standards/ codes

**1.08.04 Air Compressor**

a) All pressure parts shall be hydraulically tested at not less than 150% of design pressure for a duration of 30 minutes prior to painting.

b) All other parts including inter-connecting piping shall be hydraulically tested wherever possible, as per relevant codes.

c) Ultrasonic testing shall be carried out on all forgings and rotor for dia 50mm and above. MPI/DPT shall be done on machined area of the components.

d) During assembly all clearances and alignments shall also be checked and recorded

e) Rotor shall be statically and dynamically balanced

f) Performance Test(Shop Test)

i. Performance test on the compressor shall be carried out in accordance with ISO:1217/Eq. The test shall also include demonstration of loading and unloading mechanism(Capacity control) and operation of safety valve

ii. Vibration and Noise level measurement shall be done during shop performance test.

**1.08.05 Air Receiver**

a) Each finished vessel shall be hydraulically tested at 150% of the design pressure for a duration of 30 minutes

b) NDT on weld joints shall be as per respective code requirements or the minimum as specified below

i. 100% DPT on root run of butt welds

ii. 100% DPT on all finished butt welds and fillet welds

iii. 10% RT on butt welds which shall include all T-Joints

**1.09.00 Dust Extraction and Ventilation System**

**1.09.01** Fan

(a) All materials should be of tested quality and test certificates should be provided.

(b) Dynamic balancing of the fan impellers to be carried out.

(c) Shop run test shall be conducted on all centrifugal fans including check for noise and vibration level.

(d) Performance test shall be conducted on one fan of each type at shop for capacity, pressure, efficiency and power consumption.

**1.09.02 Valves and Specialties**

Refer 1.08.02 above

**1.09.03 Pipes and Fittings**

Refer 1.08.03 above

**1.09.04 Package Air-Conditioner**

Each Unit shall be subjected to production routine Test excluding performance test carried out as per relevant standard. Performance test of PAC shall be carried out as per relevant standard on one unit of each type and rating at site.

**1.10.00 Crushers**

The details of the checks to be carried out for various components are to be submitted by the Contractor for Owner's approval. However, some indicative checks on different items are given below which should necessarily form part of the Quality Assurance Plan to be agreed with the Owner.

(a) All plates equal to or above 25mm thickness shall be ultrasonically tested.

(b) Shaft forgings and suspension bars to be checked for ultrasonic testing in addition to check for chemical, mechanical, hardness, microstructure etc. as per applicable material specification.

(c) Following minimum NDT requirements to be ensured for welds:

i) Butt welds - 10% UT/RT and 100% MPI/DPT.

ii) Fillet Welds - 10% MPI/DPT.

(d) Crusher rotor to be dynamically balanced. Procedure to be submitted for approval.

(e) No-load trial run test to be carried out at shop to check for speed(RPM),temperature rise, noise level and vibration .

**1.11.00 Mobile Trippers**

(a) Shaft and wheel forgings – Ultrasonic test in addition to check for chemical, mechanical, hardness, microstructure etc. as per applicable material specification shall be conducted.

(b) Following minimum NDT requirements to be ensured for welds:

i) Butt welds - 10% UT/RT and 100% MPI/DPT.

ii) Fillet Welds - 10% MPI/DPT.

(c) Shop trial run test shall be carried out and shall include check for noise level and vibration.

**1.12.00 In-Line Magnetic Separators**

i) Overall Dimensional, Visual check alongwith control panel.

ii) HV & IR.

iii) Operation, temperature rise, lifting capacity, force index and gauss strength.

**1.13.00 Metal Detectors**

i) Functional test including sensitivity, Burn in test, operation of liquid spray marker, detection of smallest piece of different materials as specified.

ii) Test report for Degree of protection test to be furnished.

**1.14.00 Sampling Units**

(a) Free carriage and cutter movement, speed of cutter and dust door closing and sealing shall be tested for samplers.

(b) “No load test” shall be carried out for crushers.

**1.15.00 Elevators (Passenger cum goods elevator)**

Refer QA table for passenger/service elevator.

## 1.16.00 Steel Structure

1.16.01 Only material which has been identified against mill sheet or test certificates shall be used for construction. Check testing shall be carried out in the absence of MTC. Correlation shall be maintained by Manufacturer. All plates above 40mm thickness shall be 100% ultrasonically tested.

1.16.02 Visual inspection of all welds shall be performed in accordance with AWS D.1.1.

1.16.03 NDT requirements of structural steel welds shall be as under:

a) 100% RT/UT on butt-welds of plate thickness >= 32 mm. Edge for field weld shall be examined by MPI for plate thickness >= 32mm.

b) For Plates of 10 mm < thickness < 32 mm - 10% RT On butt welds.

c) 10% Ultrasonic testing shall be carried out on full penetration welds (other than butt welds)

d) DP Test on Welds:

- 100% on Root Run & 10% on Final Welds of all butt welds
- At random 5% on fillet of built-up plate girders.

1.16.04 Girders/columns/Beams etc shall be trial assembled and match marked prior to dispatch. Trial assembly procedure at shop shall be submitted for NTPC review and approval.

1.17.00 **Paddle feeder**

1.17.01 Shaft and wheel forgings – Chemical, Mechanical, Hardness and Ultrasonic Test shall be conducted.

1.17.02 Following minimum NDT on Weld Joint shall be carried out

(a) Butt Welds - 10% UT/RT & 100% MPI/DPT

(b) Fillet Welds - 10% MPI/DPT

1.17.03 Shop trial run shall be conducted to check for movement and RPM of Paddle wheel & Travel wheel, function of P/F in locked rotor condition, noise and vibration etc.

1.18.00 **Vibrating Screen Feeders**

(a) Shaft forgings to be checked for ultrasonic testing in addition to check for chemical, mechanical, hardness, microstructure etc. as per applicable material specification

(b) Following minimum NDT requirements to be ensured for welds:

i) Butt welds - 10% UT/RT and 100% MPI/DPT.

ii) Fillet Welds - 10% MPI/DPT.

(c) Shop trial run test shall be conducted to checks for speed (RPM), amplitude (stroke), temperature rise and noise level.

**1.19.00 APRON FEEDER**

1.19.01 All plates equal to or above 25 mm thickness shall be ultrasonically tested.

1.19.02 Castings and forgings, forged/rolled bar/section shall be subjected to ultrasonically test in addition to check for chemical, mechanical, hardness, microstructure etc. as per applicable material specification.

1.19.03 Machined and hard faced surface of casting/forging and other hardened, stellited parts shall be subjected to DPT/MPI in addition to check for case depth, hardness as applicable for chain/sprocket/gear reducer/rollers/wheel/pan etc.

1.19.04 Suitable check for life time sealing of rollers for protection from dust and water shall be done

1.19.05 Following minimum NDT requirements shall be followed for welds:

i) Butt Welds in Tension- 100% UT/RT and 100% MPI/DPT.

ii) Butt Welds in Compression- 10% UT/RT and 10% MPI/DPT.

iii) Fillet Welds - 10% MPI/DPT.

1.19.06 For other items like drive system, motor, pulley, belt relevant portion of specification shall be applicable

1.19.07 No load trial run test shall be carried out at shop on completely assembled apron feeder to check for trouble free operation, temperature rise, Noise & vibration.

| B.3 | Shaft | Y[1] | | Y | | Y | Y[6] | | | Y[9] | | | |

**NOTES**

1 One per heat / HT batch

2 DP Test shall be conducted for 10% of the lot of HT plates. However, in case of any defect, entire lot shall be tested and only defect free plates shall be accepted.

3 100% DP Test shall be conducted on butt welds and 10% DPT on fillet weld after final run.

4 100% DPT shall be carried out on machined surfaces.

5 UT shall be done on plates with thickness 25 mm or above.

6 UT shall be done on shaft / tie rod with diameter above 40 mm.

7 After pressing each HT plate shall be subjected to either of the following tests, as per Manufacturer Practice
a) Light Box Test b) Vacuum Test c) Air Chamber Test

8 All pressure retaining parts shall be hydrostatically tested at 200% of pump rated head or 150% of shut – off head, whichever is higher, for at least 30 minutes. No leakage is allowed.

9 Static and Dynamic Balancing shall be carried out on complete rotor assembly.

10 All pumps shall be tested at rated speed, for head, flow capacity, efficiency and power consumption for the entire operating range i.e. from shut off head to maximum flow. A minimum of 7 readings shall be taken to plot the curve, with one reading at design flow. Testing standard shall be HIS (Hydraulic Institute Standard) of USA.
Performance test shall be carried out with contract motor, wherever Liquidated Damages are to be ascertained based on performance test at shop.

11 For Pipes, Valves and RE Joints refer LP Piping System requirements.

# SUB-SECTION-V-QM4

# AIR CONDITIONING & VENTILATION SYSTEM

| | |
|---|---|
| **LOT-IA PROJECTS**<br>**FLUE GAS DESULPHURISATION (FGD) SYSTEM PACKAGE** | **TECHNICAL SPECIFICATION**<br>**SECTION-VI**<br>**BID DOCUMENT NO.: CS-0011-109(1A)-2** |

## AIR CONDITIONING AND VENTILATION SYSTEM FOR FGDS

| CLAUSE NO | QA MODULE FOR AIR CONDITIONING AND VENTILATION SYSTEM |
|---|---|
| 1.00.00 | Air cooled Condensing Unit (Outdoor unit), Evaporating unit (Indoor unit) |
| 1.01.00 | Compressor of Condensing Unit shall be tested as per relevant standard |
| 1.01.01 | Condenser (Heat Exchanger) , Evaporator coils assembly shall be subjected to Hydraulic/Pneumatic pressure/leakage test as applicable and Electronic refrigerant leakage test along with all relevant test on tube as per applicable code.. |
| 1.01.02 | Assembled Condensing unit (Outdoor Unit) shall be subjected to Leakage test,Vacuum test, Run test/Functional test as applicable |
| | |
| 2.00.00 | **FANS** |
| 2.01.00 | 20% DPT of welding on fan hub, blades, casing and impeller as applicable shall be carried out. |
| 2.02.00 | DPT of fan shafts shall be carried out after machining. |
| 2.03.00 | UT of fan shafts (diameter equal to or above 50mm) shall be carried out. |
| 2.04.00 | Rotating components of all fans shall be dynamically balanced to ISO-1940 Gr. 6.3 |
| 2.05.00 | All Fans shall be subjected to run test for 4 hrs. or till temperature stabilization is reached. Vibration, Noise level, Temp. rise and current drawn shall be measured during the run test. |
| 2.06.00 | One fan of each type and size will be performance tested as per corresponding BIS /AMCA for Air flow, Static Pressure, Speed, Efficiency, Power Consumption, Noise, Vibration and Temp. Rise. |
| | |
| 3.00.00 | **AIR HANDLING UNIT** |
| 3.01.00 | For Fans refer tests as mentioned at 2.00.00 |
| 3.02.00 | One per type of assembled AHU (AHU casing and fan assembly) shall be subjected to free run test. Noise, Vibration and Temp. Rise of bearing shall be measured during run test. |
| 3.03.00 | All cooling coil shall be pneumatically tested and no leakage shall be permitted. |
| | |
| 4.00.00 | **CENTRIFUGAL PUMP** |
| 4.01.00 | UT on pump shaft (dia equal to or above 40 mm) and MPI/DPT on pump shaft and impeller after machining shall be carried out. |
| 4.02.00 | All rotating components of the pumps shall be dynamically balanced to ISO-1940 Gr. 6.3 |
| 4.03.00 | A standard hydrostatic test shall be conducted on the pump casing with water at 1.5 times the shut off pressure on the head characteristics curve or twice the rated pressure whichever is higher, for a minimum duration of 30 minutes. |
| 4.04.00 | Standard Running Test |

| | |
|---|---|
| 4.05.01 | All pumps shall be tested in the manufacturer's works preferably with contract motor for capacity, efficiency, head and brake horse power. Pump shall be given running test over the entire operating range covering from the shut-off head to the maximum flow. The duration of test shall be minimum one (1) hr. A minimum of seven readings approximately equidistant shall be taken for plotting the curves with one point at design flow. Testing of pumps shall be in accordance with stipulations of Hydraulic Institute Standard (HIS) and/or as per applicable Indian Standard or equivalent. Acceptance norms shall be as per approved datasheet & HIS standard only. |
| 4.05.02 | Noise and vibration shall be measured at shop for reference purpose only. |
| 4.05.03 | Pumps shall be subjected to strip down examination visually to check for mechanical damages after testing at shop in case abnormal noise level and/or excessive vibration are observed during the shop test. |
| 4.05.04 | NPSH test shall be conducted with water as the medium, if required as per approved data sheets. |
| | |
| 5.00.00 | **LOW PRESSURE AIR DISTRIBUTION SYSTEM** |
| 5.01.00 | Functional test for fire damper along with solenoid shall be done. |
| 5.02.00 | Prototype tests report of fire damper (duly approved/accepted by ENGG) for each type and size as per UL-555 for fire rating shall be furnished. |
| 5.03.00 | Site Test- After completion, all ducting system shall be checked/tested for air leakages/tightness (smoke test) at site. |
| | |
| 6.00.00 | **INSULATION** |
| 6.01.00 | Insulation material shall be tested for all mandatory tests only as per relevant code/standard. |
| 6.02.00 | Thermal conductivity tests (for thermal insulation only) shall be done as per relevant code for the same density and thickness of material and validity of test shall be as per relevant standard. |
| | |
| 7.00.00 | **AIR FILTERS** |
| 7.01.00 | Pre/Fine filters shall be tested for initial and final pressure drop Vs flow and average synthetic dust weight arrestance as per the requirement of BS 6540/ASHARE-52-76/EN779.<br>HEPA (Absolute) filters shall be tested as per applicable code. |
| 8.00.00 | **PIPES & FITTINGS** |
| 8.01.00 | All pipes and fittings shall be tested as per applicable codes / standard. |
| 8.02.00 | Site test- Pipes shall be tested at site hydraulically/pneumatically as per application requirement |
| 9.00.00 | **VALVES & SPECIALTIES** |
| 9.01.00 | Visual and dimensional check of valves as per relevant codes and approved drawing. |
| 9.02.00 | All the water line valves shall be hydraulically tested for body, seat and back seat (wherever provided) as per the relevant standard to which these valves are supplied irrespective of the working pressure for which these valves are selected. Check valves shall also be tested for leak tightness test at 25% of the specified seat test pressure. |

| | |
|---|---|
| 9.03.00 | Valves shall be offered for hydro test and pneumatic test in unpainted condition. |
| 9.04.00 | Functional check of the valves for smooth opening and closing shall be done. |
| 10.00.00 | **SPLIT/CASSETTE / WINDOW AC/ PAC** |
| 10.01.00 | Split/Cassette/ Window AC will be accepted on the basis of Manufacturer Standard Guarantee and Warrantee certificate. |
| 10.02.00 | PAC Each Unit shall be subjected to production routine Test excluding performance test carried out as per relevant standard. |
| 10.03.00 | Performance test of PAC shall be carried out as per relevant standard on one unit of each type and rating at site. |
| 11.00.00 | **Unitary Air Filter (UAF)** |
| 11.01.00 | Random 10% DPT on weld joints shall be carried out |
| 11.02.00 | Hydraulic test of pressure parts at 1.5 times the design. Pressure and water fill test of tanks shall be carried out |
| 11.03.00 | Trial assembly of Air washer/UAF for one of each size shall be done in shop. |

| **3. Dosing/ Metering Pumps** | $Y^a$ | | | | Y | | Y | $Y^1$ | Y | | |
| **4. Gate/ Globe/ Check Valves** | $Y^a$ | | $Y^b$ | | Y | | Y | Y | Y | $Y^3, Y^6$ | |
| **5. Dual Plate Check Valves** | $Y^a$ | | $Y^b$ | | Y | | Y | Y | Y | $Y^6, Y^{12}$ | |
| **6. Diaphragm Valves** | $Y^a$ | | | | Y | | Y | | Y | $Y^4, Y^3$ | |
| **7. Butterfly Valves (Low Pr.)** | | | | Y | Y | | Y | Y | Y | $Y^3$ | |
| 7.1 Body & Disc (Cast | $Y^a$ | | $Y^b$ | | Y | | | | | | |
| 7.2 Body and Disc (Fabricated) | $Y^a$ | Y | $Y^b$ | | Y | | | | Y | $Y^2$ | |

**LEGENDS:** Applicable tests are identified by 'Y'.

$Y^a$ : One per Heat / Heat Treatment batch / Lot.

$Y^b$ : On machined surfaces only. Also 100% on Butt Welds & 10% on Fillet Welds.

$Y^c$ : UT shall be done for shafts with Dia 50 mm or above & Plates of Thickness 25 mm or above.

$Y^d$ :Dynamic Balancing per ISO: 1940, Grade 6.3 minimum shall be conducted for rotating assy.

$Y^1$ : As per Pump governing standard. Tolerences as per HIS, USA.

$Y^2$ : Random 10% RT to be conducted on butt welds for Thk $\geq$10 mm.

$Y^3$ : Seat Leakage Test for actuator operated valves shall be done by operating the valve with job actuator.

$Y^4$ : Tests on Rubber Diaphragms shall be conducted per batch of Rubber mix for Tensile, Elongation, Hardness, Thickness, Bleed Resistance. In addition, Type Test for 50,000 cycles for each type of diaphragm shall also be conducted.

$Y^6$ : Blue Matching, Wear Travel for Gate Valves and reduced pressure test

## ZERO LIQUID DISCHARGE (ZLD) PLANT FOR FGD WASTE WATER

for check valves shall be conducted as per relevant standards.

Y[7] : Heat Treatment of the Tank/Vessel shall be done per fabrication code requirement. Welded dished ends shall be stress relieved. Dished ends manufactured by cold working shall also be stress relieved as per the requirement of code.

Y[8] : RT as per fabrication code requirements. However, dished ends welds, if manufactured by using welded plates shall be subjected to 100% RT.

Y[9] : Rubber Lining Mix shall be subjected to Bleed Resistance Test on mould sample. Adhesion Test, Spark Test and Hardness Test for the Rubber lined jobs shall also be conducted.

Y[10] :Gear Boxes shall be checked for smooth No Load Operation at shop to verify noise and vibration levels. Gear Ratio and Kerosene Leak Test shall also be conducted.

Y[11] :One Fan of each type & size shall be routine performance tested as per corresponding code for air flow, static pressure, total pressure, speed, efficiency, power consumption, noise & temperature rise. Also all Fans shall be subjected to run test of 4 hours during which noise, vibration, temperature rise and current drawn shall be measured.

Y[12] :Dry cycle test on valve spring for 1, 00,000 cycles shall be carried out as type test, if not carried out earlier, for the similar MOC, size and type of spring.

Y[14] : Electronic leak test for condenser & evaporator unit.

# COMPRESSOR AIR SYSTEM

| | |
|---|---|
| **LOT-IA PROJECTS**<br>**FLUE GAS DESULPHURISATION (FGD) SYSTEM PACKAGE** | **TECHNICAL SPECIFICATION**<br>**SECTION-VI**<br>**BID DOCUMENT NO.: CS-0011-109(1A)-2** |

| CLAUSE NO. | QUALITY ASSURANCE |
|---|---|

**1.00.00** **AIR COMPRESSOR SYSTEM**

1.01.00 AIR COMPRESSORS :

a) All pressure parts shall be hydraulically tested at not less than 150% of design pressure prior to painting and lining, if applicable. The test pressure will be maintained for 30 minutes.

b) All other parts including inter-connecting piping shall be hydraulically tested wherever possible, as per relevant codes.

c) Ultrasonic testing shall be carried out on all forgings and shafts (if dia.> 40mm). MPI/DP test will be done on machined areas of the above components.

e) During assembly all clearances and alignments shall also be checked and recorded.

f) Rotor shall be statically and dynamically balanced.

1.01.01 PERFORMANCE TEST (SHOP TEST) :

a) Performance test on the compressors shall be carried out in accordance relevant standard. The test shall also include demonstration of loading and unloading mechanism (Capacity control) and operation of safety valves.

b) Power consumption at motor input terminal at rated capacity as well as at fully unloaded condition of all the compressor shall be measured.

c) Vibration and noise level measurement will be done during shop performance test.

d) Test shall be carried out on all compressors with contract drive motor where power consumption for compressors has been indicated as a guaranteed parameter

e) Clearance on Type test requirements from Employer's Engg. Shall be reviewed prior to final clearance.

1.02.00 AIR RECEIVER, HEAT EXCHANGERS, MOISTURE SEPERATORS, AIR DRYING PLANT:

a) Each finished vessel shall be hydraulically tested to 150% of the design pressure for a duration of 30 minutes.

b) NDT on weld joints shall be as per respective code requirements or the minimum as specified below:

(i) 100 % DPT on root run of butt welds.

| CLAUSE NO. | QUALITY ASSURANCE |
|---|---|

(ii) 100% DPT on all finished butt welds and fillet welds

(iii) 10% RT on butt welds which shall include all T- joints.

c) Tube to Tube sheet joint of the heat exchangers shall be subject to Mock-up test as per the relevant standards.

d) Reactivation blowers shall be tested for FAD, temp. rise, noise & vibration. Rotating parts shall be dynamically balanced.

e) Completely assembled ADP shall be pneumatically tested at design pressure for a duration of 5 minutes. Functional and sequential operation testing of the completely assembled ADP shall be demonstrated at shop. Other accessories shall be tested as per relevant code and sections. Dew point measurement shall be done.

1.04.00 H.O.T. CRANE :

a) Chain pulley Blocks shall be tested as per IS: 3832.

b) Following NDT requirements shall be met :

(i) 100% RT of Butt welds in tension and 10% RT of butt welds in compression.

(ii) DP at random on all weldments.

Deflection, load, overload & travel check on HOT crane assembly shall be carried out as per IS:3177.

1.05.00 PIPINGS, VALVES, AND FITTINGS

a. All pipes and fittings shall be tested as per applicable code.

b. All valves shall be hydraulically tested for body, seat and back-seat (if applicable) as per relevant standard. Check valves shall also be tested for leak tightness test at 25% of the specified seat test pressure.

c. Valves shall be offered for hydro test in unpainted condition.

d. Functional checks of the valves for smooth opening and closing shall also be done.

All forgings, dia ≥ 40 mm shall be Ultrasonic Tested irrespective of the type, size & rating of the valve.

|---|---|

(g.) Anti-corrosive protection shall be tested as per applicable code.

**1.04.00 PORTABLE & MOBILE FIRE EXTINGUISHERS**

1.04.01 SHOP TEST

(a.) All fire extinguishers shall be tested as per relevant standard.

(b.) Performance / function test shall be carried out on sampling basis as per relevant code / standard.

**1.05.00 SITE TESTS**:

(a.) Fire Extinguishers: A performance demonstration test at site of five (5) percent or one (1) number, whichever is higher, of each type and capacity of the extinguisher shall be carried out by the contractor. All consumables and replaceable items require for the contractor without any extra cost to employer would supply this test would be supplied by the Contractor without any extra cost to employer.

(b.) Piping Protection:

(1.) Thickness, Holiday by spark test, Adhesion test shall be carried out as per relevant standard.

(2.) Complete piping shall be Hydro pressure tested, at 1.5 X DP or 2 X MWP whichever is higher, before protection.

(c.) Welding of Pipes:

(1.) ERW Black / rolled welded:

100% DPT on root of butt and finish weld of butt and fillet.

RT on 10% randomly selected joints shall be carried out (for underground piping).

(2.) GI Pipes

Welding on GI Pipes in general shall not be done. Welding of GI Pipes, if permitted by design, (butt / socket / fillet weld) shall be done strictly as per approved drawing and procedure approved by NTPC Engineering. For all such welds 100% DP test and random 1% RT shall be done.

| | | |
|---|---|---|
| **ROUTINE TESTS** | **Following routine tests shall be carried out on each drum of finished cables for all types (PVC / XLPE insulated) & sizes.** | |
| 1) | Conductor Resistance test | |
| 2) | High voltage test | |
| | | |
| **ACCEPTANCE TESTS** | **Following Acceptance tests shall be carried out on each size of each type (PVC / XLPE insulated) of cables, in the offered lot.** | |
| **A) For Conductor (as per sampling plan mentioned in IS: 1554 / 7098)** | | |
| | 1) | Annealing test (Copper) |
| | 2) | Tensile Test ( Aluminum) |
| | 3) | Wrapping Test ( Aluminum) |
| | 4) | Resistance test |
| | | |
| **B) For Armour Wires / Formed Wires ( If applicable ) (as per sampling plan mentioned in IS: 1554 / 7098)** | | |
| | 1. | Measurement of Dimensions |
| | 2. | Tensile Tests |
| | 3. | Elongation Test |
| | 4. | Torsion Test For Round wires only |
| | 5. | Wrapping Test |
| | 6. | Resistance Test |
| | 7. | Mass of Zinc coating test For G S wires / Formed wires only |
| | 8. | Uniformity of Zinc coating For G S wires / Formed wires only |
| | 9. | Adhesion test For G S wires / Formed wires only |
| | 10. | Freedom from surface defects |
| | | |
| **C ) For PVC / XLPE insulation & PVC Sheath (as per sampling plan mentioned in IS: 1554 / 7098)** | | |
| | 1) | Test for thickness |
| | 2) | Tensile strength & Elongation before ageing (for tests after ageing see “D”) |
| | 3) | Hot set test (For XLPE insulation) |

| D) Ageing test: | | | | |
|---|---|---|---|---|
| | **Criteria** | **Condition** | **Test Requirements** | **Remarks** |
| **PVC insulation & outer sheath:** | Samples as per relevant IS, from each size of cables in the offered lot, shall be tested for tensile strength & elongation (before ageing). **Tensile & elongation testing shall preferably be done with a computerized machine.** The values will be compared with corresponding values mentioned in the Type Test report accepted by NTPC. These values of Tensile Strength & Elongation (before ageing) should be within +/ - 15% of the corresponding values of Type Test report. (Please note that test values should be more than the minimum values indicated in relevant standard). | All sizes which meet the criteria | The size which has maximum negative deviation from type test report values will be put on accelerated ageing test. The samples shall be aged in air oven at temperature of 130ºc+/- 2ºc for 5 hours and tested for TS & elongation. Acceptance norms shall be as per IS. | In case the size does not meet the requirement in accelerated ageing test **then all sizes (which had met the criteria) will be put on ageing test as per IS.** |
| | | Sizes which do not meet the criteria | Every size will be put on ageing test as per IS. | ---- |
| **XLPE insulation** | Samples as per relevant IS, from each size of cables in the offered lot,will be put on ageing test as per IS. | | | |

| **E) Following tests will be carried out on completed cables as per IS on each size of each type (PVC / XLPE insulated)** | | |
|---|---|---|
| | 1) | Insulation resistance test ( Volume resistivity method ) |
| | 2) | High voltage test |

| **F) Following tests shall be carried out on only one size of offered lot (comprising of all sizes & types)** | | |
|---|---|---|
| | 1) | Thermal stability test on PVC insulation and outer sheath |
| | 2) | Oxygen index test on outer sheath |

| | | |
|---|---|---|
| | 3) | Smoke density rating test on outer sheath |
| | 4) | Acid gas generation test on outer sheath |
| **G) Flammability test as per IEC 60332 - Part- 3 (Category- B) on completed cables as per following sampling plan:** | | |
| | | This test will be carried out using composite sampling i.e. irrespective of size; cables of one particular type (i.e. armoured PVC insulated, unarmoured PVC insulated, armoured XLPE insulated, unarmoured XLPE insulated) will be bunched together, as per calculations in line with the IEC. All sizes of PVC & XLPE insulated, armoured & unarmoured cables shall be covered.<br>For one particular type, cables with OD less than or equal to 30 mm shall be clubbed together in touching formation while cables with OD greater than 30 mm shall be clubbed together leaving a gap equal to OD of cable having least diameter. Cable OD shall be taken as nominal overall diameter as per NTPC approved datasheet. |
| **H) Following tests shall be carried on one length of each size of each type (PVC / XLPE insulated) of offered lot:** | | |
| | 1) | Constructional / dimensional check, surface finish, length measurement, sequence of cores, armour coverage, Gap between two consecutive armour wires / formed wires, Sequential marking, drum / Batch (outer sheath extrusion batch )number marking on sheath |
| | 2) | Measurement of Eccentricity & Ovality |

| 1) | Conductor Resistance test | |
| 2) | High voltage test | |
| 3) | Partial discharge test **(for Screened cables only)** | |
| | | |
| **ACCEPTANCE TESTS** | **Following Acceptance tests shall be carried out on each size of each type (voltage rating) of cables, in the offered lot.** | |
| **A) For Conductor (as per sampling plan mentioned in IS: 7098 Part II)** | | |
| | 1) | Annealing test (Copper) |
| | 2) | Tensile Test ( Aluminum) |
| | 3) | Wrapping Test ( Aluminum) |
| | 4) | Resistance test |
| | | |
| **B) For copper tape / Wires (as per sampling plan mentioned in IS: 7098 Part II)** | | |
| | 1) | Measurement of Dimensions |
| | 2) | Conductivity check |
| | | |
| **B) For Armour Wires / Formed Wires ( If applicable ) (as per sampling plan mentioned in IS: 7098 Part II)** | | |
| | 1. | Measurement of Dimensions |
| | 2. | Tensile Tests |
| | 3. | Elongation Test |
| | 4. | Torsion Test For Round wires only |
| | 5. | Wrapping Test |
| | 6. | Resistance Test |
| | 7. | Mass of Zinc coating test For G S wires / Formed wires only |
| | 8. | Uniformity of Zinc coating For G S wires / Formed wires only |
| | 9. | Adhesion test For G S wires / Formed wires only |
| | 10. | Freedom from surface defects |
| | | |

| C) For XLPE insulation & PVC Sheath (as per sampling plan mentioned in IS: 7098 Part II) | | |
|---|---|---|
| | 1) | Test for thickness |
| | 2) | Tensile strength & Elongation before ageing (for tests after ageing see "D") |
| | 3) | Hot set test (For XLPE insulation) |

| D) Ageing test: | | | | |
|---|---|---|---|---|
| | **Criteria** | **Condition** | **Test Requirements** | **Remarks** |
| **PVC outer sheath :** | Samples as per relevant IS, from each size of each type (voltage rating) of cables in the offered lot, shall be tested for tensile strength & elongation (before ageing). **Tensile & elongation testing shall preferably be done with a computerized machine.** The values will be compared with corresponding values mentioned in the Type Test report accepted by NTPC. These values of Tensile Strength & Elongation (before ageing) should be within +/ - 15% of the corresponding values of Type Test report. (Please note that test values should be more than the minimum values indicated in relevant standard). | All sizes which meet the criteria | For PVC: The size which has maximum negative deviation from type test report values will be put on accelerated ageing test. The samples shall be aged in air oven at temperature of 130°c+/- 2°c for 5 hours and tested for TS & elongation. Acceptance norms shall be as per IS. | In case the size does not meet the requirement in accelerated ageing test **then all sizes (which had met the criteria) will be put on ageing test as per IS.** |
| | | Sizes which do not meet the criteria | Every size will be put on ageing test as per IS. | ---- |
| **XLPE Insulation** | Samples as per relevant IS, from each size of each type (voltage rating) of cables in the offered lot, will be put on ageing test as per IS. | | | |

| E) Following tests will be carried out on completed cables as per IS on each size of each type | | |
|---|---|---|
| | 1) | Insulation resistance test ( Volume resistivity method ) |
| | 2) | High voltage test |
| | 3) | Partial discharge test ( for Screened cables only ) |

| | | |
|---|---|---|
| **F) Following tests shall be carried out on only one size of offered lot (comprising of all sizes & types)** | | |
| | 1) | Thermal stability test on outer sheath |
| | 2) | Oxygen index test on outer sheath |
| | 3) | Smoke density rating test on outer sheath |
| | 4) | Acid gas generation test on outer sheath |
| | 5) | Flammability test as per IEC 60332 - Part- 3 (Category- B) on completed cable |
| **G) Following tests shall be carried on one length of each size of each type of offered lot:** | | |
| | 1) | Constructional / dimensional check, surface finish, length measurement, sequence of cores, armour coverage, Gap between two consecutive armour wires / formed wires, Sequential marking, marking of drum no. / Batch number of outer sheath extrusion |
| | 2) | Measurement of Eccentricity & Ovality |

**LED Luminaire quality requirements:**

1) LED modules to conform to IS: 16103 part 2. Manufacturer to issue a certificate of compliance for the same.

2) Control gear to conform to IS 15885 part 2 section 13. Manufacturer to issue a certificate of compliance for the same.

3) LED luminaire to conform to IS 16107 part 2 section 1. Manufacturer to issue a certificate of compliance for the same.

4) LED luminaire marking to be as per IS 16107 part 2 section 1. Manufacturer to issue a certificate of compliance for the same.

5) Acceptance tests as per IS 16107 part 2 section 1 to be carried out on LED luminaire except long duration tests i.e. a) Chromaticity coordinates & correlated color temperature (CCT); b) Color rendering index (CRI). Manufacturer will submit a COC for above tests i.e. CCT & CRI

6) LED driver make, model, type & rating may be as per recommendations of LED module manufacturer.

Notes:
1. This is an indicative list of tests / checks. The manufacturer is to furnish a detailed Quality Plan indicating the practice and procedure along with relevant supporting documents.
2. Make of all major Bought Out Items will be subject to NTPC approval.

# (CIVIL WORKS)

## SUB-SECTION-V-QD1

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|

## SAMPLING, TESTING AND QUALITY ASSURANCE FOR CIVIL WORKS

**1.0.0 INTRODUCTION**

1.1.0 This part of the specification covers the sampling, testing and quality assurance requirement (including construction tolerances and acceptance criteria) for all civil and structural works covered in this specification including excavation and filling, cast in situ concrete and allied works, fabrication and erection of structural steel works, masonry / sheeting and allied works, finishing items etc.

1.2.0 This part of the technical specification shall be read in conjunction with other Parts of the technical specifications, general technical requirements & erection conditions of the contract. Wherever IS code or standards have been referred they shall be the latest revisions.

1.3.0 All tests required for all materials (bought by Contractor) and workmanship shall be done / got done by the contractor at his own cost. The rate for respective items of work or price shall include the cost for all works, activities, equipment, instrument, personnel, material etc. whatsoever associated to comply with sampling, testing and quality assurance requirement including construction tolerances and acceptance criteria and as specified in subsequent clauses of this part.

1.4.0 The Contractor shall provide the facilities whatsoever required and also bear the cost for all sampling, testing and quality assurance in the field and in the laboratory. The Contractor shall carry out all sampling and testing in accordance with the relevant Indian standards and / or international standards and this technical specification. Where no specific testing procedure is mentioned, the tests shall be carried out as per the best prevalent engineering practices and to the directions of the Engineer. All sampling shall be done in the presence of the Engineer or his authorised representative. The Contractor shall establish the QA&QC laboratory at site and all field tests shall be done in the presence of the Engineer and / or his authorised representative. The tests which cannot be carried out in the field laboratory shall be done at a laboratory of repute such as CSMRS, NCBM, IITs, National Test House, Kolkata etc. as agreed by the Engineer. The test samples for such test shall be jointly selected and sealed by the engineer and thereafter these shall be sent to the concerned laboratory through the covering letter signed by FQA representative of the engineer. The cost of transportation and other associative cost including the test charges shall be borne by the contractor. These cost shall deemed to be included in the respective item of work in the contract. If the Engineer desires to witness such tests at laboratory, Contractor shall arrange to conduct the test in his presence.

1.5.0 The recommendations and suitability of material for concreting and other building materials like brick, cement, aggregates etc., shall be ascertained by contractor prior to start of work.

Preliminary evaluation of aggregate and its evaluation for potential alkali-aggregate reactivity as per following scope of work shall be done:-

A. Evaluation of Aggregates:

I. To carry out different tests on coarse aggregate sample i.e. specific gravity,

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|
| | water absorption, sieve analysis, deleterious material; soundness, crushing value, impact value, abrasion value, elongation index and flakiness index, as per IS: 2386.<br>II. To carry out different tests on fine aggregate sample i.e. specific gravity, water absorption, sieve analysis soundness, deleterious material, silt content, clay content and organic impurities as per IS: 2386.<br>III. To prepare evaluation report based on test results of I) and ii) above and to advise regarding suitability of fine and coarse aggregates.<br>B. <u>Evaluation of Aggregates for Potential Alkali-Aggregate Reactivity:</u><br>Evaluation for Potential Alkali-Aggregate reactivity as per following scope of work:<br>I. To carry out petrographic analysis and accelerated Mortar bar Test on aggregate samples (1N NaOH at 80 deg. Centigrade for 14 days as per ASTM 1260, or the method established/ developed by CSMRS for 22days test.<br>II. To prepare a report based on test results of I) above and to advise regarding suitability of aggregates and further testing required if any.<br>The contractor shall initiate the action with regard to the above mentioned evaluation of aggregates and other building material, so as to ensure timely completion of these tests thereby not affecting any project work. All records shall be submitted, unless specified otherwise, as per the format developed by the Contractor and approved by the Engineer. |
| 1.6.0 | The Contractor shall enclose a comprehensive list of bought out items (BOIs) envisaged in the contract for carrying out fabrication/ manufacturing/ erection/ construction/ commissioning activities, procurement of forged, cast, semi-finished and finished components/equipment etc and shall indicate the names of reputed manufacturers for each of them in their bid proposal. The items envisaged by the Contractor to be procured from these manufacturers shall meet the specification requirement. An indicative list of major bought out items (not exhaustive) for civil works is enclosed at **Annexure-I**, for which the contractor shall submit the requisite details / lists of manufacturer's in their bid proposal. |
| 1.7.0 | The list of manufacturers / sub-vendors of each of the BOIs identified / indicated by the Contractor shall be discussed / reviewed by the NTPC during post bid discussions and the list of proposed manufacturers / sub-vendors for each of the BOI shall be agreed/ approved. The list of manufacturers for all the BOIs envisaged in contract shall be included in the bid proposal and the same shall be discussed for finalization during the post bid discussions before placement of award. Where the manufacturers are placed in "DR" (Details required) category, the details of the manufacturers / sub-vendors placed in the "DR" category shall be submitted to the NTPC for approval within the period agreed at the time of post bid discussions. The Contractor's proposal shall include vendor's site facilities, expertise, facilities established at the respective works, the process capability, process stabilization, QC systems followed, experience list, etc. along with his own technical evaluation for identified sub-Contractors proposed. The formats for furnishing above details shall be given to the Contractor at post bid discussion stage. Monthly progress reports on sub-Contractor detail submission / approval shall be furnished on format no. QS-01-QAI-P-02/F1. The NTPC shall furnish other relevant formats for information/ clarification for manufacturers / sub-vendors approval to the Contractor at the time of post bid discussions (Main supplier's evaluation report Format No: |

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|
| | QA-01-QAI-P-04/F1-R0 and Sub supplier questionnaire Format no: QA-01-QAI-P-04/F2-R0). Such manufacturers / sub-vendors approval shall not relieve the Contractor from any obligation, duty or responsibility under the contract. |
| 1.8.0 | Structural steel and Reinforcement steel supply if in the scope of the contractor shall be procured from Main Steel Producers enlisted by NTPC from time to time. Currently, Main Steel Producers enlisted by NTPC are SAIL, JSW Steel Ltd, Jindal Steel & Power, Tata steel Ltd. (for Reinforcement steel/TMT bars), RINL (for long products/Rolled sections and Reinforcement steel/TMT bars), Essar Steel India Ltd. (for Flat products/ Steel Plates), Electosteel steel Ltd. (for Reinforcement steel/TMT bars) and Monnet Ispat and Energy Ltd. (for long products/Rolled sections and Reinforcement steel/TMT bars). Subsequent, if any new Main Steel Producer/s are enlisted, they may also be considered for procurement during execution of the contract if proposed by the Contractor. |
| 1.9.0 | The Field Quality Plans shall detail out all the equipment, the quality practices and procedures etc. to be followed by the Contractor's "Site Quality Control Organisation", during various stages of site activities starting from receipt of materials/equipment at site.<br><br>The contractor shall furnish complete QA & QC programme (QAP) for the work envisaged which may include the following:-<br>• The organisation structure for the management and implementation of the proposed Quality Assurance Programme.<br>• Documentation Control System<br>• The procedure for procurement of materials and source inspection.<br>• System for site controls including process controls.<br>• Control of non-conforming items and systems for corrective action<br>• Inspection and test procedures for site activities<br>• System for indication and appraisal of inspection status<br>• System for maintenance of records<br>• System for handling, storage and delivery.<br>• Quality Plan detailing out quality practices and procedures, relevant standards and acceptance levels for all types of work under the scope of this contract.<br><br>The Contractor shall appoint a dedicated, experienced and competent quality management representative on site, preferably directly reporting to the Project Manager, supported by experienced personnel, to ensure the effective implementation of the approved quality assurance programme.<br><br>The onsite quality management representative shall have the organisational freedom and authority to implement the requirements of these quality assurance arrangements, free from commercial and programme restraints.<br><br>The QA & QC setup of the contractor shall consist of qualified and experienced engineers, with their supporting staff. The QA&QC set up in addition to requisite mechanical & electrical engineers shall consist sufficient graduate civil engineers & supervisors to take care of quality assurance activities of both site & laboratory. An |

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|
| | indicative QA & QC organization chart is attached at **Annexure-III**. The deployment of man power for QA & QC set up shall be affected on the basis of agreed manpower deployment schedule, which shall be prepared by the contractor based on the L-2 network and the same shall be submitted to the Engineer-in-charge for acceptance.<br><br>Based on the schedule of work agreed with the Engineer-in-charge and the approved FQP, the Contractor shall prepare a schedule of tests and submit them to the Engineer-in-charge and organise to carry out the tests as scheduled/ agreed.<br><br>The QA&QC laboratory shall have all necessary equipment, instruments and shall be managed by a qualified / experienced person. An indicative list of test equipment is attached at **Annexure-II**. All these testing equipment shall be provided by the contractor at his own cost. The contractor shall maintain the equipment in good working condition along with valid calibration certificates, for the duration of the contract. Any other equipment though required for testing but not listed in the equipment list shall be provided / arranged by the contractor at his own cost.<br><br>QA&QC laboratory building shall be constructed by the Contractor at their own cost. The laboratory building shall be constructed and installed with the appropriate facilities. Temperature and humidity controls shall be available wherever necessary during testing of samples. |
| 1.10.0 | The contractor shall prepare and obtain approval of the Owner of the Field Quality Plan (FQP) well before the start of the work. This FQP shall cover for all the items / activities covered in the contract/schedule of items and required for completion of the work. |
| 1.11.0 | All materials / components and equipment covered under the scope of work which are to be manufactured at shop/ factory of the vendor/subvendor shall be covered under a comprehensive quality assurance programme. The detailed quality plan for manufacturing shall be drawn up by the contractor and will be submitted to the owner for approval in the prescribed format for manufacturing quality plan.<br><br>Manufacturing Quality Plan (MQP) shall detail out all the components and equipment, various test/inspection, to be carried out as per the requirements of this specification and standards mentioned therein. The quality practices and procedures followed by Bidder's/Sub-Bidder's/ sub-supplier's Quality Control Organization shall include , the relevant reference documents and standards, acceptance norms, inspection documents raised etc., during all stages of material procurement, manufacture, assembly and final testing / performance testing . The quality plan shall be submitted in electronic media e.g. CD or E-mail in addition to hard copy, for review and approval. After approval the same shall be finally submitted in compiled form on CD. |
| 1.12.0 | The contractor shall store and handle the materials as per the requirements of the relevant standards at his own cost. |
| 1.13.0 | All the equipment shall be duly calibrated by NABL/ NPL accredited laboratories/accreditation agencies. |
| 1.14.0 | The Contractor shall submit to the NTPC Field Welding Schedule for field welding activities in the format No.: QS-01-CQA-W11/F1, this format shall be furnished to the Contractor at pre-award stage. The field-welding schedule shall be submitted |

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|
| | to the NTPC along with all supporting documents, like welding procedures, heat treatment procedures, NDT procedures etc. at least ninety days before schedule start of erection work at site. The Contractor shall submit Welding Procedure Specification (WPS) in the format No: QS-01-QAI-W-06/F1 for NTPC approval/ acceptance, this format shall be furnished to the Contractor during post bid discussion stage.<br><br>All welding and brazing shall be carried out as per procedure drawn and qualified in accordance with requirements of ASME Section IX/BS-4870 or other International equivalent standard acceptable to the NTPC.<br><br>All welding/brazing procedures shall be submitted to the NTPC or its authorized representative for approval prior to carrying out the welding/brazing.<br><br>All brazers, welders and welding operators employed on any part of the contract either in the Contractor's/ sub-Contractor's works or at site or elsewhere shall be qualified as per AWSD1.1/ASME Section-IX or BS-4871 or other equivalent International Standards acceptable to the NTPC.<br><br>Welding procedure qualification and Welder qualification test results shall be furnished to the NTPC for approval. However, where required by the NTPC, tests shall be conducted in presence of NTPC/authorized representative.<br><br>No welding shall be carried out on cast iron components for repair.<br><br>All the heat treatment results shall be recorded on time temperature charts and verified with recommended regimes.<br><br>All Non-destructive examination shall be performed in accordance with written procedures as per International Standards and as mentioned elsewhere in the technical specification; The NDT operator shall be qualified as per SNT-TC-IA (of the American Society of non-destructive examination). NDT shall be recorded in a report, which includes details of methods and equipment used, result/evaluation, job data and identification of personnel employed and details of co-relation of the test report with the job. The records of RT (Films) and UT (inspection records or printed reports if possible) shall be documented and produced to NTPC. |
| 1.15.0 | The Contractor shall associate themselves with the reputed specialized blasting agency such as CMRI, NIRM for trials blasts, design blasts, blasting pattern, monitoring of blast during the blasting operations at site. The blasting operation shall remain in charge of a responsible, competent, authorized and experienced supervisor (Man-In-Charge) and thoroughly acquainted workmen. All blasting work shall be done as per approved blasting scheme/ design/ pattern in line with the technical specification requirements and all statutory laws, rules, regulations, relevant standards pertaining to the acquisition, transport, storage, handling along with use of explosives shall be strictly followed by the Contractor.<br><br>The Contractor shall install and operate equipments (such as tri-axial seismograph) for continuous monitoring and control of blast induced vibrations, noise level/ air pressure, dust, silica and noxious gases during all blasting operations in line with |

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|

the Technical Specification requirements in association with the specialized blasting agency.

