**ANNEXURE -A**

**(Techno-Commercial Bid)**

**Name of work:** Scraping, Matching & Oil point formation on flat and sliding guide ways of Russian HB m/c Plan No1-012/Bl.1 (Model HC27T).

- **Short Description & nature of Work** - Hand scraping is a manual process of truing and providing texture to mated surfaces in a machine tool. It is most often performed using a scraper bit, which is a hand tool with a flat-edged tip. The main reasons for hand scraping mated surfaces have to do with oil retention, stability and accuracy. Once the two castings/mating parts have been joined, the master/reference piece is coated with engineer's blue—the pigment Prussian blue in an oil base—and rested a top the way on which it will ride during operation. The resulting imprint reveals areas of contact, allowing the hand scraper to true the surfaces so that they are properly mated and tight tolerances can only be achieved by adding high and low spots that hold oil and allow for gliding, rather than sticking. Introducing more contact points via the high and low spots also allows for balance and therefore perfect mating. With flat surfaces there is only one contact point, which creates a state of imbalance.

The hand-scraping has been opted to achieve the four main processes-

- **Accuracy** - Scraping is done to align the components within microns, allowing for consistently-held, tight tolerances.
- **Flatness** - Contact points prevent rocking, add balance when tightening, and allow for true flatness in parts. For bolted parts, hand scraping creates a tighter fit, which is less likely to separate as a result of the material expansion, contraction and flexing that occurs during machining processes.
- **Oil Pockets** – Oil holding pockets on the surface allows gliding motion.
- **Appearance** - The finishing touch of scraping is aesthetic. Parts are “design scraped” to achieve an attractive textured finish

**Note: Total Flat guide ways area is 55700 sq. inch and total Sliding guide ways area is 14300 sq. inch**