The contractor shall submit the un-priced copy of the award on the specialized blasting agencies to NTPC, highlighting the scope of services/ work awarded to them by contractor. The services of such specialized blasting agency shall be available through out the period in which the blasting work is undertaken at site.

1.16.0 **ASSOCIATED DOCUMENT FOR QUALITY ASSURANCE PROGRAMME:**

i. Field Quality Plan Format No.: QS-01-QAI-P-09/F2-R1
ii. Indicative list of Field Quality Laboratory and Survey equipment list (Annexure-II)
iii. Indicative QA&QC Manpower requirements (Annexure-III)
iv. Indicative Field Quality Plan for Civil Works (Annexure-IV)
v. Indicative Field Quality Plan for Structural Steel Works (Annexure-V)
vi. Manufacturing Quality Plan Format No.: QS-01-QAI-P-09/F1-R1
vii. Status of items requiring Quality Plan and sub supplier approval. Format No.: QS-01-QAI-P-02/F1-R0
viii. List of items requiring quality plan and sub supplier approval. Format No.: QS-01-QAI-P-01/F3-R0
ix. Field Welding Schedule Format No.: QS-01-CQA-W-11/F1-R0
x. Welding Procedure Specification (WPS) Format No.: QS-01-QAI-W-06/F1-R0
xi. Main supplier's evaluation report Format No: QA-01-QAI-P-04/F1-R2
xii. Sub supplier questionnaire Format no: QA-01-QAI-P-04/F2-R1

(Note: The field quality plan attached is indicative and the contractor shall prepare the field Quality plan covering the entire scope of work in the contract and submit the same to corporate QA for acceptance/approval. However any addition or deletion in the scope of work, during detailed engineering shall be accordingly added/ deducted from the Field Quality Plan)

**2.0.0 GENERAL QA REQUIREMENTS**

2.1.0 **STORAGE AND HANDLING OF COMMON BUILDING MATERIALS**

All materials shall be stacked and stored by the Contractor as per IS-4082 and as per the requirements specified in NTPC Technical Specification.

2.2.0 **EXCAVATION AND FILLING WORKS**

The contractor shall submit a work methodology covering various items of works for all stages of excavation and filling works. This methodology shall broadly include the quantity wise and classification wise identification of source of excavation and filling, suitability tests as per specification requirements, method of stockpiling, transportation, placement, spreading , compaction, equipment, list of protocols, in-situ tests, third party lab test if required, acceptance checks for final clearance.

For blasting work at site if required, the contractor shall associate themselves with the reputed specialized blasting agency such as CMRI, NIRM for trials blasts, design blasts, blasting pattern, monitoring of blast during the blasting operations at

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|

site. The contractor shall install and operate equipment (such as tri-axial seismograph) for continuous monitoring and control of blast induced vibrations, noise level/ air pressure, dust, silica and noxious gases during all blasting operations in line with the technical specification requirements in association with the specialized blasting agency. The contractor shall submit the un-priced copy of the award on the specialized blasting agencies to NTPC, highlighting the scope of services / work awarded to them by contractor. The services of such specialized blasting agency shall be available through out the period in which the blasting work is undertaken at site. The blasting operation shall remain in charge of a responsible, competent, authorized and experienced supervisor (man-in-charge) and thoroughly acquainted workmen. All blasting work shall be done as per approved blasting scheme/ design/ pattern in line with the technical specification requirements and all statutory laws, rules, regulations, relevant standards pertaining to the acquisition, transport, storage, handling along with use of explosives shall be strictly followed by the contractor.

Tolerance for finished surface level shall be within 20 mm of the level shown in the drawing. For an unimportant area, tolerance up to +75mm shall be acceptable at the discretion of the engineer. However, these tolerances shall be applicable for localized areas only.

Acceptance criteria shall be

a) When only one set of sample is tested, then all individual samples collected and tested should pass without any deviation

b) For retest of any sample two additional samples shall be collected and tested, and both should pass without any deviation.

c) Where a large number of samples are tested for a particular test then 9 samples out of every 10 consecutive samples tested shall meet the specification requirement.

**2.3.0 MASONRY AND ALLIED WORKS**

The execution, finishing, testing and acceptance of masonry related works shall be as per the provisions of technical specifications / relevant practices IS code. Local depressions on account of faulty workmanship, broken / chipped edges shall not be acceptable.

All masonry shall be built true and plumb within the tolerances prescribed as below. Care shall be taken to keep the perpends properly aligned. Unless specified otherwise the tolerances in construction of masonry works shall be as below:

| Sl. No. | Type of Check | Tolerance |
|---|---|---|
| | Deviation in verticality in total height of any wall of a building | Shall not exceed ± 12.5mm (more than one storey)<br>± 6mm per 3m height (within a storey) |
| | Deviation from the position shown on the plan of any brickwork | Shall not exceed 12.5mm (more than one storey) |

| | | |
|---|---|---|
| | Relative displacement between load bearing walls in adjacent storeys intended to be in vertical alignment | Shall not exceed 6mm |
| | Deviation of bed joint from horizontal in any length, and it | Shall not exceed 6mm (upto 12m)<br>Shall not exceed 12.5mm total (in any length over 12m) |
| | Deviation from the specified thickness of bed-joints, cross-joints or perpends | Shall not exceed ± 3mm |
| | Finished plastered surface | Deviation not more than 4 mm when checked with a straight edge of 2 m length placed against the surface |
| | The average thickness of plaster | Not be less than the specified thickness |
| | The minimum thickness over any portion of the surface | Not less than the specified thickness by more than 3 mm for plaster thickness above 12mm and 1 mm for ceiling plaster |

**2.4.0 CONCRETE WORKS**

For concreting works provisions of technical specifications and IS: 456 shall apply. A detailed methodology for concrete works shall be submitted by the contractor to NTPC for approval. The methodology may require change / modification based on the site conditions, for which suitable revisions shall be submitted.

The methodology for concrete works shall broadly contain the suitability of source of aggregates, cement, admixture, water and reinforcement steel, etc. The available concrete mix design recommended from a specialist institute, results of trial mix carried out at site, method / control of batching, mixing, transportation, layer wise placement, compaction, fixing / removal of form work, staging, fixing of water stops at appropriate locations along with specials, expansion joints, contraction joints and construction joints, cover blocks and method of curing, methodology of repair of newly placed hardened concrete, testing and sampling of concrete during production and placement and acceptance checks for final clearance.

The equipment, deployment of manpower and machinery shall arranged by the contractor to ensure the continuous rate of placement of specified grade of concrete so as to prevent segregation, bleeding, formation of cold joints, temperature control for concreting in extreme weather conditions and for mass concreting works.

Exposed surfaces of concrete shall be kept continuously in a damp or wet condition for at least seven days from the date of placing concrete in case of ordinary Portland cement, not be less than 10 days for concrete exposed to dry and hot weather conditions, at least 10 days or period may be extended to 14 days where mineral admixtures or blended cements are used. Approved curing compounds may be used in lieu of moist curing with the permission of engineer-in-charge.

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|

Reinforcement steel shall conform to relevant IS codes. Lapping / spacing of reinforcement shall be so staggered that under no circumstances more than 50% of bars at any cross section shall be lapped. Corrosion resistance Steel shall be used for the foundations wherever specified in the technical specification. Sample test for 3% of the number of mechanical bars grips subject to a minimum of three, shall be carried out up to the yield strength of reinforcement of bars.

Test shall be conducted for the water tightness of the liquid retaining structures as per technical specifications, IS 3370 and IS 6494.

All the materials, equipments, processes used in pre cast concrete work shall conform to the requirements for the cast-in-situ concrete.

If fly ash is used in concrete, source of supply shall be checked for suitability as per IS 3812 (Part-I). Routine tests for retention of particles on 45µ sieve and loss on ignition shall be carried out on each lot of fly ash before its use. The storage of fly ash shall be similar to that of cement. Separate Silo for fly ash shall be provided in the batching plant. Validation of Mix design using fly ash shall be carried out by an approved specialist agency, before start of concrete production.

The acceptance criteria of concrete shall be in accordance with clause no.16 of IS 456. However in exceptional circumstances and that too in non-critical areas, the engineer may accept concrete work which is marginally unacceptable as per the criteria laid down in IS 456. For such accepted work, payment shall be made at a reduced rate pro rata to the concrete cube strength obtained, against that stipulated.

All records of concreting, reinforcement, testing of materials, as-built dimensions, the details of the rectification, etc, shall be maintained as given below. Four copies of such record in a bound form shall be submitted to owner for their record and future reference.

i. Testing data / report of aggregates including petrographic examination & potential reactivity of aggregate and repeated temperature cycle tests wherever specified
ii. Mix design details and record of trial mixes carried out at site
iii. Testing records of admixture as per IS-9103 / ASTM C494 including third party test reports.
iv. Approved scheme for concreting
v. Hourly records of concreting including pour card
vi. Protocol indicating the dimensional tolerance and details of inserts
vii. Records giving the details of rectification giving the location of grouting, the quantity of grout used at each location, type of grout used
viii. Bar bending schedule
ix. Location and details of mechanical anchoring used for reinforcement
x. Protocol giving the details of checking of reinforcements before concreting and conformance to the reinforcement details as shown in the construction drawings
xi. Photographs showing the areas where rectification works have been carried out. Photographs should be taken before and after rectification
xii. Temperature control record of concrete at the time of placement if applicable.

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|

xiii. Details of curing, staging and fixing / removal of formwork, checklist for formwork as per Clause 9.9 and Annexure-C of IS 14687 including all machine foundations

xiv. Batching Plant shall be calibrated regularly at least once in a 3 months. Computerized output shall be taken for each batch of production of concrete. For concreting works of ash pipe pedestals, mixer with weight batcher may be used. Production and supply of concrete from batching plant shall conform to the provisions of IS 4926

xv. Dimensions (length, cross sectional dimensions, straightness, squareness, and flatness) and tolerances for pre cast members as per NTPC Technical Specification. Load test on Pre cast members (except pre- cast tiles to be laid in the reservoir) shall be carried out @ 1% up to 1000 nos., @0.5% from more than 1000 nos. precast members of one type. The load test shall be carried out as per the provisions of IS-456 and relevant IS code.

| **TOLERANCES** | | | | |
|---|---|---|---|---|
| **Description of Item/ Structural Element** | | | **Max (mm)** | **Min (mm)** |
| **Cast In Situ Concrete** | | | | |
| 1. | Faces of concrete in foundations and structural members against which back fill is placed | | +25 | -10 |
| 2. | Eccentricity of footing as percentage of footing width in the direction of placement | | 2% but limited to 50mm | |
| 3. | Top surfaces of slabs and of concrete to receive base plates to be grouted | | +5 | -5 |
| 4. | Alignment of beams, lintels, columns, walls, slabs and similar structural elements | | +5 | -5 |
| 5. | Cross sectional dimensions of walls, slabs and similar structural elements | | +5 | -5 |
| 6. | Deviation from specified dimensions of cross-section of columns and beams | | +12 | -6 |
| 7. | Alignment of holding down bolts without sleeves | | +1.5 | -1.5 |
| 8. | Alignment of holding down bolts with sleeves | | +5 | -5 |

| | **Batching** | | Clause 10.2.2 of IS 456 | |

**2.5.0 STRUCTURAL STEEL WORK**

For structural steel works provisions of technical specifications and IS: 800 shall apply. A detailed methodology for structural steel works shall be submitted by the contractor to NTPC for approval. The methodology may require change / modification based on the site conditions, for which suitable revisions shall be submitted.

The contractor shall submit the welding procedures specification (WPS), heat treatment procedures, NDT procedures etc. at least ninety days before scheduled start of erection work at site. All welding and brazing shall be submitted to the NTPC and carried out as per procedure drawn and qualified in accordance with requirements of ASME Section IX/BS-4870 or other International equivalent standard acceptable to the NTPC.

All brazers, welders and welding operators employed on any part of the contract either in the contractor's / sub-contractor's works or at site or elsewhere shall be qualified as per AWSD1.1/ASME Section-IX or BS-4871 or other equivalent International Standards acceptable to the NTPC.

The records of welding procedure qualification and welder qualification test results shall be furnished to the NTPC for approval. However, where required by the NTPC, the tests shall be conducted in presence of NTPC / authorized representative.

No welding shall be carried out on cast iron components for repair. All the heat treatment results shall be recorded on time temperature charts and verified with recommended regimes.

All Non-destructive examination shall be performed in accordance with written procedures as per International Standards and as mentioned elsewhere in the technical specification. The NDT operator shall be qualified as per SNT-TC-IA (of the American Society of non-destructive examination). NDT shall be recorded in a report, which includes details of methods and equipment used, result/evaluation, job data and identification of personnel employed and details of co-relation of the test

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|

report with the job. The records of RT (Films) and UT (inspection records or printed reports if possible) shall be documented and produced to NTPC.

Low hydrogen electrode (AWS E-7018) for welding of High/Medium tensile steel, for M.S (IS 2062 Gr. A/Gr. B, IS 8500) sections thickness above 20mm shall be used. Preheating and Post weld heat treatment requirements shall be complied as specified in the technical specification / approved WPS.

The requirements of pre-heating shall be

| Thickness of thickest part at the area of welding / heat affected zone | Welding using other than low hydrogen welding electrodes IS 2062 | Welding using low hydrogen welding electrodes or submerged arc welding IS 2062 |
|---|---|---|
| Upto 20 mm (including) | None | None |
| Over 20 mm to 40 mm (including) | Not allowed | 200 C |
| Over 40 mm to 63 mm (including) | Not allowed | 660 C |
| Over 63 mm | Not allowed | 1100 C |

The following tests / checks shall be carried out for structural steel works

| SL. NO. | TESTS / CHECKS | QUANTUM / STANDARD |
|---|---|---|
| | Physical and chemical properties of material if supply in the scope of contractor | As per relevant codes, review of correlated mill test certificates or check testing in absence of MTC |
| | Ultrasonic test on plates above 40mm | As per ASTM A435 |
| | Welding procedure & welders qualification test | AWSD1.1/ASME Section-IX or BS-4871 or other equivalent International Standards |
| Fillet Weld | | |
| | Macro-etch examination on production test coupons for main fillet welds | Minimum one joint per built up beams, columns and crane girder etc. |
| | Tension member of crane girder | Dye penetration test on 25% weld length |
| | All other fillet welds | DPT on 5% of weld length with minimum 300mm at each location |
| Butt Weld | | |
| | DPT | 100% after back gouging on all butt welds |
| | Mechanical testing of production test coupons | Minimum one joint per built up beam, column and crane girder. |
| | Radiography test on butt welds<br>(In case of failure of any welds in SPOT/RT or UT the % of retesting shall be doubled at that particular location. Acceptance criteria of NDT on welds shall be as per AWS D1.1.<br>Wherever RT is not feasible UT to be carried out with the approval of the | 100% RT on butt welds of tension flange (bottom flange) of crane girders<br>10% RT weld length of each welder on butt welds, |

| Clause No | QUALITY ASSURANCE PROGRAMME |

| | engineer) | |
| | Ultrasonic testing on full penetration welds (other than butt welds) | 100% UT on the web to flange joint of crane girder<br>10% UT on other full penetration joints |
| | Control assembly check in shop before erection | 1st and further every 10th set of identical structure |
| | Dimensional tolerances during fabrication and erection | as per IS-7215 and IS-12843 |
| | Surface Preparation and Paint thickness | SA 2 1/2 , By elcometer random after each coat, each member |

**2.6.0 PAINTING WORKS**

Painting works shall be carried out as per the provisions of technical specifications. A detailed methodology for painting works shall be submitted by the contractor to NTPC for approval. The methodology may require change / modification based on the site conditions, for which suitable revisions shall be submitted.

The methodology for painting works shall broadly contain the source of approved brand of paints, shot / sand blasting as specified, minimum acceptable size of shot used for blasting, application of primer, intermediate coat and final coat, experience of applicator, etc. testing of painting work and acceptance checks for final clearance.

**2.7.0 SHEETING WORKS**

All bought out items shall be procured from the manufacturer's approved by engineer and tested as per relevant IS Codes/ Specification. Raw material of colour coated sheets shall meet the chemical & physical properties as per relevant standards / codes referred in the approved data sheet. It shall be tested for colour match, bare metal thickness, weight of Z/AZ coating, thickness of painting system, reverse impact, T-Bend adhesion, scratch resistance, salt spray test for 1000 Hrs and any other test / properties as specified in the technical specifications. Colour coated sheets shall be marked with video jet printing at the interval not more than 2m bearing manufacturer's name, date and time of manufacturing. Fasteners shall also be tested for 1000 hrs salt spray test as per the requirement of technical specifications.

Bonded Mineral Wool Insulation shall meet the requirements of thickness, density, thermal Conductivity, all other tests as per the technical specifications and IS-8183.

For sheet installation no gas cut opening shall be allowed at the site, whenever opening is specified these shall be properly cut in the factory and shall be filled with lipping / flashing for true shape / dimension etc. The sheets/ packets shall be stacked neatly clear off the ground at an angle to the ground, over a base pallet to provide drainage. Water / moisture should not be allowed to stagnate on surface, or in between layers. This can damage the coating, and cause corrosion.

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|
| **2.8.0** | **TILE WORKS**<br><br>The contractor shall submit the work methodology which shall include the type, grade and make of materials along with their technical data sheets, details, etc, clearance from E-I-C regarding leak proofness and damp proofness of parent concrete surface, surface preparation, the procedure of application, curing, testing and acceptance.<br><br>The agencies having adequate experience to execute the acid / alkali resistant lining works shall be engaged for executing the acid / alkali resistant lining works after obtaining the approval from the E-I-C.<br><br>The execution, finishing, testing and acceptance of tile works shall be as per the provisions of technical specifications. The material for tile works shall be procured from the NTPC approved brand / source. Local depressions on account of faulty workmanship, tiles / natural stones with cracked or broken / chipped edges shall not be acceptable.<br><br>The tests shall be carried out on acid resistant bricks / tile- water absorption, compressive strength, resistance to acid, flexural strength, dimensions and all other tests as per IS 4860 and IS 4457, bitumastic ready mixed paint as per IS 158, bitumastic as per IS 9510, potassium silicate, resin type and sulphur type mortars as per IS 4832, part I, II and III, surface preparation for painting as per IS 2395, epoxy painting shall be carried for required coating thickness and dry film thickness. |
| **2.9.0** | **FIRE PROOF DOORS**<br><br>Fire Proof doors shall be tested for the requirements mentioned in the Technical Specification. The type test of the doors shall be carried out at CBRI Roorkee for minimum 2 hours fire rating and its Fabrication drawing shall also be approved by CBRI, Roorkee. DFT of paint of Fire Proof Doors and its fittings and fixtures as per BOQ shall be checked. The doors shall be finished with suitable fire retardant painting system |
| **2.10.0** | **WATER PROOFING**<br><br>The execution, finishing, testing and acceptance of water proofing works shall be as per the provisions of technical specifications. The material for the works shall be procured from the NTPC approved brand / source and the works shall be executed by the authorized applicator of the supplier.<br><br>Water proofing shall be tested for water tightness by creating a pond of water minimum 25 mm height on area of 6 m x 6 m, for the period of 48 hrs on fully dried elastomeric membrane surfaces. Minimum 5% area of the roof shall be subjected to water tightness test. Such test necessarily be conducted on vulnerable areas like drain channel / drain head. No dampness shall be visible on the underneath side of roof (i.e. ceiling), parapet and well junctions etc. which have been subjected for testing. The above testing shall be carried out prior to application of wearing course. |
| **2.11.0** | **PILING WORK (If Applicable)**<br><br>For piling works provisions of technical specifications, approved drawings, BOQs and relevant IS codes / standards shall apply. The piling works shall be executed by the agency meeting the qualifying requirements as specified. A detailed |

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|

methodology for piling works shall be submitted by the contractor to NTPC for approval. The methodology may require change / modification based on the site conditions, for which suitable revisions shall be submitted.

The methodology for piling works shall broadly contain the method of boring, stability of bore hole, termination criteria, tests / checks for termination level, fabrication of cage, cage lowering, concrete batching / mixing, transportation, placing, recording of the time of construction operations, method of conducting initial and routine load tests, testing and sampling of concrete during production and placement and acceptance checks on piles for final clearance.

The equipment, deployment of manpower and machinery shall be arranged by the contractor to prevent the collapse of bore hole and to ensure continuous rate of placement of specified grade of concrete.

The piling works shall be executed as per the technical specifications, approved drawings, relevant codes / standards, FQP and BOQ. In addition to the requirements of technical specifications, the following shall also be ensured while execution of piling works:

a) Time gap between completion of pile boring and start of concreting should be kept to the minimum. However the maximum time gap shall not be more than 6 hours.

b) Muck Debris should be removed from the pile bore by air lift technique(by keeping the tremie & air pipe as close as to bottom of pile bore) i.e. after completion of boring, after completion of SPT(wherever applicable), after lowering reinforcement cage, but before start of concreting.

c) Density of bentonite slurry shall be checked from the sample taken from the bottom of pile bore( not at 1.0 m above the bottom of the pile bore)

d) Minimum two welding sets shall be kept ready to join the two cages of reinforcement by engaging 3 or more welders. This will ensure the lowering of R/F cage in minimum time.

e) While lowering the R/F cage into the pile bore, two hooks shall always be used to ensure balanced/symmetrical insertion of cage into the pile bore.

f) Concrete cover blocks at the junction of two R/F cage shall be ensured before lowering the second segment.

g) Surge concreting of about 1.0 cum shall be ensured at the start of concreting (i.e. in the first pour), by suddenly allowing to fall through the tremie pipe from the funnel. This will help in displacing left out muck/debris in the pile bore (by the impact).

h) Continuous feeding of concrete shall be ensured by deploying at least two transit concrete mixers (if required to be deployed) and mixing done through concrete batching plant (if deployed). Cold joints in the pile shall be avoided.

i) In a pile group, SPT shall be carried out at termination level in the pile, taken up first.

j) Bentonite slurry circulation to be ensured from start of boring to start of concreting. Flushing of bentonite slurry will only ensure maintaining of density of bentonite slurry uniformly and will not allow bentonite jelly to settle at the bottom, whereas air lift technique with bentonite circulation will ensure removal of muck debris from the bottom of pile bore.

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|

k) Properties of drilling mud shall be checked prior to commencement of the piling work and thereafter, minimum once per week or as found necessary by the engineer. One sample consisting of 3 specimens shall be tested for the above.

l) Low strain pile integrity test on all job piles and test piles shall be conducted as specified in the Technical Specification. This test shall be suitably used to identify the piles for routine tests. High Strain dynamic test shall be done as per the technical specification. The frequency of the test shall be as per the BOQ

m) For Working Piles: Minimum one sample consisting of 6 test cubes shall be made for first ten piles. Out of these 3 shall be tested for 7 days cube strength and 3 for 28 days cube strength. Minimum one sample of 6 test cubes for every 25 nos. of piles shall be tested, out of these 3 shall be tested for 7 days cube strength and 3 for 28 days cube strength

**PILE LOAD TEST**

Pile load testing shall conform to the requirements of IS-2911 (Part IV) and the technical specification. Initial load tests as specified in the contract documents shall be conducted to assess the safe load carrying capacity of pile before start of work. To verify the load carrying capacity of the working piles, routine load test shall be conducted.

Pile load-testing procedure and the test setup / scheme shall be submitted for approval of NTPC. The contractor shall use the test setup having arrangement for anchor piles / rock anchors alone or combination of anchor piles / rock anchors and kentledge for both vertical compression and uplift (tension) Load test (initial) on piles. The cost of reaction system / piles shall deem to be included in the cost of test piles

All the gauges and instruments shall be calibrated before the start of the tests on test piles and working piles and the calibration record shall be verified before start of execution of the test.

**2.12.0 WATER SUPPLY, DRAINAGE & SANITATION**

Material used for sanitary and plumbing fittings and fixtures shall conform to and be tested as per the requirements of relevant IS Codes specified in NTPC technical specification.

The obstructions in sewer lines shall be checked by inserting a smooth ball, of diameter 13 mm less than the pipe bore at the high end of the sewer or drain. If absence of any obstructions, such as yarn or mortar projecting through the joints, ball shall roll down the invert of the pipe and emerge at the lower end. The straightness shall be checked by means of a mirror at one end of the line and lamp at the other. If the pipeline is straight, the full circle of the light may be observed. The mirror will also indicate obstruction in the barrel, if the pipeline is not straight.

The service pipes shall be slowly and carefully charged with water, allowing all air to escape avoiding all shock or water hammer. The service pipe shall then be inspected under test / working condition of pressure and flow, when all draw-off taps

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|
| | are closed. The service pipes shall be checked for satisfactory support and protection from damage, corrosion and frost. |
| **2.13.0** | **ARCHITECTURAL & MISC. WORKS** |
| | Material used for sanitary and plumbing fittings and fixtures, floor finishes and allied work shall conform and tested as per the requirements of relevant IS Codes specified in NTPC technical specification. |
| | Fabricated item like metal doors, windows, ventilators, louvers, rolling shutters and grills etc. shall be checked for correctness of locations and smoothness of operation and fixtures. All controls and locking devices shall give fault free performance. Door and window shutters shall operate without jamming. The clearance at head and jamb for door shutters shall not exceed 1.5 mm. For double leaf doors, the gap at the meeting stiles shall not be more than 2.5 mm. |
| | Materials used in glass and glazing shall be procured from source approved by NTPC and shall conform to the requirements of the Technical Specification and IS Codes. |
| | False ceiling panels shall be best quality material in thickness and properties called for in the specification / schedule of items. Material Test Certificate to be submitted before bulk supply. |
| | All bought items covered in the scope of contract shall be procured from sources approved by NTPC and shall conform to the requirements of the technical specifications and referred standards /codes. |
| **2.14.0** | **PRE CAST CONCRETE WORKS** |
| | 1. All the materials used in Pre cast Concrete work shall be tested and conform to the requirements of IS codes and NTPC Tech. Specification.<br>2. Concrete mix for Pre cast members shall conform to IS-456-2000.<br>3. All relevant QA requirements pertaining to cast insitu concrete shall be applicable.<br>4. Pre Cast Concrete member shall be checked for dimensions (length, cross sectional dimensions, straightness, squareness, and flatness) and tolerances shall be as per NTPC Technical Specification. |
| **2.15.0** | **FABRIC EXPANSION COMPENSATOR:** |
| | Each layer of fabric Compensator shall be checked for thickness, unit weight, tensile strength & elongation, composite layer of the expansion joint shall be tested for temperature withstandability test. |
| | Thermal Insulation shall be checked for thickness, density, thermal conductivity test and all other tests as per IS:8183. |
| | Tests and checks on all other items shall be carried out as per relevant codes. |

| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|
| **2.16.0** | **SLIPFORM SHUTTERING**<br><br>1. The monitoring of the leveling of the yoke and the platform of the slip form shuttering to be done in each shift to avoid tilt during the casting of the chimney shell.<br><br>2. Manning of each shift shall be done by at least two experienced operators and a foreman particularly in night shift.<br><br>3. Suitable removal/ reduction of overhung / excess yoke beam length shall be affected with the decrease in the diameter of Chimney shell, as per the approved plan.<br><br>4. The laser centering method to be deployed for chimney alignment and Monitoring of chimney centre should be done by laser instruments at least two points. Monitoring/Recording of the same shall be done in each shift of 8 hours<br><br>5. Shuttering plates to be used for slip form shall be new and the grade of steel shall conform to the specification requirements.<br><br>6. The outage of the alignment of chimney centre shall be prevented by creating a counterbalance for alignment purpose to avoid differential loading, arising out of placement of reinforcement bars at one side or unloading of concrete in a hopper at one side of the platform for slip form shuttering. |

LEGENDS:

1. SYSTEM SUPPLIER/SUB-SUPPLIER APPROVAL STATUS CATEGORY (SHALL BE FILLED BY NTPC)

A – For these items proposed vendor is acceptable to NTPC. To be indicated with letter “A” in the list along with the condition of approval, if any.

DR – For these items “Details required” for NTPC review. To be identified with letter “DR” in the list.

'N' NOTED – For these items vendors are approved by Main Supplier and accepted by NTPC without specific vendor approval from NTPC. To be identified with ‘NOTED.’

2. QP/INSPN CATEGORY:

CAT-I : For these items the Quality Plans are approved by NTPC and the final acceptance will be on physical inspection witness by NTPC.

CAT-II : For these items the Quality Plans approved by NTPC. However no physical inspection shall be done by NTPC. The final acceptance by NTPC shall be on the basis review of documents as per approved

CAT-III : For these items Main Supplier approves the Quality Plans. The final acceptance by NTPC shall be on the basis certificate of conformance by the main supplier.

UNITS/ WORKS : Place of manufacturing Place of Main Supplier of multi units/works.

**NOTE: For the items placed in CAT-III for Civil Works, the review and final acceptance shall be done by NTPC-EIC/ FQA on the basis of certificate of conformance submitted by the main supplier/ main contractor.**

## INDICATIVE FIELD QA&QC LABORATORY SET-UP

| S.No | Equipment | Nos. |
|---|---|---|
| 1 | Vicat Apparatus with deskpot | 2 |
| 2 | Le Chatelier flask | 2 |
| 3 | Le Chatelier Mould | 2 |
| 4 | Cube Moulds for cement testing | 12 |
| 5 | Vibration Machine | 1 |
| 6 | Length comparator | 2 |
| 7 | Shrinkage Bar mould | 2 |
| 8 | Sieve shaker | 1 |
| 9 | Sieves for sand, coarse & fine aggregate | 1 set for each |
| 10 | Sieves for coarse aggregate for Road | 1 set |
| 11 | Proctor testing equipment | 2 sets + 18 cores |
| 12 | Slump testing equipment | 6 sets |
| 13 | Oven | 2 |
| 14 | Physical balance | 1 |
| 15 | Rapid moisture meter | 2 |
| 16 | Thermometer | 4 |
| 17 | Burret | 2 |
| 18 | Measuring cylinders | 9 |
| 19 | Measuring flasks | 3 |
| 20 | Compression testing machine | 2 sets |
| 21 | Cube moulds | 30 |
| 22 | Electronic balance | 2 (12 kg capacity), 2 ( 200 mg capacity) |
| 23 | pH balance | As per requirement |
| 24 | Radiographic facilities | As per requirement, Party should deploy BARC approved agency for carrying out RT |
| 25 | Mechanical weighing machine | 1 (100 kg capacity) |
| 26 | Ultrasonic testing machine | As per requirement |
| 27 | D.P. Test kit | 10 |
| 28 | Vernier 300 mm, 600 mm | 2 |
| 29 | Micrometer (0.25 mm) out side (25.00) | 2 |
| 30 | Radiography film viewer | 2 |
| 31 | Inside Micrometer 25-750 dia | 2 |
| 32 | Digital elcometer for paint thickness | 2 |
| 33 | Baking oven for electrode | 3 |
| 34 | Portable ovens | 2 |
| 35 | Rebar detector to locate the reinforcement before core cutting operation | 1 |
| 36 | Concrete coring machine (55mm, 60mm upto 150 mm dia core bit) | 1 |
| 37 | Rebound hammer | 1 |
| 38 | Ultrasonic pulse velocity tester | May be arranged from specialist laboratory. |

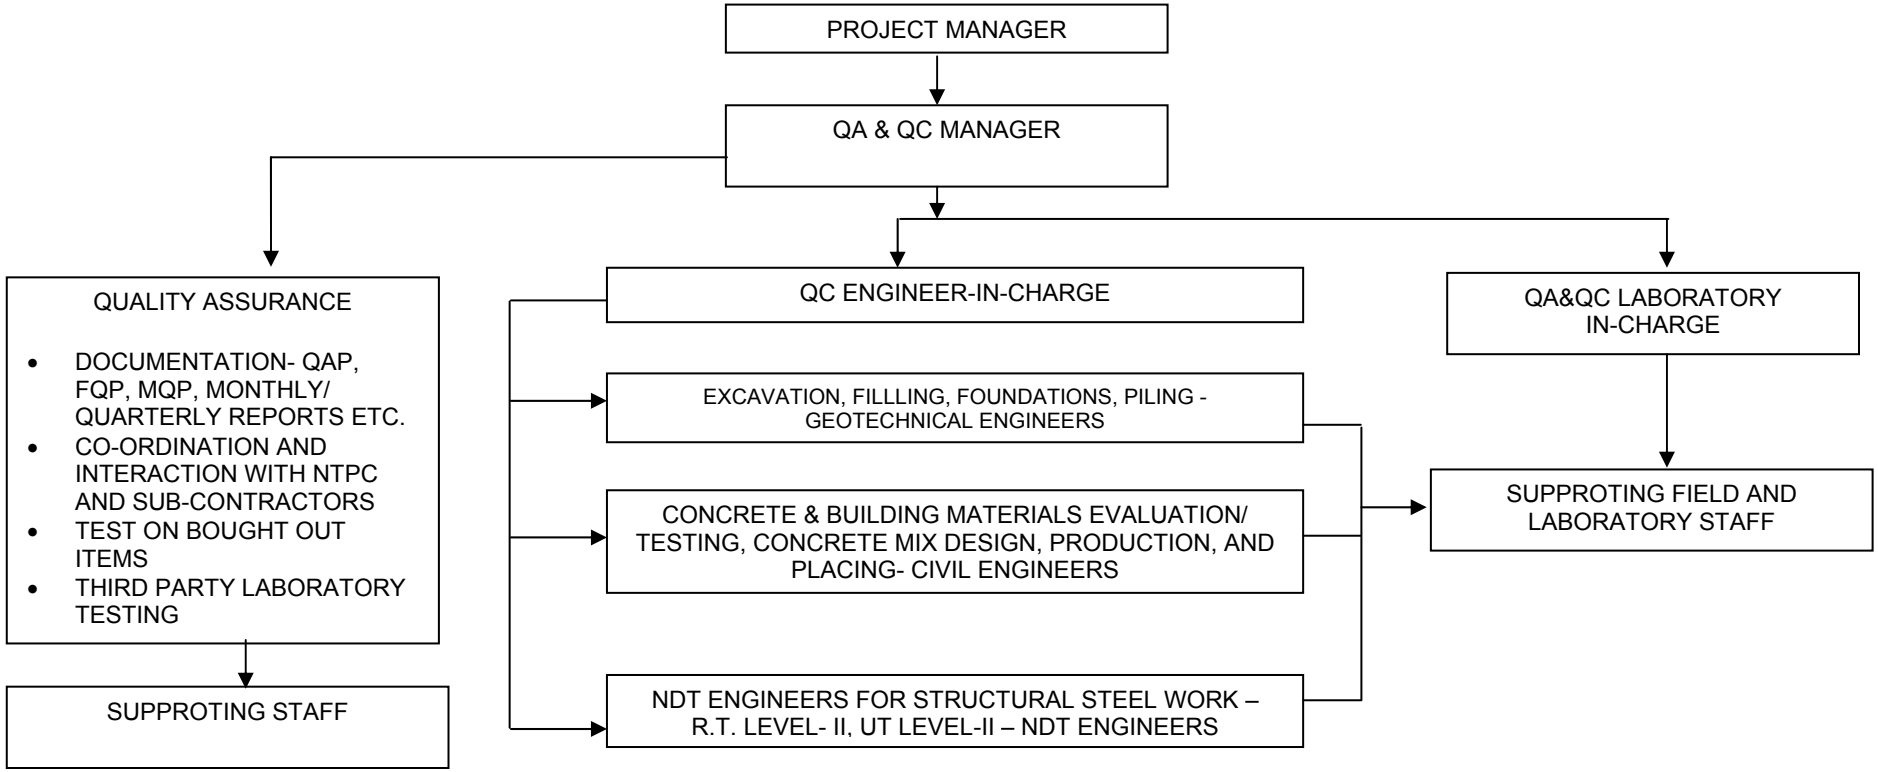
| Clause No | QUALITY ASSURANCE PROGRAMME |
|---|---|

Note :

1. The equipments listed above are indicative and required to be mobilised as minimum requirement. additional equipment if any ,required for successful completion of work shall be provided /arranged by the contractor.
2. All test reports/ inspection reports have to be computerized and maintained on LAN with an access to the owner
3. Computers - 2 Nos shall be deployed with Windows operating system and connected to the NTPC server
4. Based on the schedule (L2/L3 Network), Quality control & Quality Assurance work plan shall be finalized by the contractor and the same shall be submitted to the engineer-in-charge for acceptance/approval. The Finalized work plan shall be maintained on the computer to be accessed by the owner for database and day to day monitoring.

**Annexure – III**

***INDICATIVE FIELD QA & QC MANPOWER STRUCTURE***



**NOTE:**

1. The above organization setup is minimum, however their deployment shall be as per the agreed deployment schedule. The contractor shall prepare a manpower deployment schedule in line with the finalized work plan and the same shall be submitted to the engineer-in charge for acceptance/ approval.
2. The contractor shall mobilize the QA& QC manpower in line with the finalized manpower deployment schedule and shall ensure their availability well in advance (15 days approx.) of the beginning of the concerned activity/ work.
3. The contractor shall further mobilize required number of skilled & supporting staff and additional resources, if any to meet the work schedule.

Drawings | | SR/TR | √ | Reporting of petrographic examination shall be done as illustrated in IS 2386 ( part-VIII)-1963. petrographic report shall be supported by the analysis and recommendation by a specialist instute. |
| viii | | Crushing value abrasion value and impact value | As required/ agreed | A | Physical | Once per source/ on every change of source | IS:383, IS-2386 Part IV/, Tech Specs and Const. Drawings | | SR/TR | | -do- |
| 3 | **Fine Aggregate** | | | | | | | | | | |
| i | | Moisture content | As agreed / required | B | Physical | To be done every day before start of work | IS: 2386 Part-III IS:383 , Tech Specs and Const. Drawings | | SR/TR | | Weight of sand and weight of water shall be adjusted as per moisture content. |
| ii | | Silt, Clay content and organic impurities | As agreed / required | B | Physical | Once per source& for on every change of source | IS: 2386 Part-II, IS:383 , Tech Specs and Const. Drawings | | SR/TR | | Acceptance limit as per relevant IS code |
| iii | | All other tests similar to coarse aggregates as mentioned above. | As agreed / required | B | As above | Refer S.No. 2.01.02 | IS-2386, IS-383, Tech Specs and Const. Drawings | | SR/TR | | |
| 4 | **Water** | | | | | | | | | | |
| i | | Test for sulphates and chlorides | As required/ agreed | B | Testing | Once per each source thereof yearly. | IS:3025 part 22 and 23 (for test procedure ), IS:456(for acceptance criteria ) , Tech Specs and | | SR/TR | | |
| ii | | Tests for ascertaining limit of solids | As required/ agreed | B | Physical | Once per each source thereof yearly. | IS:3025 part 18 (organic),IS:456 , Tech Specs and Const. Drawings | | SR/TR | | |
| iii | | Tests for pH Value | As required/ agreed | B | Testing | Once per each source thereof yearly. | IS:3025, IS:456, Tech Specs and Const. Drawings | | SR/TR | | |
| iv | Check for initial set time for used water and distilled water | vicat appratus | | A | Physical | See Remarks | See Remarks, Tech Specs and Const. Drawings | | See Remarks | √ | Initial set time with used water should not be less than that with distilled water. This check is to be carried out only if the results of the tests mentioned at sl. no. 3.00, .4 i),ii)& iii) mentioned above |

| v | Check for Concrete compressive strength with used water and distilled water | standard sand and compression testing machine | As agreed / required | A | Physical | See Remarks | See Remarks, Tech Specs and Const. Drawings | | See Remarks | √ | This check is to be carried out only if the results of the tests mentioned at sl. no. 3.00, .4 i),ii)& iii) mentioned above |
| 5 | CONCRETE PRODUCTION | | | | | | | | | | |
| i | | Check for the proportaions of materials for nominal mix concrete as per Table-9 of IS 456 | As agreed / required | B | Physical | Random in each shift | IS:456, Tech Specs and Const. Drawings | | SR/TR | | |
| ii | | Trial mix (Cubes compressive strength) as per Mix Design | As agreed / required | A | Physical | Min. 4 Trial Mixes with admixtures and Without admixtures With fly ash. | IS: 516 & IS:456, IS:10262, Tech Specs and Const. Drawings | | SR/TR | √ | For trial mix min. of 6 cubes for each mix, 3 specimen shall be tested at 7 days remaining 3 shall be for 28 days comp. Strength. Mix design shall carried out at agency finalised during pre award ) |
| iii | | Crushing strength (works Tests cubes) | As agreed / required | A | Physical | One set of 6 cubes per 50 M3 or part thereof for each grade of concrete per shift whichever is earlier. | IS:516, IS:456, Tech Specs and Const. Drawings | | SR/TR | √ | Min. of 6 cubes for each mix, 3 specimen shall be tested at 7 days remaining 3 shall be for 28 days comp. Strength. |
| iv | | Workability - slump test | As required/ agreed | B | Physical | One sample every 2 hrs. from every mixing plant | IS:456, Tech Specs and Const. Drawings | | SR/TR | | Slump test for medium and high workability, Compaction factor test for medium and low workability, V.B. test for low to Very low workability |
| v | | Cement content | As agreed / required | B | Physical | At random at the time of batching. | IS:1199 , Tech Specs and Const. Drawings | | SR/TR | | |
| vi | | Admixtures for Concrete from approved sources | As agreed / required | A | Review of MTC | Random in each shift | IS:456 , Tech Specs and Const. Drawings | | SR/TR | √ | Admixture of appd. Brand and tested quality shall be used. |
| vii | | Water Tightness Test for Water Retaining Structures | As agreed / required | B | Physical | 100% | IS:3370 (Tanks and Revision) , Tech Specs and Const. Drawings | | SR | √ | |
| viii | | Dimensions and visual exa-mination of finished structure | As agreed / required | B | Physical/ visual | 100% | As per Tech. Specification./Appd. Drg./IS-456 | | SR | | |
| 6 | CONCRETE CONVEYING, PLACING& COMPACTION | | | | | | | | | | |
| i | Mixing of concrete | mixing of concrete shall be done in a approved mixer such as to produce a homogenous mix | As required/ agreed | | | To be calibrated at the time of starting and subsequently once in three months, and shall confirm to IS:4925 | Review of calibration chart/ Certificate, IS 457, Tech Specs and Const. Drawings | | | | time of mixing will be as given in IS 457 |
| ii | | Calibration of Batching Plant | As required/ agreed | A | Physical | To be calibrated at the time of starting and subsequently once in three months, and shall confirm to IS:4925 | Review of calibration chart/ Certificate, Tech Specs and Const. Drawings | | SR/TR | √ | Cement consumption at batching plant shall also be obtained through comp. Output.Provision of online printer is manadatory |
| iii | | Handling and Transportation of concrete | As required/ agreed | B | Physical | Random in each shift | IS:456, Tech Specs and Const. Drawings | | SR | | Free fall or drop shall be limited to 150 cm unless permitted concrete should be placed within 30 min of its removal from mixure . Construction methodology to be approved one week prior to start of work. |
| iv | | Placement of concrete | As required/ agreed | B | Physical | Random in each shift | IS:456, Tech Specs and Const. Drawings | | SR | | No concrete shall be placed until the place of deposit has been throughly inspected and approved, the concrete shall be deposited in such a manner to maintain, until completion of unit, a plastic horizontal surface throughout |
| v | | Check for compaction and Curing | As required/ agreed | B | Physical | Random in each shift | Check for period of curing as per IS 456 , Tech Specs and Const. Drawings | | SR | | Exposed concrete surface shall be protected against heating and drying for atleast 72 hrs after placement, curing compound may be used |
| vi | | Cleanliness, provision of chute and arrangement for transportation & placement of concrete. | As agreed / required | C | Visual | 100% | IS:456, Tech Specs and Const. Drawings | | SR | | |
| x | | check for segregation | As agreed / required | C | Visual | 100% | IS:456, Tech Specs and Const. Drawings | | | | |
| 7 | TEST/CHECK ON RCC STRUCTURE IN HARDENDED CONDITIONS | | | | | | | | | | |
| i | | Core Test | As agreed / required | A | Physical | As required by NTPC Engineer. | As per IS:456, IS 516, Tech Specs and Const. Drawings | | SR/LB/ Test Report | √ | Acceptable if average equivalent cube strength of the cores is equal to at least 85% of the cube strength of the grade of concrete specified for the corresponding age and no indivisual conc has result less than 75%` |
| ii | | Dimensional check on finished structures & Dimensional tolerances | As agreed / required | B | Measurement | Approved Drawing | As per IS:456, Tech Specs and Const. Drawings | | SR/LB | | |
| iii | | Rebound Hammer test | As agreed / required | A | physical | As required by the NTPC engineer | Tech Specs and Const. Drawings | | SR/LB | √ | |
| 8 | REINFORCEMENT STEEL | | | | | | | | | | |
| i | | Physical and Chemical Properties for each lot as per relevant IS codes | As required/ agreed | A | Review of MTC | Each batch of delivery | IS : 1786, IS:432, IS:1566, Tech Specs and Const. Drawings | | MTC | √ | Applicable if steel is procured by Contractor |
| ii | | Cutting tolerance | As agreed / required | B | Measurement | Random in each shift | IS : 1852, IS: 432, IS:1786, Tech Specs and Const. Drawings | | SR/LB | | Tolerance as per specifications |

Drawings | | SR/LB | | To be checked at site. Steel collected from source should be free from excessive rust. To be stored as per Technical Specs. |
| 9 | PLACEMENT OF REINFORCEMENT STEEL | | | | | | | | | | |
| I | | Check for bar bending schedule with necessary laps. Spacers & Chairs | As agreed / required | B | Visual & Measurement | Random in each shift | Approved Drawings, Tech Specs and Const. Drawings | | SR | | |
| ii | | Check for cover, spacing of bars | As agreed / required | B | Visual & Measurement | Random in each shift | Approved Drawings, Tech Specs and Const. Drawings | | SR | | |
| iii | | Check for bending of bars | As agreed / required | B | Visual & Measurement | Random in each shift | Approved Drawings, Tech Specs and Const. Drawings | | SR | | |
| iv | | Check for spacers and chairs after the reinforcement cage is put inside the formwork | As agreed / required | B | Visual & Measurement | Random in each shift | Approved Drawings, Tech Specs and Const. Drawings | | SR | | |
| v | | Acceptance of placement od reinforcement before start of concreting | As agreed / required | B | Visual & Measurement | beofre start of each concreting | IS : 456/ Drawings & approved bar bending, Tech Specs and Const. Drawings schedule | | SR | | |
| 10 | STAGING AND FORMS | | | | | | | | | | |
| i | | Materials and accessories | As agreed / required | B | Visual | Once before start of work | As per relevant IS, Tech Specs and Const. Drawings | | SR | | Proper care should be taken in order to combat corrosion. Proper care should be taken while cleaning, moving and stacking the scaffolds |
| ii | | Soundness of staging, shuttering and scaffolding | As agreed / required | B | Visual | Once before start of work | As per manufacturer's spec.and as per 3696,4014, 4990, Tech Specs and Const. | | SR | | |
| iii | | Acceptance of formwork before start concreting | | B | Physical / visual | beofre start of each concreting | As per provisions and tolerances, Tech Specs | | SR | | |
| 11 | EMBEDDED PART(INCLUDING LAYING OF RAILS & ANCHOR FASTENERS) | | | | | | | | | | |
| i | | Position and levels of embedded parts | As agreed / required | B | Physical/ measurement | 100% | As per drawing, Tech Specs and Const. Drawings | | SR | | Exposed surfsce of the embeded parts other than holding down bolts are to be painted with primer ,chlorinated , rubber baed zinc phosphate |
| ii | | Position depth and size of bolt hole | As agreed / required | B | Physical/ measurement | Random in each shift | As per drawing, Tech Specs and Const. Drawings | | SR | | |
| iii | | Location verticality of pipe sleeve/opening of bolt hold | As agreed / required | B | Physical/ measurement | Random in each shift | As per drawing, Tech Specs and Const. Drawings | | SR | | |
| iv | | Laying of rails under supervision of NTPCs specilised agency. | As agreed / required | B | Physical/ measurement | Random in each shift | As per drawing, Tech Specs and Const. Drawings | | SR | | |
| v | | Welding / tieing of embeddment to reinforce-ment | As agreed / required | B | Physical/ measurement | Random in each shift | As per drawing, Tech Specs and Const. Drawings | | SR | | |
| 12 | PRE-CAST CONCRETE | | | | | | | | | | |
| i | | Crushing strength | As required/ agreed | A | Physical | one sample of six cubes per 50 cum or part thereof | IS:516&IS; 456, Tech Specs and Const. Drawings | | SR/LB | √ | a minimum of three specimen shall be tested for 28 days comp. strength |
| ii | | Workmanship free from visual defects | As required/ agreed | B | Physical | 100% | Tech Specs and Const. Drawings | | SR | | The precast units shall be free from defects like honeycombing, reinforcement exposure and should have good finish. All relevant tests like workability, cube test shall be carried out as per IS 456-2000 Same as applicable to cast in situ concrete. |
| iii | | Dimension of finish structure | As required/ agreed | B | Measurement | 100% | As per IS:456, Tech Specs and Const. Drawings | | SR | | If the material already tested of the cast-in-situ concrete and part of the same is used for precast concrete, further testing is not required, otherwise testing is required for every 50 Cum. Of Concrete. |
| iv | | Workability | slump test apparatus | B | Physical | one sample every two hrs from mixing plant | IS:1199 &IS:456, Tech Specs and Const. Drawings | | SR/LB | | According to the mix design |
| v | | Water cement ratio | As agreed / required | B | Physical | At random at the time of batching | IS:1199 , Tech Specs and Const. Drawings | | SR/LB | | According to the mix design |
| vi | | Cement content | As agreed / required | B | Physical | At random at the time of batching | IS:1199 /tech spec, Tech Specs and Const. Drawings | | SR | | According to the mix design |
| vii | | Load Test | As agreed / required | A | Physical | 5% or as desired by EIC | IS:456/ As decided by NTPC Site Engr. Incharge., Tech Specs and Const. Drawings | | SR | √ | These tests shall also be carried out, in case of doubt regarding grade of concrete and poor quality. |
| 13 | JOINTS IN CONCRETE | | | | | | | | | | |
| i | | Check for the joint material - bitumen impregnated fibre board, PVC water stops, Sealing compound, Expanded polystyrene board, Hydrophillic strip, Acrylic polymer etc. | As per manufacturer Standards | A | Review of MTC | Each batch of delivery | Tech Specs and Const. Drawings, IS 1838, IS 1834, IS12200 | | MTC | √ | |
| ii | | Acceptance of installation of materials for Joints in concrete | As agreed / required | B | Acceptance | Each installation randomly | As per technical specifications and construction drawings | | | | |
| 14 | DAMP PROOF COURSE | | | | | | | | | | |
| i | | Check for the material - Hot bitumen and water proffing materials etc | As agreed / required | A | Review of MTC | Each batch of delivery at site | Tech Specs and Const. Drawings, IS 702 | | SR | √ | |
| ii | | Acceptance of damp proof course | As agreed / required | B | Acceptance | 100% | As per technical specifications and construction drawings | | SR | | |

| 1 | **Check for the material/ items for all type of timber, flush doors, Particle doors, wire guage, Aluminium doors, Fire proof doors, windows fittings, Anodized aluminium works, Mortice locks, Automatic operating system etc received at site** | Review of MTC / make or/and Physical checks, tests report ( if MTC is not available) | As agreed / required | A | Review of MTC/ Physical | for each batch of delivery | Tech Specs and Const. Drawings | | SR | √ | |
| 2 | **Wood work in frames** | Wood work in frames - Check for dimensions, surface finish and rebating etc. | As agreed / required | B | Physical | Random for each installation | Tech Specs and Const. Drawings | | SR | | |
| 3 | **Wardrobe shutter and show cases** | | | | | | | | | | |
| i | | Check for material as per IS 3087 and 3097 - from NTPC approved source | As agreed / required | B | Physical | one sample for each section for each lot of delivery | Tech Specs and Const. Drawings, IS 3087 and 3097 | | SR | | |
| ii | | Acceptance of fixing after completion | As agreed / required | B | Acceptance | 100% | Tech Specs and Const. Drawings, IS 3087 and 3098 | | SR | | |
| 4 | **Pelmets** | | | | | | | | | | |
| i | | Check for material as per IS 3087/ 3097 - from NTPC approved source | As agreed / required | B | Physical | one sample for each section for each lot of delivery | Tech Specs and Const. Drawings, IS 3087/ 3097 | | SR | | |
| ii | | Acceptance of fixing after completion | As agreed / required | B | Acceptance | 100% | Tech Specs and Const. Drawings, IS 3087/ 3098 | | SR | | |
| 5 | **MS Grills** | | | | | | | | | | |
| i | | Check for the material for section and weight from NTPC approved source | As agreed / required | A | Physical | one sample for each section for each lot of delivery | Tech Specs and Const. Drawings | | SR | √ | |
| ii | | Check for fabrication done at approved workshop | As agreed / required | B | Physical | Random | Tech Specs and Const. Drawings | | SR | | |
| | | Acceptance of fixing of MS Grills | As agreed / required | B | Acceptance | Random | Tech Specs and Const. Drawings | | SR | | |
| 6 | **Fitting and fixtures - MS sliding door bolts, tower bolts, pull bolt lock, MS handles, Safety Chains, brass locks, brass latch, hydraulic floor springs & door closers, etc** | Check for fitting items as per relavent IS codes, tech specifications and BOQ- from NTPC approved source | As agreed / required | B | Physical and acceptance | Five samples for each item for each lot of delivery | Tech Specs and Const. Drawings | | SR | | |
| 7 | **Fitting and fixtures - Aluminium sliding door bolts, tower bolts, pull bolt locks, handles, door stoppers etc.** | Check for fitting items as per relavent IS codes, tech specifications and BOQ- from NTPC approved source | As agreed / required | B | Physical and acceptance | Five samples for each item for each lot of delivery | Tech Specs and Const. Drawings | | SR | | |
| 8 | **Fire proof doors** | | | | | | | | | | |
| i | | a) Check for the Fire Proof Doors | As required/ agreed | A | Review of MTC | Each lot | As per Technical Specifications and approved drawings, IS 3614 Part (I &II), TAC | | MTC | √ | |
| ii | | b) Check for DFT and Fire Retardency of Paint | As required/ agreed | B | Physical | Each Door | As per Technical Specifications and approved drawings, IS 3614 Part (I &II) | | SR/LB | | |
| 9 | **Acceptance of all type fittings after fixing** | Acceptance of fittings after completion | As agreed / required | B | Physical and acceptance | Random for each type of fitting | Tech Specs and Const. Drawings | | SR | | |
| | | | | | | | | | | | |
| 8.00 | **GENERAL STEEL WORK** | | | | | | | | | | |
| 1 | **Check for Material** | Review of MTC/ make / Physical checks, tests ( if MTC is not available) | As agreed / required | A | Review of MTC for each delivery | For each batch of delivery | Tech Specs and Const. Drawings | | SR | √ | |
| 2 | **Rolling shutters** | | | | | | | | | | |
| i | | Check for surface finish and thickness of plate of rolling shutters of approved make and DFT | As agreed / required | B | Physical | Random for each batch of delivery | Tech Specs and Const. Drawings | | SR | | |
| ii | | Acceptance of rolling shutters after fixing | As agreed / required | B | Physical and acceptance | Random | Tech Specs and Const. Drawings | | SR | | |
| 3 | **Steel Glazed doors and T-iron frames sections** | | | | | | | | | | |
| i | | Check for shape, tolerances, thickness, welding and finishing of sections (Check MTC whereever applicable) | As agreed / required | A | Review of MTC for each delivery | Random for each delivery | Tech Specs and Const. Drawings | | SR | √ | |
| ii | | Acceptance of Steel Glazed doors and T-iron frames sections after fixing | As agreed / required | B | Physical and acceptance | Random for each installation | Tech Specs and Const. Drawings | | SR | | |
| 4 | **Pressed steel pressed frames/ doors** | | | | | | | | | | |
| i | | Check for shape, tolerances, thickness, welding and finishing (Check MTC whereever applicable) | As agreed / required | A | Review of MTC for each delivery | Random for each delivery | Tech Specs and Const. Drawings, IS4351, IS2202 | | SR | √ | |
| ii | | Acceptance of Pressed steel pressed doors after fixing | As agreed / required | B | Physical and acceptance | Random for each installation | Tech Specs and Const. Drawings | | SR | | |
| 5 | **Fencing and Gates** | | | | | | | | | | |

| Maharatna Company | **TITLE: - 4X250 MW BRBCL NABINAGAR FGD**<br>**SPECIFICATIONS FOR SINGLE FLUE RCC CHIMNEY** | SPECIFICATION NO. PE-TS-463-620-C002<br>VOLUME :<br>SECTION :<br>REV.NO. 00<br>SHEET |

# SECTION-C

# SPECIFIC TECHNICAL REQUIREMENTS FOR ELECTRICAL WORKS

# SPECIFICATION NO. PE-TS-463-620-C002

**TECHNICAL SPECIFICATION FOR CHIMNEY(ELECTRICAL**

**SECTION-C**

# VOLUME – II

# SECTION-C

# SPECIFIC TECHNICAL REQUIREMENTS FOR ELECTRICAL WORKS

Note : In case of any conflict between section-C & section-D of electrical portion, section-C of electrical portion shall prevail.

# TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)

**SECTION-C**

## 01.00.00 GENERAL

This specification lays down requirement of work for the Electrics to be executed on Chimney. The Bidder will include all such items of work which are essential to make the individual equipment/system complete in all respect and satisfactory completion of the proposed scheme irrespective of whether specifically mentioned here or not.

All equipment/ fittings will be easily approachable for maintenance/ replacement. Necessary platforms with handrails will be provided for maintenance of all the fittings/ equipment.

All equipment and accessories covered under this specification will conform to Technical Specification given in this document. The owner, however, reserves the right to accept or reject the proposal without assigning any reason.

All safety measures as required to be adopted as per the statutory regulations and the safety rules of the plant will be strictly followed by the Bidder during execution of the contract.

Supply, laying and termination of all the cables required for chimney elevator including trailing cable will be under scope of the Bidder.

## 01.01.00 Standards and Regulations

The electrical equipment / installation will comply with the requirements of the following Rules/regulations as amended up to date:

i) Indian Electricity Rules

ii) National Electrical codes and Indian standards

iii) International Civil Aviation Organization regulations

iv) National Airport Authority / DARA regulations

## 01.02.00 Ambient conditions

The entire electrical installation of the chimney will be suitable for an ambient temperature of 55 deg C since this temperature is likely to be encountered during service when the chimney is in full operation. The equipment will be suitable for operation in the rigorous weather conditions prevailing at the chimney.

# TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)

**SECTION-C**

## 02.00.00 SCOPE AND BRIEF DESCRIPTION OF WORK

The scope of work includes design, detailed engineering, procurement of items, shop testing, packaging, delivery to site, unloading at site, storage, handling, comprehensive insurance, erection, testing and commissioning of all necessary items for the chimney as indicated below.

1) Lightning protection system consisting of air termination, down rods/ GI strips, test points etc.
2) Main Power Distribution boards(PDB), Emergency distribution board, Elevator board, Lighting Panels, Power Panels etc. for power supply to various electrical items
3) Earthing system for equipment and structures of the chimney.
4) Aviation warning system.
5) Illumination of various platforms & landings of RCC chimney
6) Welding sockets, Power receptacles, switches and other hardware
7) Power and control Cables
8) Cabling system including trays, supporting structure, conduits etc.
9) Electrics for the freight cum passenger elevator and roll up door.
10) Accessories like clamps, nuts, bolts etc.
11) Under ground earthing for the earthing system as well as lightning protection
12) Communication system

The Bidder will provide change over facility in the DB

The successful Bidder will have to carry out the detailed engineering for the entire work.
For installation of fixtures etc., the Bidder will have to arrange tools, tackles, welding sets, pipe bending machine, cable crimping tools, IR megger, earth megger, tester etc.

The Bidder will be responsible for supply and fixing of all accessories required for installation of lightning protection equipment, aviation lighting system equipment, light fittings, distribution panel, electrics for the freight cum passenger elevator, elevator control panel, etc. at required places even though every individual item necessarily may not have been detailed out explicitly in the specification.

The main items in the scope will be as follows:

- AC distribution board
- Telephone handset

## TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)

**SECTION-C**

- Power & control Cables including incoming cables to the board
- Cable accessories like glands, lugs, clamps, brackets, JBs, ferrules and other fixing accessories
- Conduits of required sizes for protection of cables
- Air termination rods
- GI strips for lightning protection.
- GI strips for earthing of equipment & structures
- Earthing electrodes & Treated earth pits.
- Aviation warning lights
- 24 Hrs timer, Photoelectric light detector etc. for controlling the lights
- Outdoor type fittings and lamps
- Indoor type fittings for illumination of premises inside
- 20A and 63 A Power receptacles, 24V sockets etc.
- O & M spares and commissioning spares
- Special tools and tackles for the equipment/system supplied
- Complete electrics for the freight cum passenger elevator and for electrically operated door.
- Danger boards, safety items etc.
- Various fixing accessories such as nut bolts, check nuts, bushes, clips, nails, clamps, screws, hoppers, conduits, etc.

For lightning protection, Bidder scope of work will include supply, installation testing and commissioning of the complete system consisting of air terminations, down rods, earth, testing points, earthing pits, etc.

Bidder will furnish a detailed drawing of the lightning protection and earthing system and execution of work will be commenced only after obtaining approval to this from the owner.

For aviation warning system Bidder scope of work will include supply and installation & commissioning of the complete aviation warning system including supply & laying of cables, termination etc.

Aviation lighting system will be test operated by the Bidder for not less than 60 days. Equipment and work, which fails during the test period, will be repaired or replaced at the option of the owner.

The scope will also include the civil works associated with aviation lighting.

The Bidder will furnish a detailed drawing of aviation warning system and associated power distribution scheme and execution of work will be commenced only after obtaining approval to this from the owner.

For general illumination of chimney , scope of work includes installation of complete illumination system including distribution board, illumination fittings,

cabling, power receptacles, maintenance sockets, earthing etc.

The Bidder will also furnish a detailed drawing of illumination system and associated power distribution network.

02.01.00 **Power Supply System**

The details of power supply system are outlined below.

a) 415 Volt system (Normal)

| | | |
|---|---|---|
| i) | System voltage | 415 V +/-10%, three phase, 4 wire, neutral solidly earthed |
| ii) | System frequency | 50 Hz +/- 5% |
| iii) | Combined Voltage and frequency variation | 10% |
| iv) | Fault level | 50 KA |

b) 415 Volt system (Emergency)

| | | |
|---|---|---|
| i) | System voltage | 415 V +/-10%, three phase, 3 wire syatem |
| ii) | System frequency | 50 Hz +/- 5% |
| iii) | Combined Voltage and frequency variation | 10% |
| iv) | Fault level | 50 KA |

c) In case any power supply other than 415 V, 3 phase indicated above is required, same will be generated by the Bidder through suitable step down transformer, rectifier etc.

03.00.00 **TECHNICAL SPECIFICATION/DETAILS OF EQUIPMENT AND INSTALLATION**

03.01.00 **LIGHTNING PROTECTION**

The chimney will be protected against damage by the lightning protection system complying with IEC-62305 & latest IS standard,and will be subject to approval of the owner.

## TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)

**SECTION-C**

Around the top of each of the flue ducts, a coronal band of lead coated copper strip of size 50x6 mm or equivalent approved section will be provided. The circumferential conductor will be connected to the down conductors of minimum 50x6 mm size galvanized steel strips. The other end of each down conductor will be connected to an earth termination. Vertical down conductors will be spaced as per IEC-62305 & latest IS standard.

Vertical air termination will be of 2.5 m height and will be projecting 0.75 m above the highest part of the chimney. Air terminations will be equally spaced along the periphery at intervals of maximum 2.4 m.

The vertical air terminations will be made of minimum 20 mm dia solid copper rod with top with lead coating and will have spikes on solid sphere on top. The termination rod will be secured to the top of the chimney with adequate number of fasteners to withstand high wind pressure at the height involved.

The vertical air terminations will be electrically connected together with the lead coated copper strip coronal band which will be fixed 600 mm below top of the chimney . The coronal band will be clamped along the surface at intervals of 600 mm by 25x6 mm GI clamps. The connection between copper and GI will be done by brazing.

The down conductor will be clamped along the surface at intervals of 1500 mm by GI clamps. The connection between the GI Flats and GI clamps will be done by arc welding.

The down conductors will be minimum 4 numbers per flue ducts and will be evenly spaced along the periphery. These material provided at top of 12m shall have additional coating of 2mm thick seamless lead cover.
At each chimney platform level, a circulating band will be provided which will be made of 50 x 6 mm GI flat and electrically connected to each down conductor.

Earthing system for lightning protection will be electrically separate from the earthing of ladders, platforms, equipment and structures. Separate earthing systems will be provided accordingly.

Earth termination will consist of earth electrodes made of 3 Metre long MS rods driven into ground. The earth electrode will conform to IS: 3043. Test joint will be provided at a height of 1.0m from grade level for each down conductor before termination on earth electrode. The test point will be covered in 150 X 150 X 100 mm GI box. The testing point of the down conductors will be convenient for testing but inaccessible for interference. Testing point will be of phosphor-bronze gunmetal or copper. The down conductors will come via these test points to the earth pits. Sufficient earth electrodes will be provided to limit the earth resistance as per standards. No sharp bends will be formed in the down conductors and will be kept as straight as possible.

## TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)

**SECTION-C**

A suitable chamber having a water tight manhole cover of approved pattern and size will be constructed around each earth termination and will also house the joint between the earth termination and the down conductor.

Earth pit will consist of 40 mm dia 3000 mm long MS rod electrode in accordance with IS: 3043. These earth pits will be interconnected by providing a peripheral band of 40 mm dia MS rods to be laid at depth of minimum 600 mm below grade level. At least two pig tails each of 2 nos. 40 mm MS rod will be brought out one meter above ground to interconnect the Earth grid of RCC Biflue chimney with the main grounding grid. Interconnection will be done by the Bidder.

All connections clamps, anchors, etc. of the lightning protection system will be made of suitable galvanized steel fittings. All joints will be clamped or bolted by high-pressure contact or by phosphorus copper brazing of the metal to form a connection of adequate current carrying capacity and mechanical strength. Soldered connections will not be permitted.

All reinforcing bars will be properly bonded and connected to down conductors if the latter is taken along the wall of the structure.

The ohmic resistance of the lightning conductor system when isolated from earth electrode will be less than 1.0 ohm. The earth electrode resistance will also be less than 1 ohm when measured after disconnecting from plant grid.

The minimum number of earth pits will be eight, however, to achieve earth resistance value as described above, more pits will be provided.

The exposed conductors, connections, clamps, base plates, etc., will be protected by hot dip galvanizing. All site-welded joints in down conductors will be coated with anticorrosive paints over a coat of primer.

All metallic structures like ladders, handrails, light fixtures along with reinforcement bars will be bonded to the down conductors/circumferential conductor by GI strip of size not less than 50x6 mm either by welding or by bolting.

The down conductors on the base diagonal columns will be protected from mechanical damage for a height of 2.5 metres from the grade by taking them through cement pipe fixed on the face of the column, the pipe in turn filled with concrete of 1:5:10 nominal mix.

During the construction of the chimney, temporary lightning protection will be maintained by connecting the reinforcement bars to two earth electrodes by means of two 50x6 mm GI conductors. Temporary protection will be provided even after the completion of the tower till such time that the permanent air

## TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)

**SECTION-C**

termination rods are installed.
Interconnection of earth pits will be done by bolting so that earth resistance of individual earth pits can be measured.

Separate earthing systems will be considered for lightning protection and for equipment/structure earthing.

03.02.00 **AVIATION WARNING SYSTEM**

The aviation warning system lights will meet the regulations of ICAO, National Airport Authority.

The aviation warning lights will be clustered type LED.

The aviation warning system will be of High intensity flashing white LED

Aviation warning light will have Integral flasher & intensity control and latched lid for easy flashtube replacement. It will have three auto switched intensities - day / twilight and night.

The aviation warning lights will be controlled through photo electric control unit. Photo electric controller will be housed in a rugged, weather tight, IP 65, enclosure. LEDs will be provided to indicate the operation status of the unit. A bypass manual switch will be provided to bypass the photoelectric device, whenever required. Aviation warning light will have a day time effective intensity

Aviation obstruction lighting system shall conform to the requirements of the latest rules and regulations of the International Civil Aviation Organization (ICAO), National Airports Authority (NAA) and Directorate of Air Routes and Aerodromes (DARA). The type of aviation obstruction lighting system shall be of high intensity aviation obstruction lights having an effective intensity of 2000 to 200,000 cd (minimum) depending upon back ground illuminance. Obstacle lights shall have a day time effective intensity of minimum 200000 cd. The intensity of lights shall be 20000 cd ± 25% at twilight and shall reduce automatically to a night time intensity of 2000 cd ± 25% through the use of photocell. The obstacle lights shall flash simultaneously at a rate between 20 to 60 per minute. A minimum of three levels will be provided with aviation obstruction lights and there will be four light units per level. The lowest level should not be lower than 45 meters above the ground and vertical spacing of the intermediate levels could vary between 45 and 105 meters. The intermediate lights shall be spaced as equally as possible. Aviation obstruction lighting shall be complete with lights, photo cell, controller, special cables, etc.

The system will be suitable for operation on 240V +/- 10%, single phase, 50 Hz, AC supply. Emergency supply shall feed aviation obstruction lighting.

Aviation Warning Lights (AWL) shall be mounted on door panel of required size (open able from interior of chimney shell) fixed to openings in the chimney shell at
locations and levels specified elsewhere. Suitable provision for approach to the AWL
shall be provided at the platform level. AWL shall be located at about 1-1.5 metre
above the top of platform to enable easy handling for maintenance.
The size of roll-up door shall be determined based on minimum requirement for ventilation and transportation & erection of flue segments.

## TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)

**SECTION-C**

The body of the aviation light will be made of corrosion resistant aluminium casting finished in stove-enameled aviation yellow. The fittings will be complete with double compression type cable glands.

Aviation lights supports etc. will be fitted to the chimney by GI nuts on to GI inserts projecting from concrete surface. All bolts clamps etc used will be hot dip galvanized.

All the aviation light fixtures will be weatherproof and outdoor type suitable for highly humid and flue laden atmosphere.

The aviation light circuits will be distributed among R,Y and B phases of 3 phase, 4 wire supply.

1100 V grade, cable as per Electrical BOQ PVC insulated, heat resistant, steel wire armoured cable conforming to IS-1554 (Part-I) will be used for wiring the aviation warning system. The cable will be clamped by the side of the ladder at 750 mm centers by means of GI clamps.

Weather proof terminal boxes with cable glands made of brass, tin plate will be provided at the location of each of the aviation warning lights for termination of cables.

Temporary warning lights will be installed during construction suitably located above the top most point of obstruction and will be shifted up as the construction progresses. These lights need be installed only after the level of obstruction is greater than 40 m above the graded level.

Temporary warning lights will be four fixtures each with not less than 10 candelas of red light. As construction progresses, each completed level will be provided with temporary aviation warning lights. Temporary obstruction lights will have four fixtures located in a horizontal plane on the chimney structure to ensure unobstructed visibility of at least one obstruction light from aircraft at any normal angle of approach. Power for operation of the temporary lights will be obtained from the construction Power system. Supply circuits for these lights will be furnished, installed and maintained by the Bidder. These lights will be operated right from sunset to sunrise on each day of the contract period until the normal aviation warning system is commissioned and put to operation.

**TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)**

**SECTION-C**

The Bidder will provide sufficient hand railing, ladders, and platforms to attend any maintenance work.

03.03.00 **POWER DISTRIBUTION BOARD (PDB) / ACDB**

Distribution board will be of metal enclosed , single front, Indoor, floor mounted, free standing , fixed type conforming to IS: 13947 Part-1. The elevator board / power panels/Lighting panel will be of floor/wall mounted type. The equipment will be fully assembled and wired, complete with base frame, anchoring arrangement, gland plates, internal wiring, terminal blocks etc. Operating height of switches will be limited to 1800 mm.

Boards will have IP 52 enclosure.

PDB/AC Distribution Board (DB) will house SFU
modules only. They will have duplicate incomer with bus coupler.

Will have base channel of size ISMC 75.

Will have isolated busbar chamber for main busbar at the top, running through out the length of the board. Chamber will have removable cover.

Cable alley will have sufficient space for aluminium power cables and bottom cable chamber will be left free completely isolated from the vertical busbar.

Busbars will have same cross section through out the length. Rating of the neutral busbar will be 50% of the main busbar. Earth bus bar will run in bottom chamber throughout the length of the panel.

Bus bars and jumper connections will be of high conductivity aluminium alloy/copper.

Temperature rise of busbar and contacts when carrying rated current will not exceed 45 deg C with silver plated joints and 35 deg C with other type of joints over an ambient of 55 deg C..
All busbars will be adequately supported by non-hygroscopic, non-combustible track resistant and high strength sheet moulded compound or polyester fibre glass moulded insulators.

20% of the total feeders will be kept as spare.

The front of the feeder compartments will have hinged door with locking facility.

## TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)

**SECTION-C**

The incoming SFU unit of the Emergency board will be changeove
type and will have provision for two incoming supplies(one from emergency and one from normal). Autochangeover scheme shall be provided to enable changeover to healthy source on the failure of supply the incoming switch .

The board will be painted with one coat of zinc chromate primer (yellow) and two coats of synthetic enamel paint of approved shade.

DB will have indicating meters in the incoming feeders. Ammeter and voltmeter selector switches will be of rotary type with four stay put positions with adequate number of contacts for 3 phase 4 wire system.

All indicating meters will be flush mounted on panel front. They will be of at least 96 mm square size with 90 deg scales and will have an accuracy class of 2.0 or better.

Current transformers will be completely encapsulated epoxy resin insulated type having accuracy class of 1.0 conforming to IS 2705.

DB will have indicating lamps. Indicating lamps will be of the panel mounting, low wattage type. Lamps and lamp covers will be easily replaceable from the front of the panels.

Wiring for power circuits will be through 1100 V grade, copper wires of 2.5 sq mm size.

All internal control wiring will be through 660V grade, single core, 1.5 sq mm or larger stranded copper wires.

All panels will have continuous earth bus of minimum 50 x 6 mm size.

**Lighting Circuits**

Lighting panels will receive power from the power DB through lighting transformer for reducing the fault level. Lighting transformers will be dry type, natural air cooled with class F insulation or better. +/- 5% taps will be provided in steps of 2.5%. In case the transformer is not mounted inside the DB, same will be mounted in a separate enclosure with IP 42 degree of protection. However transformer terminal box will have IP-52 degree of protection.

**TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)**

**SECTION-C**

Miniature Circuit Breakers (MCB) will be used for the lighting circuits. They will conform to IS 8828.They will be current limiting type with magnetic and thermal release suitable for manual closing and automatic tripping under fault condition. MCBs will have interrupting capacity of 9 KA rms. MCB terminal will be shrouded to avoid accidental contact.
Different circuits will be used for aviation warning lights and general lighting. Various lights will be grouped in to different circuits and will be controlled through Miniature Circuit Breakers (MCBs) of adequate rating. MCB feeders will be provided for power receptacles and instrument supplies also. 20% of the MCBs will be kept as spare. Distribution board will be installed at a convenient operating height of 1.5 mtr from floor level. Supporting structure of the DB will be grouted properly. The distribution board will be supplied with tinned brass glands and tinned crimping type copper cable lugs for termination of cables. The DB and the entire installation will be earthed as per IS 3043 and electricity rules.

03.04.00 **GENERAL ILLUMINATION**

Adequate illumination will be provided at various platforms, stairways, landings etc.

The following average illumination levels will be maintained at different locations:

a) On equipment : 150 Lux
b) General platform area : 70 Lux
c) Stairways and landings : 100 Lux

Minimum one fitting will be provided on each landing.

80% of lighting at various platforms and 50% lighting in staircases will be fed from normal AC source and balance from Emergency AC source. Emergency AC supply will be obtained from Emergency Distribution board.

Following type of fixtures will be used:(Min 1 Fixture at each landing)

a) LED /HPSV well glass fixture dust tight(for platforms)
b) Energy efficient lamp fixture (for staircase)
c) Dust tight well glass fixture for internal light at each floor.
d) Street light type fixture ( for area illumination, illumination at 0.0 level etc.)

General illumination will be controlled by 24 hrs timer.

General illumination of the RCC chimney will be done for platform lighting with industrial weather proof dust tight with reflector integral mounted control gear

## TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)

**SECTION-C**

with LED lamps mounted on brackets on the platform hand rails on fabricated MS angle support

Number of light fittings for platform lighting provided on each platform level will be four. These fittings will be equally spaced on the platform outside the chimney at each level. Two fittings will be fixed to the ladder near access doors at each level. Lights will be operated through switches, outdoor duty type, located on the platform.

Light fixtures will have IP-55 enclosure.

The fittings will be fixed on hand railing of the platform such that they can be capable of withstanding high wind pressure.

General lighting system of chimney will be fed from a separate feeder of distribution board.

Considering voltage drop, 1100V, cable as per Electrical BOQ
armoured, PVC insulated, heat resistance cable conforming to IS:1554(part-I) will be used for wiring all lighting fixtures and power receptacles. The cable will be clamped by the side of the ladder at 750 mm centers by means of GI clamps.

Lighting fixtures, conduits, junction boxes etc. will be properly earthed using galvanized iron wire of 8 SWG. Earth wire will run inside along the entire length of conduit between the fixtures and distribution panel where it will be connected to the earth.

Heavy duty metal clad, welding receptacles rated for 415 V, 63 A will be provided at each internal platform level. Welding receptacles will have IP 55 degree of protection. The receptacle unit will be compete with 63A, AC 23 category switch, plug top and safety lid.

The welding receptacle will be wall mounted type. It will be interlocked such that

a) Switch can be put ON only when the plug is fully engaged

b) Plug can be taken out only when the switch is in OFF position.

c) Cover can be opened only when the switch is in OFF position.

Two nos. 20A, 240V, AC 3 pin industrial type power receptacles with controlling switches and loose matching plugs mounted in a weather proof and dust tight boxes will be supplied and installed at each of the platforms near access doors. The box will be fabricated of galvanized sheet steel having suitable hinged door properly gasketted to make it dust proof.

The lighting fixtures and receptacles will be fed such that loading of all the three

phases is balanced. The lamps on the same vertical line will be fed from different phases, so that failure of any one phase will not cause total blackout on one side.

**WIRING ARRANGEMENT AND INSTALLATION FOR ILLUMINATION WORK**

For aviation warning system two independent and separate circuits will be laid along the ladder inside the chimney and will come out through the access door to the outside platform . Cable as per Electrical BOQ will be laid for this purpose. At each platform a junction box will be provided for taking connection through MCB. Junction box at a platform will be looped with the junction box at next higher platform. The two circuits will be diametrically opposite of the chimney. At ground level in aviation lighting circuit contacts of the contactor will be provided to monitor the aviation lights. The contactor will be operating through a suitable timer/ photoelectric device which is mounted at the bottom on the distribution board. In case of malfunction of timer/ photoelectric device, manual bypass arrangement through bypass switch will be provided.

Similarly for platform lighting two independent circuits will be laid along the stairs at each platform junction boxes will be provided for taking connection through MCB to light fittings. From the junction box, cable will be connected to another junction box located at higher elevation. as per Electrical BOQ
cables will be laid for this purpose. From each circuit at each platform two separate sub circuits will be provided, one for platform level lighting and one for sockets.

Wiring installation covers supply and wiring of all the conduits, junction boxes, wires, accessories, cable identification tags/ferrules, hardware and consumables required to complete the installation.

All the cables and conduits will be clamped in steel supports fixed to the wall. Necessary dash fasteners will be provided by the Bidder for this purpose. The conduits will be supported at 750 mm intervals. The wiring will be continuous without any loose joints. Whenever looping or connection is to be made on wires, it will be done within the junction box through suitable fixed terminal strips. For longer run of conduits, pullout boxes will be provided at an interval of 4 m. Separate conduit will be used for individual phases.

All conduits will be electrically continuous and thoroughly grounded by drawing 8 SWG GI wire along the conduit.

The Bidder will install weather proof terminal boxes with MCBs and cable glands on each platform of the chimney at location close to the aviation warning beacons. The maximum conduit fill will not exceed 60%. Suitable pull boxes will be provided at convenient locations. All aviation light fixture, conduits and junction boxes etc. will be properly earthed. Earth wire will run inside along the entire length of conduit between the fixtures and distribution board where it will

be connected to earth.

Cables will be protected with GI pipes wherever there is a chance of mechanical damage.

03.05.00 **Cables**

Power cables will be 1100V grade, multi core, FRLS HR PVC or XLPE insulated, PVC sheathed, steel wire or steel strip armoured, stranded copper or aluminium conductor conforming to IS-1554.

Control cables will be 1100V grade, multi core, FRLS HR PVC insulated, PVC inner sheathed, steel wire armoured, PVC outer sheathed, stranded copper conductor conforming to IS-1554.

Following factors will be considered in sizing of cables:

a) Continuous current carrying capacity
b) Short circuit capacity
c) Voltage drop
d) Ambient temperature (55 deg C)
e) Cable grouping factors

Maximum voltage drop between main DB and the final equipment will be imited to 3 % when carrying full load current.

All cable sizing calculation will be submitted for approval.

Minimum size of cable will be 2.5 sq mm for copper and 6 sq mm for Aluminium.

**03.06 Installation**

Equipments/items will be installed in a neat manner so that it is leveled, plumbed, squared and properly aligned and oriented.

The Bidder will furnish all supervision, labour, tools, equipment, rigging materials, incidental items such as bolts, wedges, anchors/angles, frames, studs, rawl plugs, concrete inserts etc. required to completely install, test, adjust and fix the equipment.

Manufacturer's drawings, instructions and recommendations will be correctly followed in handling, erecting, testing and commissioning of all items/equipments and care will be exercised in handling to avoid distortion to stationary structures, the marring of finish, or damaging of delicate instruments or other electrical parts. All care should be taken to avoid damage of galvanised/painted surfaces during installation. All damaged surfaces of galvanised or ungalvanised faces of steel structures, conduits, junction boxes,

trays etc. will be brushed up and will be painted with red primer paint followed by two coats of aluminium paint/enamel paint to the satisfaction of Engineer.

Connections between distribution boards, between distribution board and Elevator board/lighting & power panels and between distribution board/power panels & receptacles will be carried out with FRLS-HRPVC or XLPE insulated armoured copper / aluminium cables. Connections between lighting panel and lighting fixture/ receptacles and for aviation lighting system will be carried out with PVC insulated copper / aluminium wires laid in galvanised steel conduit.

After installation of lighting fixtures/ receptacles/switch boxes, the panel number and circuit number will be painted on them at a suitable place.

Wherever non-galvanised steel members/structures are erected, they will be brushed before giving one coat of lead primer followed by two coats of epoxy paint. All nuts, bolts and washers required for complete installation will be hot dipped galvanised.

Wooden plugs in walls and ceilings for fixing of lighting fixtures and accessories are not acceptable. A suitable fool-proof method (preferably using dash fasteners) for fixing these will be offered and this will be subject to Owner's approval.

To distinguish emergency AC fixtures from normal AC fixtures, red painted circular mark of 1 cm. dia. will be provided on emergency fixtures

Exposed conduits will run in straight lines. Conduits will be fixed by using metallic saddles/clamp secured to suitable nylon rawl plugs with screws or secured to the wall/structure at an interval of not more than 1 metre. Notwithstanding the above in case of couplers or similar fittings, saddles/clamps will be fixed at a distance of 30 cm from the center of such fittings.

All openings in the floor/wall/ceiling etc, made for conduit installation will be sealed and made water proof.

For long conduit runs pull out boxes will be provided at suitable intervals (not exceeding 4 m to facilitate wiring. However pull out boxes need not be provided wherever junction boxes exists in circuit.

The entire metallic conduit system whether embedded or exposed will be electrically continuous and thoroughly grounded. Where slip joints are used, suitable bonding will be provided among the joint to ensure a continuous ground circuit. G.I. Pull wire of adequate size will be laid in all conduits before installation.

Each conduit run will be marked with its designation as indicated on the drawings. Identifications will be marked by means of painting so that each run of conduit is readily identified at each end. Where conduits terminate at panels, switch boxes, junction boxes, or other enclosures, the designations will also be

painted on the inside of the enclosure adjacent to the conduits.

Wires will not be pulled through more than two equivalent 90 deg bends in a single circuit run. Wherever required, suitable conduit junction boxes/pull boxes will be provided. All types of wiring, concealed or unconcealed will be capable of easy inspection

Receptacles and lighting circuits will be fed from different circuits. The switch controlling these circuits will be on the live side (phase wire) of the circuits

A.C. normal & AC emergency wiring will run throughout, in separate conduits. Wires of different phases will run in different conduits

Wiring will be spliced only at junction boxes. Maximum two wires will be connected at each terminal. In vertical run of wires, in conduit the wires will be suitably supported by means of hard rubber plugs, at each pull/junction box

Cables will be installed on trays/troughs or cleated to steel work. Cable trays/ troughs and supports will be prefabricated and hot dip galvanised. Cable trays/ troughs will be of ladder/ perforated type constructed of minimum 2mm thick mild steel

Cable tray/trough supports will be fixed by bolting in case of concrete structures and by welding in case of steel structures. Cable trays will be adequately fastened to supports. Cables will be cleated/clamped with cable tray/ trough on vertical runs at every 1 metre interval. Cables laid on horizontal runs will be secured to trays with nylon cable ties at every 5 metre interval.

Wherever cable passes through floor/wall, pipe sleeves will be provided and will be properly sealed after laying cable. No joints will be allowed in any cable run. Power and control cables will not be laid together. Cable tags will be provided on all cables at each end, on both sides of floor/wall crossings and at every 20 metre interval in cable tray runs.

**Electrics for Roll up Door**

The Bidder will include all necessary Electrics including electric drive, starter panel consisting of isolator , contactor , overload relay, On/Off push button , wiring etc.

Starter panel will be of IP54 enclosure and all components will be approved make only.

Types of cables and glands will be used as per details given in earlier clauses.

Incoming power supply will be taken from distribution board.

## 04.00 LIST OF MAJOR APPLICABLE CODES FOR ELECTRICAL EQUIPMENT

## TECHNICAL SPECIFICATION FOR CHIMNEY (ELECTRICAL)

**SECTION-C**

| | | |
|---|---|---|
| Protection against lightning | : | IEC-62305 & latest IS standard. |
| Earthing | : | IS-3043 (1991) |
| Aviation warning lighting | : | IS-4998 (1992) |
| Dust proof electric lighting fittings | : | IS-4012 (1990) |
| Switches | : | IS-13947 (1993) |
| Elevator motor/main control panel | : | IS-325 / IS-4722 |

Communication system

Communication system comprising of telephone socket at every internal platform level and at grade level,necessary wiring installation ,a telephone handset,junction boxes etc shall also be provided.Telephone cables shall be of mimimum 0.6mm diameter annealed high conductivity elecro copper conductor,PVC insulated,twisted,PVC tape wrapped,screened,rip corded,PVC sheathed,conforming to relevant ITD(Indian telephones department)specifications.

All equipment to be supplied shall be of type tested quality.The contractor shall submit for owner's approval the reports of all type tests as listed below:

(A) Distribution boards/panels-degree of protection tests

(B)aviation lights:

1)Intensity test

2)degree of protection test

Rack & Pinion Elevator

Drive motor shall be of S3 duty class with CDF of 25% and maximum number of 120 starts per hour in 55 degree celsius ambient temperature. The motor shall be provided with internal 220V AC single phase space heaters or an alternate heating system.Emergency supply shall feed the elevator load

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|

## ELEVATORS (ELECTRICALS)

1.00.00 **CODES AND STANDARDS**

1.01.00 All standards, specifications and codes of practice referred to herein shall be the latest editions including all applicable official amendments and revisions. In case of conflict between this specification and those (IS codes, standards, etc.) referred to herein, the former shall prevail. All work shall be carried out as per the following standards/ codes as applicable.

**IS:4722, IS:325**

2.00.00 **Electric motor:**

The driving motors shall conform to I.S 325 and suitable for the Variable Voltage Variable Frequency (VVVF) application. All motors shall be squirrel cage induction type, suitable for operation at 415V (+/- 10% variation) , 3 phase, 3 wire, 50HZ (+3% to -5% variation) supply. Motors shall be provided with **thermal class 130 (B) or better insulation**

3.00.00 **CAR ELECTRICAL ACCESSORIES**

The following accessories shall be provided :

i) LED light fittings for illumination level of 100 lux on car floor.

ii) Portable light and alarm bell with battery and charger ventilation fan with control.

iii) Car control station with position indicator inside the car and at landing platforms ( both visual and audio).

iv) Emergency stop switch.

v) 5/15A, 3 pin plug socket with switch on top of lift car.

vi) Hand free speaker telephone set connected to plant network.

vii) AUTOMATIC RESCUE DEVICE (ARD)-(BATTERY DRIVE) :

Contractor to provide a modern Advanced electronic drive system of "RESCUING Passenger Trapped in a ELEVATOR".

viii) EMERGENCY SAFETY DEVICES :

The lift shall be provided with safety Device attached to the lift car frame and placed beneath the car. The safety device shall be capable of stopping and sustaining the lift car up at governor tripping speed with full rated load in car.

4.00.00 **OPERATIONAL REQUIRMENTS:**

a. Contractor shall provide car operating panel with luminous buttons, car position indication in car (both visual and audio) combined with direction arrows, overload warning indicator, battery operated alarm bell and emergency light and fan & hands free speaker telephone set with suitable battery, charger & controls.

| CLAUSE NO. | TECHNICAL REQUIREMENTS |
|---|---|
| | b. Contractor shall provide emergency indicator to indicate the location of elevator in case of elevator being stuck up between the floors through automatic flashers (both audio & visual).<br><br>c. Contractor shall provide electronic door detector ( Infra red curtain type).<br><br>d. Digital hall position indicator at all floors, tell lights at all floors shall also be provided by the Contractor.<br><br>e. For facilitating the movement of visually & hearing impaired persons, hall lantern and car arrival chimes shall be provided<br><br>f. All fixtures shall be in stainless steel face plates.<br><br>g. Push buttons shall be fixed in the car for holding the doors open for any length of the time required.<br><br>h. All other safety/protection/operation interlocks as required by IS:14665 (latest edition). |
| 4.00.00 | **POWER SUPPLY**<br><br>Each elevator shall be provided with a separate three phase, three wire 415V feeder of adequate rating |
| 5.00.00 | **Controls:**<br><br>The controls shall be Variable Voltage and Variable frequency type and shall provide smooth and constant acceleration and retardation under all conditions of operation . Suitable control panel shall be provided in the machine room. |
| 6.00.00 | **Cables and wiring:**<br><br>All the cables except trailing cables shall be as per IS:1554-1 or IS-7098-I. the PVC outer sheath of these cables shall be flame retardant, low smoke (FRLS) type with the following FRLS properties.<br><br>a) Oxygen index of min. 29 (as per IS:10810 Part-58)<br>b) Acid gas emission of max. 20% (as per IEC-754-I).<br>c) Smoke density rating shall not be more than 60% (as per ASTMD-2843).<br><br>The circular trailing cables shall be either in accordance with IS 4289 Part-I (Elastomer insulated ) or IS-4289 Part-II (PVC insulated). The flat type trailing cables if offered shall be in accordance with IEC-60227-6.<br><br>All wiring / cabling between the equipments in the lift machine room and that between the machine room and equipments in the lift well and at the landings shall be wired in HDP conduits/ galvanized steel conduits to be supplied by the contractor. Alternatively armored cables may be used. |
| 7.00.00 | **Earthing:**<br><br>The elevator structures and all Electrical equipment, including metal conduits shall be effectively earthed with the earth conductors provided in the machine room as per IS: 3043. |

## ANNEXURE-A

**Table 6.3. Characteristics of obstacle light**

Note: - This table does not include recommended horizontal beam spreads. 6.3.22 requires 360º coverage around an obstacle. Therefore, the number of light needed to meet this requirement will depend on the horizontal beam spreads of each light as well as the obstacle. Thus, with narrower beam spreads, more lights will be required.

a) See 6.3.25
b) Effective intensity, as determined in accordance with the Aerodrome Design Manual, Part4.
c) Beam spread is defined as the angle between two directions in a plane for which the intensity is equal to 50% of the lower tolerance value of the intensity shown in columns 4.,5and 6. The beam pattern is not necessarily symmetrical about the elevation angle at which the peak intensity occurs.
d) Elevation (vertical) angle are referenced to the horizontal.
e) Intensity at any specified horizontal radial as a percentage of the actual peak intensity at he same radial when operated at each of the intensities shown in columns 4, 5and 6.
f) Intensity at any specified horizontal radial as a percentage of the lower tolerance value of the intensity shown in columns 4, 5 and 6.
g) In addition to specified values, light will have sufficient intensity to ensure conspicuity at elevation angle ±0º and 50º.
h) Peak intensity should be located at approximately 2.5º vertical.
i) Peak intensity should be located at approximately 17º vertical.

## TECHNICAL SPECIFICATION FOR CHIMNEY(ELECTRICAL

## SECTION-C

**DRAWINGS, DATA AND MANUALS**

1. **To be submitted with the Bid**

1.01.01 Typical general arrangement drawing of Chimney showing location of lighting fixtures, lightning protection system, grounding system etc.

1.01.02 Typical general arrangement drawing of A.C. distribution board, lightning board.

1.01.03 Catalogue cuts of various types of lightning fixtures, major components, cables, conduits etc

1.01.04 Type Test Certificate of various equipment

2. **To be submitted for Approval (A) / Reference (R) and subsequent Distribution**

2.02.01 Dimensional general arrangement drawing of chimney showing disposition of aviation warning lights, interior lights on platforms and stairs, receptacles, A.C. distribution boards, lighting boards including their fixing arrangements (A).

2.02.02 Arrangement drawings for lightning protection and grounding system (A)

2.02.03 Single line drawing of A.C. distribution boards and lighting boards (A)

2.02.04 Cable and Conduit layout (A)

2.02.05 Technical data sheet of all equipment / components (A).

2.02.06 Instruction Manuals and Catalogue cuts of all equipment (R)

The manuals shall clearly indicate the method of installation, check-up and tests to be carried out before commissioning of the equipment.

2.02.07 Any other relevant drawing or data necessary for satisfactory installation, operation and maintenance.

2.03.00 The Contractor may note that the drawings, data and manuals listed are minimum requirement only. The Contractor shall ensure that all other necessary information required to fully describe the equipment / system offered are submitted with his Bid.

# SECTION-C

# SPECIFIC TECHNICAL REQUIREMENTS FOR CHIMNEY ELEVATOR

# SPECIFICATION NO. PE-TS-463-620-C002

# SECTION - C
# SUB SECTION – A6

# STACK ELEVATORS

## 1. SYSTEM DESCRIPTION

1.1 The Rack and pinion type stack elevator is required for installation inside multi-flue or outside single flue chimney. The stack Elevator is normally used for the movement of the maintenance personnel and for materials such as refractory bricks, etc. for maintenance of chimney.

## 2. SCOPE OF SUPPLY AND SERVICES

2.1 The scope of supply and services covered under the specification are broadly described below:

2.1.1 Four (4) Nos. Rack and Pinion type stack elevator complete with all other accessories and associated steel work.

2.1.2 Drive motor and control panel for Stack elevator

2.1.3 Control Panel

2.1.4 Equipment earthing

2.1.5 All power and control cables, trailing cables

2.1.6 Limit switches

2.1.7 Over speed governor

2.1.8 Alarm push button in the cage connected to battery operated alarm at elevator base.

2.1.9 Reverse phase relay connected to prevent operation of the cab with improper phase rotation or failure in any phase of power supply.

2.1.10 Continuous duty electrical torque motor recoil cable reels or cable trolley or any equivalent arrangement to maintain electrical power service to all electrical components of the elevator for complete travel of stack elevator.

2.1.11 One auxiliary panel shall be provided and mounted on the graded level enclosure equipped with a main ON-OFF selector switch, main contractor, breaker, relays, control transformer and fuses, tone frequency transmitter or equivalent arrangement, terminal blocks and all other accessories required for normal operation of the elevator.

2.1.12 One main control panel shall be furnished and mounted on top of the cab. Panel shall be in enclosure equipped with necessary equipment like rectifier, battery charger charger, tone frequency receiver, contactors, breakers, control transformer and fuses, thermal overload relays, and all other equipment and accessories required for normal operation of the elevator.

2.1.13 Cab shall be controlled by semi-automatic floor selection control system. Cab shall be furnished with 240 V grounding receptacle, emergency alarm push button with normally open contact, indicating light, limit switches, and all other necessary control devices required to ensure safe and continuous cab operation. One trailing cable shall connect the main control panel to aux. Panel at ground level. Cable shall supply the cab necessary power supply requirements. Cable guides shall be installed at every 6 m intervals to avoid entanglement of this cable. Control signal between the aux. Panel at ground level, the main control panel on the cab and the landings shall be provided with tone frequency receiver or any other equivalent arrangement by trailing control cable.

2.1.14 Each landing assembly shall include a limit switch and push button control station installed and wired to a landing junction box.

2.1.15 All power cable and race way shall be provided and installed by the bidder for interconnection of the main control panel, auxiliary panel and landing junction boxes. Trailing cables shall be as per relevant IS/IEC standard.

2.1.16 Bidder shall provide, install and connect a system equipment ground to owner's chimney grounding system. Equipment grounding system shall electrically connect panels and junction boxes which contain electrical devices, motors and elevator platform and structures. Raceway system shall not be considered as an equipment ground.

2.1.17 All enclosures containing electrical devices shall be provided with 240 V, single phase heaters with adjustable thermostat control.

2.1.18 Cab shall be equipped with a 240 V AC interior light and duplex outlet.

2.1.19 Cable accessories as required to install the cables in bidder's scope shall be provided by the bidders.

2.1.20 Complete erection, testing and commissioning including all erection materials, consumables and other tools and tackles required for erection along with commissioning spares.

2.1.21 All inserts, anchor bolts, sleeves, anchoring steel and any other items required to complete the job satisfactorily shall be in bidder's scope.

2.1.22 First fill of lubricant and consumables shall be in bidder's scope.

2.1.23 Satisfactory running and maintenance of elevator for a continuous period of 30 days including training of owner's operators.

2.1.24 Supply of One complete set of special maintenance tools and tackles shall be in bidder's scope.

2.1.25 Any other equipment or accessories not specified, but required for the satisfactory operation of chimney elevator shall be in bidder's scope.

2.1.26 Recommended spares including instrumentation for 3 years of normal operation of stack elevator. (List to be furnished by the bidder and for which order shall be placed separately by owner as per their requirements)

## 3. SPECIFIC REQUIREMENTS

3.1 The equipment supplied, erected and commissioned shall meet the technical requirements of respective Section –D and Data Sheet-A.

3.2 Bidder shall note that all QP and Field quality plans shall be subject to purchaser's approval.

3.3 All equipment offered shall have suitable provision of termination and connection of power and control cables inclusive of cable boxes, lugs and glands, etc.

3.4 All the equipment shall be suitable for the power supply fault level and other climatic conditions as indicated in project information.

3.5 The bidder shall guarantee the rating and performance parameters of the system/equipment offered in accordance with specification requirements.

3.6 It is the responsibility of bidder to arrange license for operation of chimney elevator from statutory body of that area before handing over.

3.7 Bidder shall furnish deviation (clause wise) in the deviation schedule. In absence of dully filled deviation list, it will be presumed that offer is exactly in line with the technical specification.

3.8 Bidder shall furnish duly filled data sheet –B along with the offer. In absence of same, offer shall be treated as incomplete.

3.9 Bidder shall offer the stack elevator considering prevailing statutory and regulatory requirements of project location.

3.10 Bidder shall indicate degree of protection of various electrical equipment in the offer.

3.11 Makes of all bought out items shall subject to purchaser's approval after award of contract.

3.12 All drawings/documents shall subject to purchaser's approval after award of contract.

*3.13* Please refer / comply customer- NTPC specification *(rack & pinion type elevator)*

## 10.00.00 ANALYSER INSTRUMENTS (OTHER THAN CEMS)

### 10.01.00 Common requirements:-

| | | |
|---|---|---|
| 1 | Type | Microprocessor based with self-indicating type diagnostic feature.<br>Output signal: 4-20 mA DC galvanically isolated.<br>Binary Signal: 2NO+2NC |
| 2 | Display | Digital display with reading in engineering units. Display of the measurement values as well as all the information required for checking/maintenance of the analyzer. |
| 3 | Zero & span Adjustment | To be provided for all selectable ranges. |
| 4 | Ambient temp. | 0-50°C unless defined otherwise. |
| 5 | Analyser enclosure Type/Material | Weather protection for analyser mounted inside analyser panel shall be IP-22 or better. For all other analysers, weather protection class shall be IP-55. |
| 6 | Calibration | Auto & Manual (from Remote). |
| 7 | Power Supply | To be arranged by Contractor subject to Employer's approval. |
| 8 | Others | i) All interconnection tubing and cabling between probe and analyser / analyser panel and cabling from analyser/ analyser panel to FGD Control system are to be provided by Contractor.<br>ii) All the calibration gases (certified cylinder) required for one year continuous operation shall be provided. The calibration gas container material shall not contaminate the calibration gas. |
| 9 | Compliance to standards | USEPA, TUV, MCERTS or equivalent standards |
| 10 | Type of Technology | SO2/NOx :- Hot-extractive sampling type/ Dilution Extractive/ In-situ (Path) type<br>Note:- For Hot extractive sampling type and Dilution extractive sampling type system – The components involved in sample handling system shall be imported & further, Sample handling system design shall be vetted by Original Analyzer Manufacturer (OAM). Necessary documents shall be furnished during detailed engineering in order to establish the above requirement. Technical expert of OAM shall witness testing of sample handling system and validate it. Alternatively sampling handling system assembled at Original Analyzer manufacturer (OAM) works shall also be accepted. |
| 11 | Measurement range, tapping point | As per FGD system design and process parameters. |

Note: Analysers shall be placed inside CONTAINERISED ROOM (PORTABLE CABIN) provided by the contactor. For detailed specification of CONTAINERISED ROOM

(PORTABLE CABIN), Contractor to refer Sub section IIIC-11, Part-B, Section-VI of technical specification.

**10.02.00 Specific requirements for Hot-extractive sampling type SO2 analysers**

| **Specification Requirements** | **SO2 Analyser** |
|---|---|
| Type of Instrument | Sampling type - Hot Extractive type |
| Principle of Measurement | Radiation absorption |
| Accuracy | +/- 1% of lowest measurement range or better |
| Linearity | ≤ +/-1% of lowest measurement range |
| Repeatability | ≤ 1% of lowest measurement range |
| Minimum detection limit | ≤ 0.5% of lowest measurement range |
| Temperature Drift | ≤ +/- 2%/10 Deg.C |
| Zero Drift | ≤ +/-1% of lowest measurement range /week |
| Span Drift | ≤ +/-1% of lowest measurement range /week |
| Analyser Response time (up to 90% of full scale) | ≤ 5 secs |
| Operating Temperature Range for probe | 0-300 deg.C |
| Filter | Ceramic 3.5 Micron |
| Accessories for purging system | Purging system including Auto Scavenging facility shall be provided |
| Sample gas inlet temperature to analyser | Temperature of the sample gas inlet to analyser shall be controlled before analyser as per manufacturer standards**.** |

**10.03.00 Specific requirements for Dilution Extractive type SO2 Analsyers**

The design of the Dilution Extractive type system shall be satisfying the following requirements. The sampling system shall consist of In-situ dilution probe, dilution probe controller, sample conditioning system like air drier and filters etc and other accessories meeting the following requirements as a minimum. All system components and accessories required for completion of this system shall be furnished although these may not be individually specified herein. Following are the minimum requirements:

a) Modular Electronic Design.
b) Heatless Air dryer with inlet filter, chemical scrubbers to remove traces of NOx/CO2/SO2 from air and accumulator.
c) Self test facility with screen display.

d) Protection of instrument in case ambient or surrounding temp going high beyond stipulated limit.
e) The following are the minimum requirement for the probe:-

- Flange and counter flange for inserting probe
- Flange and counter flange for inserting probe
- Coarse and Fine Filters
- Critical orifice
- Automatic blow back or purging facility
- SS316L probe material

f) Further dilution probe controller shall be provided with the ability to control dilution ratio.
g) Unheated umbilical chord to be provided for transportation of the diluted sample, zero air, vacuum pressure, and calibration gas. This chord has to be a single bundle in FRLS PVC outer sheath. The sample line has to be of PTFE.

| **Specification Requirements** | **SO2 Analsyer** |
|---|---|
| Principle of measurement | Pulsed/UV Fluorescence technology. |
| Probe operating temp | 0-300 deg C |
| Accuracy | +/- 1% of lowest measurement range or better |
| Linearity | ≤ +/-1% of lowest measurement range |
| Repeatability | ≤ 1% of lowest measurement range |
| Minimum detection limit | ≤ 0.5% of lowest measurement range |
| Zero drift | ≤ +/-1% of lowest measurement range/week |
| span drift | ≤ +/-1% of lowest measurement range/week |
| Response time (up to 95% of full scale) | 100 sec |
| Sample gas inlet temperature to analyser | 5 deg.C - 40 deg.C |

**10.04.00 Specific requirements for In-situ (Path) type SO2 analysers**

| **Specification Requirements** | **SO2 Analyser cum monitor** |
|---|---|
| Principle of Measurement | Differential Optical Absorption Spectroscopy |
| Accuracy | +/- 1% of lowest measurement range or better |
| Linearity | ≤ +/-1% of lowest measurement range |

| | |
|---|---|
| Repeatability | ≤ 1% of lowest measurement range |
| Minimum detection limit | ≤ 0.5% of lowest measurement range |
| Temperature Drift | ≤ +/- 2%/10 Deg.C |
| Zero Drift | ≤ +/-1% of lowest measurement range/week |
| Span Drift | ≤ +/-1% of lowest measurement range/week |
| Response time(up to 90% of full scale) | ≤ 5 sec |
| Probe Operating Temperature Range | 0 to 300 deg C |
| Accessories for purging system | Purging system to be provided with heavy duty blowers and shutter mechanism for automatic isolation of lens during purge air failure. |
| Temperature compensation | Automatic temperature compensation to be provided |

**10.05.00 pH Analyser**

| | | |
|---|---|---|
| **a)** | **Type** | **:** Cell - flow through |
| **b)** | **Accuracy** | **:** < ± 1% of reading |
| **c)** | **Range** | **:** 0 - 14 pH freely programmable (For others) |
| **d)** | **No. of steams** | **:** Single |
| **e)** | **Temp. compensation** | **:** Automatic |

**11.00.00 CONTINUOUS EMISSION MONITORING SYSTEM (CEMS):-**

(i) CEMS comprising of analysers and associated items for measurement of SO2, NOx, CO, CO2, Mercury, Particulate Matter (dust density) monitor and Stack Flue Gas Flow in Stack emission shall be provided by the Contractor.

(ii) Direct measurement of NO and NO2 shall be done. Total NOx values shall be reported as NO2 i.e. NOx = NO + NO2 = NO X 1.53 + NO2 = NOx as NO2.

(iii) Oxygen (O2) measurement in stack emission based on Paramagnetic/ Zirconia type instrument shall be provided by the Contractor for correction of SO2, NOx and Particulate matter value corresponding to the standard/reference O2.

(iv) CEMS Parameters shall be normalized for temperature, pressure, moisture (applicable in case wet measurement techniques), etc. This facility shall be available

in the respective analysers. Necessary measurement shall be provided by the Contractor for these parameters. All the CEMS parameters shall be reported on dry basis.

(v) CO2 Measurement at stack and at instrument end shall be provided in case dilution techniques are used.

(vi) CEMS analysers for which dual ranges are specified shall be calibrated for range near to operating process value.

(vii) Offered CEMS should be capable of operating unattended over the prolonged period of time.

(viii) CEMS analysers shall be placed inside CONTAINERISED ROOM (PORTABLE CABIN) provided by the contactor. For detailed specification of CONTAINERISED ROOM (PORTABLE CABIN), Contractor to refer Sub section IIIC-11, Part-B, Section-VI of technical specification.

The common requirements to be met for all types of analysers are as below. The specific requirements to be met by each type of analyser are detailed in the subsequent clauses.

**11.01.00 Common Requirements for all Analysers**

| | | |
|---|---|---|
| 1 | Type | Microprocessor based with self-indicating type diagnostic feature.<br>Output signal: 4-20 mA DC galvanically isolated.<br>Digital signal transmission: RS232/ RS485 Modbus Protocol/ Ethernet TCP/IP protocol shall be provided in CEMS analysers for bidirectional communication of stack emission data to Employer's cloud server. |
| 2 | Display | Digital display with reading in engineering units. Display of the measurement values as well as all the information required for checking/maintenance of the analyzer. |
| 3 | Zero & span Adjustment | To be provided for all selectable ranges. |
| 4 | Ambient temp. | 0-50°C unless defined otherwise. |
| 5 | Analyser enclosure Type/Material | Weather protection for analyser mounted inside analyser panel shall be IP-22 or better. For all other analysers, weather protection class shall be IP-55. |
| 6 | Calibration | Auto & Manual (from Remote). CEMS analyser should have inbuilt zero and calibration check capability. |
| 7 | Power Supply | To be arranged by Contractor subject to Employer's approval. |
| 8 | Others | i) All interconnection tubing and cabling between probe and analyser / analyser panel and cabling from analyser/ analyser panel to DCS (in respective unit control room) are to be provided by Contractor.<br>ii) All the calibration gases (certified cylinder) required for one year continuous operation shall be provided. The calibration gas container material shall not contaminate the calibration gas. |

| | | |
|---|---|---|
| 9 | Location of probe | SO2/NOx/CO/CO2-On stack at approximate elevation of 35 Mtrs.<br>Particulate Matter (Dust Density) & Flow measurement -On stack at approximate elevation of 88 Mtrs<br>Mercury:- On stack at approximate elevation of 35 Mtrs |
| 10 | Location of the analysers (other than insitu type)/Analyser Panel. | AT 0' Mtrs near stack for CEMS analysers except particulate matter analyser. For particulate matter preferred location is '0' meter near stack. Remote display cum configuration unit for particulate matter analyser should be provided at '0' meter near stack in the analyser panel in case particulate matter analyser is kept near the sample point due to technical limitation. |
| 11 | Compliance to standards | USEPA, TUV, MCERTS or equivalent standards |
| 12 | Type of Technology | SO2/NOx :- Hot-extractive sampling type/ Dilution Extractive/ In-situ (Path) type<br>CO :- Hot-extractive sampling type/ Dilution Extractive/ In-situ (Cross-duct) type. (can be combined with SO2/NOx)<br>CO2 :- Hot-extractive sampling type/ Dilution Extractive/ In-situ (Cross-duct) type (can be combined with CO or SO2/NOx above).<br>Particulate Matter (Dust Density):- Extractive type with reheating or dilution.<br>Mercury (Hg) :- Hot extractive type<br>Note:- For Hot extractive sampling type and Dilution extractive sampling type system – The components involved in sample handling system shall be imported & further, Sample handling system design shall be vetted by Original Analyzer Manufacturer (OAM). Necessary documents shall be furnished during detailed engineering in order to establish the above requirement. Technical expert of OAM shall witness testing of sample handling system and validate it. Alternatively sampling handling system assembled at Original Analyzer manufacturer (OAM) works shall also be accepted. |
| 13 | Contractual conditions for CEMS system | Warranty:- As defined elsewhere in the Contract.<br>Comprehensive Annual Maintenance Contract:-. Refer sub-section-IIC-C& I/ Section-VI/ Part-A. This shall cover total maintenance of all hardware and software related to CEMS and shall include free repair/replacement of all components/cables/equipment etc and supply of expendable items.<br>Availability of valid data:-AT least 90% of time during warranty and CAMC period. For this purpose, contractor may take necessary steps to ensure availability.<br>Services to be provided during Warranty and CAMC period shall be as per clause no. 2.04.00, 2.05.00 and 2.06.00, Sub-Section-III-C, SECTION-VI, PART-A. |

**11.02.00 Specific requirements for Hot-extractive sampling type SO2, NOx, CO2 & CO analysers**

| **Specification Requirements** | **SO2 Analyser and Nox Analyser cum monitor (combined)** | **CO2 ANALYZER** | **CO Analyser** |
|---|---|---|---|

| | | | |
|---|---|---|---|
| Accessories for purging system | Purging system including Auto Scavenging facility shall be provided | Purging system including Auto Scavenging facility shall be provided | Purging system including Auto Scavenging facility shall be provided |
| Sample gas inlet temperature to analyser | Temperature of the sample gas inlet to analyser shall be controlled before analyser as per manufacturer standards. | Temperature of the sample gas inlet to analyser shall be controlled before analyser as per manufacturer standards. | Temperature of the sample gas inlet to analyser shall be controlled before analyser as per manufacturer standards. |

**11.03.00 Specific requirements for Dilution Extractive type SO2, NOx, CO2 & CO Analsyers**

The design of the Dilution Extractive type system shall be satisfying the following requirements. The sampling system shall consist of In-situ dilution probe, dilution probe controller, sample conditioning system like air drier and filters etc and other accessories meeting the following requirements as a minimum. All system components and accessories required for completion of this system shall be furnished although these may not be individually specified herein. Following are the minimum requirements:

h) Modular Electronic Design.
i) Heatless Air dryer with inlet filter, chemical scrubbers to remove traces of NOx/CO2/SO2 from air and accumulator.
j) Self test facility with screen display.
k) Protection of instrument in case ambient or surrounding temp going high beyond stipulated limit.
l) The following are the minimum requirement for the probe:-

- Flange and counter flange for inserting probe
- Flange and counter flange for inserting probe
- Coarse and Fine Filters
- Critical orifice
- Automatic blow back or purging facility
- SS316L probe material

m) Further dilution probe controller shall be provided with the ability to control dilution ratio.
n) Unheated umbilical chord to be provided for transportation of the diluted sample, zero air, vacuum pressure, and calibration gas. This chord has to be a single bundle in FRLS PVC outer sheath. The sample line has to be of PTFE.
o) Any dilution extractive system must have CO2 measurement facility at source/stack and measuring point/instrument end to prove the correctness of the selected dilution ratio.

| **Specification Requirements** | **SO2 Analsyer** | **NOx Analsyer** | **CO2 Analsyer** | **CO Analsyer** |

| Analyser Response time(up to 90% of full scale) | ≤ 5 sec |
| Operating Temperature Range for probe | 0-300 deg.C |
| Filter | To be provided |
| Accessories purging system | Purging system to be provided. |
| Temperature compensation/measurement | Temperature compensation to be provided, if applicable. |
| | First site Calibration of the instrument should be done based on the results of an extractive IsoKinetic Test by the Contractor. |

**11.06.00 Specific requirements for Continuous On-line Mercury Analyser**

| S.NO. | PARAMETER | DETAILS |
|---|---|---|
| 1 | Measurement Principle | Atomic Absorption Spectrometry/ Atomic Fluorescence spectrometry. |
| 2 | Range | 0 - 35 microgram/Nm3 |
| 3 | Accuracy | +/- 1% of Span or better |
| 4. | Minimum detection limit | 1 microgram/Nm3 |

**11.07.00 ULTRASONIC FLOW METER FOR FLUE GAS FLOW IN STACK**

| | |
|---|---|
| Type | Microprocessor based with self-indicating type diagnostic feature.<br>Output signal: 4-20 mA DC galvanically isolated.<br>Digital signal transmission: RS232/ RS485 Modbus Protocol/ Ethernet TCP/IP protocol for bidirectional communication of stack emission data to Employer's cloud server. |
| Mounting Style | Transducers on the duct/stack |
| Transducer type and material | Single pair of Corrosion resistant material to be provided |
| Zero and Span adjustment | To be provided |
| Flow measurement | Instantaneous Flow rate as well as totalized flow |
| Power supply Distribution | To be arranged by the Contractor from Employer's terminal point. |
| Display/Indication | Flow meter with LCD screen backlight based local display and keypad . If required, transmitter shall be suitably located away from the sensor for better access and visibility. |
| Recording / Totalizing/Logging Facilities | To be provided |
| Diagnostics | False signal tolerance , power supply failure etc |
| Protection class | IP-65 or better |
| Ambient temperature | -20 deg to +60 deg C |
| Accuracy | +/- 2% of span or better |
| Electrical connection | Plug and socket |
| Accessories | All mounting hardware required like clamping fixtures, mechanism to remove the transducers online, interconnecting cables to DDCMIS, cables, flexible conduits, junction boxes etc |

| | |
|---|---|
| | Purging arrangement for Cleaning sensors to be provided. Material of all fittings shall be SS 316. |
| Software features | Compensation for temperature and pressure and any cross path errors.<br>Programming, configuration, shall be possible from front panel. |

NOTES:-

01. Hot extractive sampling type/ Dilution extractive type systems shall be provided with dual sample probes along with all required accessories such as redundant heavy duty pumps with continuous rated motors, moisture detection facility, pre-fabricated heated (for sampling type only) sample lines from probes to analyser panel, solenoid valves, filters, coolers along with level switch in gas coolers for auto draining purpose and flow meter etc as applicable. Alternatively, permeation based dryer (located near the tapping point) alongwith necessary sample conditioning devices to ensure full protection, to avoid clogging & long life of permeation tubes may also be provided in place of sample cooler. Also, healthiness status/alarm/indication of permeation based dryer shall be provided in analyser panel.

02. In case IR based technique is used for SO2/NOx measurement, correction for H2O cross interference shall be available in the analyser.

03. If the SOx, NOx, CO2 & CO ( if sampling/dilution type) analyzers do not meet the environmental conditions specified at cl. 7.00.00 of Sub Sec IIIC-01, Section-VI, Part-B, all weather Local Panel fitted with integral Air Conditioner located in non-air conditioned area shall be provided for housing analysers etc.

04. For O2 Analyser, the construction of the sensor shall be such that joints between dissimilar materials are avoided to prevent formation of cracks.

11.08.00 Connectivity with DDCMIS and provision for bidirectional communication with Employer's Cloud Server

1. 4-20mA signals from all the above analysers, flow meters, stack gas temperature, stack pressure, stack gas moisture, stack gas O2 shall be wired to DCS of respective unit.

2. RS232/ RS485 Modbus protocol/ Ethernet TCIP/IP protocol for bidirectional communication with Employer's Cloud Server as defined in Sub-section-IIIC-C&I/ Section-VI/ Part-A.

All the accessories and cables required for connecting Analysers outputs to DCS and provision of bidirectional communication as defined above shall be provided by Contractor on as required basis.

**1.25.00 CONTROL AND INSTRUMENTATION (EXCLUDING AIR CONDITIONING AND VENTILATION SYSTEM, COMPRESSED AIR SYSTEM, FIRE DETECTION AND PROTECTION SYSTEM. For mandatory spare of these systems, refer mandatory spare clauses specified under respective systems)**

| 7.6.1 | CTs, CVTs, VTs, chokes, AC/DC isolators, contactors, timers, relays | 5% or 2 Nos. of each type and rating whichever is more. |
| 7.6.2 | Fuses of each type and rating | 200% |
| 7.6.3 | Fuse free Circuit breakers | 5% or 5 Nos. of each type and rating whichever is more. |
| 7.6.4 | Electronic modules of all types | One No. of each type |
| 7.6.5 | Indication lamps | 100% |
| 7.6.6 | Cooling Fans | 1 No. of each type |
| 7.6.7 | Indicators | 1 No of each type and rating |
| 7.6.8 | Relays of all types including overload relays | 2 Nos. of each type and rating |
| 7.6.9 | Batteries | 5% or 2 nos. of each type & rating whichever is more |

**1.00.00 GENERAL:**

1.01.00 Actuators shall be designed for valve operation to ensure proper function in accordance with specifications given below and complying to EN15714-2 or equivalent. All standards, specifications and codes of practice referred to herein shall be the latest editions including all applicable official amendments and revisions.

1.02.00 This sub-section of specification is applicable for following types of electric actuators:

1.02.01 **Modulating duty electric actuators:**

These shall be provided as per standard practice of OEM of equipment, meeting other requirements of specifications. For specifications of Blade pitch actuators, refer clause no. 5.00.00 of this chapter.

1.02.02 **Electric actuators for valves/ dampers/ gates (other than covered in 1.02.01):**

These actuators shall be Non-Intrusive type electric actuators. The interface of these actuators with DDCMIS shall be of two types viz. with Hardwired interface and with Fieldbus interface. The common requirements of both these type of actuators are specified at clause 2.00.00, specific requirements of Non-Intrusive hardwired actuators are specified at clause 3.00.00 and specific requirements of Non-Intrusive fieldbus actuators are specified at clause 4.00.00. The applications where these two types of actuators are to be provided is specified in Part-A of Technical Specifications.

**2.00.00 COMMON REQUIREMENTS FOR NON INTRUSIVE ELECTRIC ACTUATORS**

**2.01.00 TYPE:**

2.01.01 The actuators shall have integral starters with built in SPP (Single Phasing Preventer). 415 V, 3 phase 3 wire power supply shall be given to the actuator from switch board as applicable through a switch fuse unit. Control voltage of the motor starter shall be 110 V AC / 24 V DC, derived suitably from 415V power supply.

2.01.02 The actuators shall be Non- Intrusive electric actuator. All actuator settings including torque, limit shall be possible without opening the actuator cover and LCD indication shall be available integral to actuator body.

**2.02.00 RATING:**

(a) Supply Voltage & frequency: 415V +/- 10%, 3 Phase, 3 Wire & 50HZ +/-5%.

(b) Sizing:

Open/Close at rated speed against designed differential pressure at 90% of rated voltage.

For ON/OFF type: Three successive open-close operations or 15 minutes, whichever is higher.

For inching type: 150 starts per hour or required cycles, whichever is higher.

**2.03.00 CONSTRUCTION:**

(a) Enclosure:

Totally enclosed weatherproof, minimum IP-68 degree of protection.

(b) Manual Wheel:

Shall disengage automatically during motor operation.

**2.04.00 MOTOR:**

(a) Type :

Squirrel cage induction motor suitable for Direct On Line ( DOL )starting.

(b) Enclosure:

Totally enclosed, self-ventilated.

(c) Insulation

Class F. Temperature rise 70 Deg C. over 50 Deg C ambient.

(d) Bearings:

Double shielded, grease lubricated antifriction.

(e) Earth Terminals:

Two

(f) Protection:

Single Phasing Protection, Over heating protection through Thermostat (as applicable) and wrong phase sequence protection shall be provided over and above other protection features standard to bidder's design. Suitable means shall be provided to diagnose the type of fault locally.

**2.05.00 POSITION/TORQUE TRANSMITTER:**

The Position/ Limit measurement shall be done using absolute encoders which will give information of position/ limit in both the directions. Electronic measurement of torque shall be provided.

**2.06.00 LOCAL OPERATION:**

It shall be possible to operate the actuator locally also. Lockable local/remote selection shall be provided on the actuator.

**2.07.00 LCD DISPLAY:**

A local LCD display shall be provided to give information regarding actuator alarms, status and valve position indications as a minimum in local.

**2.08.00 WIRING:**

Suitable voltage grade copper wire.

**2.09.00 TERMINAL BLOCK:**

For power cables, the grade of TBs shall be minimum 650V.

**2.10.00 ACCESSORIES:**

All required accessories (if applicable) for calibration / settings/ configuration of various parameters of actuator shall be provided. For quantities, please refer Part A of technical specifications.

**2.11.00 SIL CERTIFICATION:**

All actuators shall be certified for SIL 2 or better.

**3.00.00 SPECIFIC REQUREMENTS FOR NON INTRUSIVE HARDWIRED ACTUATORS**

**3.01.00 INTERFACES:**

For ON-OFF and INCHING type actuators interface with the control system shall be through hardwired signal only.

(a) Open/Close command, open/ close status and disturbance monitoring signal (common contact for Overload, Thermostat, control supply failure, L/R selector switch at local & other protections operated) shall be provided hardwired.

(b) The actuator shall be able to accept open/close command at 24V DC with max. 2.5VA load from control system. Accordingly suitable isolated interface in the actuator shall be provided.

(c) Open/close command termination logic shall be suitably built inside actuator.

(d) For typical wiring diagram Refer Tender Drawing No. 0000-999-POI-A-063 (Except plug & socket connector, if not applicable)

**3.02.00 TERMINAL BOX:**

Suitable terminals/ connectors, integral to actuator, for terminating instrumentation & power cables shall be provided. Necessary glands for power cables and instrumentation cables shall be provided.

**3.03.00 TRAINING:**

Contractor shall provide training on Non-Intrusive hardwired Electric Actuator for Employer's personnel. The duration of the training shall be as elaborated in Part-C, Section-VI of technical specifications.

**4.00.00 SPECIFIC REQUIREMENTS FOR NON INTRUSIVE FIELDBUS ACTUATORS**

**4.01.00 INTERFACES:**

For ON-OFF and INCHING type actuators interface with the control system shall be through fieldbus network.

(a) Open/ close commands, open/ close feedback status, disturbance signal etc. shall be available to the Control System through the fieldbus network along with diagnostics. The detailed diagnostics including the actuator operating data shall be available to the DDCMIS through the fieldbus network.

(b) All actuators shall be Foundation Fieldbus/ Profibus compatible. However the exact protocol shall be based on finalized protocol of DDCMIS. If Profibus DP protocol is envisaged then actuator shall have two (redundant) Profibus DP ports for connecting the redundant Profibus DP cables. That is if one profibus cable is cut or not working/ not available, then complete actuator functionality shall be available through the second redundant cable without any manual intervention.

(c) Open/close command termination logic shall be suitably built inside actuator.

**4.02.00 TERMINAL BOX:**

Suitable terminals/ connectors, integral to actuator, for terminating fieldbus cables and power cables shall be provided. Necessary glands for power cables and armored fieldbus cables shall be provided.

**4.03.00 TRAINING:**

Contractor shall provide training on Non-Intrusive Fieldbus Electric Actuator along with detail training on Foundation Fieldbus/ Profibus interface used in actuator for Employer's personnel. The duration of the training shall be as elaborated in Part-C, Section-VI of technical specifications.

**5.00.00 SPECIFIC REQUIREMENTS FOR BLADE PITCH ACTUATORS**

| Sl No. | Description | Requirement |
|---|---|---|
| 1. | Duty | Continuous duty / Modulation, |
| 2. | Operating Ambient Temperature | -20 to +60 Deg C or better |
| 3. | Enclosure Protection | IP 68 |
| 4. | Resolution/ Precision | 0.1%- 0.2% or better of total travel |
| 5. | Supply Voltage & frequency | 415V +/- 10%, 3 Phase, 50HZ +/-5%<br>or<br>230V +/- 10%, Single Phase, 50Hz +/- 5% |
| 6. | Motor Suitable for | Continuous Duty |
| 7. | Motor insulation Class | F |
| 8. | Analog Control | 4-20mA, (24VDC) |
| 9. | Position Transmitter | 4-20mA (24VDC) |
| 10. | Integral Starter | Yes |
| 11. | Terminal Block | For power cables, the grade of TBs shall be minimum 600V |
| 12. | Accessories (if applicable) | for calibration / settings/ configuration of various parameters of actuator shall be provided |
| 13. | Hand wheel | Yes |
| 14. | Standard Compliance | EN 15714-2 Class D or equivalent |

## 2.01.00 SPECIFICATION FOR ELECTRONIC TRANSMITTER FOR PRESSURE, DIFF PRESS AND DP BASED FLOW / LEVEL MEASUREMENTS

| Sl.No. | Features | Essential/Minimum Requirements |
|---|---|---|
| 1. | Type of Transmitter | Microprocessor based 2 wire type (loop powered), Hart protocol compatible. |
| 2 | Output signal | 4-20 mA DC (Analog) along with superimposed digital signal based on HART protocol |
| 3 | Accuracy | ± 0.060 % of calibrated range (minimum) for calibrated range greater than 400 mmwc.<br>+0.065% of calibrated range (minimum) for calibrated range greater than 250 kg/cm2.<br>± 0.10 % of calibrated range (minimum) for calibrated range less than 400 mmwc |
| 4. | Turn down (minimum) | 50:1 for greater than or equal to span of 400mmwcl.<br>20:1 for span below 400mmwcl.<br>10:1 for span greater than 250 kg/cm2 |
| 5. | Stability | 0.25 % of calibrated range for 10 years for calibrated range greater than equal to 400 mmwc on standard conditions of manufacturer.<br>0.2 % of calibrated range for 1 years for calibrated range less than 400 mmwc on standard conditions of manufacturer.<br>0.15% of calibrated range for 5 years for static pressure greater than 250 kg/cm2. |

(Above mentioned (3,4,5 ) parameters/features of offered models shall be strictly as defined in standard published catalogue of the manufacturer only).

| | | |
|---|---|---|
| 6. | Zero and span drift | +/- 0.015 per degC at max span<br>+/-0.11% per degC at min. Span |
| | Power Supply | 24V DC ± 10%. |
| 7. | Load impedance | 500 ohm (minimum) |
| 8. | Housing | Weather proof as per IP-67, metallic housing with durable corrosion resistant coating |
| 9. | Over Pressure | 150% of max. Operating pressure |

| | | |
|---|---|---|
| 10. | Electrical Connection | Plug and socket type except in hazardous area |
| 11. | Process connection | 1/2 inch NPT (F) |
| 12. | Span and Zero | Continuous, tamper proof, Remote as well as manual adjustability from instrument with zero suppression and elevation facility. |
| 13. | Accessories | -Diaphragm seal, pulsation dampeners, syphon etc. as required by service and operating condition. |
| | Diagnostics and Display | Self-Indicating feature and digital display |
| 14. | Accessories | 2 valve manifold for absolute & Gauge pressure transmitters,<br>3-valve manifold for Differential Pressure and 5 valve manifold for Level /Flow applications.<br>The valve manifold shall be non integral type (except Fuel Oil area).<br>-For hazardous area, enclosure as described in NEC article 500<br>-2 inch pipe for mounting with Enclosure /Rack/Canopy |
| 15. | Certification | SIL 2 or Better |
| 16. | Adjustment/calibration/maintenance | From hand held HART calibrator |

Notes

LVDT type is not acceptable.

For primary air/ secondary air/flue gas applications, DP type transmitters shall be provided for pressure measurement below range of 2000 mmwc

Where the process fluids are corrosive, viscous, solid bearing or slurry type, diaphragm seals shall be provided. Parts below the diaphragm shall be removable for cleaning. The entire volume above the diaphragm shall be completely filled with an inert liquid suitable for the application.

## 3.05.00 TEMPERATURE TRANSMITTER (TT)

Following specifications are applicable for Dual input/ Single input temperature transmitter.

Temperature transmitter shall be 2-wire (loop powered) directly powered from 4-20mA input cards of DDCMIS. TT shall be fully compatible with thermocouples and RTDs being

provided by the contractor. Temperature compensation for thermocouples shall be performed in the temperature transmitter itself.

| S No. | Features | Essential/Minimum Requirements |
|---|---|---|
| 1. | Output | 2-wire (power supply from input card of control system) with 4-20mA output with superimposed HART protocol signal |
| 2. | Input | Same transmitter shall be capable to handle Pt-100 RTD, Thermocouples –K, R & ,S types ( Selectable through HART terminal/calibrator) |
| | Isolation | Min 500 VAC |
| | EMC compatibility | As per EN 61326 |
| | Power supply | 24 V C +/- 10% |
| 3. | Housing | Weather proof as per IP-67, metallic housing with durable corrosion resistant coating |
| 4. | Electrical connection | Plug and Socket connector except hazardous area |
| 5. | Diagnostics & display | Self-Indicating feature and digital display on transmitter |
| 6. | Operating Ambient temperature | 85 deg C without display.<br>70 deg C with display. |
| 7. | Mounting | 2 inch pipe mounting with Canopy. |
| 8. | Accessories | As required by service and operating condition. |
| 9. | Composite Accuracy | (Refer note 2 )<br>RTD =<0.25% of 0-250 deg C span<br>T/C-K type =<0.2% of 0-600 deg C span<br>CJC accuracy (for thermocouples) shall be =< 1 deg C |

Notes:

1. In case of failure (open or burn-out) of RTD/thermocouple, transmitter shall provide low temperature output.

2. Dual input temperature transmitter shall have bump less changeover facility to second sensor in case first sensor fails. This changeover is to be alarmed in control system.

3. Composite accuracy is to be calculated as summation of all applicable accuracies of temperature transmitter for converting sensor input to output (e.g., A/D accuracy, basic accuracy, digital accuracy, etc.) and temperature effect on these

accuracies at ambient temperature of 50 deg C, based on the figure/ formula given in the standard product catalogue for span as specified above for various types of temperature elements specified. All such accuracy/ temperature effect figures in catalogue shall be first converted to deg C, and then percentage of this converted accuracy in specified span shall be calculated to compare with the specified composite accuracy figures. All temperature transmitters shall be interchangeable (i.e. can be used for either RTD or thermocouple) and composite accuracy shall be met for each type of input as specified above.

4. Above mentioned parameters/features of offered models shall be strictly as defined in standard published catalogue of the manufacturer only.

5. Dual input temperature transmitters can also be accepted in place of single input TT.

**15.00.00 Vibration Monitoring System**

The Vibration Monitoring System shall be furnished on a system basis including, vibration transducers, phase marker sensor with low noise flexible cables in flexible conduit, terminated in local terminal boxes, necessary pre-amplifier/electronics mounted in local weather proof boxes, vibration monitors, mounting racks and cabinets etc. The vibration monitoring system shall include all power supplies, interconnecting cabling, calibration equipment, indicators, integrating units, signal conditioning devices and all other accessories, erection hardware required for monitoring of Vibration at each point. The contractor shall provide the vibration pads.

Contractor can offer up to Four Channel Vibration monitors. The allocation of channels shall be such that loss of one monitor shall not affect more than one side of the bearing of one machine. In the case of more than two channel Vibration monitors being provided by the Contractor, then one spare monitor shall be provided mounted in the panel to take care of immediate replacement of any failed monitors. Offered vibration monitors shall be modular in construction, plug in type.

Eddy current / piezoelectric type transducers shall be used. The sensors shall be either proximity or velocity or accelerometer type. However, the finally selected sensor type shall also depend on recommendation of the equipment manufacturer & suitable for application requirement which shall be finalised during detail engineering and without any extra price. Transducers shall be furnished in weatherproof housing suitable for field conditions. Cables/cabling from transducers local JB to Vibration Monitoring system in Control Room/Control Equipment Room shall be provided by the Contractor.

Vibration monitoring system shall give one no. buffered output of 4-20 mA DC and two no. of buffered raw signal for each point monitored and one no. of buffered raw signal for each phase marker sensor. The 4-20mA signal shall be suitable for use as an input to DDCMIS, linear in proportion to vibration velocity or displacement. Raw buffered signal(s) shall be suitable for archiving and analysis. Monitor shall provide vibration indication calibrated in velocity units along with provisions of changing to displacement unit (field-programmable) for each measurement point in both horizontal & vertical planes. The generation of alarm and trip signals is not envisaged in vibration monitoring system, the same shall be derived in DDCMIS. However in case of vibration initiated protection of equipments, OEM standard and proven practices shall also be considered.

The vibration monitor racks with power supplies shall be mounted in a separate self standing cabinet to be located in control room. The number of racks and power supplies shall be such that on failure of a single power supply/module, not more than four monitors shall be affected. The vibration monitoring cabinet shall be fed from redundant 24V DC feeders with auto changeover scheme.

The power supply arrangement for monitors shall ensure that failure of one power supply shall not affect any monitoring function in the system. Also any power supply failure /earth fault in any of the monitors will be isolated without affecting other monitors/ common power supply. If 230 V AC UPS power supply is required for panel PC/ desktop PC, UPS/Mini UPS for the same shall be provided by the contractor.

The functional requirement for vibration monitoring system shall include but not be limited to the following:

- Vibration monitor front face status indications shall be available for indications of healthy conditions of pick up circuit, monitor circuit and power supply. On sensor fault/wire break in the sensor circuit, the system shall have the feature of identifying the same through suitable means like the signal forced to a value less than 4 mA. In case, such a feature is not available then suitable contact shall be provided from the monitor for sensor fault.
- The facility shall be available for online functional checking of monitors.
- All vibration monitoring equipment shall be functionally tested for circuit continuity and output response. All the components & interconnection cables shall be tested to ensure compliance with the specification requirements & all other applicable codes & standards.

In case it is the proven standard practice of a Contractor to provide vibration monitoring PC with TFT LCD monitor, instead of dedicated monitors with the signal conditioning equipment in control equipment room, the same shall also be acceptable. However, all relevant functional requirements detailed above shall be met and the system shall be subject to Employer’s approval.

## 16.00.00 FIELD INSTRUMENTS BASED ON FIELDBUS

The following instruments shall be connected to DDCMIS through fieldbus i.e. FOUNDATION Fieldbus/PROFIBUS PA protocol complying to IEC 61158 directly from transmitter.

### 16.01.00 Electronic Transmitter for Pressure, Differential Pressure and DP based Flow / Level measurements.

| S No. | Features | Essential/Minimum Requirements |
|---|---|---|
| 1. | Type of Transmitter | FOUNDATION Fieldbus/PROFIBUS PA based output |

| | | |
|---|---|---|
| 2 | Accuracy | ± 0.060 % of calibrated range (minimum) for calibrated range greater than 400 mmwc.<br>+0.065% of calibrated range (minimum) for calibrated range greater than 250 kg/cm2.<br>± 0.10 % of calibrated range (minimum) for calibrated range less than 400 mmwc. |
| 3. | Stability | 0.25 % of calibrated range for 10 years for calibrated range greater than equal to 400 mmwc on standard conditions of manufacturer.<br>0.2 % of calibrated range for 1 years for calibrated range less than 400 mmwc on standard conditions of manufacturer.<br>0.15% of calibrated range for 5 years for DPT with static pressure greater than 250 kg/cm2. |
| 4 | Turn down | 50:1 for greater than or equal to span of 400mmwcl.<br>20:1 for span below 400mmwcl.<br>10:1 for span greater than 250 kg/cm2 |
| | (Above mentioned (2,3,4) parameters/features of offered models shall be strictly as defined in standard published catalogue of the manufacturer only). | |
| 5 | Housing | Weather proof as per IP-67, metallic housing with durable corrosion resistant coating |
| 6. | Electrical connection | ½" NPT(F) FOUNDATION Fieldbus/PROFIBUS PA compatible |
| 7. | Process connection | ½" NPT (F) |
| 8. | Operating Ambient temperature | 85 deg C without display.<br>70 deg C with display. |
| | Overpressure | 150% of max operating pressure |
| 9 | Accessories | -Diaphragm seal, pulsation dampeners, syphon etc. as required by service and operating condition.<br>-2 valve manifold for absolute & gauge pressure transmitters, -3-valve for DP and 5 valve manifold for level/flow applications.<br>-The valve manifold shall be non-integral type.<br>-For hazardous area, enclosure as described in NEC article 5. |

| | | |
|---|---|---|
| 10. | Mounting | 2 inch pipe mounting with Enclosure/Rack/Canopy. |
| 11. | Diagnostics & display | Self-Indicating feature and digital display on transmitter |

Notes

- For primary air/ secondary air/flue gas/ furnace pressure applications, DP type transmitters shall be provided for pressure measurement below 2000 mmwc.
- LVDT type is not acceptable.
- Where the process fluids are corrosive, viscous, solid bearing or slurry type, diaphragm seals shall be provided. Parts below the diaphragm shall be removable for cleaning. The entire volume above the diaphragm shall be completely filled with an inert liquid suitable for the application.

**16.02.00 Temperature Transmitter**

**16.02.01 Single Input /Dual Input Temperature transmitter**

Temperature transmitter shall be provided which shall be fully compatible with thermocouples and RTDs being provided by the contractor. Temperature compensation for thermocouples shall be performed in the temperature transmitter itself. Transmitters shall be capable of withstanding ambient temperature up to 85 deg C.

Following specifications are applicable for dual input/single input temperature transmitter.

| S No. | Features | Essential/Minimum Requirements |
|---|---|---|
| 1. | Output | FOUNDATION fieldbus /PROFIBUS PA |
| 2. | Input | Same transmitter shall be capable to handle Pt-100 RTD, Thermocouples –K, R & ,S types |
| 3. | Housing | Weather proof as per IP-67, metallic housing with durable corrosion resistant coating |
| 4. | Electrical connection | ½" NPT(F) FOUNDATION Fieldbus/PROFIBUS PA compatible |
| 5. | Diagnostics & display | Self-Indicating feature and digital display on transmitter |
| 6. | Operating Ambient temperature | 85 deg C without display.<br>70 deg C with display. |

| | | |
|---|---|---|
| 7. | Mounting | 2 inch pipe mounting with Canopy. |
| 8. | Accessories | As required by service and operating condition. |
| 9. | Composite Accuracy | (Refer note 2 ) |

RTD =<0.25% of 0-250 deg C span

T/C-K type =<0.2% of 0-600 deg C span

CJC accuracy (for thermocouples) shall be =< 1 deg C

Notes:

1. In case of failure (open or burn-out) of RTD/thermocouple, transmitter shall provide low temperature output.
2. Dual input temperature transmitter shall have bump less changeover facility to second sensor in case first sensor fails. This changeover is to be alarmed.
3. Composite accuracy is to be calculated as summation of all applicable accuracies of temperature transmitter for converting sensor input to output (e.g., basic accuracy, digital accuracy, etc.) and temperature effect on these accuracies at ambient temperature of 50 deg C, based on the figure/ formula given in the standard product catalogue for span as specified above for various types of temperature elements specified. All such accuracy/ temperature effect figures in catalogue shall be first converted to deg C, and then percentage of this converted accuracy in specified span shall be calculated to compare with the specified composite accuracy figures. All temperature transmitters shall be interchangeable (i.e. can be used for either RTD or thermocouple) and composite accuracy shall be met for each type of input as specified above.
3. Above mentioned parameters/features of offered models shall be strictly as defined in standard published catalogue of the manufacturer only.
4. Dual input temperature transmitters can also be accepted in place of single input TT.

**1.00.00 CONTROL DESK & PANELS**

**1.01.00 GENERAL**

1.01.01 All control desk, panels, LVS panel etc. shall be furnished fully wired with necessary provision for convenience outlets, internal lighting, grounding, ventilation, space heating, anti-vibration pads, internal piping & accessories as required for completeness of the system.

1.01.02 All panels, desks, cabinets shall be free standing type & have bottom / top entry for cables to be finalised application wise during detailed engineering stage. The bottom of desk & cabinets shall be sealed with bottom plate, compression cable glands (double for field and single for inside rooms) and fire proof sealing material to prevent ingress of dust and propagation of fire. Sufficient number of power receptacles with disconnect switches shall be installed within all panels/desk.

1.01.03 Exterior steel surface shall be sand blasted, ground smooth, filled, primed, sanded and smooth enamel painted to give a good finish subject to minimum paint thickness of 65-75 microns for sheet thickness of 3 mm and 50 microns for sheet thickness of 2mm. The exact color shall be finalised during detailed engineering.

1.01.04 The design shall conform to the EN ISO 11064 (Ergonomical design of control room), Part-1,2 and 3.

**2.00.00 CONTROL DESK & PANEL**

**2.01.00 GENERAL**

2.01.01 The exact dimensions, material, construction details, grounding, general arrangement etc. of Control Desk etc. shall be as per the actual requirement and shall be finalised during detailed engineering and subjected to Employer’s Approval.

2.01.02 For control desk mounted instruments/ devices etc., which are to be powered from UPS, all required conversion of interface equipments / accessories to make such devices compatible with UPS supply shall be provided. All necessary hardware like Input switches/ fuse unit for each feeder as well as switch fuse unit for each instrument/ device on the power supply line shall be provided. From UPS, redundant feeders shall be provided with suitably rated MCB and provision of fast auto changeover of UPS feeders.

**2.02.00 Control Desk (CD)**

2.02.01 Control desk shall be Modular, non-welded construction free standing table top type with front & back cover constructed of 1.6 mm thick CRCA steel plates. The tabletop of the control desk shall be arc-shaped for mounting TFT monitors & mice. The work surface of control desk shall be 30mm thick with the top 12mm of Acrylic Solid Surface (ASS) and the remaining 18mm of laminated medium density fiber board. Work surface shall be made of two different colors at same level and seamlessly joined in each section. The structure frame shall consist of extruded aluminum top and bottom horizontal beams and vertical support tensioned together to form an integrated, finished curvilinear shaped frame. Vertical & Horizontal supports, minimum 2.5mm and 2mm thick respectively, have to be provided for the structure frame. Extreme side legs shall be illuminated type and should complete the

overall form and aesthetics of the desk. It shall have concealed cable & wire way management system. Telephone sets shall be mounted on the control desk. Sliding keyboard trays shall be provided on the CD. The exact profile of the desk, dimension and the radius of curvature shall be finalised during detailed engineering stage.

2.02.02 All operator monitors & mice shall be mounted on this CD.

2.02.03 The cabling / wiring between OWS & CPU's, power supply cables etc. shall be aesthetically routed and concealed from view.

**2.03.00 Internal Panel/Desk Items**

Equipment and devices mounted within the panels/desk shall be mounted on suitable racks/brackets and shall be arranged for convenient access for adjustment and maintenance work.

**2.04.00 Furniture**

Bidder shall provide following industrial grade furniture items as a minimum from reputed manufacturers/suppliers meeting International Standards. The furniture shall be modular and latest with ease of operational features. The furniture shall be modern, aesthetically designed, modular, flexible, space saving and future safe. Each module shall have transparent cover and adjustable partition. It shall have locking provision for security. The components shall be suitable for integration/fabrication without any welding technology.

1. Work Station furniture

   Modular work station furniture, suitable for mounting servers & historians, programmer stations, PC based systems, printers (inkjet or A4 laser) etc. is to be provided..

2. Server Rack

   **Server rack shall be provided to mount programmer stations, PC based systems (of rack type and tower type), Matrix KVM switcher, Mini UPS etc. Suitable arrangement for Ventillation and cooling shall be built in.**

3. PC rack

   PC rack shall be provided to mount CPUs of work stations/PCs of OWS/LVS etc in Control Room.

4. Chairs

   Industry standard revolving chairs with wheels and with provision for adjustment of height (hydraulically/gas lift) shall be provided for the operators & other personnel in control room area. These shall be designed for sitting for long duration such that these are comfortable for the back.

5. Tables

a Industry standard computer tables shall be provided & shall be as approved by Employer during detailed Engineering.

6. Almirahs

Steel Almirahs shall be provided for keeping documents in the documentation room.

7. Keypad

Keypads shall be provided for the storing of keys of relevant areas in the respective control rooms

8. Lockers

Suitable lockers shall be provided in the room adjacent to the control room for storing of personal articles of control room personnel & also for documents.

## 1.00.00 DISTRIBUTED DIGITAL CONTROL, MONITORING AND INFORMATION SYSTEM (DDCMIS)

### 1.01.00 General Requirements

1.01.01 The requirements for Distributed Digital Control Monitoring and Information System (DDCMIS) are indicated on functional basis in this specification. Contractor shall be responsible for engineering, selection and connection of all components and sub-systems to form a complete system whose performance is in accordance with functional, hardware, parametric and other requirements of this specifications. It is not the intent or purpose of this specification to specify all individual system components since the Contractor has full responsibility for engineering and furnishing of a complete system.

### 1.02.00 System Configuration

DDCMIS shall basically consist of the following:

1.02.01 Control System (including its Measurement system).

1.02.02 Human-Machine Interface and Plant Information System (HMIPIS)

1.02.03 System Programming & Documentation Facility

1.02.04 Data Communication System

1.02.05 Integrated OWS based Annunciation functions

1.02.06 Time synchronization with Master clock

The basic configuration of DDCMIS shall be as indicated in the DDCMIS configuration drawing No. 0000-151-POI-A-013.

Contract Quantities of the C&I System shall be as per Part-A.

### 1.03.00 System Expandability

1.03.01 Modular System design shall be adopted to facilitate easy system expansion. The system shall have the capability and facility for expansion through the addition of controller modules, I/O cards, peripherals like operator workstations (OWS), printers etc. The system shall have the capability to add any new control loops, groups/subgroups logics in control system.

### 1.04.00 On-Line Maintenance

1.04.01 It shall be possible to remove/replace various modules online (like I/O module, interface module etc.) from its slot for maintenance purpose without switching off power supply to the corresponding rack. System design shall ensure that while doing so, undefined signaling and releases do not occur and controller operation in any way is not affected. Further, it shall also be possible to remove/replace any of the redundant controller module without switching off the power to the corresponding rack and this will not result in system disturbance or loss of any controller functions for the other controller. The on-line removal/insertion of controller, I/O modules etc. shall in no way jeopardize safety of plant and personnel.

### 1.05.00 Fault Diagnostics

1.05.01 The DDCMIS shall include on-line self-surveillance, monitoring and diagnostic facility so that a failure/malfunction can be diagnosed automatically and reported/indicated remotely on OWS/Programmer station. The failure/ malfunctions to be reported shall include:

(a) Module level faults of control system.

(b) Failure of HMIPIS bus/unit LAN, system bus, Local/Remote comm. Bus.

(c) Power supply faults (Over voltage, under voltage, loss of input) for each feeder of power supply for system / marshalling/ relay and HMIPIS cabinets.

(d) Software faults.

These faults shall typically be reported as color change on system status display and messages on programmer station/ OWS as well as through local indication. The diagnostic system shall ensure that the faults are detected before any significant change in any controller output has taken place. Failure of any I/O modules, Controller etc. shall be annunciated to OWS. For I/O modules, these alarms shall be grouped, while for controller, comm. controller, power supply, these shall be individual. In case the faults are not acknowledged / rectified within certain interval, then the same shall be reported to predefined users through messaging system described subsequently in this subsection. The exact strategy of the messaging system shall be elaborated and finalised during detailed engineering.

HMIPIS shall include on-line self surveillance, monitoring and diagnostic facility so that a failure/malfunction in any of the nodes, networking device as well as communication medium can be diagnosed on the programmer/engg. Work station/OWS.

1.06.00 **Fault Tolerance & Controllability**

1.06.01 The DDCMIS shall provide safe operation under all plant disturbances and on component failure so that under no condition the safety of plant, personnel or equipment is jeopardised. Control System shall be designed to prevent abnormal swings due to loss of Control System power supply, failure of any Control System component, open circuits/short circuits, instrument air supply failure etc. On any of these failures the control system output shall either remain in last position before failure or shall come to fully open/close or on/off state as required for the safety of plant/personnel/equipment and as finalised during detailed engineering. System shall be designed such that there will be no upset when Power is restored.

1.06.02 I/O modules shall have protection so that any fault in sensor & its wiring upto I/O module like open/short circuit, earth fault affects only that channel of I/O module. Other channels of that I/O module or other modules or other parts of system shall not be affected in any way.

1.06.03 No single failure either of equipment or power source shall be capable of rendering any part/system/sub-system of DDCMIS inoperative to any degree. No single failure in HMIPIS shall lead to non-availability of more than one OWS. In such an event i.e., single failure leading to non-availability of any OWS, it shall be possible to operate the entire plant in all regimes of operation including emergency conditions from each of the other available OWS.

1.06.04 In order to achieve above, following shall be redundant with automatic change-over (including the associated software), as a minimum:

- Controller, Comm. Controllers, HMIPIS bus/Unit LAN, System bus, Local/Remote communication bus.
- Power supply arrangement (feeders/modules)
- Output modules. (for which redundancy is specified in part-A-Contract quantities for DDCMIS).
- Servers/information work stations

- However, following need not be redundant:
  - I/O bus, (if it is a backplane bus & extension/joining of such backplane buses cabinet/adjacent cabinet) and input modules.

1.06.05 The system design shall ensure that no single failure, whatsoever in any part of DDCMIS result in loss of communication except communication between HMI and control system, for which loss of communication upto a maximum of five seconds is acceptable. However, during this period, the control system shall remain fully functional and this event shall not create any disturbance/malfunction whatsoever (e.g., accumulation of control commands, issue of spurious commands/signals etc.).

1.06.06 DDCMIS shall meet all requirements stipulated under other Sub-sections/sections of the specification including Sub-Section-IIIC, Part-A, (including the requirement Authorization to shipment test ATST) Quality assurance (Part B, Section VI of technical specifications) & General Technical Requirements (Part C Section VI of Technical Specifications).

1.07.00 **Signal Exchange**

All the signal exchange between various functional groups of each control systems shall be implemented through redundant system bus.

1.08.00 **System Spare Capacity**

1.08.01 For Control system spare capacity, refer Control System Spare Capacity as mentioned in Part A, Section VI of technical specification.

For HMIPIS spare capacity, refer Appendix-I to part A, Section VI of technical specification.

1.08.02 NOT USED.

1.08.03 NOT USED.

1.08.04 NOT USED

1.09.00 NOT USED.

1.10.00 NOT USED.

1.11.00 DDCMIS shall meet system performance and parametric requirements as stipulated under Part-A, Section-VI of specifications.

## 2.00.00 SYSTEM DESCRIPTION

2.01.00 The DDCMIS shall include following main constituents. (Also refer DDCMIS configuration drg.no. 0000-151-POI-A-013). The DDCMIS shall work in full integration and conjunction with field equipment/drives like pumps, motors, valves, actuators, dampers, hydraulic control systems and field instruments.

2.02.00 **Control System**

2.02.01 The Control system along with its measurement system shall perform functions of closed loop control, sequence control, interlock & protection of the Plant and auxiliaries in all regimes of its operation.

2.02.02 The measurement system of control system shall perform the functions of signal acquisition, conditioning and signal distribution of various types of inputs/outputs like analog, (4-20 mA DC- either from pressure / DP/ flow / level transmitters, analysers etc. as well as from temperature transmitters for all temperature) measurements from thermocouple, RTD to be connected to this system), binary, pulse, digital transmission through serial port, bus connection etc. (from remote I/O etc., Through various industry standard protect including MODBUS/FIELDBUS/PROFIBUS, prefabs freed and Ethernet etc. The inputs, which are required for only information & monitoring purposes, shall be distributed suitably in various groups plant area-wise.

2.02.03 The control system shall also perform logic & computation for annunciation functions.

2.02.04 The control system hardware (controllers, modules/cards etc.) shall be housed in cabinets located in respective control equipment room (CER) unitised and offsite except for the remote I/O cubicles (as specified in Part-A) which shall be located in respective areas.

2.03.00 **Human-Machine Interface and Plant Information System (HMIPIS)**

2.03.01 Functionality/features mentioned for HMIPIS in this specification are also applicable for unified HMIPIS. The HMIPIS shall perform control, monitoring and operation of the Plant and auxiliaries in all regimes of its operation, interacting with the Control System. For this, HMIPIS shall primarily perform following functions:

2.03.02 Operator interface for Control System

2.03.03 Plant Supervisory functions like displays, alarm monitoring & reporting, reports & logs, calculations, trend recording, historical and long term data storage & retrieval, etc.

2.04.00 **System Programming & Documentation Facility**

2.04.01 The programmer stations shall be provided for On-line configuration & tuning of Control System and On-line program development/modifications in HMIPIS.

2.04.02 A work-station based system documentation facility shall be provided to generate retrieve store & all system documentation, logic, control loops, cable interconnection, etc. to achieve paperless documentation for the complete plant.

2.05.00 **Data Communication System (DCS)**

2.05.01 The Data Communication System shall be provided for communication between Control System and HMIPIS, communication & signal exchange between various functional groups as well as communication between various units & off site / off line systems.

2.06.00 **Annunciation System**

The annunciation logic will be implemented as a part of DDCMIS and annunciation shall be made available on all OWS.

2.07.00 **Power supply:**

2.07.01 Power supply of control system shall be based on 24V DC. The Power supply along with its associated circuitry is intended to provide the following functionalities

(a) Isolation between input & output side and distribution.

(b) Multiple voltages as required by various modules as well as integration/supply voltage to field devices.

(c) Auctioneering of dual voltages.

(d) Providing stabilized/regulated power to Control System, taking care of input power supply variations.

2.07.02 The Control System shall be fed from 24V DC power supply system (please refer power supply section of specification). The complete Control System, including power supply for various modules & field interrogation, shall be through regulated power supply using power supply modules/packs. Further, the monitoring of individual feeders of input power supply shall be done as specified at clause 1.05.01 (c) of IIIC-05.

**3.00.00 MEASUREMENT FUNCTIONS OF CONTROL SYSTEM**

3.01.00 The input / output modules employed in the Control System shall be separate from controller hardware.

3.01.01 The functions listed below shall generally be performed in I/O modules. However, some of the functions can be implemented in the controllers .

3.01.02 FIELDBUS ((Foundation Fieldbus/ Profibus) Interface

For interfacing fieldbus compatible field devices/ actuators, Foundation Fieldbus/Profibus interface modules, power supply, field cables(armoured) and other accessories shall be provided. The design of fieldbus interfacing scheme, from field to Controller shall comply with all requirements of latest version of standards for Foundation Fieldbus/Profibus viz. IEC 61158. All required libraries to execute various tasks like data acquisition, control/protection etc shall be provided. Redundant host/ master card and redundant power supply along with diagnostic module shall be provided. For detailed fieldbus design guidelines, refer Annexure-IIIC-02K, Part-B, Section-VI.

The Contractor shall present complete implementation scheme, including wiring scheme during detailed engineering stage for review & approval by Employer.

3.02.00 **Analog signal conditioning & processing**

3.02.01 The conditioning and processing functions to be performed as a minimum for the analog inputs coming for control and information purposes are:

1. : Galvanic isolation of input and output signals for which power supply source is other than the measurement system of the control system.
2. : Transmitter power supply with per point fuse protection or current limiting and power supply monitoring.
3. : Monitor sensor wire break/open circuit/short circuit and take suitable actions in logic/loop. (This will include blocking of trip signals in case of RTD failure).

3.02.02 All analog signals for control purpose shall be acquired, validated, processed and their respective Controller data base updated at a maximum interval of 250 milli seconds except for some fast-acting control loops for which the above-referred time shall be as per process requirement. For signals required for information only, the above functions shall be performed at an interval of 1 seconds. The HMI database updation shall not take more than one (1) second. The validated analog inputs shall be converted into engineering units on a per point basis. Analog input processing (scanning to alarm checking) shall be performed once every scan cycle. It shall be possible to manually disable any analog input either through deleting from scan or substitution from HMI.

3.02.03 For Unit DDCMIS, the analog 4-20 mA input cards shall have input resistance >= 250 ohm inside the card/FTA (as applicable) for interfacing transmitters/analysers/temp. signals (through temp transmitters) giving 4-20mA analog signal along with superimposed HART interface signals. 4-20 mA DC signal will only be used for control purpose and superimposed HART signal will be used for configuration, maintenance, diagnostic and record keeping facility for electronic transmitters and Analysers etc

3.03.00 **Binary signal conditioning & processing**

3.03.01 The binary inputs shall be wired either in form of changeover type contacts (i.e. 'NC' + 'NO' together) or non-changeover type Contact ('NC' or 'NO') depending on the requirement, as defined in Part-A of specification.

3.03.02 The conditioning and processing functions to be performed as a minimum for the binary inputs coming for control and information purposes are:

1. : 24 VDC power supply for contact interrogation for all potential free contacts with per point fuse protection or suitable current limit feature/ isolation through opto-coupler.
2. : Contact bounce filtering. (The field contact which is changing state must remain in the new state for the filter delay time to be reported as one event). The filter delay time should be suitable for the field input & its scan rate.
3. : Facility for automatic pegging the binary signal to logic one/zero or last correct value in case of failure of binary input module.
4. : All binary signals shall be acquired validated, processed, alarm checked and their data base updated within one second.

5. : It shall be possible to manually disable any binary input either through deleting from scan or substitution from HMI.

6. : The non-coincidence monitoring shall be provided for binary inputs for all changeover signals.

3.04.00 **Multiple Measurement Scheme**

3.04.01 Triple / Dual measurement schemes shall be provided for triple / dual redundant sensors used in closed loop and open loop controls.

3.04.02 The triple / dual measurement schemes for closed loop control shall provide median / average outputs. The operator shall be able to select any of the transmitters or the median/average value from the OWS.

3.04.03 The sensors for multiple measurement schemes for open loop controls shall always be in service (except when gone Bad) and operator shall not be able to select / deselect any of the sensors. Further, measurement scheme shall be implemented considering safety / availability aspects.

3.04.04 Individual transmitter signals, their status and selected value for control/ measurement and shall be available on OWS in the CLCS displays and the popups

3.05.00 **Wiring Scheme for inputs to control system**

3.05.01 Each of the triple redundant binary & analog inputs shall be wired to separate input modules. Similarly each of the dual redundant binary & analog inputs shall be wired to separate input modules. Implementation of multiple measurement schemes of these inputs will be performed in the redundant hardware. Loss of one input module shall not affect the signal to other modules. Other channels of these modules can be used by other inputs of the same functional group.

No single failure in any component of the control system shall lead to unavailability of more than one of dual/triple redundant input signals to control system. Similarly, no single failure in any component of the control system shall lead to unavailability of more than one of dual/triple redundant Output signals from the control system.

3.05.02 The single (i.e. non-redundant) binary & analog signal required for control purposes shall be wired as follows:

1. The on-off status of HT drives and synch type breakers shall be wired to two input modules in parallel.

2. Triple/dual analog sensors are required both in CLCS and OLCS for control purpose, then all of these triple/dual sensors shall be wired to the controller where CLCS loop is configured. If based on the same set of sensors, any protection action is required in OLCS (e.g., protection stop of drive) in another controller(s), then CLCS Controller shall provide three digital outputs for each such controller from three separate output modules (at defined LVM-Limit Value Monitor blocks inside Controller). The three

such digital outputs of CLCS controller shall be acquired in each of the OLCS controllers in three separate digital input modules. Similar philosophy will be used when triple/dual analog sensors are required in OLCS in multiple controllers for protection function.

3. If triple/dual/single binary sensors are required in OLCS in multiple controllers for protection function in these controllers, each of these sensors shall be shared among these controllers. Each of these sensors shall be directly shared from marshalling TBs without any 'active' multiplying hardware ('active' defined as hardware which requires a separate power supply for its functioning). Further, removal/insertion of any of such multiple modules shall not affect availability of such signal(s) to other modules.

4. The input sharing scheme shall be subject to Employer's approval during detailed engineering. The inputs/outputs for such sharing is already included in he Contract quantities in Part-A).

3.06.00 **Remote Input output modules and cubicles**

It is envisaged to use remote I/O modules in various plant areas. The remote I/O signals shall be connected to the respective functional groups through redundant extended I/O bus as indicated in the Contract quantities for DDCMIS. The hardware independence of functional groups mentioned elsewhere in specification shall be applicable for remote I/O as well.

The remote input/output modules shall be located in cubicles in respective areas. Remote input/output modules may be located in harsh environment, the modules shall be designed in such a way to work continuously under the harsh environment expected to be encountered in these areas (high temp, dust level, humidity etc.). It shall be ensured that extending of I/O bus of functional group in field does not result in false signaling /noise pickups. Further, it shall in no way deteriorate the performance of that functional group and Control System.

3.06.01 Power supply arrangement for these cubicles shall be similar to DDCMIS system cabinets.

3.07.00 The maximum number of inputs/outputs to be connected to each type of module shall be as follows:

| | | | |
|---|---|---|---|
| 1 | : | Analog input module | 16 |
| 2 | : | Analog output module | 16 |
| 3 | : | Binary input module | 32 |
| 4 | : | Binary output module | 32 |
| 5 | : | Analog input & output (combined) module | 16 |
| 6 | : | Binary input and output (combined) module | 32 |

Note: For binary inputs, one changeover contact is counted as 2 inputs.

3.08.00 The following requirements shall be met for analog/binary input/output modules as applicable.

3.08.01 Input filters to attenuate noise shall be provided.

3.08.02 All analog outputs shall be short circuit proof.

3.09.00 The Control Desk mounted hardwired devices & stations shall be interfaced through the I/O modules. No signal multiplication shall be done at marshalling end input termination end.

**4.00.00 CONTROL SYSTEM REQUIREMENTS**

4.01.00 The control system shall be broadly divided into the followings:-

4.01.01 (i) Close Loop Control System (CLCS) - Modulating control functions for various applications including individual control and operation of modulating drives.

(ii) Open Loop Control System (OLCS) - Binary control functions pertaining to sequence / interlock / protection of plant auxiliaries for various applications including individual control and operation of binary drives.

(iii) Other functions as per various requirements specified in Part-A of specification.

(iv) Performing logic & computation for annunciation functions & other miscellaneous Controls, signal processing etc.

4.01.02 The number of Functional Groups (FGs) which are derived from the above mentioned guideline are the minimum required. For each of the FGs, separate sets of controllers, I/O modules, communication controllers, power packs/ modules etc. shall be provided. Mixing of hardware of two or more FGs shall not be acceptable. However, splitting of any functional group in more than one FGs due to any limitation in Contractor's system (e.g. limitation in handling number of inputs/outputs including spare capacity, limitation in implementation of number of functional blocks including spare blocks etc.) shall be acceptable, subject to Employer's approval. It may be noted that after splitting of the functional groups, each FG must have its own set of controllers, I/O modules, etc. It shall be ensured that failure of any set(s) of hardware of any FG does not affect other FG(s) and data communication between other FG(s) and HMIPIS. Each FG can have one or more set of controllers, if supported by standard design of the offered system.

4.01.03 The Contractor shall provide all hardware/software, whether or not specifically indicated in this specification to fully meet operational/maintenance/ safety requirement as well as statutory/international standard and proven practices.

4.01.04 The Control System shall function reliably under the environmental conditions as specified in Sub-Section:- Basic Design Criteria of this specification. It shall be immune from the interference resulting from disturbances in power supply feeders, signals lines, inputs, outputs etc. as experienced in a coal fired power station. It shall be able to withstand power line disturbances.

4.01.05 The Control System shall have on-line simulation & testing facility.

4.01.06 The system shall have the flexibility to easily reconfigure any controller at any time without requiring additional hardware or system wiring changes and without disabling other devices from their normal operation mode. Modifications shall not require switching off power to any part of the system.

4.01.07 Power supply to individual functional group shall be from redundant 24V feeders with diode auctioneering and further sub-distribution.

4.01.08 The assignment of I/O channels for Inputs/Outputs, arrangement of modules within cabinet etc. shall be identical for all units except those inputs/outputs which are common for all units. Further uniformity should be maintained for redundant stream of process equipment within a unit.

4.01.09 The application programs for the functional controllers shall be software based which shall be maintained even through power supply failure.

4.01.10 Independent and dedicated controllers (main and its 100% standby) shall be provided for each of the functional group (FG) of Control System except for the cases where triple redundant controllers are to be used as per this specifications. All the 100% hot redundant backup controllers shall be identical in hardware and software implementation to their corresponding main controllers and shall be able to perform all its tasks. The backup controller shall track its corresponding main controller. There shall be an automatic and bumpless switchover from the main controller to its corresponding backup controller in case of main controller failure and vice versa without resulting in any change in control status. In case of switchover from main controller to the 100% hot backup controller, the back-up controller shall work as the main controller. Further, when only one controller is working and other controller is inserted on line (for example after repair/replacement), there should not be any degradation in the function of the working controller & control operation.

4.01.11 The loop/logic reaction time (from change of input to input module to the corresponding control command output) shall be suitable to match actual process requirements, subject to minimum requirement wherever specified.

4.02.00 **Binary Controls/Open Loop Control System (OLCS) Functions**

4.02.01 These clauses are applicable for all the Binary controls of DDCMIS included in Contractor's Scope.

4.02.02 The OLCS shall include sequence control, interlock & protection for various plant auxiliaries/valves/dampers/drives etc. The sequence control shall provide safe and automatic startup and shutdown of plant and of plant items associated with a plant group. The interlock and protection system shall ensure safe operation of plant/plant items at all times and shall automatically shut down plant/plant items when unsafe conditions arise.

4.02.03 The OLCS shall be arranged in the hierarchical control structure consisting of unit level, group level, subgroup level & drive level (as applicable).

4.02.04 The group level shall control a set of functional sub-groups of drives. Appropriate start-up and shut down commands shall be issued to the sub-group control and various check-backs shall be received from sub-groups or drives. Each sub-group shall execute the sequential

start-up and shut down programs of a set of inter-related drives along with system interlocks and protections associated with that sub-group as well as basic interlocks and protections related to individual drive falling under that sub-group. The drive level shall accept commands from the sub-groups, push buttons (wherever provided), etc., and transmit them to the respective drive, after taking into account various per missives and protections of that particular drive. For HT and other critical drives, first-up logic shall be incorporated to indicate the cause of protection/trip.

4.02.05 **Sequence Control**

(a.) A sequence shall be used to move a set of groups, sub-groups from an initial steady state (for instance 'OFF') to a final steady state (for instance 'ON'). The sequence initiating command for the unit & group level shall be issued from OWS.

(b.) A sequence shall be made of steps. The steps shall be executed in predetermined order according to logic criteria and monitoring time consisting of the interlock & protection requirements and check back of previous step which shall act as preconditions before the sequence control can execute the command for that step.

(c.) Each step shall have a "waiting time" implying that the subsequent step would not be executed unless the specified time elapses. A monitoring time shall also be defined as the maximum time required in executing the commands of any step and the time required for appearance of check back signals. In case, this is not completed within the specified time, a message shall be displayed and program will not proceed further.

(d.) Manual intervention shall be possible at any stage of operation and the sequence control shall be able to continue at the correct point in the program on return to automatic control. Protection commands shall have priority over manual commands, and manual commands shall prevail over auto commands.

(e.) Open or close priority shall be selectable for each drive.

(f.) The sequence startup mode shall be of the following types.

i) Automatic Mode

ii) Semi-Automatic Mode

iii) Operator Guide Mode/Test Mode

4.02.06 For the drives, the command shall be provided through O/P module to the coupling relays in MCC/SWGR/Actuator/Relay Cabinets as applicable and inputs (status, SWGR & process) shall be acquired through input modules. Redundancy in drive outputs shall be provided for drives, as quantified in Part-A). The failure of one of the redundant, output module shall in no way affect the function of the other output module, wherever redundancy is provided.

4.02.07 The output modules shall have the feature that ensures that in case of failure, all the outputs are driven to zero. The 24V DC command outputs to drives for ON/OPEN, OFF/CLOSE shall be separate and independent and inverted outputs shall not be employed. Live +24V DC outputs shall be provided to MCC/SWGR/ actuator as applicable when command is to be issued. Keeping +24V DC extended to the relays for these outputs continuously & extending

ground/negative when command is to be issued, is not acceptable except some of the auxiliary plants as to be decided during detailed Engineering.

4.02.08 For inching type of drives, position transmitter power supply and monitoring of position transmitter signal shall be provided.

4.02.09 The sequence interlock & protection requirements shall be finalised during detailed engineering and the same shall be subject to Employer's approval.

4.02.10 The drive function i.e. basic interlock & protection logic of the drive shall be implemented in redundant controllers. The drive function shall ensure that protection signals for the safety of the drive shall be effective under all conditions and under all modes of operation. The different commands shall be performed according to the priority of protection 'Off', Protection 'On', manual and automatic. The standard functions like running time monitoring, status signaling, alarm/drive annunciation, etc. shall be performed in drive function. The drive function shall prevent hunting of the actuator in the presence of both open & close commands for actuators of the valves & dampers. The drive function shall be implemented in dedicated standard software functional block (drive macros).

4.02.11 It shall be possible to control all common system drives (i.e. common for more than one units), from all or some of the units.

4.03.00 **Modulating Controls/Closed Loop Control System (CLCS) Functions**

4.03.01 This Clause is applicable for all analog controls of DDCMIS.

4.03.02 The CLCS shall continuously act on valves, dampers or other mechanical modulating devices such as hydraulic couplings etc., which alter the plant operation conditions. The system shall be designed to give stable control action in steady state condition and for load changes in step/ramp over the load range of 60% to 100% MCR. The system shall have the following minimum features :

4.03.03 The controller capability shall, as a minimum, include (i) P, PI, PD and PID control functions and their variations (ii) cascade control (iii) feed forward control (iv) On-Off control, (v) Ratio and bias control, (vi) Logical operation. Other advanced control strategy like adaptive & predictive control etc. can be considered for important loops like Furnace Draft, combustion control, FW flow control etc. in addition to SH/RH temperature control.

4.03.04 The control loop shall have enough flexibility and various features to perform feed forward, balancing of controller, increasing the response to achieve the desired process parameter within prescribed time frame.

4.03.05 The control system shall be bumplessly transferred to manual on the conditions of Control power supply failure, Failure of redundant controllers, Field input signal not available, Analog input and / or deviation exceeding preset value, etc. as a minimum and as finalised during detailed engineering.

4.03.06 Any switch over from auto to manual, manual to auto and switchover from OWS operation to H/A station operation and vice versa shall be bumpless and without resulting in any change

in the plant regulations and the same shall be reported to the operator and recorded automatically.

4.03.07 Analog output (positioning signal) of 4-20mADC shall be provided from CLCS to the respective microprocessor based positioner E/P converters / electrical actuators as applicable. Redundancy in drive outputs shall be provided for drives as quantified in Part-A. The failure of one of the redundant, output module shall in no way affect the function of the other output module, wherever redundancy is provided. CLCS shall also provide all the necessary outputs for indicators and other devices as specified in Part-A with output loop resistance of 500 ohms for each channel of the output module.

4.03.08 The System being supplied shall be such that when permissible limits are exceeded, an automatic switchover from an operation governed by maximum efficiency, to an operation governed by safety and availability is affected.

4.03.09 For safety reasons, switchover logics associated with the modulating control loops shall be performed within the same controller. Modulating control loops shall be provided with standard features to interface overriding commands from OLCS/SG/TG Protection System like open, protection open etc.

4.03.10 All controllers shall be freely configurable with respect to requisite control algorithms.

## 5.00.00 HUMAN-MACHINE INTERFACE AND PLANT INFORMATION SYSTEM (HMIPIS) REQUIREMENTS

### 5.01.00 Operator interface to the Control System

5.01.01 The following functions shall be provided as a minimum:

All OWS of the HMIPIS shall be fully interchangeable i.e. all operator functions including control, monitoring and operation of any plant area or drive shall be possible from any of the OWS at any point of time without the necessity of any action like downloading of additional files.

5.01.02 Further, simultaneous operation (availability of popup window/faceplate) of multiple drives of control system shall be possible from a single display.

5.01.03 The system shall have built-in safety features that will allow/disallow certain functions and entry fields within a function to be under password control to protect against inadvertent and unauthorised use of these functions. Assignment of allowable functions and entry fields shall be on the basis of user profile. The system security shall contain various user levels with specific rights which shall be as finalized by the Employer during detailed engineering. However, no. of user levels, no. of users in a level and rights for each level shall be changeable by the programmer (Administrator). The users created for a particular user level shall be specific to a DDCMIS. Hence, a user of one DDCMIS shall not be able to exercise the same privileges in other DDCMIS(s). The rights of each user shall contain two types of privileges as follows :-

a) Privileges for the DDCMIS

b) Privileges for the Operating System features.

5.01.04 Typically following user levels shall be available:

a) Operator

b) Supervisor

c) Maintenance Engineer

d) Programmer

e) Shift Incharge/Station Incharge/other Monitoring Users.

5.01.05 The system shall have functionality to configure view only privilege of any sub-system from HMI of any other sub-system. In case Cross HMI operation is applicable as per Part-A, it shall be possible to enable/disable operation of any valve or drive or area belonging to any sub-system from the HMI of any other sub-systems by a supervisory command through station LAN. Such control shall be based on a pre-engineered list and as per pre-predefined priority hierarchy. In case, cross HMI operation privilege is not available for a particular drive/area and still an operation is attempted for the drive/area then a suitable regret message should be displayed in HMI to the operator. It shall be possible to modify the list at site under Maintenance Engineers/ Administrator's right.

The Contractor shall implement all necessary logics & selection facility in Control System/HMIPIS for the same with safeguard to prevent multiple operations simultaneously. Status & other signals related to the drive and the selection by any other user shall be made available to other users.

5.02.00 The following functions shall be provided:

a) Calculations: Basic calculations like time of max./min., number of transgression of a point in a band etc. shall be provided. Same can be implemented in control system also. These calculated points shall be capable of being assigned to any functions like any other scanned point.

b) Displays such as mimics, bar chart displays, X-t plots with various update rates using the data from historian, X-Y plots (with superimposed operating curves).

c) Control related displays like faceplates for different types of drives, sequence displays, drive level displays (pop-ups giving details of auto/ protection/ permissive condition/ faults), control type display (giving details of A/M selection, tagout / maintenance mode, process value, set point, deviation, command output, position feedback etc). Further, CLCS displays giving the single line diagram of the control loop shall be provided.

d) System status displays: This will provide an indication of the faults in a graphical form.

5.02.01 **OWS Annunciation Display**

The OWS annunciation will replicate in software the salient features of conventional hardware annunciations facia (for permanent viewing i.e., not operator changeable) while presenting more flexibility. This annunciation shall include both the process alarms as well as system alarms. The top area of the OWS (around 20-25%), shall be reserved for these display.

The annunciation system shall be implemented as an in-built function of DDCMIS. The field contacts shall be acquired through DDCMIS only. The annunciation points will be presented on topmost area of mimics display. The annunciation area will be divided in three (3) “alarm bands”. The annunciation sequence shall be as discussed and finalized during detailed engineering.

Bidder shall implement the annunciation functionality as described below as a minimum.

There will be one alarm for each alarm window. Grouped alarms shall be provided only for pre-defined system / field faults like non-coincidence, monitoring etc. The alarm text is to be displayed only when that alarm is present. A “tool-tip” will be associated with each alarm window, which will show tag no. of alarm point when cursor is brought over alarm window.

Hooters/Speakers of different audio types shall be available for reporting new alarms and resetting of alarms (corresponding to slow flash) etc shall be available. All flashing windows shall flash together (synchronized) in any screen. Suitable means shall be provided to distinguish new alarms and return to normal messages.

Annunciation points shall be distributed on various stations based on process area. That is, each annunciation point will be assigned screen no.(s) and an alarm band no. A particular point can be assigned more than one station also.

No fixed space will be reserved for any alarm on any of the band. Once a particular alarm band is full, the new alarm in that band will be reported by automatic shifting of the older alarm(s) on left side of band one by one in FIFO fashion. Scroll buttons shall be provided on both the sides to view the alarms in a particular band after the particular band is full.

The scroll button will fast flash when scrolled alarms are fast flashing, will slow flash when alarms are slow flashing and will be steady when alarms are steady. When scrolled alarms are of mixed type, the scroll bar will flash with highest flashing rate of scrolled alarms.

When operator right clicks on alarm area, he will get a menu with following options (i) acknowledge all- to acknowledge all new alarm(s) (ii) reset all- to reset all alarm(s) returning to normal (iii) acknowledge point- to acknowledge the particular point in alarm (iv) reset- to reset the particular point in alarm (v) Root Cause – To link to Alarm Analysis result for that particular tag (vi) “configuration utility”- to view and edit alarm list, tag nos., etc of all points in all stations (vii) closing the annunciation display. This menu can be dragged & placed anywhere on station screen. The actions (i), (ii), (iii), (iv) and (v) can be done by operator but action (vi) & (vii) will be permitted only to Programmer. The hooter sounds will be different for each of the Unit of power plant, when there is common control room for multiple Units.

Bidder shall provide suitable “configuration utility” for viewing and modifying list of all alarms (process and system) to be displayed on all annunciation area, band color, text color, flashing color and frequency, font, etc.

5.02.02 Facility of separate individual pop-up window for 30 critical alarms (to be decided during detail engineering) over the active mimic display, in OWS is to be provided. The pop-up window should require operator intervention to close. Pop-up window of one critical alarm should not overlap with any other critical alarm pop-up. The size of the pop-up window, colour of description and size of font shall be decided during detail engineering.

5.03.00 Facility of time activated logs ( Daily & Shift logs), event activated logs ( Post trip log) shall be provided. At any point of time, log/ report can be demanded by operator. Maintenance data log shall be provided for total running timer & other maintenance related statistics. This shall also include standby running hours.

5.04.00 **Historical storage and retrieval system (HSRS)**

Complete HSRS functionality shall be implemented in server/information work station (Please refer Part-A for redundancy requirements). The data shall be saved online on hard disk and transferred to the portable storage device like DVD periodically for long term storage. Provision shall be made to notify the operator when the portable disk is required to be replaced with a fresh disk. The Hard disk capacity shall be sufficient to store at least One(1) year data Suitable facility for retrieval of data shall also be provided.

The data to be stored in the above system shall include alarm and event list, periodic plant data (tags computed in control system as well as computed in HMIPIS) including data required for Residual life assessment, logs/reports etc. The data/information to be stored & frequency of storage and retrieval shall be as finalized during detailed engineering.

**6.00.00 PROGRAMMER'S STATION (PROGRAM DEVELOPMENT/ MODIFICATION, SYSTEM MAINTENANCE AND DOCUMENTATION FACILITY)**

6.01.01 The structuring/configuration/modification of Control loops/logics in Control system and program development/modification in HMIPIS shall be possible from fully graphic displays using familiar & conventional functional blocks.

6.01.02 Any modification done in Control System and HMIPIS shall be suitably logged so that it can be traced to the user log-in ID and time of change.

6.02.00 **Control system structuring/configuration/tuning facilities**

6.02.01 Structuring/configuring and tuning facilities shall be provided for structuring/ modification, storing/loading, testing, tuning, monitoring, etc. of all the microprocessor-based controllers of the control system.

6.02.02 It shall be possible to configure the system with ease without any special knowledge of programming or high level languages.

6.02.03 On-line tuning of the control loops shall be possible without causing any disturbance in the execution of the control loops. Provision to store and retrieve on immediate and long term basis the system configuration, data base etc. on some device such as floppy disk shall be included. Facility shall be provided to reload/down-load the system or controller module from the already stored data, on-line.

6.02.04 Facility for modification shall be user-friendly. For example, modification of logics/loops etc., zooming for better display, stretching etc. should be possible. It shall be possible to add/modify, delete blocks in logics/loops on-line

6.03.00 **System Documentation Facility**

6.03.01 The system shall have the facility to generate the associated documentation for both the Control System & HMIPIS with all required software and hardware tools for viewing and printing drawings and documents..

**7.00.00 DATA COMMUNICATION SYSTEM (DCS)**

7.01.00 The Data Communication System shall include a redundant System Bus for major subsystems with hot back-up. Other applicable bus systems like cubicle bus, local bus, I/O bus etc shall be redundant except for backplane buses which can be non-redundant. The system shall have the following minimum features:

7.01.01 Redundant communication controllers shall be provided to handle the communication between each functional group of controllers of Control System and the System Bus.

7.01.02 Failure of one bus and changeover to the standby system bus shall be automatic and completely bumpless.

7.01.03 The following buses shall be fiber-optic only.

(a) System bus from locally mounted control system cabinets/OWS to central location.

(b) I/O Bus from remote I/Os to centrally located system cabinets.

7.01.04 The redundant buses shall be physically separate and shall be routed separately.

## 8.00.00 POWER SUPPLY, GROUNDING, CABINET/PANELS, ETC.

### 8.01.01 Power Supply

8.01.02 Contractor shall provide totally reliable & quality power supply for DDCMIS.

8.01.03 Wherever hot backup or redundant equipment likes controllers, processors, I/O modules, etc. have been specified and provided, the same shall be powered through separate power supply feeders.

### 8.02.00 Grounding

All panels, desks, cabinets shall be provided with a continuous bare copper ground bus, bolted to the panel structure on bottom on both sides. The bolts shall face inside of panels.

Further, for connection of shields of the field instrumentation cables, a separate shield bus independent of the ground bus shall be provided, which shall be connected to the earth risers by means of independent cables.

### 8.03.00 System Cabinets/Panels

8.03.01 All DDCMIS system modules, power supply components, other control devices (except field mounted sensors/transmitters) which are required for completeness of the system shall be housed in cabinets furnished by the Contractor. All equipment and dedicated cabinets required for termination, marshalling and proper interface within Contractor’s system and also with other systems shall also be provided by the Contractor.

8.03.02 The cabinet mounted equipments shall be fully assembled, installed in mounting racks, wired and fully tested as per specification requirements and Employer approved drawings in the

manufacturing works of a qualified manufacturer prior to shipment to the project site. The Contractor shall ensure that the cabinets are complete and ready for installation before dispatch from manufacturing works. The installation work at project site for these cabinets should only involve connections through multi pair cables from marshalling cabinets (wherever provided) to system cabinets and inter-cabinet/cabinet to Control Desk/UCP.

8.03.03 The DDCMIS cabinets shall be grouped into physically separate cabinets as follows:

(a.) Control System Cabinets

(b.) Marshalling cabinets

(c.) Relay cabinets

(d.) HMIPIS cabinets

However, in case Bidder’s system design requires the termination cabinet independent from system cabinet, the marshalling cabinets can be combined with the termination cabinet. In case, the termination arrangement is part of the system cabinet, independent marshalling cabinets shall be provided. The HMIPIS cabinets can be clubbed with Control System Cabinets for small areas where only 24V dc power supply is used.

Contractor may make a special note that termination of field cables directly to control system cabinet is not acceptable.

8.03.04 Hardware like network components, power supply distribution etc. shall be suitably housed in cabinets/enclosures. In network cabinets suitable arrangements shall be provided to ensure that the network components are visible in door closed condition (e.g. Glass doors etc), as approved by Employer

8.03.05 Relay cabinets (or marshalling / termination cabinet cum relay cabinets, as the case may be) shall house all the interfacing relays in the system.

8.03.06 **Marshalling**

All the incoming / outgoing signals shall be grouped as per their origin / destination and will be terminated in the marshalling cabinets (or marshalling cum termination cabinet as the case may be). The grouping of these signals shall be subject to Employer's approval. The Contractor may make a special note that termination of field cables directly to the system cabinet (whether on TBs or on the pins on I/O modules) is not at all acceptable.

System cabinet(s) and corresponding marshalling and termination cabinet(s) shall be a single shipping section, so that the internal wiring from field terminal to the module is done completely at the factory itself.

The system cabinets shall be furnished with side panels even within a shipping section.

8.03.07 Contractor shall design the cabinet internal arrangement, floor cutout and cable gland plate such that all the cables entering or leaving the cabinet can be properly glanded in the gland

plate. In case, glanding is not possible Contractor shall indicate in his proposal his suggested procedure for cable entry and securing the cable at place.

8.03.08 The type of termination and terminal blocks to be used in the relay cum termination/ Field Termination cabinets shall be as per requirements specified under Sub-Section-Inst. Cable. The terminals used for terminating the spare cores/ pairs of field cables shall not be employed for terminating the spare channels of I/O modules/ FTMs. The following are the guidelines for termination:

a. 8 level cage clamp type of termination block shall be used in marshalling/ termination panel

b. Minimum 4 pair Instrumentation Cables shall be used for connection between field/JB and DDCMIS marshalling cabinet and all the cores of 4 pairs or its multiples to be terminated in the marshalling panel (including spare cores) sequentially as per color coding philosophy indicated in the corresponding Tender Drawing. When more than 4 pair cable is used, the same is to be terminated in consecutive marshalling posts. No core/ bundle shall be left un terminated in the marshalling panel.

c. In MFT and Turbine protection and governing system, Contractor’s standard and proven practice for cable type and cable termination scheme shall also be acceptable.

8.03.09 The protection class of cabinets and environmental rating shall be as defined in Basic Design Criteria. The Contractor shall ensure that the packaging density of equipment in these cabinets is not excessive and abnormal temperature rise, above the cabinet temperature during normal operation or air-conditioning failure, is prevented by careful design. Temperature rise inside cabinet shall not be more than 10 deg C with respect to ambient temperature in any condition. Dual blowers/fan with blower/fan failure alarm shall be provided in each cabinet with proper enclosure. Suitable louvers with wire mesh shall be provided on the cabinet. Contractor shall furnish detailed calculation of heat dissipation of various components housed in the cabinet like power supply, controller, I/O cards etc., cooling fans/ blower capacity and component density in cabinets, during detailed engineering to ensure that temperature rise is limited as specified above. Further, temperature sensor (RTD) shall be provided in each system cabinet to monitor temperature inside cabinet and suitable alarms shall be configured to indicate high temperature inside the cabinet.

8.03.10 The cabinets shall be totally enclosed, free standing type and shall be constructed with minimum 2 mm thick steel plate frame and 1.6 mm thick CRCA steel sheet or as per supplier's standard practice for similar applications, preferred height of the cabinet is 2200 mm. The cabinets shall be equipped with full height front and rear doors. The floor mounting arrangement for other cabinets shall be as required by the Employer and shall be furnished by the Contractor during detailed engineering.

8.03.11 Front and rear doors shall be provided with locking arrangements with a master key for all cabinets. If width of a cabinet is 600 mm or above, double doors shall be provided.

8.03.12 Two spray coats of inhibitive epoxy primer-surface shall be applied to all exterior and interior surfaces. A minimum of 2 spray coats of final finish color shall be applied to all surfaces. The final finished thickness of paint film on steel shall not be less than 65-75 micron for sheet thickness of 2 mm and 50 microns for sheet thickness of 1.6 mm. As an alternative, single

coat of anodic dip coat primer along with single textured powder coating with epoxy polyester meeting the thickness requirement is also acceptable.

The Bidder shall furnish sufficient touch-up paint for one complete finish coat on all exterior factory applied painted surface of each item of equipment.

The finish colors for exterior and interior surfaces shall conform to following shades:

Front & Rear-RAL 9002; End panel side- RAL 5012. Internal color shall be same as external color.

Paint films which show sags, checks or other imperfections shall not be acceptable.

8.03.13 Cabinets shall be designed for a grounded installation on the building structure. Any isolation from the building ground which is required by equipment design shall be provided internal to the cabinet.

8.03.14 All alarm contacts located within cabinets as well as inputs/outputs from other related system shall be suitably terminated in the cabinets.

8.03.15 The Contractor may submit details of his standard wiring practice for similar application for consideration and approval of Employer.

8.04.00 **Relays**

8.04.01 All the relays provided by Contractor shall be suitable for control supply of 24V DC. Each relay shall have 2 changeover type contacts & the rating of contacts shall be 5 Amp at 240V AC & 0.2A at 220V DC. The VA burden of relays shall be suitable to match the capacity of output modules (however, it shall not be more than 2.5 VA). Each relay shall be provided with a freewheeling diode. The relays shall be mounted in relay cabinets except for cases where number of relays is vey less . In the cases where the number of relays is very less, the same can be mounted in termination / marshalling cabinets. All the contacts of relays shall be wired upto the cabinet terminal blocks.

## 9.00.00 SYSTEM SOFTWARE REQUIREMENTS

9.01.00 The Contractor shall provide all licensed software packages required by the system for meeting the intent, functional and parametric and performance requirements of the specification.

9.02.00 All licenses shall be valid for the continuous service life of the plant. The software licenses shall be provided for the project (e.g. organisation or site license) and shall not be hardware/machine-specific, except the operating system licenses, in the event of non-machine specific license not being supported by the operating system supplier. Necessary documentary evidence to establish the same shall be submitted by the DDCMIS supplier

9.03.00 As a customer support, the Contractor shall periodically inform and upgrade the Anti-Virus / IPS/IDS software of the workstations/servers/switches/firewall till completion of the warranty period.

9.04.00 DDCMIS supplier to qualify operating system patches/ service packs and software patches of other third party software (like Office, Adobe etc as applicable, except antivirus and IPS/IDS) for use on its system during the continuous service life of the plant, subject to availability of the same by the manufacturer of the software.

9.05.00 DDCMIS supplier should periodically inform and provide software patches for all DDCMIS software till continuous service life of the plant.

**10.00.00 SYSTEM DOCUMENTATION**

The Contractor shall furnish detailed system and equipment documentation. It shall include detailed system and components description covering the installation, operation, care and maintenance of all system components. All final system documentation for DDCMIS hardware and related software shall be furnished. The same shall be complete, accurate and fully representative of the supplied system and its elements. All documentation/catalogues etc., shall be furnished in English language. In addition to the hard copies, CD ROM based documentation system shall also be provided. The same should be compatible to the On-line document generation facility indicated above.

10.01.00 **Hardware documentation**

10.01.01 Detailed technical literature, reference manuals, user's guide/manuals for the complete hardware like control system hardware, HMIPIS hardware, I/O hardware, bulk memory units, peripherals and their controllers, communication hardware including controllers, man-machine interfaces programmers unit, power supply modules etc., shall be furnished by the Bidder.

10.01.02 **Operation and Maintenance manuals**

The operation and maintenance manuals shall include all information required for trouble shooting, repair and maintenance information regarding all equipments furnished for the completeness of the system. For details refer Part-C, General Technical Requirements.

10.02.00 **Software Documentation And Software Listings**

10.02.01 All technical manuals, reference manuals, user's guide etc., in English required for modification/editing/addition/deletion of features in the software of the DDCMIS shall be furnished. The Bidder shall furnish a comprehensive list of all system/application software documentation after system finalisation for Employer's review and approval.

10.02.02 The software listings shall be submitted by the Bidder for source code of project specific application software and all special-to-project data files

**11.00.00 NOT USED**

**12.00.00 WARRANTY**

12.01.00 The Bidder shall provide an unlimited warranty on all equipment and software during the Defect liability period. This warranty shall include repair, replacement or correction of identified software or hardware discrepancies at no cost to Employer.

12.02.00 NOT USED.

12.03.00 The Bidder shall provide warranty spares and an exhaustive list of warranty spares including components for system hardware and instrumentation and peripherals based on (and keeping adequate margin over) normally experienced failure rate shall be submitted by the Bidder for Employer's review regarding adequacy of the same. The warranty spares as per the list mentioned above will be dispatched by the Bidder along with the main equipment consignment. The Bidder shall also provide expandable items for the warranty period. This shall include printer ribbon, ink/tonner cartridge print head etc. Excluding floppy disk, M.O. Disk, tape cartridge and paper. Unused spare/consumable shall be contractor’s property and taken back.

12.04.00 In case of any hardware failure which hampers normal operation, the Bidder during the warranty period must provide on-site technical expertise to repair/rectify the problem within a week and if any component is not available at site, the Bidder must arrange to supply these components at site within additional 48 hours. If a software problem is identified, this problem shall be corrected within two weeks.

12.05.00 After six months of DDCMIS operation the Bidder shall provide the list of parts and expendables utilized for the period. The same information will be provided at the conclusion of the warranty.

12.06.00 In order to discharge the warranty responsibility, the bidder shall include in his proposal lumpsum price for the provisions of a team of service personnel at Site who will be fully qualified to perform the required duties throughout the warranty period of one year. The Bidder shall deploy at least one engineer, one supervisor and two technicians in the team. The Employer shall approve the exact nos. & composition of team members. In case, the team is unable to rectify hardware or software problems, the Bidder shall depute and/or station additional specialist to rectify the problem to ensure 99.7% availability of system. The availability of system shall be calculated as per Sub-section-IV, Part-A, Section-VI of specifications.

**13.00.00 ANNUAL MAINTENANCE CONTRACT (AMC)**

13.01.00 The Bidder shall provide maintenance services of complete DDCMIS System under a comprehensive Annual Maintenance Contract (AMC) for period of Three years after Warranty period.

13.02.00 The AMC shall cover total maintenance of all hardware & software coming under the scope of DDCMIS and shall include free repair/replacement of all cards/ modules/ peripherals/ cables/ components etc., correction of software problems and supply of expendable items. The Bidder shall ensure 99.7% availability of the system with the AMC. For that purpose, contractor may maintain adequate no. of staff at site as per his own assessment if considered necessary to ensure availability.

13.03.00 Further, Bidder may note that during the AMC he will be allowed to use Employer's mandatory spares and has to replenish the same within three months time or before completion of AMC period whichever is earlier. However, if in the opinion of the Bidder, more

spares than those included in the mandatory spare list are required to meet the availability requirement, then Bidder shall stock the same.

13.04.00 The Bidder shall prepare detailed list of faults corrected and parts, expendables utilised during AMC period and shall furnish the same to Employer, properly documented at the end of AMC period. Further, during AMC period the details as required by Employer/ Project Manager shall be made available by Bidder's personnel.

**14.00.00 REMOTE SERVICE CENTRE**

Bidder shall provide the necessary hardware & software required for connecting the DDCMIS system to Bidder's remote service centre, through which the diagnostics & fault analysis of the DDCMIS system can be carried out. This shall include the control system and HMI, however the diagnostic of bought out items like LAN switches, etc are excluded. The method of connection shall be as per Bidder's standard practice. However, it is preferred to have the connection through a single point in the FGD DDCMIS system. The fixed charges & running cost till warranty period shall be included in the Quoted Price. The running cost thereafter shall be included in the AMC price. Connection for Remote access to the DDCMIS for diagnostics shall be through firewall. Virtual Private Networks(VPN) technology shall be used for data integrity and confidentiality. The type of VPN (SSL,IP Sec, SSL) ,no. of bits for encryption etc shall decided during detailed engineering. Further, this access shall be strictly under request control & record of such access shall be made available to the Employer’s designated personnel. Also, it should be ensured that the hardware at the other end of the Remote access connection (i.e. at the contractor’s works) shall be standalone/isolated (i.e. not connected to any network).

**15.00.00 TESTING AND COMMISSIONING TOOL**

The testing and commissioning tool is intended to be used for test operation of any drive in absence of DDCMIS during initial commissioning (e.g. fan trial run, etc.) While the tool shall be used for all type of drives envisaged in the specification, it is designed to be operated for one drive at a time. Portable trolley mounted system completed with necessary hardware for operating the drives and monitoring its parameter shall be supplied.

**1.00.00 Requirements for HMI Hardware (Refer sub section- scope of supply & services for applicability of this annexure)**

1.01.00 HMIPIS Hardware

1.01.01 All the peripherals shall conform to the following minimum requirement but the exact make & model shall be as approved by Employer during detailed engineering.

1.01.02 The Servers/Worstations/PCs/Laptop to be provided by the Contractor should be latest available in the market at the time of supply to prevent early obsolescence and shall be subject to Employer's approval. The software packages to be included with the PCs shall also be the latest version available at the time of supply.

1.01.03 The actual size of the Main and Bulk Memory shall be sufficient to meet the functional and parametric requirements as specified with 25% additional working memory and 50% additional bulk memory over and above the memory capacity required for system implementation.

1.01.04 Power Fail Auto Restart (PFAR) facility with automatic time update shall be provided.

1.01.05 For Servers and Historians / Station LAN Server/ Programming station/NMS Server the hardware shall conform to the following minimum requirements:

HARDWARE REQUIREMENTS

1. Min three no. redundant; hot swappable; Hard Disk with RAID 5 implementation. Usable Hard disk capacity shall be sufficient for the application and to store at least one (1) year historical data, wherever required.

2. Redundant Hot swappable Power supply

3. Quantity of Monitor, Keyboard and Mouse (as indicated in Part-A, appendix) has to be supplied in total for the stations placed in Programmer room of Unit Area. For all other stations Monitor Keyboard and mouse are provided as per Bidder's standard Practice.

4. One intelligent SNMP manageable mini-UPS (online) for 30 minutes backup shall be provided, with all accessories and software for remote monitoring facility, with each station.

5. Additional external graphics card with dual output ports (apart from onboard graphics card) suitable to display full HD resolution in Programmer room.

SOFTWARE REQUIREMENTS

1. Application software as per the functional requirement.

2. Anti-Virus Software with IPS#

# if anti-virus software cannot be provided as per standard practice of the DCS OEM suitable mitigating controls like whitelisting to be provided.

1.01.06 For Operator workstations/ Other workstations/ Documentation station (in case not part of prog. Stn.)

HARDWARE REQUIREMENTS

1. Standard Hardware as recommended by the Bidder shall be acceptable.

2. Individual Monitors shall be supplied for all stations (except LVS OWS)

3. Additional external graphics card with dual output ports (apart from onboard graphics card) suitable to display full HD resolution in control room.

SOFTWARE REQUIREMENTS

1. Application software as per the functional requirement.

2. Anti-Virus Software with IPS#

# if anti-virus software cannot be provided as per standard practice of the DCS OEM suitable mitigating controls like whitelisting to be provided.

1.01.07 For PC Station

HARDWARE REQUIREMENTS

1. Standard Hardware as recommended by the Contractor shall be acceptable.

2. One intelligent SNMP manageable mini-UPS (online) for 30 minutes backup shall be provided, with all accessories and software for remote monitoring facility, with each PC Station.

SOFTWARE REQUIREMENTS

1. Application software as per functional requirement

2. Latest MS OFFICE (Word, Excel, PowerPoint, Outlook)

3. Microsoft Visual Studio (only for Programmer PC)

4. Adobe Acrobat

5. Anti-Virus Software with IPS#

# if anti-virus software cannot be provided as per standard practice of the DCS OEM suitable mitigating controls like whitelisting to be provided.

1.01.08 Specification for Lap-Top (Note-Book) PC

The screen size of the laptops should be 15 – 17 inches.

All the Laptop will also be used as pluggable temporary programmer's station and operator station functionalities of the programming stations mentioned in the specifications shall be provided (including requisite license).

**1.01.09 Not used**

**1.01.10 Not used**

**1.01.11 Printers**

| Sr. No | Features | Colour Laser Printer | Colour Laser Printer | Line Impact Dot Matrix Printer |
|---|---|---|---|---|
| 1 | Paper Size | A3 | A4 | 132 column continuous fan fold type |
| 2 | Printing Speed (min.)- in normal mode for A4 size paper | 6 ppm (Color)<br>24 ppm (B&W) | 4 ppm (color)<br>16 ppm (B&W) | 1000 LPM |
| 3 | Type | Heavy duty, at least 50000 pages/month | Heavy duty, at least 30000 pages/month | Heavy duty, at least 50000 pages/month |
| 4 | Resolution (black) (min.) | 600 dpi | 600 dpi | - |
| 5 | First page out time (with full graphic display) | =<1 min for color,<br><45 sec for BW | =<1 min for color,<br><45 sec for BW | |
| 6 | Paper input capacity (min.) | 500 sheets | 500 sheets | Continuous paper feed |
| 7 | Additional features | Automatic Duplex Printing | | With printer Stand & sound proof enclosure (<60 dB) |
| 8 | Additional Cartridge/toner/ ribbon of each type as used in printer with each printer | 1 | 1 | 100 |

1.01.12 Switches :

Layer-3 switches shall have the following features:

- Minimum 15 nos. Fiber Gigabit Ethernet Port. 20% spare ports are to be provided over and above the total ports used
- 10/100/1000 Base TX ports (STP) as per requirement with 20% spare
- SNMP v1, v2, v3, RMON, VLAN, Multi link Trunk support (IEEE 802.3ad – Link Aggregation)
- Broadcast/multicast storm control
- Non-Blocking wire speed
- Hot swappable dual redundant Power Supply
- RIP, OSPF, BGP
- VRRP
- PIM and DVMRP Multicast Routing
- IPV4and IPV6 ready
- Support MACsec in hardware (IEEE 802.1AE)
- 10 GB module support for future upgradeability

Expandability/stackability through a dedicated high speed expansion port.

Routable, remotely manageable, configurable.

One intelligent SNMP manageable mini-UPS for 30 minutes backup shall be provided with all accessories and software.

Secondary switches shall have the following features:

- 10/100/1000 Base TX ports (STP) as per requirement with 20% spare
- Gigabit Ethernet Port as per requirement with 20% spare
- SNMP, RMON, VLAN, Multi link Trunk support.
- Support for stacking with high throughput
- Broadcast/multicast storm control

1.01.13 Firewall :

Firewall appliance should facilitate multi-vendor, multi-application environment and should support third-party products on open alliance. It should support Active-Active configuration.

- The firewall should contain following features:

  (a) Stateful inspection of packets.

  (b) NAT functionality, including dynamic and static NAT translations

  (c) Latest version of SNMP

- The firewall must send log information to a separate log server via an encrypted connection. Firewall logging must not impact firewall performance.

- Remote network access to the firewall should only be possible through the administration interface.

Firewall should also meet the following requirements.

- The firewall must not support any unencrypted means of access to the firewall.

- It should Monitors ALL network traffic-traffic at Firewalls (Internet and external networks), in the DMZ and detect known threat through deep packet inspection.

- Detects unknown threats via anomaly scanning.

- Detect unknown threats via behavior pattern to protect from zero day attacks.

- Keeps up-to-date on new threats and vulnerabilities.

1.01.14 IPS/ IDS Features :

In order to inspect all inbound and outbound network activity and identify suspicious patterns that may indicate a network or system attack from someone attempting to break into or compromise a system on the NTPC Station LAN Network, the IDS/IPS will be provided as per the Station LAN configuration.

1.01.15 Network Management Software (NMS) :

The network management software should contain the below mentioned features.

- Graphical user interface (GUI) management.

- Automated discovery and display of Ethernet topology and devices.

- Monitor traffic flow through the device

- View a device image indicating which ports are active and which modules are installed. It a particular network device is down, it should give the tools like ping/telnet options in the same screen to further diagnose the problem.

- Real-time activity and utilization statistics and graphical trends.

- Facility of providing pre-defined actions like e-mail, SMS etc. upon any event generated in the network.

- Facility of viewing logical graphs of devices like routers, web servers, according to the needs.
- The following parameters should be monitored.
  - Device status
  - Port Status
  - CPU utilization
  - Memory Utilization
  - All port utilization including uplink ports.

  For monitoring the parameters mentioned above, the NMS workstation should be connected to all HMIPIS switches/firewalls through management LAN which is a separate LAN from the redundant Station LAN.

**Security Policies/Procedures and Security Audits** :

In order to enforce network security in the Station LAN & the HMI of all DDCMIS, security policies and procedures are to be followed by the Contractor during the tenure of the Contract & by Employer's site personnel thereafter.

For checking compliance to the above security policies & procedures ,periodic security audit by a certified auditor (as per CERT-IN panel or CERT of country of origin of DDCMIS supplier)) is to be arranged by the Contractor during ATST, at the time of trial operation/PG test of C&I package and every year during AMC period. This shall include vulnerability assessment of the workstations/ servers and penetration testing of the Station LAN through the firewall from a node outside the network. Suitable actions based on the findings of the security audit shall be carried out by the Contractor.

These security policies/procedures envisages formation of an Information Security team which shall comprise of vendor's personnel deputed at site during tenure of the contract and NTPC personnel thereafter. All the responsibilities of information security team have to be discharged by vendor's team during tenure of the contract and NTPC team thereafter. Even though different roles have been identified for the individual members of the information security team more than one role can be performed by the same person. It may be noted that following policies/procedures are only the operation guidelines and advisory steps to ensure maximum data security.

The following security policies shall be followed. Details of the same shall be provided during detailed engg.

1. Information Security Policy
a) Information Security Team Policy
b) Firewall Policy
c) Information Identification and Classification Policy
d) Security Policy Review Policy
e) Information Labeling and Handling Policy
f) System Planning and Acceptance Policy
g) Capacity Management Policy
h) Media Handling Policy
i) Information Security Awareness Policy
j) Third Party Access Policy
k) Change Control Policy
l) Anti Virus Policy
m) System Access Policy
n) Monitoring Policy
o) Incident Handling Policy
p) Information Backup and Restoration Policy
q) Network Access Policy
r) User Access Management Policy

## 1.00.00 GENEREAL REQUIREMENTS FOR FIELDBUS INSTRUMENTS AND ACTUATORS

This section provides the basic guidelines for the design and implementation of Fieldbus (Foundation Field Bus/ Profibus) based control system.

1.01.00 The requirements given herein are minimum requirements to be considered by Contractor to ensure uniformity in basic design and shall not be considered as final requirements. The Fieldbus design shall be further validated by contractor and approved by Employer during detailed engineering and any variation/ changes required based on DDCMIS system requirements and actual field installation, operational philosophy etc. shall be considered by contractor without any implications.

1.02.00 The fieldbus segment design shall be finalized and validated based on functional requirements as per:

- Process requirements (P&IDs/ operational requirements).
- Loop response time of different loops device communication time i.e. cycle time for fast and slow loops with scheduled and unscheduled organization as per project.
- Area classification requirements (e.g. hazardous or safe).
- Fieldbus devices specifications (maximum current drawn from bus, block execution speeds, power conditioner suitable for field barrier, etc.)
- Length of segments.
- Instrument location plans with elevation details.
- Host-system documentation showing configuration rules or restrictions.
- For Foundation Fieldbus & Profibus PA chicken foot/ branch/ or combination of both topology shall be provided. For Profibus DP, Bus/ Line topology in Redundant mode shall be provided. That is, for Profibus DP redundant cables connected to redundant ports of devices shall be provided.
  Suitable field bus segment design shall be considered keeping the safety & integrity of the system intact so that the cabling, marshalling, junction boxes and system performance shall be optimized.

However, all such segment device allocation, topology shall be decided during detailed engineering. Any modification shall be carried out by contractor without price implication.

1.03.00 Contractor to provide all standard functional blocks for all Foundation Fieldbus/ Profibus devices as per latest FF/ Profibus version and standard guidelines. Fieldbus components including power supply, terminators, isolators, etc. provided by Contractor shall comply to IEC 61158 and other standard Fieldbus guidelines.

1.04.01 Redundant host/ master card and redundant power supply along with advance diagnostic module shall be provided. All required libraries to execute various tasks like data acquisition, control/protection etc. shall be provided.

1.04.02 In fieldbus system following spare capacity in each FG shall be provided :

| Item | Sub Item | Spare capacity |
|---|---|---|
| Controller | Software Blocks | 30% |
| | Host | 30% |
| Host/ Power supply | Installed spare capacity | 10% |
| Host/ Power supply space | Only spare space | 20% |
| Segment spare capacity | | 40% |

If in a FG, conventional and fieldbus system both are implemented then above spare capacity shall be in proportion to fieldbus/ conventional system implementation.

1.04.03 The contractor shall present complete implementation scheme, including wiring scheme during detailed engineering stage for review and approval by Employer.

1.05.00 Fieldbus cable (specifically used for Foundation Fieldbus/ Profibus PA and Profibus DP) shall be Individually shielded twisted pair, with round steel wired armour (SWA) complying to IEC 61158, Type A. The cable construction shall meet EN 50288-7 standard for physical properties and the outer sheath shall be of PVC-TM53 as per EN 50290-2-22. Continuous operating temperature of Fieldbus cable shall be minimum 90 Deg C.
For laying of fieldbus cables, cable trays envisaged for instrumentation cable with all the accessories shall be used by the contractor. Minimum 300 mm spacing to be kept between the fieldbus trays and other high voltage cables to avoid any interference.
SS Junction boxes specially designed for fieldbus application shall be provided on as required basis. These SS JBs shall house field mounted fieldbus components like distributers, tee, etc. These SS JBs shall have suitable cover and gasket and shall have protection class of IP-66 or better. SS Cable glands and blind plugs shall be provided by the Contractor.

1.06.00 Comprehensive Fieldbus Maintenance and Diagnostic software shall be provided. This software shall be capable of collecting complete diagnostic information from fieldbus network and all fieldbus devices and presenting in user friendly interface for detailed diagnostic and troubleshooting of the system. It shall be possible to completely configure parameters of fieldbus network and fieldbus devices from centralized system through this software. This software shall have feature of providing data related to maintenance of

fieldbus devices as available through fieldbus system. This system/ software shall have provision to get updated to latest version/ release of various fieldbus devices.

1.07.00 During FAT suitable arrangement shall be made by Contractor to test Fieldbus modules including field devices as per approved FAT procedure.

1.08.00 The contractor shall use fieldbus segment design tool / software to design complete network verifying various design parameters like device voltage, total cable length, spur length, system power requirements etc. the contractor shall provide device voltage calculations for all segments, based on calculation in software package. All these calculations shall be handed over during detailed engineering in electronic format in a way that Employer can thoroughly verify design basis/ calculations carried out by Contractor.

1.09.00 Suitable short circuit protection, surge protection, grounding requirements shall be provided for all devices, so that fault in one device shall not impact the availability of other devices in the segment.

1.10.00 All required diagnostic and configuration tools/ hand held devices shall be provided for configuration and troubleshooting of devices and network.

## ELECTRICAL POWER SUPPLY SYSTEM

### 1.00.00 General Requirements

The requirements of Electrical Power Supply system are specified herein on system basis. The Contractor shall be responsible for engineering and furnishing a complete and operational system fully meeting the intent and requirements of this specification including tender drawings and Employer approved drawings during detailed engineering. All equipment and accessories required for completeness of this system shall be furnished by the Contractor whether these are specifically mentioned herein or not. All the equipments and sub systems offered shall be from reputed experienced manufacturers. All system cabinets, enclosures, & distribution boards shall be manufactured, assembled, wired and fully tested as a complete assembly as per the requirements of this specification at the manufacturer's works.

The Contractor shall furnish all required equipment cubicles and wiring required for conversion and/or stabilization of the power sources provided by the Employer to all other levels which may be necessary for meeting the individual requirement of equipment/system furnished by him including the panel/desk mounted equipment.

24 V DC power supply system shall be provided as below:-

**i)** 24V DC power supply system for DDCMIS based control system shall comprise of two sets, each set shall consist of 1 x 100% microprocessor controlled, intelligent, modular rectifier banks, Controller – one for each rectifier bank, 1 x 100% Nickel - Cadmium batteries for one (1) hour duty, 1 X 100% DC distribution board. 1x100% Microprocessor controlled Battery Health Monitoring System (BHMS)–common for both the sets.

Necessary redundant transformers shall be provided by the contractor to derive the power supply from 415V, 3 phase, 3 wire incomers for above.

### 1.01.00 POWER SUPPLY SYSTEM FOR DDCMIS BASED CONTROL PANELS

1.01.01 Microprocessor based, Intelligent, Modular Power Supply.

1.01.02 Microprocessor based, intelligent, modular power supp1y shall be sized to meet connected load requirements and keep the connected battery full charged in Float/ Boost mode. A provision of 10% design margin shall be kept over and above the load requirement. Either of the bank of rectifier modules shall be able to recharge fully discharged battery within 8 hours. It shall also be possible to discharge batteries periodically manually. Each rectifier bank shall have N+1 rectifier modules for all applications. The exact sizing of the rectifiers in one bank shall be as approved by

Employer during detailed engineering. While selecting the components and finalizing the cooling arrangements, Bidder to note that these rectifier modules are required to operate at 30-40 % of the rated load for most of the time. While sizing, the temperature derating factor as applicable, is to be considered for arriving at the rating of the modules as per Bidder's manufacturing standard if the modules are rated for lower than the 50 deg. C ambient. For the rectifier bank, matching controller along with applicable software shall be provided to meet system requirements under all modes of operation."

1.01.03 The rectifier module shall be microprocessor controlled, IGBT/Power MOSFET based, high frequency with active load sharing, designed for single and parallel operation with battery and shall have automatic voltage regulators for a close voltage stability even when AC supply voltage and DC load fluctuates, effective current limiting features, front access design, programmable temperature compensation feature for battery charging and filters on both input and output to minimize harmonics. The rectifier module output regulation shall be +/- 1% or better from no load to full load with an input power supply variation of +/- 10% in voltage and +/- 5% in frequency. In addition to indications / display on rectifier panel, alarms along with relevant analog measurements shall also be provided by employing RS 485 Port Modbus Protocol / Ethernet TCP/IP protocol for use in DDCMIS system. Further isolated 4-20 mA signals shall be provided for important parameters like rectifier bank voltage, rectifier bank current, battery voltage, battery current, DCDB Voltage, DCDB current etc. The list of alarm output & 4-20 mA signals shall be as approved by Employer during detailed engineering. Necessary provision shall be done in DDCMIS end also.

1.01.04 "Float / Boost" charge functions shall be provided with alarm / indications.

1.01.05 Each rectifier bank shall be rated for 100% load requirement and keep the connected battery full charged and one spare rectifier module.

1.01.06 The rectifier module circuitry shall be of fail-safe design and failure of any component should not result in any rectifier bank output voltage to increase beyond acceptable limits of the C&I system being fed from it.

1.01.07 The rectifier module shall be current limited for circuit protection and protection of battery from overcharge. The current limit shall be continuously programmable.

1.01.08 The rectifier module shall have a slow walk-in circuit which shall prevent application of full load DC current in less than 10 seconds after AC power is energized.

1.01.09 The rectifier module shall be fed from 415 V AC, 50 HZ, 3 phase, 3 wire system. Bidder shall provide all required power cables & other accessories etc. from 415 V AC power supply system to his electrical power supply system.

1.01.10 The full load efficiency of rectifier module at nominal input and output shall be 90%. The ripple content shall be limited to +/- 0.5% of output voltage.

1.01.11 Bidder shall furnish the equipment complete in all respect along with rectifier module rating & voltage drop calculations, supporting curves / data etc.

1.01.12 The Controller shall be intelligent, microprocessor controlled for monitoring & control of rectifier modules with features viz. auto / manual battery discharge test, battery reserve time prediction, energy management, float / boost mode control etc.

1.01.13 All software as required for smooth operation and monitoring of rectifier modules in conjunction with controller & BHMS shall be provided by the Contractor.

1.02.00 **Batteries for DDCMIS system**

1.02.01 The batteries shall be heavy duty Nickel-cadmium type and shall be sized for one hour of full load operation during non-availability of AC supply / chargers. The Ni-Cd batteries shall conform to IS: 10918. The batteries shall be sized as per relevant IEEE Standards. For sizing calculation, an aging factor of 0.8 and a temperature correction factor as per manufacturer's standard at 4 deg. C electrolyte temperature (Based on temperature characteristics curve to be submitted by the Contractor at a temperature of 4 deg. C). Capacity factor, Float Correction Factor, as per Battery Supplier Standard, shall be taken into consideration, if applicable and ambient temperature shall be considered as the electrolytic temperature. The sizing of the battery shall be as approved by Employer during detailed engineering. However, Contractor shall consider a suitable voltage drop of 2V from battery room to DCDB and DCDB to load, while sizing the battery.

1.03.00 **DC DISTRIBUTION BOARD (DCDB)**

Redundant DC feeders (one from each DCDB) shall supply each of the connected panels. From DCDB / panel to driver/load feeder shall be in scope of Bidder. The exact design, rating & number of feeders of the each redundant DCDB shall be as finalized during detailed engineering and as approved by Employer. However, 25% spare feeder (min. 1 no.) with fuses for each rating shall be provided in each DCDB.

1.04.00 **Battery Health Monitoring System (BHMS)**

BHMS, wherever applicable, shall include microprocessor based hardware and software to monitor the condition of each battery cell of 24 V DC systems on-line. With BHMS it shall be possible to measure & analyze the minimum and maximum voltage values of each battery-cell so that any damage to battery shall be prevented

by pro-active maintenance. BHMS shall communicate with the charger/DDCMIS and provide alarms as finalized by Employer during detailed engineering.

**1.05.00** The UPS Power Supply for various systems shall consist of one or more of the following configurations.

Bidder shall clearly bring out in the proposal the configuration diagram, single line diagram and datasheets etc. & this shall be finalized subject to employer's approval during detail engineering.

Configuration B :

UPS system shall consist of 1 x 100% charger and inverter with input isolation transformer, 1 x 100% Ni Cd Battery Bank for 1 hour, Bypass Line Transformers and Voltage Stabilizer, static switch, manual bypass switch, 2 x 100% ACDB, 1x100% Microprocessor controlled Battery Health Monitoring System (BHMS) and other necessary protective devices and accessories.

The specifications for this UPS configuration shall be as per Cl.No. 1.06.00 to 1.06.05 and specifications for Battery shall be as per Cl. No 1.06.06 for Ni-Cd type Batteries.

**Configuration C :** On line UPS with remote monitoring having a battery backup of 30 min. The batteries for UPS System shall be Sealed Maintenance Free type and shall be as per Control System Vendor's standards.

**1.06.00 UNINTERRUPTIBLE POWER SUPPLY (UPS) SYSTEM**

The minimum capacity of the UPS at load factor of 0.8 lagging inclusive of 10% design margin at 50 deg c.

The UPS system shall meet the following requirements as a minimum.

If UPS KVA rating is applicable at a lower ambient temperature than specified 50 deg.c, the bidder shall consider a derating factor of at least 1.5%/deg.c for arriving at the specified UPS capacity at 50 deg.c ambient. The UPS shall have an overload capacity of 125 % rated capacity for 10 minutes and 150 % rated capacity for 10 seconds. The inverter shall have sufficient capability to clear fault in the maximum rated branch circuit, limited to 8 percent of finally selected ups capacity.

**1.06.01 Chargers**

**1.06.01.01** The chargers shall be self regulating, solid state silicon controlled, full-wave rectifier type designed for single and parallel operation with battery and shall have automatic voltage regulators for close voltage stability even when AC supply voltage fluctuates,

effective current limiting features and filters to minimise harmonics. The charger should be capable to fully charge the required batteries as well as supply the full rated load through inverter. Furthermore the charger should be able to re-charge the fully discharged battery within 8 hours. The charger output regulation shall be ± 1% from no load to full load with an input power supply variation of ± 10% in voltage and ± 5% in frequency. In addition to indications/display on charger panel, alarms along with relevant analog measurements shall also be provided by employing RS 485 Port Modbus Protocol / Ethernet TCP/IP protocol for use in DDCMIS. The list of alarm output & 4-20 mA signals shall be as approved by Employer during detailed engineering.

**1.06.01.02** The charger shall be current limited for charger circuit protection and protection of battery from overcharge shall also be provided. The current limit shall be continuously adjustable. The chargers shall have a slow walk-in circuit which shall prevent application of full load DC current in less than 10 seconds after AC power is energised.

1.06.01.03 The chargers shall be fed from 415V AC, 50 HZ, 3 phase, 3 wire system. Charger design shall ensure that there is no component failure due to fluctuations of input supply or loss of supply and restoration.

1.06.01.04 The minimum full load efficiency at nominal input and output shall be 90%. The ripple content shall be limited to +/- 2 % of Charger output voltage.

1.06.01.05 The UPS battery shall have sufficient amp-hour capacity to supply the steady state KVA rating of the UPS specified for 60 minute, irrespective of the actual load on UPS.

1.06.01.06 The UPS system shall be capable of operating without D.C. battery in circuit under all conditions of load and the performance of various components of UPS like inverter, charger, static switch etc. shall be guaranteed without the battery in circuit.

1.06.01.07 The UPS system design shall ensure that in case of failure of mains input power supply to one of the chargers, the other charger whose mains input power supply is healthy, shall feed to one or both the inverters as the case may be as per manufacturer's standard practice & continue to charge the D.C. battery at all load conditions. The Bidder should note that this situation should not in any way lead to the discharge of the D.C. Battery.

**1.06.02 Static Inverters**

The static inverter shall be of continuous duty, solid state type using proven Pulse Width Modulation (PWM)/Quasi square wave/step wave technique. Ferro-resonant types Inverters are not acceptable. The nominal voltage output shall be 230 Volts. single phase ,50 Hz. The inverter equipment shall include all necessary circuitry and devices to conform to requirements like voltage regulation, current limiting, wave shaping, transient recovery, automatic synchronization etc. The steady state voltage regulation shall be +/-2% and transient voltage regulation (on application/removal of

100% load) shall be +/-20%. Time to recover from transient to normal voltage shall not be more than 50 mSec. Frequency regulation for all conditions of input supplies, loads and temperature occurring simultaneously or in any combination shall be better than ± 0.5% (automatically controlled). The total harmonic content shall be 5% maximum and content of any single harmonic shall be 3% maximum. The inverter efficiency shall be at least 85% on full load and 80% on 50% load. The synchronisation limit for maintenance of synchronisation between the inverter and stand by AC source shall be 48-52Hz, field adjustable in steps of 1 Hz.

**1.06.03 Static Switch and Manual Bypass Switch**

The static switch shall be provided to perform the function of transferring UPS loads automatically without any break from (i) faulty inverter to healthy inverter in case of failure of one of the two inverters and (ii) from faulty inverter to standby AC source in case of failure of both the inverters. The transfer time shall be ¼ cycle maximum in synchronous mode.

Manual bypass switch shall be employed for isolating the UPS during maintenance.

Continuous and overload capacity of the switches shall be equal to 100% of the continuous and overload rating of each inverter. Peak Capacity shall be 1000% of continuous rating for 5 cycles.

**1.06.04 Step Down Transformer and Voltage Stabiliser**

One 415V three phase to 230V, single phase transformer along with associated voltage stablizer shall be furnished with each UPS system. The transformer and stablizer combination shall convert Employer furnished 415V ± 10% three phase plant auxiliary AC supply to 230 V ± 2%, single phase standby AC Power Supply source.

The transformer shall be of low impedance air-cooled type and its KVA rating and percentage impedance should be selected so that extremely fast fault clearance is achieved.

The overload capacity of the transformer and voltage stabilizer shall not be less than 300% for 200 millisecond duration. The voltage stabilizer shall employ servo-controlled circuitry and shall maintain the specified output voltage for 0-100% load with maximum input voltage variations as indicated above. The efficiency of the stabiliser shall be 95% or better.

The type and other details shall be subject to Employer’s approval.

**1.06.05 AC Distribution Board (ACDB)**

The details of the AC distribution board, i.e. exact, rating and number of feeders etc. of the 2x100% ACDB shall be designed to cater to the requirements of Contractors systems. 25% Spare feeders of each type and rating to be provided in each ACDB.

**1.06.06** The batteries shall be heavy duty Nickel-cadmium type and shall be sized for one

hour of full load operation during non-availability of AC supply / chargers. The Ni-Cd batteries shall conform to IS: 10918. The batteries shall be sized as per relevant IEEE Standards. For sizing calculation, an aging factor of 0.8 and a temperature correction factor as per manufacturer's standard at 4 deg. C electrolyte temperature (Based on temperature characteristics curve to be submitted by the Contractor at a temperature of 4 deg. C). Capacity factor, Float Correction Factor, as per Battery Supplier Standard, shall be taken into consideration, if applicable and ambient temperature shall be considered as the electrolytic temperature. The sizing of the battery shall be as approved by Employer during detailed engineering. However, Contractor shall consider a suitable voltage drop from battery room to ACDB and ACDB to load, while sizing the battery.

## CONTROL AND INSTRUMENTATION SYSTEM

### 1.00.00 GENERAL

1.01.00 a) The Contractor shall provide Independent Control & Instrumentation system for control, monitoring and operation of associated drives and auxiliaries in FGD system including Limestone grinding & handling system, Gypsum Dewatering & handling system and other systems being provided under the contract, in all regimes of operation in safe and most efficient manner. The Contractor shall provide all systems, equipment, accessories and associated equipment, which are included in Contractor's scope, in a fully operational condition acceptable to the Employer.

b) The Contractor shall provide all material, equipment and services which may not be specifically stated in the specifications but are required for completeness of the equipment/systems furnished by the Contractor and for meeting the intent and requirements of these specifications. The work shall be consistent with modern FGD based power plant practices and shall be in compliance with all applicable codes, standards, guidelines and safety requirements in force on the date of award of the contract.

c) The scope of work shall also include all material, equipment and services so as to make a totally integrated Instrumentation and Control System together with all accessories, auxiliaries and associated equipment ensuring operability, maintainability and reliability.

d) The Contractor shall also provide all the instruments along with cables, JB etc. for equipments / drives and services which may not be specifically stated in this specifications but are required for completeness of the FGD Control system shall be furnished by the Contractor and for meeting the intent and requirements of these specifications.

e) The Bidder scope shall include design, manufacture, engineering, inspection & testing at supplier's works, packing, forwarding to site, unloading, erection, testing & commissioning. The following clauses describe the brief scope of supplies. Scope shall be as described briefly in the following clauses but not limited to it. The detailed technical specifications are stipulated under Part - B, Section-VI of the specification as well as in various other Parts of the Technical Specifications.

f) In this project fieldbus(FF/Profibus) based instruments(PT/DPT/TT), Fieldbus based Non-intrusive Electrical actuators are also envisaged which shall be connected to the DDCMIS. The protocol of fieldbus (FF/Profibus) for non-intrusive electric actuators and fieldbus based instruments shall be matching with fieldbus

protocol of FGD System DDCMIS, and the same shall be subject to Employer's approval.

g) Scope defined in PART-A read in conjunction with PART-B has to be provided for each station (i.e. 11 sets for 11 stations) under LOT-1A package. The scope detailed hereunder in the following clauses is for one set.

1.02.00 In this package fieldbus based controls and conventional controls (hardwired 4-20mA/DI/DO) both are envisaged.

1.02.01 Fieldbus based control system for fieldbus based actuators and fieldbus based instruments (PT/DPT/TT) shall be provided for all applications. In case non fieldbus based actuator or transmitters are required for few applications then the same shall be discussed and finalized during detailed engineering.

A. For fieldbus based instruments/ actuators following guidelines shall be followed:

a. Actuators which are in main and standby line shall be wired to separate host/ master of FF/Profibus.
b. Dual/Triple redundant PT/DPT/TT shall be wired to separate segments.

B. Loop Reaction Time (time between field acquisition to field output in control system) :

a. For Fast Closed loop controls of conventional system, loop reaction time shall be 250ms or better as per process requirement.
b. For other Closed loop controls, conventional/ fieldbus based/ mixed, loop reaction time shall be 500 ms or better as per process requirement.
c. For Fast Open loop controls of conventional system (Tie/ trip selection), loop reaction time shall be 100ms or better.
d. For other Open loop controls, conventional/ fieldbus based/ mixed, loop reaction time shall be 1 Second or better as per process requirement.

The above shall be suitably demonstrated by the contractor.

C. For Foundation Fieldbus & Profibus PA chicken foot/ branch/ or combination of both topology shall be provided. For Profibus DP, Bus/ Line topology in redundant mode shall be provided. That is, for Profibus DP redundant cables connected to redundant ports of devices shall be provided.

Specific approval of Employer shall be taken before finalization of protocol of Fieldbus for DDCMIS and for the fieldbus based equipments being connected to DDCMIS like PT/DPT/TT and actuators.

Further, the grounding scheme of fieldbus system shall be as recommended by FF/ Profibus standards and Contractor shall submit the detailed scheme at the start of engineering for Employer's approval.

D. The design of control system cabinets with fieldbus components shall be finalized during detailed engineering stage and various requirements specified for DDCMIS cabinets in Part-B of this specification will not apply.

E. The actuators shall be fully compatible with the valves being provided in this package. Further, 5 Nos. configuration/ diagnostic tool (if applicable) for non-intrusive actuators and 5 nos. configuration/ diagnostic tool (if applicable) for all fieldbus compatible devices shall be provided for complete package.

F. Twisted pair with round steel wired armour (SWA), Type A fieldbus cable complying to 61158 (detailed Specification as per PART-B), SS JBs with IP-66 and accessories for fieldbus based instruments and actuators shall be provided by the contractor under this package.

## 2.00.00 DISTRIBUTED DIGITAL CONTROL, MONITORING & INFORMATION SYSTEM (DDCMIS)

2.01.00 Latest state of the art microprocessor based Distributed Digital Control, Monitoring & Information System (DDCMIS) shall be provided comprising of the following as a minimum and meeting all requirements specified under Sub-section IIIC-02 DDCMIS of Part -B, Section-VI of Technical Specification and the following annexure of this subsection:

IIIC-02G: HMI Hardware

IIIC-02J: Security Policies and Procedures

IIIC-02K: Guidelines for Fieldbus System

The contract quantity of hardware and peripherals of HMIPIS, programming station etc. shall be as per Appendix-I to Part- A, Section-VI of Technical specification read in conjunction with detailed technical specification.

For Messaging system, wireless link and Remote Service Centre connectivity (for each type of DDCMIS) the fixed cost (e.g. service provider charges & its equipment etc.) and running cost till warranty period shall be included in the Quoted Price. The running cost thereafter shall be included in the AMC price for the total duration of AMC, i.e. three years.

### 2.02.00 Flue Gas De Sulphurization (FGD) DDCMIS

2.02.01 FGD System comprising of binary and modulating controls of complete Flue gas desulphurization system, material handling systems etc. shall be implemented in the DDCMIS separately for each project. The Control System of FGD DDCMIS has following process blocks as minimum. Any other systems apart from the below

mentioned systems shall be included in the common system. Details of control blocks with respect to process blocks shall be finalized during detailed Engineering:

FGD DDCMIS consisting of following:

(a) Unitized process blocks:

i. Unit-1 absorber and associated system
ii. Unit-2 absorber and associated system
iii Unit-3 absorber and associated system
.
.
.
n) Unit-n absorber and associated system
where n is the number of generating unit per stage

(b) Common system process blocks:

i. Gypsum De watering Handling common system block.
ii. Lime stone preparation and handling common system block.
iii. Other associated common system.

In addition to monitoring and control from the FGD control room, the systems indicated at (a) & (b) shall also be monitored and controlled from each Unit control room.

2.02.02 In order for fast, trouble-free and smooth execution and support during Operation and Maintenance period as specified elsewhere in the specification, Bidder/ Contractor/Sub-Contractor or its group of company of the offered DDCMIS system should have a well-established DDCMIS hardware and software service center in India working for at least 5 years from the date of bid opening.

2.02.04 Depending on the cable distance between FGD control room and FGD sub systems such as Gypsum handling system, Limestone handling system etc, requirement of Remote Input Output (RIO) shall be finalized during detail engineering, In such cases, contractor to provide RIO on as required basis. Contractor shall place RIO cabinets inside building with air conditioning environment. Building, Air conditioning, power supply for RIO cabinets shall be in contractor’s scope.

2.02.05 The Bidder shall provide software license for all software being used in Bidder’s System. The software licenses shall be provided for the organization i.e. it should not be site-specific and shall also not be hardware/machine-specific. That is, if any hardware/machine is upgraded or changed, the same license shall hold good and it shall not be necessary for Owner to seek a new license/renew license due to up gradation/change of hardware/machine in Bidder’s System at site. All licenses shall be valid for the continuous service life of the plant.

2.03.00 The above system(s) shall include their respective measurement system for signal acquisition, conditioning and signal distribution of various types of inputs/outputs,

meeting specification requirements including respective Hardware requirements as stipulated in Sub-section -DDCMIS, Part-B, Section-VI of Technical Specification.

The DDCMIS also envisages fieldbus (Foundation fieldbus/ Profibus) complying with IEC61158 for control and signal acquisition from fieldbus compatible actuators and instruments. Field-bus interface modules shall be provided in each FG.

**2.04.00 Human - Machine Interface & Plant Information System (HMIPIS)**

2.04.01 HMIPIS configured around latest state-of-the art servers/Workstations with open architecture supporting OPC/TCP/IP protocols, etc. shall be provided.

2.04.02 Control, operation and monitoring of FGD and associated system being provided under the contract is primarily envisaged from Contractor's OWS placed in FGD common control room. In addition to above, it is also envisaged to control, operate and monitor FGD and associated system remotely from main plant Central Control Room (CCR) using OWS placed in CCR.

The HMIPIS will include the following as a minimum:

Operator Work Station (OWS) in Central Control Room (CCR) and FGD common control room. NTPC shall provide 02 nos. of UPS power feeder per unit from employer's ACDB, for powering FGD OWS located in CCR. Cabling from ACDB to FGD OWS (located in CCR) shall be in bidder's scope of supply.

Processing Stations (Servers/Workstations) in redundant configuration including RAM, dual bulk memory etc. Removable storage Media shall be used for historical storage and retrieval and long term storage and retrieval of data.

Redundant LAN for communication between various OWS, between OWS and processing stations and OWS. A redundant station-wide LAN for connecting the unitized and common systems of FGD DDCMIS as well for connecting to Employer’s Station LAN through firewall. This shall include all cables and accessories required for connecting Contractor’s system upto the Employer’s systems such as Station LAN, etc. Alternatively, Bidder’s standard & proven solution, which is functionally equivalent to redundant system bus and single fault tolerant, shall be acceptable.

2.04.03 Adequate measures shall be provided for the security of the DDCMIS including the interface to Employer’s Station LAN as detailed at Part-B, subsection DDCMIS. This includes Redundancy in firewall, Connection to Contractor remote service center through VPN technology, etc.

2.04.04 Suitable hardware/software for interfacing of FGD DDCMIS with following systems

(i) Employer's Station LAN.

(ii) Remote diagnostic station for FGD DDCMIS at OEM end.

2.04.05 DDCMIS vendor shall upgrade/ update all DDCMIS system along with release of DDCMIS system software/ patches, meeting the system software requirements as mentioned in DDCMIS chapter, Part-B, SECTION-VI. This shall include the latest supported OS and its corresponding latest version/ release of DDCMIS system software/ patches. The upgrade/ update shall be carried out in the penultimate year of AMC (In case of one year AMC, third month from the date of commencement of AMC). Any change in hardware required for the same shall also be carried out by the contractor within the contract price.

**2.05.00 Data Communication System**

System Bus connecting Control System and HMIPIS. Other bus systems for connecting various systems/subsystems of DDCMIS like Cubicle Bus, Local Bus, I/O Bus ( Including Remote I/O Bus) soft links (including those from Field Bus based temperature transmitter) as well as within systems/sub-systems of DDCMIS. All the bus systems shall be redundant except for back plane buses which can be non-redundant.

**2.06.00 Remote Input/ Output Modules**

Remote input / output modules and cubicles for specified locations in the plant for the signals, which are used for information and Control / Interlock purpose, are to be provided.

**2.07.00 Annunciation Function**

The annunciation system shall be built as a part of the control system of the DDCMIS.

**2.08.00 System programming, diagnostics & documentation facility**

2.08.01 The programmer station shall be provided for configuration /tuning/structuring of control system and program development /modification of HMIPIS. A Workstation based system documentation facility for automatic generation of system documentation shall be provided to achieve paperless documentation for the project. The diagnostic system shall have elaborate diagnostics facility giving details of fault in I/O modules, other modules and cabinets on OWS in form of display and text messages.

2.08.02 Software for determining optimum controller settings for control loops shall be supplied as per subsection DDCMIS, Part-B, Section VI for each unit.

## 2.09.00 Power Supplies

Redundant power supply modules/packs for powering the systems described above in system cabinets with necessary auctioneering and distribution.

## 2.10.00 Cabinets

(a.) System cabinets housing electronic modules and power pack supplies of system described above.

(b.) Marshalling cabinets separate from system cabinets for terminating inputs from field, MCC/SWGR etc., for further wiring to control system and for terminating outputs from control system to MCC/SWGR etc.

In case Bidder's system design requires the termination cabinet independent from system cabinet, the marshalling cabinets can be combined with the termination cabinet. In case, the termination arrangement is part of the system cabinet, independent marshalling cabinets shall be provided.

(c.) Relay cabinet-housing relays for providing contact outputs by control system to other system wherever contacts are used in circuit/scheme of Control supply/power supply of more than 24 V and in cases where the VA burden is more than the VA burden the Output module can drive. Alternatively, these relays can also be mounted in termination/marshalling cabinets also. It may be noted that relays cannot be mounted in system cabinets.

(d.) NOT USED

(e) In case DDCMIS supplier can provide system cabinet with suitable partition to create separate marshalling area on the rear side of the system cabinet, ensuring that dust ingression does not take place in system area, the same can also be accepted subject to Employer's approval during detailed engineering stage.

(f) The design of control system cabinets with fieldbus components shall be finalized during detailed engineering stage. The contractor shall propose suitable design of these cabinets keeping in view, ease of operation and maintenance and minimizing entry of dust to cabinets for Employer's approval.

## 2.11.00 Warranty and Annual Maintenance Contract

Warranty and Annual Maintenance Contract (AMC) for DDCMIS, as per Sub-section DDCMIS, Part -B, Section-VI of Technical Specification.

**2.12.00** Representative of OEM shall also be required to be present during Factory acceptance testing (Authorization to shipment test ATST) of respective DDCMIS for testing of finally implemented control system. Logic/HMI implementation for various DDCMIS system shall be done in Uniform way and documents of these shall be furnished in uniform format, as approved by Employer.

**2.13.00 Control System Spare Capacity**

2.13.01 Over and above the equipment and accessories required to meet the fully implemented system as per specification requirements, DDCMIS shall have spare “Usable” capacity and necessary hardware/ equipment/ accessories to meet following requirement for future expansion at site:

2.13.02 10 % spare channel shall be provided in each functional groups for each type of input / output fully wired up to the marshalling/ termination TBs.

2.13.03 Wired-in "usable" space for 20% modules along with Field Terminal assemblies, PCB/Connectors (if any in the offered system) in each of the system cabinets for mounting electronic modules shall be provided by the Contractor for future use.

2.13.04 Each controller shall have 20% spare functional capacity to implement additional function blocks, over and above implemented logic/ loops. Further, each controller shall have spare capacity to handle minimum 30% additional inputs/ outputs of each type mentioned in clause 2.13.02 & 2.13.03 above, over and above implemented capacity. Each of the corresponding communication controllers shall also have same spare capacity as that of controller.

2.13.05 Ten (10) percent spare relays of each type and rating, mounted and wired in relay cabinets. All contacts of relays shall be terminated in terminal blocks of relay cabinets. In each of the relay cabinets, 10 % spare terminal blocks shall be provided so that additional relays can be mounted and wired.

2.13.06 Twenty (20) percent spare terminal blocks in each marshalling cabinets.

2.13.07 The spare capacity as specified above shall be uniformly distributed throughout all functional groups. The system design shall ensure that above mentioned additions shall not require any additional controller/processor/ peripheral drivers/ cabinets in the system delivered at site. Further, these additions shall not deteriorate the system parametric requirements like response time / duty cycle, etc. from those stipulated under this specification and shall meet other redundancy / functional requirement.

2.13.08 The above mentioned requirements are generally applicable for conventional system. For fieldbus based system refer Annexure IIIC-02K of Part-B for spare requirements. In FGs where mix of conventional and fieldbus based system is used, the spare shall be in the respective proportion.

2.14.00 The contractor has top provide kks codes for instrument and drives in the P&ID and other related document.

2.15.00 Output redundancy is applicable for 10% of drives distributed in various functional groups. Exact application shall be finalized during detailed engineering.

2.16.00 Complete wiring / cabling from field devices to panels / MCC and vice versa including conduits / trays / fixtures etc. shall be in bidders scope.

## 3.00.00 MEASURING INSTRUMENTS

The following shall be provided as a minimum, meeting specification requirements of Sub-section - MEAS INST of Part-B, Section-VI of Technical Specification.

3.01.01 Primary instruments like Microprocessor based transmitters employing HART/ Fieldbus protocol, thermocouples & RTDs along with temperature transmitters, pressure/diff. pressure/temperature/flow (Ultrasonic/electromagnetic) transmitter & gauges, flow sensing elements (orifice plates, flow nozzles etc), Ultrasonic, Radar type level transmitters, density meter (Coriolis type. In case the bidder proposes other type of density meter as per the bidder standard and proven practice, the same shall also be acceptable except Nucleonic type density meter), pH analyser, SO2 analyser, Flue Gas flow transmitter, vibration monitoring system (VMS) etc. for:

(a) FGD plant and other system being provided under the contract, as indicated in enclosed tender diagrams (Part E) of this specification.

(b) All Instruments which are Integral to equipment like pumps, motors etc. / skid mounted instruments and are not indicated in enclosed drawings (as applicable) or in BOQ etc. included in relevant sub-sections, but are required for control, monitoring and operation of the equipment/plant/ Systems are to be provided by the Contractor to meet actual system requirements meeting redundancy and other requirements specified under technical specifications subject to Employer's approval. Specification / type of instruments shall be as per standard and proven practice of equipment supplier. However, for temp elements including bearing / winding temp of motors / pumps temp transmitters shall be provided.

(c) For Binary and analog inputs required in major equipments of FGD system protection, triple-sensing devices shall be provided. Binary and analog

inputs, which are, required for protection of more than one equipment as well as protection signals for HT Drives etc., triple sensing devices shall be provided. Microprocessor based vibration monitoring system shall be provided for Booster Fans, Limestone Crusher, Milling System and all other equipments operating on 11kV/ 6.6kV/ 3.3kv. The number of bearing locations to be monitored on each equipment shall be as per requirements finalized during detailed engineering but not less than 2 (X and Y direction) bearing locations (except for vertical pumps for which one bearing location may be sufficient).

(d) For other critical binary and analog inputs required for protection and interlock purpose of other equipment (e.g. those interlocks which may result in loss of production, non-availability of a major equipment etc.), triple sensors shall be provided.

(e) Temperature elements, electronic transmitters etc. are to be provided for all the cases. Use of process actuated switches is acceptable only in the cases as indicated in the tender drawings.

3.01.02 All Pressure Transmitters, Differential Pressure Transmitters and Temperature Transmitters in this package shall be provided based on Fieldbus protocol (complying to specification of Part-B, Section-VI). The protocol of fieldbus based instruments shall be matching with fieldbus protocol of FGD System DDCMIS, and the same shall be subject to Employer's approval.

**3.02.00** All weather analyser panel located in air conditioned containerised room (Portable cabin) shall be provided for housing analysers except In situ analysers. For balance instruments local panels which are not located inside covered building, suitable canopy/ protective arrangement shall be provided which shall be approved by Employer during detail engineering.

## 3.03.00 CONTINUOUS EMISSION MONITORING SYSTEM (CEMS)

3.03.01 CEMS comprising of analysers and associated items for measurement of SO2, NOx, CO, CO2, Mercury, Particulate Matter (dust density), and Stack Flue Gas Flow in Stack emission shall be provided for each unit by the Contractor for stack emission monitoring.

A) **LIST OF FLUE GAS EMISSION ANALYSERS FOR CONTINUOUS EMISSION MONITORING SYSTEM (CEMS)**

| S. No. | KKS CODE | DESCRIPTION | RANGE | ZONE | REMARK |
|---|---|---|---|---|---|

| CLAUSE NO. | SCOPE OF SUPPLY & SERVICES |
|---|---|

| | | | | | |
|---|---|---|---|---|---|
| 1 | HNE10CQ005 | SO2 in stack emission | 0-100 /0-1000 mg/Nm3 (SELECTABLE) | CHIMNEY | |
| 2 | HNE10CQ001 | NOX in stack emission | 0-100 /0-1000 mg/Nm3 (SELECTABLE) | CHIMNEY | Refer note-2 |
| 3 | HNE10CQ002 | CO2 in stack emission | 0-25% (Selectable) | CHIMNEY | |
| 4 | HNE10CQ004 | CO in stack emission | 0-100/ 0-1000 mg/Nm3 (SELECTABLE) | CHIMNEY | |
| 5 | HNE10CQ003 | Particulate Matter (Dust Density) in stack emission | 0-50 mg/Nm3 / 0 – 300 mg/Nm3 (PROGRAMMABLE) | CHIMNEY | |
| 6 | HNE10CQ006 | Mercury (Hg) in stack emission | 0 - 35 microgram/Nm3 | CHIMNEY | |
| 7 | HNE10CQ007 | Flue Gas flow at stack | To be Decided during Detail Engineering. | CHIMNEY | |

NOTES:

1. SO2, NOX, CO2 and CO analyser are shown separately for the purpose of input only otherwise SO2, NOX, CO2 and CO analyser may be supplied as a single unit/ Combined Unit (s) meeting specification requirement.

2. Direct measurement of NO and NO2 shall be done. Total NOx values shall be reported as NO2 i.e. NOx = NO + NO2 = NO X 1.53 + NO2 = NOx as NO2.

3. Oxygen (O2) measurement in stack emission based on Paramagnetic/ Zirconia type instrument shall be provided by the Contractor for correction of SO2, NOx and Particulate matter value corresponding to the standard/reference O2.

4. CEMS Parameters shall be normalized for temperature, pressure, moisture (applicable in case of wet measurement techniques), etc.. This facility shall be available in the respective analysers. Necessary measurement shall be provided by the Contractor for these parameters. All the CEMS parameters shall be reported on dry basis.

5. CO2 Measurement at stack and at instrument end shall be provided in case dilution techniques are used.

6. Offered CEMS should comply with latest CPCB/regulatory requirement prevailing at the time of award of the contract even if same is not explicitly indicated in the technical specification, without any cost implication to the Employer.

7. Offered CEMS shall be fully proven for the actual flue gas parameters at stack. Reference list and user feedback of offered CEMS in similar applications shall be furnished to NTPC for review during detailed engineering

| CLAUSE NO. | SCOPE OF SUPPLY & SERVICES |
|---|---|
| | stage.<br><br>8. These are per unit quantities.<br><br>9. Analyzers mentioned in S.No. 1 to 5 of the above *list of flue gas analyzers for CEMS* are not applicable for BARH-I project. However, Oxygen (O2) measurement in stack emission based on Paramagnetic/ Zirconia type instrument shall be provided by the Contractor for BARH-I project for correction of SO2, NOx and Particulate matter value corresponding to the standard/reference O2. |
| 3.03.02 | CEMS analysers/instruments shall be provided with provision for bidirectional connectivity over Modbus/RS-232/RS-485 with Employer's central cloud server for real time data monitoring, remote diagnostics & remote calibration checks, etc., complying with CPCB IT Division document "Protocol for real time (Emission & Effluent) data management from industries version 1.2 (10.6.2015), CPCB Guidelines July-2017 on CEMS or the latest regulatory requirement prevailing at the time of award of the contract. All necessary hardware and software required at instrument end shall be provided by the Contractor. Necessary details like scheme, register addresses of analyzer, etc. shall also be provided by the Contractor for implementation of above. The Contractor shall fully assist NTPC's agency involved in implementation of above connectivity. |
| 3.03.03 | For CEMS - In addition to above requirement, 4-20 mA connectivity to DDCMIS shall be provided by the Contractor. |
| 3.03.04 | Comprehensive Annual Maintenance Contract (AMC) for three (03) years after warranty period shall be provided by the contractor for CEMS and Analysers of FGD System. |
| **3.04.00** | **SERVICES DURING DEFECT LIABILITY PERIOD FOR CEMS AND ANALYSER INSTRUMENTS OF FGD** |
| 3.04.01 | The Contractor shall provide an unlimited warranty on all equipments during the Defect liability period. This warranty shall include repair, replacement, replenishment of consumables (for e.g. reagents, calibration gases etc. as applicable) and correction of identified discrepancies including Analysers, Sample Handling System, Transmitters, (as applicable) etc. at no cost to Employer. |
| 3.04.02 | The Contractor shall provide warranty spares including components for each system based on (and keeping adequate over margin) normally experienced failure rate. Exhaustive list of all such items shall be submitted along with Datasheet for Employer's review and approval during details Engg stage regarding adequacy of the same. The warranty spares as per the list mentioned above will be dispatched by the Contractor along with the main equipment consignment. However for items which have a limited shelf life shall be dispatched in a phased manner during the warranty period. Unused spares/consumables shall be Contractor's property after expiry of warranty period and shall be taken back. |
| **3.05.00** | **SERVICES DURING ANNUAL MAINTENANCE CONTRACT (AMC) PERIOD FOR CEMS AND ANALYSER INSTRUMENTS OF FGD** |

3.05.01 The Contractor shall provide complete maintenance services for each System under comprehensive Annual Maintenance Contract (AMC) for period of three years after the Warranty period.

3.05.02 The AMC shall cover total maintenance of all Analysers, Sample Handling System, Transmitters etc. coming under the scope of each system and shall include free repair/replacement of each items, replenishment of consumables, correction of problems (if any) and supply of expendable items.

3.05.03 Further, Contractor may note that during the AMC he will be allowed to use Employer's mandatory spares, but has to replenish the same within three months' time or before completion of AMC period whichever is earlier.

3.05.04 The Contractor shall prepare detailed list of faults corrected and parts, expendables utilized during AMC period and shall furnish the same to Employer, properly documented at the end of AMC period. Further, during AMC period the details as required by Employer/ Project Manager shall be made available by Contractor's personnel.

3.05.05 Contractor shall also provide a list of all required AMC spares which shall be finalized along with datasheet during detail Engineering stage. These spares will be dispatched by the Contractor at the beginning of AMC on yearly requirement basis. However for items which have a limited shelf life shall be dispatched in a phased manner during the AMC period. Unused spare/consumable shall be Contractor's property after expiry of AMC period and shall be taken back.

**3.06.00 DEPUTATION OF ENGINEER/ TECHNICAL EXPERT FOR CEMS AND ANALYSER INSTRUMENTS OF FGD**

3.06.01 Contractor shall depute Technical Experts of the OAM /OEM/OES/ (Original Analyser Manufacturer/Original Equipment Manufacturer/Original Equipment supplier) for each of the above system at Site, who will be fully qualified to perform the required duties, supervision of maintenance, repair etc. for a period of six month. Employer will intimate the contractor two weeks advance notice for start of deputation period.

3.06.02 After expiry of above six month period, Technical expert for each system shall visit site on monthly basis for monitoring the performance and rectify the problem (if any) for each system for the remaining warranty period and during entire AMC period. In the event of any malfunction/fault/failure in the system or any component thereof contractor shall depute Technical expert of respective system to reach site within 48hrs of call raised by site during the remaining warranty period and entire AMC period.

3.07.00 Material Codification of C&I items in NTPC SAP system:

a. Contractor to provide detailed catalogue with complete part number of all the instruments, Electronic cards, accessories, JBs, Panels, etc. to Site Erection

Incharge within one month of supply of item at site for material codification of Main supply and mandatory spares items.
b. Contractor to depute his representative for 30mandays at site for codification of materials in NTPC SAP system in phased manner. The detail schedule of the program shall be finalized during commissioning stage at site.
c. The material codification of all the C&I items shall be completed before completion of commissioning and handover of system to site.

3.08.00 Contractor shall provide one no. of Hand held HART calibrator per generating unit.

## 4.00.00 PROCESS CONNECTION & PIPING

Process connection & piping including LIE / LIR, all impulse piping, pneumatic piping/tubing, valves, valve manifolds, fittings and all other accessories shall be provided on as required basis for proper installation & completeness of impulse piping system and air supply system, as stipulated under Sub-section PCP, Part-B, Section-VI of Technical Specification.

All transmitters, switches, temperature transmitters etc shall be suitably grouped together and mounted inside (i) Local Instruments Enclosures (LIEs) in case of open areas of the plant and (ii) In Local Instrument Racks (LIRs) in case of covered areas.

The instruments (electronic transmitters, temperature transmitters, level transmitters, flow transmitters/ flow meter) etc which are not located inside covered building shall be grouped (two or more) and mounted inside instrument racks. In case grouping is not possible and these are to be installed individually, canopy with suitable arrangement shall be provided. The grouping and design of racks/ canopy shall be approved by Employer during detail engineering.

Additionally, the same philosophy shall be applicable for switches except for those mounted on pipe and equipment.

All electric actuators, pneumatic control valves, JBs ,SOV box and Local control panels which are not installed inside covered building, suitable canopy shall be provided and design of canopy shall be approved by Employer during detailed engineering.

## 5.00.00 INSTRUMENTATION CABLES, C & I SYSTEM, POWER SUPPLY DISTRIBUTION CABLES & CABLE SUB-TRAYS

5.01.00 a) All instrumentation cables (twisted & shielded, FRLS PVC insulated and sheathed), data highway / fibre optical cables including prefabricated cables (with plug-in connectors), cables as applicable for direct interconnection of two equipment/ system/ devices in Contractor’s scope as well as for connection of signals from/to systems like MCC/LT SWGR/HT SWGR etc. (even if they are not in Contractor’s Scope.) shall be provided by Contractor on as required basis.

b) All power supply distribution cables required for directly connecting two equipment / systems devices in contractor's scope shall be provided by the contractor. All these cables shall be FRLS & as per IS-1554 Part – I latest edition.

c) Above cables shall be provided along with necessary laying & termination accessories, hardware etc. meeting requirements specified under Sub-section INST CABLE, Part -B, Section-VI of Technical Specification. All sub trays along with supporting, connecting hardware etc. required for laying of instrumentation, control, power and other cables etc. up to main cable trays are under Bidders scope.

d) Cables required for interfacing FGD DDCMIS with Employers DDCMIS (both SG and BOP) located in CER shall be in bidder's scope.

e) Cables for connectivity of CEMS signals to Employer's Unit DDCMIS located in unit CER shall be in bidder's scope.

f) Junction boxes with requisite terminals shall be provided on as required basis. Grouping, Assignment, Sequence of termination of various field instruments /drive signals (if applicable) to Local junction boxes shall be subject to Employer's approval during detailed engineering.

## 6.00.00 CONTROL VALVES & ACTUATORS

6.01.00 Control valves, actuators and accessories, shall be provided on as required basis for meeting requirements specified under Sub-section CONTROL VALVE, Part-B, Section-VI of Technical Specification. Specially designed valves/trims to prevent cavitations and limit noise and control outlet velocity, shall be provided.

6.02.00 Microprocessor Based Electronic Positioner is to be provided on as required basis with all the Control valves and all control dampers being provided by the contractor.

## 7.00.00 ELECTRICAL POWER SUPPLY

Microprocessor based modular 24V DC power supply system shall be used for powering the control systems including its network devices.

24V DC power supply system for DDCMIS based control system shall comprise of two sets, each set shall consist of 1 x 100% microprocessor controlled, intelligent, modular rectifier banks, Controller – one for each rectifier bank, 1 x 100% Nickel - Cadmium batteries for one (1) hour duty, 1 X 100% DC distribution board. 1x100% Microprocessor controlled Battery Health Monitoring System (BHMS)–common for both the sets.

Contractor shall provide UPS of suitable capacity for the intended application meeting the requirements of Technical Specifications as stipulated under Part B, Section VI. Contractor shall provide Mini UPS for each server station as minimum.

Contractor to note that UPS of configuration C is acceptable only upto 5 KVA. In case the consolidated load requirements exceeds 5 KVA, Contractor to provide UPS with Configuration B in place of Configuration C as per Technical Specifications as Part B, Section VI.

Bidder shall provide power supply distribution panels/cabinets/boxes for sub distribution of DC/Main UPS/Utility feeders on as required basis. The power supply distribution box shall include change over circuitry, switch fuse units, MCBs, terminal blocks etc. suitable for application.

For detailed requirements of FGD system, refer Sub-Section III-C, Part B Section VI of technical specifications.

**8.00.00 TYPE TEST REQUIREMENT**

The type tests to be conducted for C&I systems & equipments shall be as detailed out in Sub-Section-C-06 Type Test Requirements, Part-B, Section-VI of Technical Specification.

**9.00.00 TOOLS & TACKLES**

The Contractor shall furnish a complete new set of all special tools and tackles of reputed make and model which are required for erection, ease in maintenance to have minimum down time, testing and calibration of all the equipments and systems to be provided by the Contractor under this specification for C&I systems.

**10.00.00 Interfacing with Employer’s DDCMIS**

10.01.00 Hardwired Signal exchange: Hardwired signal exchange between BOP DDCMIS/ CHP DDCMIS (under Employer's scope) and FGD DDCMIS (under Contractor's scope) like bypass damper status, inlet and outlet gates status, ID Fans status, ESPs status, Boiler Load Index (BLI), MFT etc. shall be provided on as required basis, for implementation of protections and interlocks. Contractor shall provide one Remote Input Output (RIO) per unit, placed in Central Equipment Room (CER) for the same. However, contractor to consider IOs and cables for minimum number of hardwired signal exchange per unit as follows DI – 130, DO – 130, AI – 50 and AO – 50. NTPC shall provide 2 (Two) nos. of 24V DC power supply feeders per unit from employer's DCDB, for powering RIO panel located in CER. Cabling from DCDB to RIO panel (located in CER) shall be in bidder's scope of supply.

10.02.00 The Contractor shall provide all assistance to the BOP C&I (in Employer's scope) supplier including co-ordination and flow of required information etc.

10.03.00 Contractor shall provide complete logics for FGD and associated system such as booster fan blade pitch control, FGD bypass damper control, FGD inlet and outlet gate control etc. FGD OEM shall furnish recommendations, if any, for implementation in employer's DDCMIS for boiler control.

10.04.00 Contractor to refer the General Layout Plan (GLP) to estimate the distance between FGD control room and Employer's CCR/CER.

**11.00.00 Grounding System**

Suitable electronic grounding is to be provided by the contractor for all C&I equipments/panels/desk in the scope of the contractor. The exact scheme shall be as finalized during detailed engineering. Also refer Sub-Section titled "Basic Design Criteria" in Part-B, of this Technical Specification.

**12.00.00 Electric Actuators**

Fieldbus based Non-Intrusive Electrical Actuators with integral starters along with associated accessories etc. shall be supplied on as required basis for Valves / Dampers to meet the functional and the other specification requirements specified elsewhere in the Technical specification.

For detailed specification refer chapter "Electric Actuator", Part B, Section-VI. These actuators shall comply the common requirements of actuators as specified at clause 2.00.00 and specific requirements of Non-Intrusive fieldbus actuators as specified at clause 4.00.00. Specific requirements of Non-Intrusive hardwired actuators specified in clause no. 3.00.00 are not applicable for this project. For Blade pitch actuators specification clause no. 5.00.00 shall be complied.

The protocol of fieldbus based non-intrusive electric actuators shall be matching with fieldbus protocol of FGD System DDCMIS, and the same shall be subject to Employer's approval.

For erection and commissioning of above specified actuators, qualified and experienced engineers of actuator manufacturer shall be deputed at site. After successful commissioning of actuators, minimum one qualified and experienced engineer of main package supplier/ actuator manufacturer shall be continuously available at site up to completion of defect liability period (warranty) of actuators, for troubleshooting and maintenance of actuators and proper interfacing with DDCMIS. Qualified and experienced engineers indicated above shall have expertise in all aspects of non-intrusive actuators along with fieldbus protocol and interfacing with DDCMIS.

**13.00.00 CONTROL DESK , PANELS AND FURNITURES**

Contractor shall provide control desk placed in FGD common control room, Central Control Room (CCR) meeting specification requirements stipulated under sub section Control Desk, Panels and Furniture PART-B, Section VI of technical specification.

Contractor shall provide control desk in CCR of each generating unit, of length 2 meter aesthetically matching with the existing control desk of main plant Central Control Room (CCR) for placing FGD OWS in main plant CCR.

The minimum quantity of furniture per generating unit, envisaged in FGD control room is as mentioned below:

a) Chair-3 nos.

b) Printer table- 1 no

c) Computer table- 2 no.

d) Key pad- 1 no.

e) Locker set -1 no

Server rack, PC rack and workstation furniture shall be provided on as required basis.

## 14.00.00 SCOPE OF SERVICES

14.01.00 The Contractor or his sub-vendor(s) / associate(s) / engineering firm(s) shall have established engineering setup including skilled & experienced manpower, engineering software(s) and other required resources for carrying out basic and detailed engineering of control and instrumentation systems of FGD System. The Control and Instrumentation engineering shall include the following as a minimum.

a. Preparation of basic logic / loop diagrams (not just the implementation), I/O list, Drive list, instrument list etc for each of the plant areas of the complete plant including offsite systems based upon the flow schemes / write ups by the OEM's.

b. Engineering of power supply system for DDCMIS, Process connection and piping, Control valves etc.

c. Instrumentation, cable engineering including preparation of interconnection cable diagram, cable schedule etc.

d. The contractor shall deploy certified and experienced engineers in the system design of fieldbus during engineering and commissioning of fieldbus

system. Further, the certified fieldbus engineers shall be available during commissioning of fieldbus instruments and actuators. Protocol will be signed with NTPC site engineer for successful commissioning of fieldbus instruments, actuator along with control system. The name(s) of such certified fieldbus commissioning engineer's shall be approved by Employer and for this the contractor shall submit CV/ experience details of proposed engineers.

Further, the contractor shall provide training to employer's personnel on following aspects of fieldbus (i) Hardware & Software features (ii) System design, diagnostic and testing (iii) maintenance, troubleshooting and fault analysis. This training shall be provided by certified training agencies of foundation fieldbus/ Profibus foundation and it shall be provided before approval of basic design and engineering document.

The block logics shall be in the format as approved by NTPC during detailed engineering stage.

For other services refer relevant sections of bidding documents.

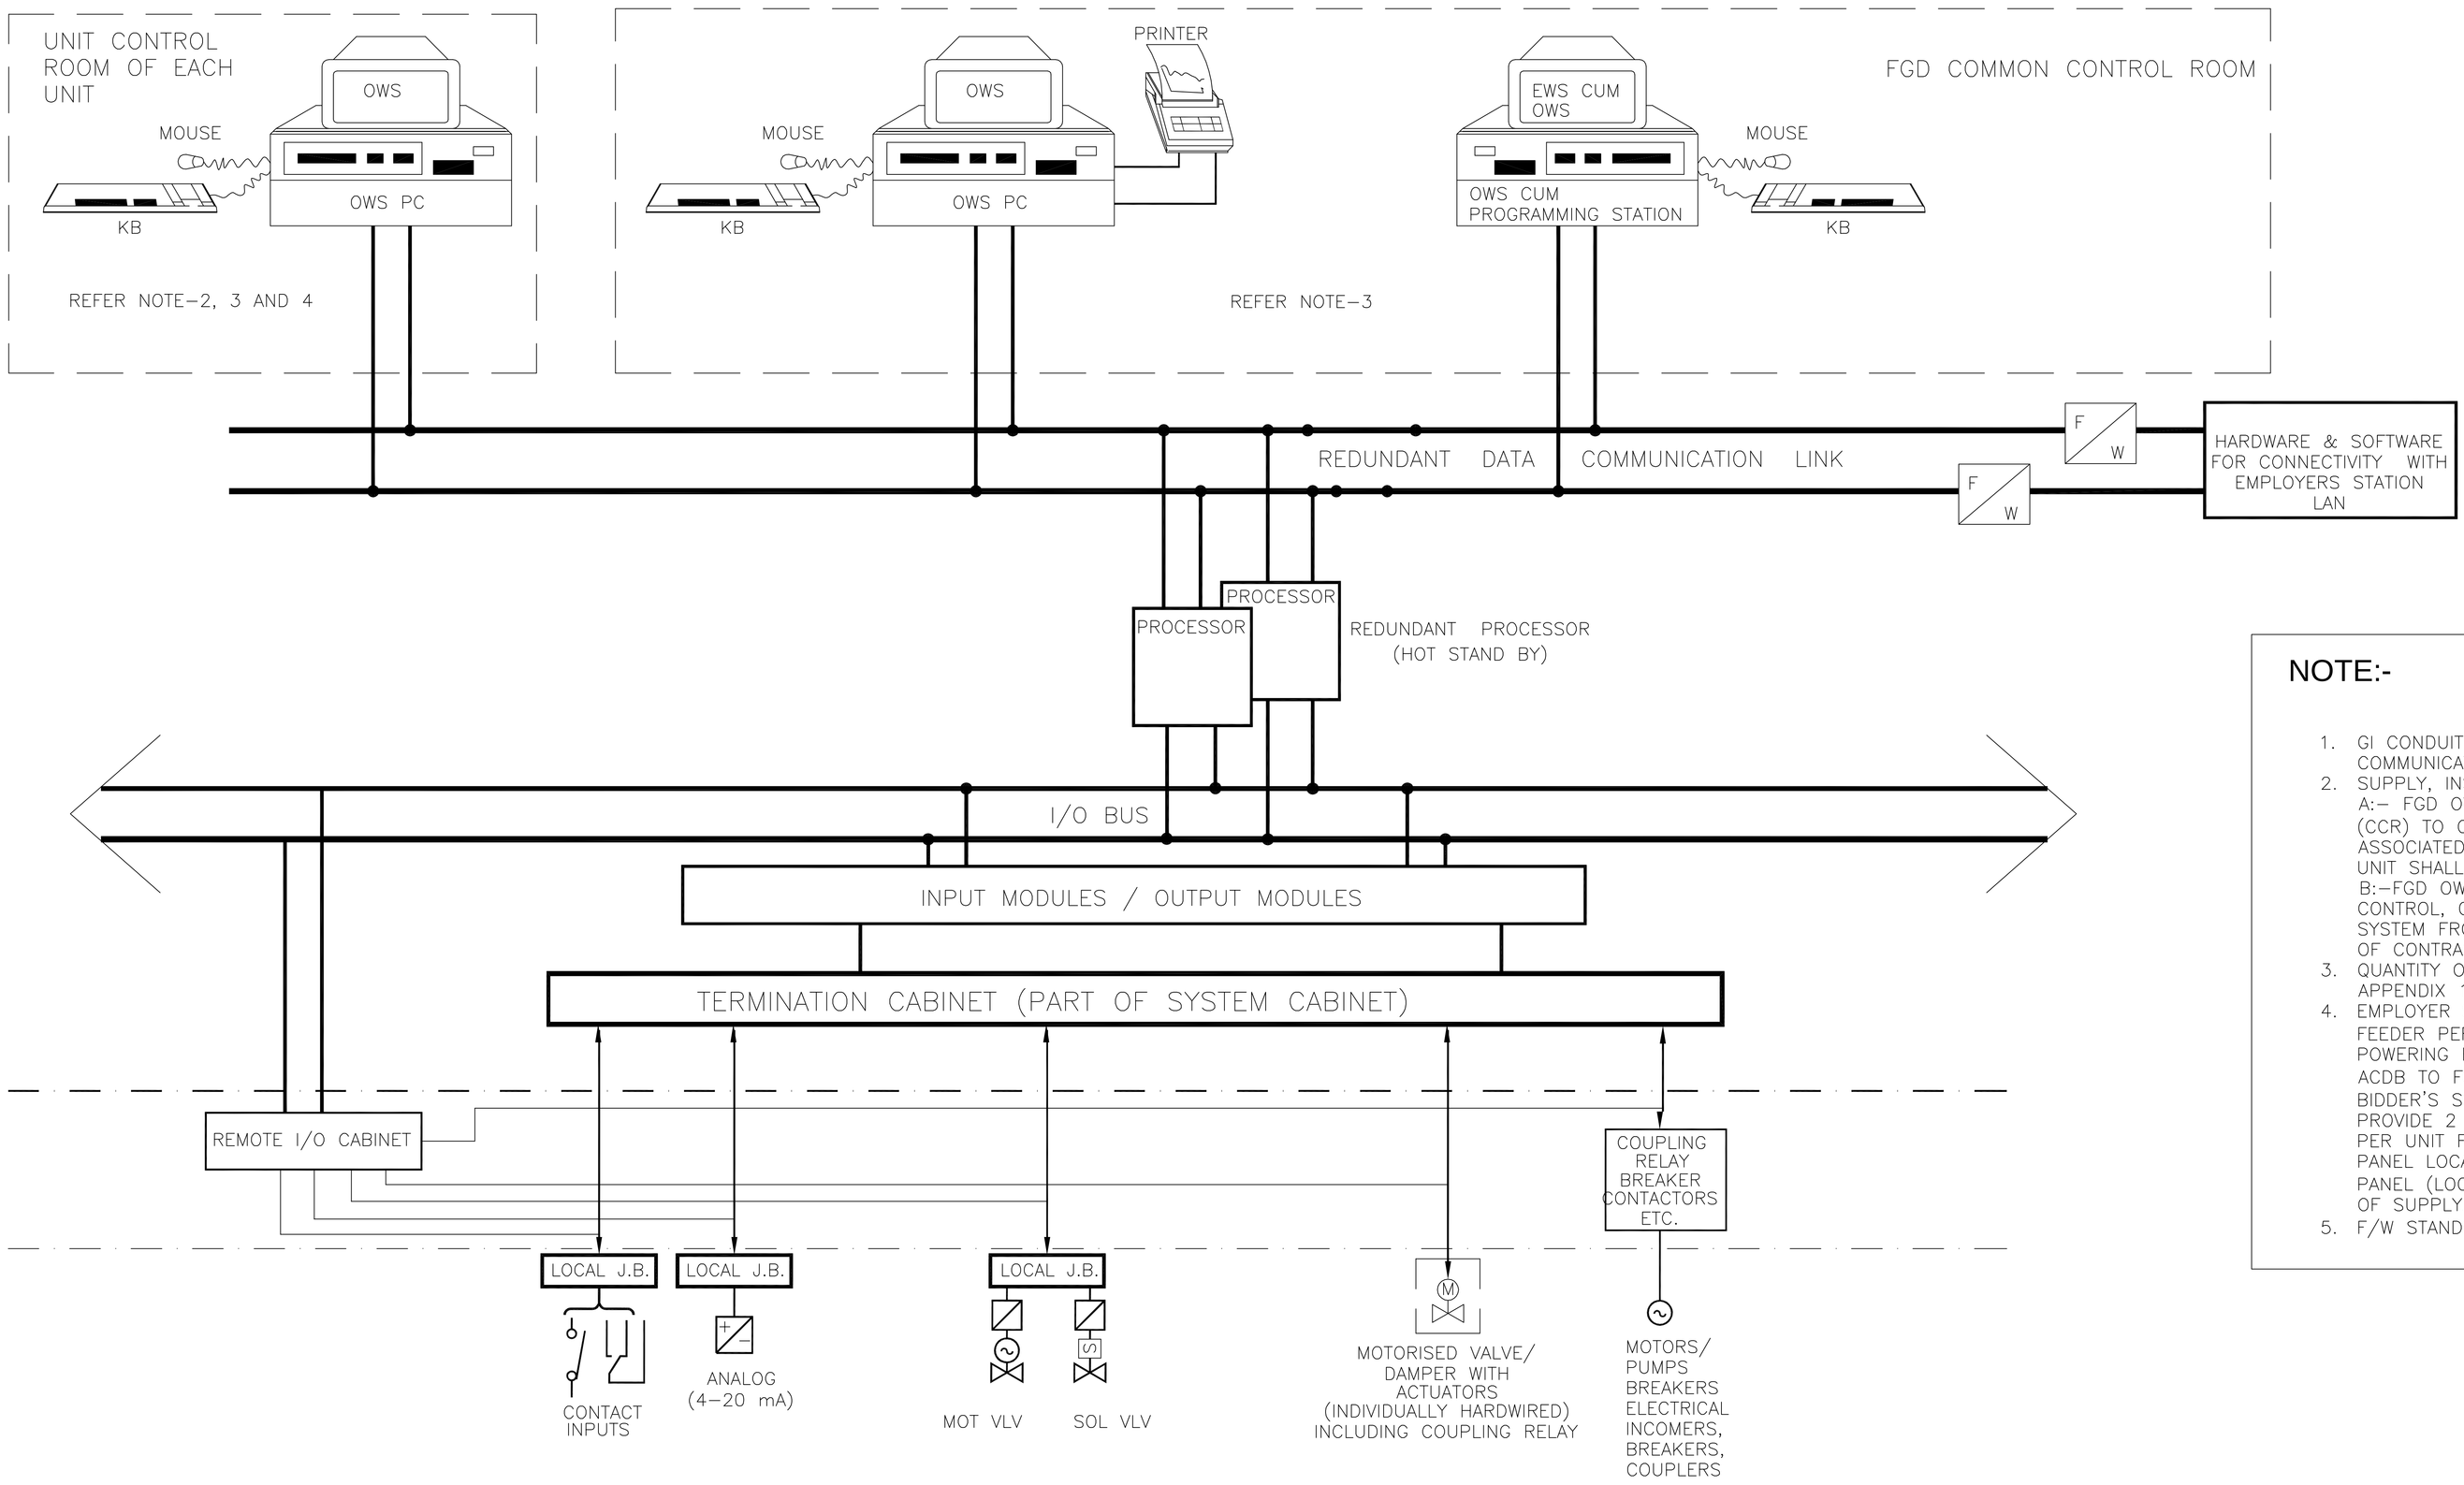
| | Not used | | | | | | |
| | 2. (i) In case, separate control system programming device is required, same shall be provided for each DDCMIS system. | | | | | | |
| | (ii) For each of the non-DDCMIS based controls being provided for any system, 1 set of programming tool for each such system shall be provided to view & change logic/program/settings. | | | | | | |
| | 3. Redundant master clock are located in CER. Interconencting cables shall be on as required basis. | | | | | | |
| | 4. Software for DDCMIS meeting requirements specified under item "SYSTEM SOFTWARE REQUIREMENTS" sub-section DDCMIS, Part-B, Section-VI of technical speciifcations shall be on as required basis for all the DDCMIS. | | | | | | |
| | 5. Data communication system shall be on as required basis. One set of suitable interfaces and links for connectivity between FGD unit LAN, FGD common LAN and employer's Station LAN shall be provided per DDCMIS, as applicable. Cubicles for mounting networking components and power supply distribution equipment shall be provided on as required basis. | | | | | | |
| | 6. Not used | | | | | | |
| | 7. Not used | | | | | | |
| | 8. Not used | | | | | | |
| | 9. Not used | | | | | | |
| | 10. Not Used | | | | | | |
| | 11. Spare Capacity for HMIPIS | | | | | | |
| | Each Sub-system HMIPIS shall be provided with capacity to handle at least 30% of each type of peripherals/equipments, additionally, like OWS, printers, etc, over and above already specified, without any additional hardware or software. Further, the Data communication system (including Main system Bus and other bus system), HMIPIS database, Server/Information workstation etc. shall be able to handle 30% extra signals over and above all process as well as calculated (at controller level) signals including the tag nos./process variables being acquired from other DDCMIS sub-system through various links meeting the specification requirements. Usable space of 20% shall also be kept in network panels of each HMIPIS for mounting network components. | | | | | | |

# C&I ANNEXURE-IX



NOTE:-

1. GI CONDUIT SHALL BE PROVIDED FOR IO BUS/DATA COMMUNICATION LINK LEAVING FGD CONTROL ROOM.
2. SUPPLY, INSTALLATION AND COMMISSIONING OF:
   A:– FGD OWS PLACED IN CENTRAL CONTROL ROOM (CCR) TO CONTROL, OPERATE AND MONITOR FGD AND ASSOCIATED SYSTEM FROM MAIN PLANT CCR OF EACH UNIT SHALL BE IN SCOPE OF CONTRACTOR.
   B:–FGD OWS PLACED IN FGD CONTROL ROOM TO CONTROL, OPERATE AND MONITOR FGD AND ASSOCIATED SYSTEM FROM FGD CONTROL ROOM SHALL BE IN SCOPE OF CONTRACTOR.
3. QUANTITY OF HMI HARDWARE SHALL BE AS PER THE APPENDIX 1 ANNEXURE II.
4. EMPLOYER SHALL PROVIDE 02 NOS. OF UPS POWER FEEDER PER UNIT FROM EMPLOYER'S ACDB, FOR POWERING FGD OWS LOCATED IN CCR CABLING FROM ACDB TO FGD OWS (LOCATED IN CCR) SHALL BE IN BIDDER'S SCOPE OF SUPPLY. EMPLOYER SHALL PROVIDE 2 NOS. OF 24V DC POWER SUPPLY FEEDERS PER UNIT FROM EMPLOYERS DCDB, FOR POWERING RIO PANEL LOCATED IN CER. CABLING FROM DCDB TO RIO PANEL (LOCATED IN CER) SHALL BE IN BIDDER'S SCOPE OF SUPPLY.
5. F/W STANDS FOR FIREWALL.

## CONTAINERISED ROOM (PORTABLE CABIN)

### 1.00.01 Enclosure rating & Design

- For the purpose of design of equipment/systems, an ambient temperature of 50 deg. Centigrade and relative humidity of 95% shall be considered. The equipment shall operate in a highly polluted environment.

- CONTAINERISED ROOM (PORTABLE CABIN) shall be designed for outdoor application.

### 1.00.02 General Description

The Containerised room shall meet all requirements of analysers and analyser panels.

- Containerised room would be closed type, weather proof and made of CRCA steel construction.
- It shall withstand heavy monsoon, heavy rain and heavy wind condition.
- Doors would be equipped with hydraulic door closer.
- Each door shall be fitted internally with "panic" bar exit handles and externally with key lockable handles. Exterior handles will be of stainless steel.
- Door will be provided with heavy-duty latches, hinges, door stop and pad lock.
- Personnel doors would be provided with canopy with necessary rubber gaskets to prevent the entry of water.
- The Containerised room shall be air-conditioned to maintain an air temperature less than 27°C.
- The Containerised room shall be designed as multiple modular transportable units; they shall be modularized for ease of separation for transport and quick re-assembly at site.
- Split Modules shall be designed for lifting as single piece along with equipment's.
- Lifting lugs should be designed to carry the weight of the Containerised room including all the Electrical panel boards.
- Suitable lifting provisions and accessories shall be provided along with Containerised room.

### 1.00.03 Structural Arrangements

#### 1) Frame

The pre-fabricated enclosure(s) frame shall be constructed as a rigid, self-supporting steel structure. Structural steel design and fabrication shall be in accordance with AISC Manual of Steel Construction.

**Construction Materials**

| | |
|---|---|
| * Steel: load bearing members: | IS 10748; Grade IV |
| * Structural Steel: | IS 2062. |
| * Side-end walls & roof panels: | IS 2062. |

* Square/Rectangular hollow sections: JIS STKR-41 / IS 1161

The roof framing and the columns shall be designed to support any additional dead load suspended from the roof such as air conditioning duct, false ceiling, cable trays, light fixtures, and piping.

The pre-fabricated enclosure(s) floor framing (skid) shall be fabricated from ASTM A36/ JIS 3101 or Equivalent steel members to form a rigid rectangular frame. The frame shall be braced with cross members as required to support the equipment installed in the building.

The pre-fabricated enclosure(s) shall be analyzed to resist both dead and live loads expected during construction, transportation, installation, and operation.

The pre-fabricated enclosure(s) shall be designed for the maximum in-place Structural loading consisting of the structure, equipment dead weight, all operating loads, and the maximum environmental loads

**2) Shell and Base frame**

The outer shell of the Containerised room shall be manufactured with 1.6mm sheet. The main load bearing members such as posts, base members, bottom and top side rails, end rails headers are selected based on approved structural analysis. Lifting hooks shall be provided at minimum at corners. The adequacy of the same shall be verified by structural analysis.

Adequate number of doors with reinforced framework and locking device shall be provided as per requirement. The door has to be effectively sealed against water ingress in closed condition. The shell structure is to be rigid enough to withstand rough handling rigorous transportation hazards etc. and able to stand flexing/distortion even when placed on uneven ground.

Base members are to be made from press formed steel sections of appropriate Geometry of required thickness. Base frame design shall be accommodating the panels provided inside the room.

Panel mounting structure shall be fabricated and drilled with holes for fixing bolts for the site erection panel during site erection. 16 gauge galvanized sheet for cable protection at the bottom sheeting plate.

**3) Side & End Walls**

External walls are to be vertically corrugated 1.6 mm thick GI/CRCA conforming to IS 2062/IS 513.

The corrugated panels shall form entire side wall and the assembled side wall shall be assembled with the peripheral frame members.

**4) Roof**

The roof has to be manufactured from 1.6 mm thick GI/CRCA conforming to IS 2062. The roof will have sloping arrangement for effective drainage.

**5) Flooring System**

Floor plating shall be covered with a non-skid surface. The exposed floor shall be covered with a insulating material as per statutory requirement.

**6) Insulation**

Containerised room will be insulated on sides, end walls, roof & doors with 50mm thick Glass Wool/Rockwool insulation. Densities should be 48 kg/m3

**7) Inner Paneling**

Interiors of the Containerised room shall be aesthetically finished so as to give a pleasing appearance with high quality workmanship. All joints shall be neatly finished. For side, roof and end walls paneling will be done with 1.6mm thick Galvanized sheet.

**8) Doors**

All exterior doors shall be of weather-proof construction with four sided frames. All exterior hardware shall be stainless steel, including, but not limited to hinges. Hinges shall be concealed type. If non concealed type then the hinge should be tamper proof arrangement.

Doors shall be fabricated from aluminum with SS panic hardware. Doors shall be lockable with one key for all doors. Provide four keys total.

Two doors of Aluminum shall be provided unless otherwise specified. One equipment door and one personnel door shall be provided. The size of equipment door shall be as per equipment sizing. One personnel door minimum 1.2M x 2.5M shall be provided. Doors shall be of 4 hours fire rated.

**9) Protective Coating Procedure**

All steel structure members shall be cleaned prior to finishing.
Standard interior finish shall be white. After welding do abrasive blast – SA 2 1/2 thereafter below process to be adapted

**A) Internal Panels Painting (Walls & Roof) :-**

Powder Paint Sheet

- Surface Preparation/Primer :Intercure 200HS Min 150 um
- Finish : Interthane 990 Min 50 um
- Total Minimum DFT shall be 200 um

**B) Exterior Panels Painting (Walls, Roof & Base structure) :**

Powder Paint Sheet

- Surface Preparation/Primer : Interzinc 52 Min 75 um
- Coating : Interguard 475HS Min 200 um

- Finish : Interthane 990 Min 50 um
- Total Minimum DFT shall be 325 um

Both Interior and exterior panels, roof and base frame will be painted in colour shade of RAL 5012.

**10) Grounding**

Internal Earthing inside enclosure with suitable cross sectional GI flats. The building shall be furnished complete with ground pads which shall bond of electrical equipment enclosure frames and ground buses to the building frame at the exterior base in two locations and at opposite ends of the building so as to provide a continuous path to ground. The Grounding system shall connect to each end of the ground bus in each assembly of installed equipment.

**11) Lighting**

The lighting system shall maintain minimum levels as given below:

Lux level shall be 200 inside the Containerised room and outside platforms/ stairs shall be 100 Lux.
All luminaries shall be suitable for industrial duty and provided with IP65 housings for outdoor enclosures and IP54 for indoor enclosures. All fittings shall be weatherproof and able to withstand direct hosing. The wiring for lighting shall be routed through GI conduits either concealed or the wall of the enclosure
External light around Containerised room only shall be considered. All Light Fixtures shall be high efficiency LED type only.

**12) Lifting Tools and Tackles**

Suitable lifting system shall be designed and furnished. The system will consist of a spreader bar, slings, shackles and other tools to lift the equipment building in one piece
A lifting system installation & operational diagram shall accompany all shipping documents.

**Civil Annexure-1**

**Mauda TPP**

**SITE SPECIFIC SEISMIC PARAMETERS FOR DESIGN OF STRUCTURES AND EQUIPMENT**

The various site specific seismic parameters for the project site shall be as follows:

| | | |
|---|---|---|
| 1) | Peak ground horizontal acceleration | : 0.17g |
| 2) | Multiplying factor to be applied to the site specific horizontal acceleration spectral coefficients (in units of gravity acceleration 'g') to obtain the design acceleration spectra | |
| a) | for special moment resisting steel frames designed and detailed as per IS:800 | : 0.043 |
| b) | For special concentrically braced steel frames designed and detailed as per IS:800 | : 0.032 |
| c) | For special moment resisting RC frames designed and detailed as per IS:456 and IS:13920 | : 0.026 |
| d) | for RCC chimney | : 0.085 |
| e) | For Liquid retaining tanks | : 0.051 |
| f) | for Steel chimney, Absorber tower, Vessels | : 0.064 |
| g) | for design of structures not covered under 2 (a) to 2 (f) above and under 3 below, in general (excluding special structure/ configuration/materials) | : 0.043 |
| 3) | Multiplying factor to be applied to the site specific horizontal acceleration spectral coefficients (in units of gravity acceleration 'g') for design of equipment and structures where inelastic action is not relevant or not permitted | : 0.085 |

Note:

1. g = Acceleration due to gravity
2. For industrial structures, analysis for verification of mechanism shall be carried out as per IS:1893 (Part 4):2015

**KUDGI STPP**

**SITE SPECIFIC SEISMIC PARAMETERS FOR DESIGN OF STRUCTURES AND EQUIPMENT**

The various site specific seismic parameters for the project site shall be as follows:

| | | |
|---|---|---|
| 1) | Peak ground horizontal acceleration (MCE) | : 0.15g |
| 2) | Multiplying factor to be applied to the site specific horizontal acceleration spectral coefficients (in units of gravity acceleration 'g') to obtain the design acceleration spectra | |
| a) | for special moment resisting steel frames designed and detailed as per IS:800 | : 0.038 |
| b) | For special concentrically braced steel frames designed and detailed as per IS:800 | : 0.028 |
| c) | for special moment resisting RC frames designed and detailed as per IS:456 and IS:13920 | : 0.023 |
| d) | for RCC chimney | :0.075 |
| e) | For Liquid retaining tanks | :0.045 |
| f) | for Steel chimney, Absorber tower, Vessels | : 0.056 |
| g) | for design of structures not covered under 2 (a) to 2 (f) above and under 3 below, in general (excluding special structure/ configuration/materials) | : 0.038 |
| 3) | Multiplying factor to be applied to the site specific horizontal acceleration spectral coefficients (in units of gravity acceleration 'g') for design of equipment and structures where inelastic action is not relevant or not permitted | : 0.075 |

Note:

1. g = Acceleration due to gravity
2. For industrial structures, analysis for verification of mechanism shall be carried out as per IS:1893 (Part 4):2015

**GADARWARA STPP**

**SITE SPECIFIC SEISMIC PARAMETERS FOR DESIGN OF STRUCTURES AND EQUIPMENT**

The various site specific seismic parameters for the project site shall be as follows:

| | | |
|---|---|---|
| 1) | Peak ground horizontal acceleration (MCE) | : 0.18g |
| 2) | Multiplying factor to be applied to the site specific horizontal acceleration spectral coefficients (in units of gravity acceleration 'g') to obtain the design acceleration spectra | |
| a) | for special moment resisting steel frames designed and detailed as per IS:800 | : 0.045 |
| b) | for special concentrically braced steel frames designed and detailed as per IS:800 | : 0.034 |
| c) | for special moment resisting RC frames designed and detailed as per IS:456 and IS:13920 | : 0.027 |
| d) | for RCC chimney | : 0.09 |
| e) | For Liquid retaining tanks | :0.054 |
| f) | for Steel chimney, Absorber tower, Vessels | : 0.068 |
| g) | for design of structures not covered under 2 (a) to 2 (f) above and under 3 below, in general (excluding special structure/ configuration/materials) | : 0.045 |
| 3) | Multiplying factor to be applied to the site specific horizontal acceleration spectral coefficients (in units of gravity acceleration 'g') for design of equipment and structures where inelastic action is not relevant or not permitted | : 0.09 |

Note:

1. g = Acceleration due to gravity.
2. For industrial structures, analysis for verification of mechanism shall be carried out as per IS:1893 (Part 4):2015.

**DARLIPALI STPP**

**SITE SPECIFIC SEISMIC PARAMETERS FOR DESIGN OF STRUCTURES AND EQUIPMENT**

The various site specific seismic parameters for the project site shall be as follows:

| | | |
|---|---|---|
| 1) | Peak ground horizontal acceleration (MCE) | : 0.10g |
| 2) | Multiplying factor to be applied to the site specific horizontal acceleration spectral coefficients (in units of gravity acceleration 'g') to obtain the design acceleration spectra | |
| a) | for special moment resisting steel frames designed and detailed as per IS:800 | : 0.025 |
| b) | for special concentrically braced steel frames designed and detailed as per IS:800 | : 0.019 |
| c) | for special moment resisting RC frames designed and detailed as per IS:456 and IS:13920 | : 0.015 |
| d) | for RCC chimney | :0.05 |
| e) | For Liquid retaining tanks | :0.03 |
| f) | for Steel chimney, Absorber tower, Vessels | : 0.038 |
| g) | for design of structures not covered under 2 (a) to 2 (f) above and under 3 below, in general (excluding special structure/ configuration/materials) | : 0.025 |
| 3) | Multiplying factor to be applied to the site specific horizontal acceleration spectral coefficients (in units of gravity acceleration 'g') for design of equipment and structures where inelastic action is not relevant or not permitted | : 0.05 |

Note:

1. g = Acceleration due to gravity.
2. For industrial structures, analysis for verification of mechanism shall be carried out as per IS:1893 (Part 4):2015.

**SOLAPUR STPP**

**SITE SPECIFIC SEISMIC PARAMETERS FOR DESIGN OF STRUCTURES AND EQUIPMENT**

The various site specific seismic parameters for the project site shall be as follows:

| | | |
|---|---|---|
| 1) | Peak ground horizontal acceleration (MCE) | : 0.16g |
| 2) | Multiplying factor to be applied to the site specific horizontal acceleration spectral coefficients (in units of gravity acceleration 'g') to obtain the design acceleration spectra | |
| a) | for special moment resisting steel frames designed and detailed as per IS:800 | : 0.04 |
| b) | for special concentrically braced steel frames designed and detailed as per IS:800 | : 0.03 |
| c) | for special moment resisting RC frames designed and detailed as per IS:456 and IS:13920 | : 0.024 |
| d) | for RCC chimney | :0.08 |
| e) | For Liquid retaining tanks | : 0.048 |
| f) | for Steel chimney, Absorber tower, Vessels | : 0.06 |
| g) | for design of structures not covered under 2 (a) to 2 (f) above and under 3 below, in general (excluding special structure/ configuration/materials) | : 0.04 |
| 3) | Multiplying factor to be applied to the site specific horizontal acceleration spectral coefficients (in units of gravity acceleration 'g') for design of equipment and structures where inelastic action is not relevant or not permitted | : 0.08 |

Note:

1. g = Acceleration due to gravity.
2. For industrial structures, analysis for verification of mechanism shall be carried out as per IS:1893 (Part 4):2015.

|---|---|---|---|---|---|---|---|
| | SEC/ PART | SUB-SEC. | PAGE NO. | CLAUSE NO. | | | |
| 6. | VI/A | VII | 197of 209 | 1.07.03 | MANDATORY SPARES:<br>1.07.00 PLC CONTROLS SYSTEM<br>1.07.03 CENTRAL PROCESSOR UNIT: | Kindly clarify what is Central processing Unit, does it mean the controller module of the DCS system? Kindly confirm. | Bidder's understanding is correct. |
| 7. | VI/B | III-C1 | 6 of 103 | 3.04.00 | Bidder shall be required to ensure supply of spare parts for lifetime of the plant. In case, the Bidder feels that certain equipment/component is likely to become obsolete, the Bidder shall clearly bring out the same in his Bid and indicate steps proposed to deal with such obsolescence. | Normally Electronic cards/module phased out in 8-10 years due to continuous up-gradation in technology, hence we request Customer to suitably modify the given clause as given below:<br><br>*"Bidder shall ensure availability of Spares for 10 years. Beyond this period, in case of phasing out of production of spares parts, a notice of 12 months in advance regarding this shall be provided to Owner in order to enable them to order & stock bulk requirement of spares.* | With reference to clause 3.04.00, Part-B, Sub Section III-C1 of technical specification, it is clarified that lifetime of the plant is envisaged as 15 years for which bidder shall ensure supply of the spare parts. Bidder shall comply with the specification. |
| 8. | VI/B | III-C4 | 55 & 56 of 103 | 5.00.00 | Marshalling/Marshalling cum Termination cubicle | Customer is requested to consider Cable termination at marshalling cabinet or any other equivalent methodology being followed by the | Bidder's proposal is not acceptable. Bidder shall comply with the specification. |

| 1 | SECTON -VI TECHNICAL SPECIFICATION, Clause: 3.14.03 | 1 | The wind shield shall be designed for vertical loading, cross wind loading, seismic loading, circumferential wind loading, thermal gradients etc. The load calculation and load combinations shall be as detailed in IS 4998 (Part 1) : 1992. The wind shield<br>shall be analysed for cases with and without flue liner loads. | NTPC to clarify wind shield design shall be performed as per IS 4998 (Part 1) : 1992 or IS 4998 (Part 1) : 2015. | Bidder shall comply to the requirements of technical specification. |
| 2 | SECTON -VI TECHNICAL SPECIFICATION, Clause: 3.14.03 | 2 | The effect of the openings/cut-outs in the chimney shell shall be duly considered in the design of the windshield. The minimum thickness of shell shall not be less than 500mm. | NTPC to confirm the minimum thickness of shell shall be as per IS 4998(Part-1) or 500mm. | Bidder shall comply to the requirements of technical specification. |
| 3 | SECTON -VI TECHNICAL SPECIFICATION, Clause: 3.14.01 | 10 | | As there is no clarity regarding mini shell above roof level, it is proposed to extend the steel flu can above chimney roof with 2 mm thick Titanium / C-276 sheet over insulation as per clause 3.02.07 of SUB-SECTION·I·M1(Part-B) on external surface of the steel flu extended above roof. No RCC mini shell considered. NTPC to confirm. | Flue liner shall be provided as pe the requirements of technical Specification. There is no specific requirement of RCC mini-shell. |
